3. DATA SET ABSTRACT
3. 1 Abstract of the Data Set

The EMAP-Est uaries STATI ONS data file cont ai ns geographic and statistical information on stations in the Loui siani an Province. Sampling stations were randomy sel ected as locations to conduct a specific suite of monitoring activities and sample gathering.
3. 2 Keywords for the Data Set

Sampling Sites, water body system estuary, I atitude, I ongitude, state, station location, EPA regi on
4. OBJ ECTI VES AND I NTRODUCTI ON
4. 1 Program Obj ective

The Envi ronmental Mbnitoring and Assessment Program(EMAP) was desi gned to periodi cally estimate the status and trends of the Nation's ecologi cal resources on a regional basis. EMAP provides a strategy to identify and bound the extent, magnitude and location of envi ronmental degradation and improvement on a regi onal scale based on randomy located station sites. Onl y the randomy locat ed Base Sampling Sites were included in this data set.
4. 2 Data Set Objective

The STATI ONS data set provides statistical and geographi cal characterization of the Sampling Sites sampled in the estuaries of the Loui si ani an Province.
4. 3 Data Set Background Information

An unbi ased sampl ing desi gn has been used in the EMAP-Estuari es Provinces so that estuarine resources and characteristics were sampled in proportion to thei $r$ areal distribution. This sampling design makes it possible to estimate, with known confidence, the proportion or amount of area having defined environmental characteristics. A series of indicators that were represent ative of the overall heal th of est uarine resources was measured at each site. These indicat ors were designed to address three maj or attributes of concern to estuarine sci entists, environmental managers and the public: 1) bi otic integrity or the exi stence of heal thy, di verse and sustai nable bi ol ogi cal commities; 2) pollutant exposure or the condition of the physio-chem cal envi ronment in which bi ota I ive and 3) soci etal val ues or indicators rel ated to public use of estuarine resources.
4. 4 Summary of Data Set Parameters

STATI ONS data set val ues were based on the geographic location of the station, independent of the station visit.
4. 5 Year-Specific Information about Data

In 1991, 16 sites were sel ected as indicator testing and eval uation sites based on historically documented conditions of hi gh or low concentrations of di ssol ved oxygen, hi gh or low agricultural runoff of pesticides, and high or lowlevel of industrial contamination.

Additionally for 1991, a pai $r$ of complementary sites were chosen for each small estuary and tidal river segment. One site was randow y located within the estuary or river segment; a second site (index site) was specifically located in an area of sediment deposition within the estuary or river segment.

1993 was the year of the Mssissippi River flooding. No sampling took pl ace for this location due to hazardous conditions and the unusual circumstances surrounding any collection of sample in this river. The station identifiers that were generated as randomy sel ected M ssissippi river locations were used instead for a suppl emental sampling study for Sabi ne Lake, Texas. The list of these suppl ement al sites are: LA93RR01-LA93RR10; LA93ST36-LA93ST38; LA93TR06; LA93RP07; and LA93TR07.

## 5. METHODS

## 5. 1 Data Acqui sition

## 5. 1. 1 Sampl ing Obj ect i ve

The primary goal was to be within 100 m of the assigned I atitude and I ongitude of a sampling site. This objective was set forth so the sample would be collected as true to the exact location sel ected during the randomsel ection process.

## 5. 1. 2 Sampl e Col I ecti on Met hods Summary

The EMAP sampling strategy uses a global grid to identify sampling sites. This grid is di vided into sub-grids in accordance with the needs of a specific ecosystem or resource type (i.e. estuari es, forest, lakes and streans, wet I ands).

In the Loui si ani an Province, I arge estuary sampling stations were randomy placed within a hexagonal space associated with each grid point. Large Tidal River sites were sel ected based on a linear anal og of the design for I arge estuaries where a river was di vi ded into segments of equal area and a station was randomy located within each segment. A list of all small estuary/tidal river systens was determined from existing maps. To ensure the systens sel ected were geographi cally di spersed, they were ordered east to west by combining adjacent small estuaries into groups of four and then sel ecting an estuary randomy without repl acement from each group. A sampling site was then sel ect from within the > 1 m depth area in each of these small estuaries. In this manner, only one fourth of the available small estuaries
were sampled each year; all small estuaries were to be sampled over the 4 year sampling cycle.
5. 1. 3 Begi nni ng Sampling Date

09 July 1991
08 Jul y 1992
06 Jul y 1993
06 Jul y 1994
5. 1. 4 Endi ng Sampl ing Date

10 Sept enber 1991
11 Sept enber 1992
19 August 1993
15 Sept ember 1994

## 5. 1. 5 Sampl ing Pl at form

Each team was supplied with a 25 -foot SeaArk work boat equi pped with a 7.5 L gas engi ne fitted with a Bravo out drive, an "A" frame boom assembly and hydraulic wi nch. On-board el ectroni cs consist of: a Loran C unit, GPS ( begi nni ng in 1993), radar unit, 2 VHF radios, cellular phone, compass, a depth finder, a tool kit, and all required and suggested saf ety equi prent. One compl et el y outfitted spare boat was stored at the Field Operations Center (EPA Lab) as backup.
5.1. 6 Sampl ing Equi prent

The LORAN C system and Raytheon GPS (Global Positioning System unit were used to navi gate to the proposed sampling site using the predetermined I atitude and Iongitude coordi nates associ at ed with a station location. The LORAN was the primary method of navigation. The GPS unit, acquired in 1992, was used as on board backup equi prent, in place of LORAN in areas of hi gh interference, and as a data integrity tool to further val idate the actual I atitude/longitude where the sample were collected.
5. 1. 7 Manuf acturer of Sampl ing Equi pment
5. 1. 8 Key Variabl es
5. 1. 9 Sampl ing Met hod Cal ibration

No formal cal ibration check required. However, the crew Captains were expected to periodi cally validate navi gational readi ngs by using a fixed point with a known latitude and I ongitude and comparing that agai nst the instrument reading of the same point.

## 5. 1. 10 Sample Collection Qual ity Control

Fi el d data were entered into field computers and uploaded ni ghtly to a centralized computer system at the EMAP-E

Provi nce field oper ations center. The station locations were both el ectroni cally and manually verified agai nst control data (i.e. proposed sampling station latitudes and I ongi tudes, sampl ing schedule). A suspect probl em could be corrected or expl ai ned the next day and a resampling for the questi onable stations could be rescheduled.

## 9. QUALI TY CONTROL/ QUALI TY ASSURANCE

9. 1 Measurement Qual ity Objectives

The primary qual ity obj ective for collecting data for the STATI ONS file was to provide an accurate chronol ogy of events that took pl ace at a sampling station. Additionally, a 0.05 nautical mile proxi mity standard was establ ished to ensure that the sampl es were collected as close as possi ble to the randomy generated station l ocati on thus foll owing the model agenda wi thout compromise.
9. 2 Qual ity Assurance/ Control Met hods

Fi el d site audits were conducted during the sampl ing seasons by the Qual ity Assurance Of ficer and the Logistics Coordinator to determine compliance with the Qual ity Assurance pl an and Fi el d Oper ations manual. Corrective action was initiated if di screpanci es were noted. Computer equi pment was regul arly checked and/ or serviced to mai nt ai $n$ oper ation readi ness.
9.3 Actual Measurement Qual ity
