Footnotes for Table 13

1. Solar input: 1195 E6 m2, 127 kcal/cm-yr average solar insolation.
 $(1195 \text{ E6 m2})(127 \text{ E4 kcal/m2-yr})(.7 \text{ absorbed})(4186 \text{ J/kcal}) = 4.44 \text{ E18 J/yr.}$
2. Wind energy: 0.19 available inshore system (areal ratio) - see Table 12, note #2.
3. Mangrove transpiration:
 $(2.5 \text{ mm/d})(365 \text{ d/yr})(1000 \text{ g/mm/m2})(4.0 \text{ J/g})(1195 \text{ E6 m2}) = 4.36 \text{ E15 J/yr}$
4. Rain chemical potential energy: Av. precipitation in Guayaquil 885 mm/yr (Twilley, 1986): $(1195 \text{ E6 m2})(.885 \text{ m})(1 \text{ E6 g/m3})(4.94 \text{ J/g}) = 5.2 \text{ E15 J/yr.}$
5. Tidal energy range absorbed in mangroves, 1.0 m;
 $(706/\text{yr})(9.8 \text{ m/s2})(1.025 \text{ E3 Kg/m3})(11.195 \text{ E9 m2})(1.0 \text{ M})(1.0\text{m}) = 4.23 \text{ E15 J/yr}$
6. Total suspended solids in sewer effluent: 6456 E6 g/yr. 0.2 of area;
 $(0.2)(6456 \text{ E6 g})(.002 \text{ organic})(5.4 \text{ kcal/g})(4186 \text{ J/kcal}) = 5.84 \text{ E10 J/yr.}$
7. Nitrogen concentration in sewer effluent 2.1 E9 g/yr; 0.2 of estuary area (Twilley, 1986).
 $(2.1\text{E9})(.2) = 4.2\text{E8 g/yr}$
8. Phosphate concentration in sewer effluent 2.58 E8 g/yr (Twilley, 1986); 0.2 area. $(2.58 \text{ E8 g/yr})(.2) = 5.15 \text{ E7 g/yr}$
9. Mangrove biomass growth: 2.8 g/m2-day (observation from Snedaker, 1986 and Sell, 1977).
 $(1195 \text{ E6 m2})(2.8\text{g/m2-d})(365 \text{ d})(3764 \text{ cal/g})(4.186 \text{ J/cal}) = 1.9 \text{ E16 J/yr.}$
 Transformity: $(279 \text{ E18 sej/yr in footnote 12})/(1.9 \text{ E16 J/yr}) = 14684 \text{ sej/J.}$
10. Mangrove litter fall: 957 - 1032 g/m2-yr (Sell, 1977); av. 995 g/m2-yr. $(995 \text{ g/m2})(1195 \text{ E6 m2})(4139 \text{ cal/g})(4.186 \text{ J/cal}) = 2.1 \text{ E16 J/yr.}$
 Transformity: $(279 \text{ E18 sej/yr})/(2.1 \text{ E16 J/yr}) = 13285 \text{ sej/J}$
11. Medium sized shrimp produced (70 individuals-tails per pound) Turner(1985): 10 kg commercial yield of adults per hectare of vegetated nursery.
 $(10 \text{ kg/ha})(2.2 \text{ lb/kg})(.7 \text{ tails})(35 \text{ tails/lb}) = 539 \text{ individuals/Ha}$
 $(539 \text{ ind./ha})(1195 \text{ E6 m2})(/70 \text{ ind/lb})/(1 \text{ E4 m2/ha}) = 9.2 \text{ E5 lb}$
 $(9.2 \text{ E5 lbs})(.2 \text{ dry})(454 \text{ g/lb})(6.0 \text{ kcal/g})(4186 \text{ J/kcal}) = 2.1 \text{ E12 J/yr}$
 Transformity for estuarine shrimp, half of larger offshore adults:
 $(0.5)(4 \text{ E6 sej/J in Table 15}) = 2 \text{ E6 SEJ/j}$
12. Total omitting double counting: sum of transpiration and tide:
 $(179 + 100) = 279 \text{ E18 sej/yr}$

Table 14a.
Annual EMERGY Flows of Shrimp Pond Mariculture in Ecuador, 1986
53,000 Hectares; 1.5 m deep; see system diagram in Figure 5.

Note	Item	Raw Units J,g,\$	Transformity Sej/unit	Solar Emergy E20	Macroeco- nomic US \$E6

Table 14b. Indices from Table 14a

EMERGY investment ratio:

With organic feed = $(16.9 \text{ E20 sej/yr}) / (4.92 \text{ E20 sej/yr}) = 3.4$

Without organic feed = $(12.7 \text{ E20 sej/yr}) / (4.92 \text{ E20 sej/yr}) = 2.6$

For comparison, regional EMERGY investment ratio = 2.3

Solar transformity of Shrimp from shrimp ponds: $(\text{Input EMERGY}) / (\text{yield energy})$

$$= (21.82 \text{ E20 sej/yr}) / (1.68 \text{ E14 J}) = 13.0 \text{ E6 sej/J.}$$

Solar transformity in ponds without organic feed

$$= (17.6 \text{ E20 sej/yr}) / (9.3 \text{ E13 J}) = 18.9 \text{ E6 sej/J.}$$

For comparisons, Peneid shrimp transformities elsewhere = 4 - 8 E6 sej/J (Table 15).

Net EMERGY yield ratio (Yield EMERGY/Purchased EMERGY):

With organic feed = $(21.82 \text{ E20 sej/yr}) / (16.9 \text{ E20}) = 1.3$

without organic feed = $(17.6 \text{ E20}) / (12.7 \text{ E20}) = 1.4$

EMERGY amplifier ratio explained in Figure 11; using an average transformity before and after amplifying production, 16 E6 sej/J.

EMERGY increase due to feeding with fish meal

$16.0 \text{ E6 sej/J} * (1.68 -.93) \text{ E14 J/yr}$

$$\text{amplifier ratio} = \frac{12.0 \text{ E20 sej/yr}}{4.3 \text{ E20 sej/yr}} = 2.8$$

EMERGY in added fish meal (Table 14a)

Footnotes for Table 14a

1. Direct solar energy:
 $(127 \text{ E4 kcal/m}^2/\text{yr})(4186 \text{ J/kcal})(0.7 \text{ absorbed})(530 \text{ E6 m}^2) = 1.97 \text{ E18 J/yr}$
2. Rain into ponds: $(1 \text{ m/yr})(530 \text{ E6 m}^2)(1 \text{ E6 g/m}^3)(5 \text{ J/g}) = 2.65 \text{ E15 J/yr}$
3. Pumped sea water to maintain water levels and salinity; evaluated freshwater content:
 $(0.1 \text{ vol/d})(365 \text{ d})(1.5 \text{ m})(5.38 \text{ E5 m}^2)(.08 \text{ fresh})(1 \text{ E6 g/m}^3)(3 \text{ J/g}) = 7.4 \text{ E15 J/yr}$
4. Input of post-larvae estimated from pond yield 3.0E4 tonne (Aquacultura de Ecuador, 1988):
 $(30 \text{ E6 kg})(2.2 \text{ lbs/kg})(.70 \text{ tails})(35 \text{ tails/lb}) / (.5 \text{ mortality}) = 3.2 \text{ E9 ind./y}$
 Larvae can be thought about as information packages with little energy. When a shrimp releases many larvae, this represents a split of the EMERGY. Each tiny new individual carries an information copy. If the population is at steady state the larvae grow and are depleted in number by mortality eventually replacing two adults. This is a closed life cycle dependent on all the inputs necessary for the whole sequence. The EMERGY per individual is a transformity that grows reaching a maximum with the reproducing individuals. For a mortality commensurate with growth of the surviving, post-larvae with 50% further mortality represents 2 individuals that will finally restore 1 adult. Thus a transformity for the post-

larvae is half that of the reproducing adult before harvest (.5 * 4 E6 sej/J). On an individual basis the solar transformity is:

$$(0.5)(4 \text{ E6 sej/J})(10 \text{ g/ind})(.2 \text{ dry})(6.2 \text{ kcal/g})(4186 \text{ J/kcal}) = 1.04 \text{ E11 sej/ind}$$

5. Transformity of Labor in Ecuador estimated as national EMERGY/person/yr from Table 6.

$$\text{Energy/person} = (2500 \text{ kcal/d})(365 \text{ d/yr})(4186 \text{ J/kcal})(4186 \text{ J/kcal}) = 3.82 \text{ E9 J/yr.}$$

$$\text{Solar transformity} = (10 \text{ E15 sej/ind/yr}) / (3.82 \text{ E9 J/ind/yr}) = 2.62 \text{ E6 sej/J}$$

90,000 fisherman 5 days a month; 20,000 people full time

$$(12.7 \text{ E6 person-days})(2500 \text{ kcal/person-day})(4186 \text{ J/kcal}) = 1.32 \text{ E14 J/yr}$$

6. Fuel: estimated as a percent of operating cost of pumped pond; price (Aquacultura del Ecuador, 1988):

$$(\$10/\text{lb shrimp})(26.4 \text{ E6 kg/yr})(2.2 \text{ lbs/kg}) / (\$.34/\text{gal fuel}) = 17 \text{ E6 gal/yr}$$

$$(17.1 \text{ E6 gal/yr})(137 \text{ E6 J/gallon}) = 2.34 \text{ E15 J/yr}$$

7. Nitrogen fertilizer for each 6 month start; 1.3 g/m³ N;

$$\text{Volume: } (1.5 \text{ m deep})(2.91 \text{ E8 m}^2) = 4.365 \text{ E8 m}^3$$

$$(4.365 \text{ E8 m}^3)(1.3 \text{ g/m}^3)(2/\text{yr}) = 1.135 \text{ E9 g/yr}$$

8. Phosphorus fertilizer for each 6 month start: 0.3 g/m³;

$$(4.365 \text{ E8 m}^3)(0.3 \text{ g/m}^3)(2/\text{yr}) = 2.62 \text{ E8 g/yr}$$

9. Feed; Fish meal from offshore herring, sardines; See text figure.

Total feed = sum of 23,600 Ha of semi-extensive ponds, fed for last 60 days.

$$(45 \text{ kg/ha/d})(1 \text{ E3 g/kg})(2.36 \text{ E4 ha})(60 \text{ d})(5.7 \text{ kcal/g})(4186 \text{ J/kcal}) = 1.52 \text{ E15 J/yr}$$

and 5500 Ha of semi-intensive ponds, fed for 300 days:

$$(45 \text{ kg/ha/d})(1 \text{ E3 g/kg})(5500 \text{ ha})(300 \text{ d})(5.7 \text{ kcal/g})(4186 \text{ J/kcal}) = 1.77 \text{ E15 J/yr}$$

$$\text{Total feed supplement: } (1.52 + 1.77 = 3.29 \text{ E15}) \text{ J/yr}$$

Much of the fish meal came from herring, sardines, etc mostly beyond the continental shelf. A solar transformity was estimated using organic carbon per square meter in herring sardines and anchovettas yield from the pelagic upwelling system published by Walsh (1981) divided by the solar EMERGY of the current. EMERGY of direct solar energy, and chemical energy of rain were also evaluated, but were less than the physical energy of the Humboldt current. As lesser by products of the world weather system direct sun and oceanic rain were omitted to avoid double counting.

Fish yield was 6.71 grams Carbon/m²/year with energy content:

$$(6.71 \text{ g C/m}^2/\text{yr})(2.5 \text{ g org./g C})(5.7 \text{ kcal/g})(4186 \text{ J/kcal}) = 4.00 \text{ E5 J/m}^2/\text{yr.}$$

Solar Emergy input per square meter of pelagic ecosystem generating this meal includes direct sun, rain, and the physical energy being used from the several sources driving the Humboldt current, the waves, and upwelling. The circulation of the east Pacific gyral includes wind energy transferred from the large scale circulation of the atmosphere wind plus large scale pressure gradients maintained by density differences due to temperature and salinity differences. In this pelagic system unlike the inshore ones, the tidal absorption and river contributions are less. The physical energy was estimated by assuming a fraction of 1% of the kinetic energy used up per day in steady state with the sources. As the calculations below show, the EMERGY of the direct sun and direct rain are small by comparison.

EMERGY of direct solar Energy under offshore stratus:

$$(1 \text{ m}^2)(1.00 \text{ E6 kcal/m}^2/\text{yr})(4186 \text{ J/kcal})(1 \text{ sej/J}) = 4.19 \text{ E9 sej/m}^2/\text{yr}$$

Physical energy (tentative pending better sources);

$(0.5)(.3 \text{ m/sec})(.3 \text{ m/sec})(100 \text{ m deep})(1 \text{ m}^2)(1025 \text{ kg/m}^3)(.01/\text{day})(365 \text{ d/yr})$

$= 1.68 \text{ E}4 \text{ J/m}^2/\text{yr}$ physical energy

EMERGY flux using solar transformity of river current at New Orleans: $(4.67 \text{ E}4 \text{ J/m}^2/\text{yr})(80 \text{ E}5 \text{ sej/J}) = 1.34 \text{ E}11 \text{ sej/m}^2/\text{yr}$

Rainfall chemical energy on the open sea:

The solar transformity of rain falling over the ocean is different from that over land. Land is at a higher level in the geological hierarchy in which the solar energy falling on the seas is part of the basis for converging atmospheric processes to interact with continent building processes to generate rain on land. Solar transformity of rain over land was calculated as the quotient of the earth's annual EMERGY divided by the Gibbs free energy of the rain over land relative to sea water. Rain over the sea is a necessary by-product feedback lower in the hierarchy with larger volume for the same earth EMERGY budget. Rain over ocean was assumed 71/29 of $1.05 \text{ E}14 \text{ m}^3/\text{yr}$ rain over land in proportion to the ocean/land areas.

Solar transformity	$8.1 \text{ E}24 \text{ sej/yr/earth}$	
of oceanic rain	$\frac{(2.57 \text{ E}14 \text{ m}^3/\text{yr})(1 \text{ E}6 \text{ g/m}^3)(4.94 \text{ J/g})}{(4.94 \text{ J/g})}$	$= 6380 \text{ sej/J}$

$(1.0 \text{ m})(1 \text{ m}^2)(1 \text{ E}6 \text{ g/m}^3)(4.94 \text{ J/g}) = 4.9 \text{ E}6 \text{ J/m}^2/\text{yr}$

Solar Emery: $(4.9 \text{ E}6 \text{ J/m}^2/\text{yr})(6380 \text{ sej/J}) = 3.13 \text{ E}10 \text{ sej/m}^2/\text{yr}$

Solar transformity of the fish meal based on 1 m^2 of pelagic offshore; see Figure. EMERGY sum $(1.34 + .014 = 1.35) \text{ E}11$

$(5.24 \text{ E}10 \text{ sej/m}^2/\text{yr})/(4.00 \text{ E}5 \text{ J/m}^2) \text{ fish meal} = 1.31 \text{ E}5 \text{ sej/J}$

Costs (services) of feed supplement for 1986 from Camara de Productores de Camaron (1989)

EMERGY value added in fishmeal preparation:

$(17\% \text{ cost for supplementary feeding})(150 \text{ E}6 \$) = 25.5 \text{ E}6 \$$

$(8.7 \text{ E}12 \text{ sej/}) (\$25.5 \text{ E}6) = 2.2 \text{ E}20 \text{ sej/yr}$

10. Operating costs given as \$2.70 (1986 U.S. \$) per kilogram of shrimp yield.

$(\$2.70 \text{ US/kg})(26.4 \text{ E}6 \text{ kg/yr yield}) = 71.2 \text{ E}6 \text{ U.S.};$

Half of this is for post larvae (note 11) and half for other services:

$(0.5)(71.2 \text{ E}6 \text{ US \$}) = 35.6 \text{ E}6 \text{ US \$}.$

For evaluating EMERGY, use $8.7 \text{ sej/}\$$ within Ecuador calculated in Table 3.

11. Costs of post larvae: 50% of total operating cost (note 10): $35.6 \text{ E}6 \text{ US \$}.$

12. Capital costs: $(235 \text{ E}3 \text{ sucre/ha})(2.91 \text{ E}4 \text{ Ha})/(122 \text{ sucre/}\$) = 58 \text{ E}6 \text{ \$US}$

Assume 30 year life of ponds; annual cost $= 58 \text{ E}6 \text{ \$US}/30 \text{ yr} = 1.93 \text{ \$US/yr}$

13. Interest on loans for capital investment at 20% of principal

$(.2)(58 \text{ E}6 \text{ \$US}/30 \text{ yr}) = 11.6 \text{ E}6 \text{ \$US}.$ Whether aid to an investor within Ecuador or one in the U.S., the sucres when converted to international \$ represent EMERGY according to the Ecuadorian EMERGY/\$ ratio ($8.5 \text{ sej/}\$$).

14. Yield: 30,000 tonne/yr:

$(3.0 \text{ E}10 \text{ g/yr})(0.2 \text{ dry})(6.7 \text{ kcal/g dry})(4186 \text{ J/kcal}) = 1.68 \text{ E}14 \text{ J/yr}$

15. Yield without organic feed: 598 lb/Ha (Camara de productores de Camaron, 1989)

$(5.3 \text{ E}4 \text{ Ha})(598 \text{ lb/Ha})(454 \text{ g/lb})(.2 \text{ dry})(6.7 \text{ Kcal/g dry})(4186 \text{ J/kcal})$
 $= 9.28 \text{ E}13 \text{ J/yr}$

E20 sej/yr

Figure 18. EMERGY benefit comparison of original system with trawls (P1), new system of ponds and trawls (P2), typical alternative investment (PA) and potential development (PD).

E20 sej/yr

Environmental inputs to trawl fishery (0.227 E20 in Table 12B and

environmental later displaced (9.1 E20 in Table 16:

I1 = 9.3

Environmental inputs to ponds (Table 14A, line 1-4):

I2 = 4.92

Purchased inputs to trawl fishery (Table 12a, line 11,12):

- 8 Shrimp feed, item 9, Table 14.
- 9 $(2000 \text{ pounds less/boat-McPadden, 1986})(249 \text{ boats}) = 498,000 \text{ pounds}$
 $(4.98 \text{ E}5 \text{ lb/yr})(454 \text{ g/lb})(.2 \text{ dry})(6.2 \text{ kcal/g})(4186 \text{ J/kcal})(4 \text{ E}6 \text{ sej/J}) = 4.68 \text{ E}18 \text{ sej/yr.}$
- 10 Items 4-9 are losses from the environmental system but transferred for the most part to the pond system, thus being retained in the area. However, their use here is grossly inefficient, generating one fourth of the EMERGY yield compared to the enviromental and purchased inputs utilized. See Table 15.
- 11 Shrimp pond yield, item 14 Table 14.
- 12 Interest and profit removes EMERGY, especially if financed from the developed countries with much smaller EMERGY/\$ ratio. See section on "Shrimp and International Exchange".
- 13 Shrimp exports item 2 Table 2. Buying power of US \$, with US EMERGY/\$ ratio
 $(315 \text{ E}6 \text{ US } \$/\text{yr})(2.4 \text{ E}12 \text{ sej/US } \$ \text{ in } 1986) = 7.56 \text{ E}20 \text{ sej/yr}$
- 14 Buying power earned from shrimp sale plus purchased inputs of EMERGY used minus environmental losses minus the EMERGY of exported shrimp.
- 15 Benefit to foreign developed economy from shrimp received plus EMERGY of Ecuador's EMERGY/\$ value of interest and profit (assuming half financed from developed country) minus purchases made with shrimp earnings.
- 16 Change in annual rate of EMERGY production and use considered on a world basis without regard to where it goes or is used or where the money goes:
Shrimp Pond production (which includes EMERGY in new fuel use and new items purchased from fuel-based economy (items 1 & 2) and some environmental inputs) minus environmental loss (item 10).
- 17 Temporary potential to developed economy using investment ratio of 7 (U.S.A.). For calculations in footnote 18.
- 18 Sustainable contribution was estimated as the sum of the renewable environmental input plus the economic development for the present regional investment ratio 2.3 which is similar to the world ratio.

The environmental EMERGY input(Table 13) per unit coastal area is:

$$(279 \text{ E}18 \text{ sej/yr})/(1.195 \text{ E}9 \text{ m}^2) = 2.33 \text{ E}11 \text{ sej/m}^2/\text{yr}$$

The environmental EMERGY input for the coastal area is calculated as if all that shrimp pond area was calculated as if all converted into tidal mangroves even that which was originally upland.

$$(2.33 \text{ E11 sej/m}^2)(5.3 \text{ E8 m}^2) = 1.17 \text{ E20 sej/yr}$$

Investment ratio 2.3 multiplied by environmental EMERGY is

$$(2.3)(1.17 \text{ E20 sej/yr}) = 2.69 \text{ E20 sej/yr}$$

Environmental and sustainable economic matching:

$$(1.17 \text{ E20} + 2.69 \text{ E20}) = 3.86 \text{ E20 sej/yr}$$
