Estimating the Co-Benefits of Clean Energy Policies

Co-Benefits Risk Assessment (COBRA) Screening Model: **How COBRA Works**

Air Quality | Human Health | Societal Benefits

What is COBRA?

- 
- The Co-Benefits Risk Assessment (COBRA) model is a peer reviewed screening tool that inexpensively and quickly estimates the air quality, human health, and associated economic impacts of various state- and county-level emission reduction scenarios.
 - The model estimates and maps the health effects and related economic value of the effects by county for state, region, U.S.
 - COBRA is based on rigorous methods used by EPA health benefits assessments and adapted for use as a screening model.
 - COBRA enables users to obtain a first order approximation of costs and benefits of different emission scenarios that can be used to narrow a long set of promising options to a smaller list which can be evaluated using more sophisticated air quality models.

How Does COBRA Work?

Users enter emissions change(s) and discount rate for 2017

- PM2.5, SO2, NOx, NH3, VOCs

COBRA:

Quantifies Changes in Air Quality

- Uses a simple air quality model, the Source Receptor (S-R) Matrix, to estimate effects of changes on ambient particulate matter.

Calculates Change in Health Outcomes

- Uses “canned” concentration response functions to link the changes in particulate matter to epidemiological studies¹

Calculates Monetary Value

- Uses “canned” values based on willingness-to-pay, cost of illnesses, value of a statistical life and direct medical costs.

Outputs = Tables and maps of illnesses and deaths avoided and the related economic value.

¹ COBRA excludes benefits beyond particulate matter-related ones and may be conservative in that respect.

Human Health Effects in COBRA

- COBRA estimates the number of health incidences avoided AND the related economic value for the following:
 - Adult Mortality,
 - Infant Mortality,
 - Non-fatal Heart Attacks,
 - Respiratory Hospital Admissions,
 - Cardiovascular-related Hospital Admissions,
 - Acute Bronchitis,
 - Upper Respiratory Symptoms,
 - Lower Respiratory Symptoms,
 - Asthma Exacerbations (attacks, shortness of breath, & wheezing),
 - Asthma Emergency Room visits,
 - Minor Restricted Activity Days,
 - Work Loss Days

Economic Values of Effects: Unit Values

Health Incident Avoided	Economic Value (\$2010)	
	3% discount rate	7% discount rate
Adult Mortality	\$8,434,924	\$7,512,853
Infant Mortality	\$9,401,680	\$9,401,680
Non-Fatal Heart Attacks	\$33,259 - \$263,795	\$31,446 - \$253,247
Hospital Admissions	\$15,430 - \$41,002	\$15,430 - \$41,002
Asthma ER Visits	\$388 - \$464	\$388 - \$464
Acute Bronchitis	\$477	\$477
Respiratory Symptoms	\$21 - \$33	\$21 - \$33
Asthma Exacerbations	\$57	\$57
Minor Restricted Activity Days	\$68	\$68
Work Loss Days	\$160	\$160

Economic Values of Effects: Sources

Health Incident Avoided	Source of Value
Adult Mortality	VSL*
Infant Mortality	VSL*
Non-Fatal Heart Attacks	Cost of Illness (COI) = Direct medical costs, opportunity cost (OC)
Hospital Admissions	COI = Hospital charges, OC
Asthma ER Visits	COI = Costs to the hospital
Acute Bronchitis	WTP = Coughing and chest tightness (CT) or restricted activity day
Respiratory Symptoms	WTP = Symptoms such as coughing, head/sinus congestion, eye irritation, CT, coughing up phlegm, and/or wheeze
Asthma Exacerbations	WTP = Bad asthma day
Minor Restricted Activity Days	WTP = Combination of coughing, throat congestion, and sinusitis
Work Loss Days	WTP = Median annual earnings divided by (5 × 52)

* For more background on the VSL, see:

Strengths of COBRA

- Enriches discussion of co-benefits and supports a balanced decision-making process that considers both the potential costs and benefits of policy choices.
- Easy-to-Use screening tool
 - Requires minimal inputs
 - Includes “canned” equations and approaches generally consistent with EPA practices
 - Detailed User’s Guide describes all assumptions and equations
- Flexible for User
 - Can enter data for a single county, group of counties, statewide, outside of state, and/or group of states
 - Can enter reductions in absolute terms or as percentage change
- Inexpensive (free!) compared to rigorous air quality models
 - Results from COBRA approach have fared well in informal comparisons;
 - Enables analysts to narrow a list of options at no/low cost and then devote resources to analyzing only those options with the best prospects using more expensive air quality models.
- Quick to generate results
- Mapping of results facilitates visualization of impacts
 - Provides very localized health effects and valuations: county level

Limitations of COBRA

- EPA is a free, screening tool not a highly sophisticated model.
 - Air Quality (AQ) model is “quick and dirty”
 - COBRA is best used as screening tool, followed up with comprehensive AQ analysis and health impact assessment
 - Somewhat inflexible and simple
 - Limited timeframe for analysis (currently 2017 only)
 - Inability to import own baseline
 - Must use “canned” equations (C-R functions, economic values)
 - Does not address cap issues
 - Relies upon inputs generated elsewhere
 - Assumptions about statewide % reductions may be an oversimplification
- While there are limitations that users should understand, technical peer reviewers found COBRA to be “a valuable model that produces a screening tool that can contribute to policy analysis and public dialogue.”
