

CProb R Scripts ReadMe

CProb.R is an R script that is the basis for the RExcel Add-in described in Hollister et al. 2008. CProb 1.0 is no longer supported and does not work with the current versions of the software. The CProb.R script is still available to conduct Conditional Probability analyses directly in R.

To run examples of CProb.R follow these directions:

- 1.) Start R
- 2.) Change working directory to location where CProb.R and example dataset (JEQData_wq.csv) are located.
- 3.) Open ScriptExamp.R and run each command. This script will load the CProb.R script, add in the example data, run the CProb command and generate a plot.
