| Connecticut: Incorporating Multiple Benefits in Evaluation Criteria for New Capacity Additions | <p>In June 2005, Connecticut policymakers enacted Public Act 05-01, An Act Concerning Energy Independence (EIA), which authorized the Connecticut Department of Public Utility Control to launch a competitive procurement process geared toward motivating new supply-side and demand-side resources.</p> <p>As part of the bid evaluation process, each capacity project is scored based on a multiple benefits weighting system: A total of 85% of the evaluation score is based on a benefit-cost analysis of the project. A total of 15% of the evaluation score is determined through the assessment of five other criteria with their associated weights (see benefits, right).</p> | Connecticut Climate Change 2005 Connecticut Climate Action Plan | <ul style="list-style-type: none"> • Use of existing sites and infrastructure – 2.5% • Benefits of fuel diversity – 2.5% <p>Other benefits (e.g., transmission reliability, employment effects, benefits of high level efficiency such as CHP) – 2.5%</p> | Reduced emissions of SO ₂ , NO _x , and CO ₂ – 5% | Front-loading of costs – 2.5% | 2005–2020 | P |
| Ohio: Clean Energy Initiatives Can Benefit Economic Development | <p>A 2007 study by the American Solar Energy Society assessed the renewable energy and energy efficiency market and developed forecasts of the market's future economic growth. The study established a baseline of 2006 and forecast the growth of the renewable energy and energy efficiency industry from this baseline to 2030 under three different scenarios. Using this approach, the authors developed a case study for Ohio, an area hard hit by the loss of manufacturing jobs. The analysis concluded that the energy efficiency and renewable energy industries offer significant development opportunities in the state.</p> | Bezdek, Roger. 2007. Renewable Energy and Energy Efficiency: Economic Drivers for the 21st Century. Prepared for the American Solar Energy Society. | | | <p>In 2030:</p> <ul style="list-style-type: none"> • \$18 billion in revenues and 175,000 jobs annually in the renewable energy industry • \$200 billion in revenues and more than 2 million jobs in the energy efficiency industry | 2006–2030 | P |

| Multiple States: Reducing Natural Gas Prices through Increased Deployment of Renewable Energy and Energy Efficiency | A recent study by the Lawrence Berkeley National Laboratory (LBNL) examined several studies of the natural gas consumer benefits from clean energy programs. Most of the studies evaluated a national or state RPS, or a combined RPS and EE program and consistently showed that "RE and EE deployment will reduce natural gas demand, thereby putting downward pressure on gas prices" (Wiser et al., 2005). | Wiser, R., M. Bolinger, and M. Clair. 2005. Easing the Natural Gas Crisis: Reducing Natural Gas Prices through Increased Deployment of Renewable Energy and Energy Efficiency. Ernest Orlando Lawrence Berkeley National Laboratory (LBNL). January. | | | <ul style="list-style-type: none"> Each 1% reduction in national gas demand is likely to lead to a long-term average reduction in wellhead gas prices of 0.8% to 2%. The present value of natural gas bill savings from 2003-2020 are within the range of \$10 - \$40 billion. Consumers' gas bill savings are estimated between \$7.50 and \$20 for each MWh of electricity produced by RE or saved with EE. | 2003–2020 | P |
| Multiple States: How Many Jobs Can the Clean Energy Industry Generate? | <p>In 2004 the University of California-Berkeley reviewed 13 independent reports and developed a model to examine the job creation potential of the renewable energy industry.</p> <p>The study analyzed the employment implications of three national 20% RPS scenarios and two scenarios where the generation required by the RPS is produced instead by fossil-fuel generation.</p> | Kammen, D., K. Kapadia, M. Fripp. 2004. Putting Renewables to Work: How Many Jobs Can the Clean Energy Industry Generate? April. | | | <ul style="list-style-type: none"> The RE industry generates more jobs than the fossil-fuel industries per unit of energy delivered and per dollar invested, driven primarily by the general shift from mining and related services to increased manufacturing, construction, and installation activity. | 1998–2004 | R |

|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|-------------------|
| State/Region and Name of Program | Summary of Policy/Program and Analysis | Link | Energy | Emissions, Air Quality, and Health | Economic | Time Period for Analysis | Type of Analysis* |
| Vermont: Energy and Energy Savings Forecasting | <p>The Vermont Department of Public Service (DPS) conducts forecasting as a part of its long-term state energy policy and planning process. The state uses the Comprehensive Energy Plan (CEP) to help manage the transition from fossil fuels to cleaner energy in order to benefit Vermont's economic and environmental future.</p> <p>An analysis performed in 2008 included an examination of historical energy consumption across all sectors 1960-2005. The forecasting process required the following steps: 1) Determine fuel price projections and avoided costs; 2) Estimate the achievable, cost-effective potential for electric energy and peak demand savings; 3) Develop a 20-year forecast of electric energy use; and 4) Develop a peak demand forecast. It also employed historical data to compare energy demand in Vermont with New England from 1990-2004.</p> | Vermont's Energy Forecasting Efforts. Vermont Department of Public Service. June 19, 2008 | <ul style="list-style-type: none"> Electricity demand is expected to grow an average of 0.93% on an average annual basis 2008-2028. When new DSM measures are implemented, DPS anticipates a decline of 0.19% on an average annual basis. | | <ul style="list-style-type: none"> Due to forecasts of a large supply gap with high costs to replace power contracts, Vermont committed itself to pursue very aggressive energy efficiency measures. | 1960–2005 | P |
| Wisconsin: Office of Energy Independence: Demand & supply baselines & energy consumption by fuel type data | <p>In 2006, then-Wisconsin Governor Jim Doyle launched the <i>Declaration of Energy Independence</i>, which included a goal of using renewable energy to generate 25 percent of the state's electricity and 25 percent of its transportation fuels by 2025. It uses a top-down approach to help a state understand the large and small consumers within the state and helps target sectors for policy interventions. It also employs a bottom-up approach to explore a sector- or technology specific clean energy policy.</p> <p>This analysis was performed in 2007 by breaking down consumption data by the sectors that consume the fuels, including the commercial, residential, industrial, transportation, and utility sectors. Consumption and/or generation-related baseline data can be obtained from DOE's EIA, EPA's eGRID, NERC, IOSs, public utility commissions, and many more.</p> | Wisconsin Office of Energy Independence. 2007. Wisconsin Energy Statistics. | <ul style="list-style-type: none"> Overall petroleum use decreased 2.3% in 2009. Of the total petroleum used in Wisconsin, 81.4 percent is in the transportation sector, which saw a decrease of 4.2%. | <p>From 2008-2009</p> <ul style="list-style-type: none"> Utility SO₂ emissions decreased 18.9 percent Utility NO_x emissions decreased 28.2 percent | <ul style="list-style-type: none"> Total electricity sales decreased 6.4% in 2009 but have grown 3.7% over the past ten years. In 2009, electricity sales decreased in all sectors. | 1970–2006 | R |

| California: Utilities' Energy Efficiency Programs | <p>The California Public Utilities Commission (CPUC) approved a new method for calculating avoided costs for use in evaluating utility energy efficiency programs in California and demonstrated how clean energy can be used in the state energy planning and policy decision-making process.</p> <p>A new methodology was used that includes five major categories of costs that are avoided when demand is reduced through installation of energy efficiency resources. It produces time- and location-specific cost estimates, whereas the previous avoided-cost methodology relied more upon average statewide values.</p> | Energy Efficiency Portfolio Plans and Program Funding Levels for 2006-2008—Phase 1 Issues. California Public Utilities Commission. Interim Opinion. September 22, 2005. | <ul style="list-style-type: none"> The electricity growth rate for all sectors from 2005-2020 is projected to be 1.52% | | <p>Avoided electricity generation costs:</p> <ul style="list-style-type: none"> \$133/MWh with the new method (compared with \$80/MWh with the old method) <p>Avoided T&D costs:</p> <ul style="list-style-type: none"> Avoided environmental externality costs Avoided ancillary services costs Reduced wholesale market clearing prices | 2006–2008 | P |
| Massachusetts: Energy Efficiency and Distributed Generation | <p>This study explores the potential price and emissions benefits of increasing distributed generation, photovoltaics (PV), combined heat and power (CHP) and energy efficiency in Massachusetts through 2020.</p> <p>A reference case was developed to determine what the wholesale electric prices and carbon dioxide emissions would be without the additional clean energy resources. PROSYM simulation model was used to determine the potential price and emissions impacts of the four scenarios which are then compared against the reference case to determine the impacts.</p> | Impacts of Distributed Generation on Wholesale Electric Prices and Air Emissions in Massachusetts. Synapse Energy Economics, March 31, 2008. | | <ul style="list-style-type: none"> Each scenario was found to achieve reductions of CO₂ emissions relative to the reference case: EE and CHP combined will have a reduction of 2.4 million short tons CO₂/year in 2020 | <ul style="list-style-type: none"> The 250MW of PV is expected to displace 356 GW of purchases from the wholesale market and reduce prices by 0.4% EE is expected to reduce prices by 1.6% EE and CHP would produce 5.1% reduction | 2007–2020 | P |

| Northeast: Price Effects of Demand Response | In all four of the structured, RTO-run eastern spot electricity markets, historically high peak load values occurred during a week-long heat wave in August 2006. Market coordinators all acknowledged the role that demand response (DR) played in keeping peak load lower than what otherwise would have occurred and the study estimate the wholesale price effects from using DR during these peak times. | "Early Aug. Demand Response Produces \$650 Million Savings in PJM: Reducing Electricity Use Stretches Power Supplies, Lowers Wholesale Electricity Supplies." August 17, 2006. | | | <ul style="list-style-type: none"> Wholesale prices would have been \$300/MWh higher without demand response during heat wave Demand response to heat wave reported savings of about \$650 million for energy purchasers | 2006 | R |
| Vermont: System Planning Approach to Estimate Avoided Transmission Costs | <p>Vermont: System Planning Approach to Estimate Avoided Transmission Costs The Vermont Electric Company (VELCO) undertook a study in 2003 of alternatives to a proposed major upgrade in the northwest corner of Vermont. VELCO conducted a thorough study of distributed generation, energy efficiency, and new central generation as alternatives to the upgrade. It demonstrates one way to use the system planning approach to estimate avoided transmission costs.</p> <p>The study identified a range of central generation and distributed generation options and estimated their costs. In addition, a location-specific study of the available energy efficiency potential and the program costs for delivering that potential was prepared. Various combinations of energy efficiency and generation were assembled as alternatives to the proposed transmission project and compared based on total present value of cost of service.</p> | LaCapra Associates. 2003. Alternatives To Velco's Northwest Vermont Reliability Project. January 29 (LaCapra Associates, 2003; Orans, 1989; Orans, 1992). | | | <ul style="list-style-type: none"> The study determined the cost of transmission upgrade and the cost of a smaller upgrade; the difference in those two costs could be used to assess the cost-effectiveness of the alternative resource package | 2002–2011 | P |

| Texas: Energy Efficiency/Renewable Energy Impact in the Texas Emissions Reduction Plan | <p>In 2001, the 77th Texas Legislature established the Texas Emissions Reduction Plan (TERP) with the enactment of Senate Bill 5, which required the Texas Commission on Environmental Quality (TCEQ) to promote EE/RE to meet ambient air quality standards and to develop a methodology for computing emission reductions for State Implementation Plans. To improve Texas air quality, TERP adopted the goal of implementing cost-effective EE/RE measures to reduce electric consumption by 5% per year for five years, beginning in 2002, using a variety of mandatory programs and voluntary financial incentive programs in non-attainment and affected counties.</p> <p>An analysis was performed with data from the TCEQ and EPA, including eGRID, to estimate the energy savings and NOX reductions from energy code compliance in new residential construction.</p> | Haberl et al 2007. Energy Efficiency/Renewable Energy Impact in the Texas Emissions Reduction Plan (TERP): Volume 1 – Summary Report. Prepared for the Texas Commission on Environmental Quality (TCEQ). August, revised in December. | <p>Annual energy savings in 2006 amounted to:</p> <ul style="list-style-type: none"> • 498,582 MWh of electricity and • 576,680 BTUs of natural gas | <p>NO_x emissions reduced by:</p> <ul style="list-style-type: none"> • 346 tons per year in 2004 • 361 tons per year in 2006 • 824 tons per year in 2007 • 1,416 tons per year in 2012 • 2,121 tons per year 2013 | | 2002–2013 | R and P |

Beach, M. Huskins, and M. McClintock. 2005. The Economics of Solar Power for California. White Paper. August. | <ul style="list-style-type: none"> Avoid \$7.1M capacity infrastructure costs (3,000 MW of peak capacity) | <ul style="list-style-type: none"> Avoid \$5,526M in emission costs, including NO_x and CO₂ | <ul style="list-style-type: none"> Additional \$0.50 economic activity in CA per \$1 invested 40 FTE jobs in CA per MW | 2007–2016 | P |
| Massachusetts: The Public Benefit of Energy Efficiency to the State of Massachusetts | This study analyzes retrospectively the benefits of EE in MA from 1977-1997 and projects future benefits through 2015. Study does not establish a link between actual government EE programs and changes in EE. It uses an econometric model. Changes in energy intensity used to approximate efficiency changes by controlling for sector composition, energy prices, new capital, and climate. | Bernstein, M., R. Lempert, D. Loughram, and D. Ortiz. 2002a. The Public Benefit of Energy Efficiency to the State of Massachusetts. Prepared by RAND Science and Technology. | | In 1997, past energy efficiency actions resulted in a reduction of: <ul style="list-style-type: none"> 2.0M tons of CO₂ 11,000 tons of SO₂ 4,000 tons of NO_x (Versus 1997 baseline) | <ul style="list-style-type: none"> From 1977-1997 EE produced \$1,644 - \$2,562 in per capita GSP \$323 - \$2,322 additional per capita gains by 2015 | 1977–1997; and through 2015 | R and P |
| Midwest: Job Jolt: The Economic Impacts of Repowering the Midwest: The Clean Energy Development Plan for the Heartland | This study analyzes benefits of implementing the <i>Repowering the Midwest Clean Energy Development Plan</i> for a 10-state region in the Midwest that includes reducing electricity demand by 28% by 2020 with EE, and diversifying towards RE and CHP generation over a 20-year period. The analysis is performed with Census and other data, and econometric I-O models developed by REAL at the University of Illinois. | Hewings and Yanai. 2002. Job Jolt: The Economic Impacts of Repowering the Midwest: The Clean Energy Development Plan for the Heartland. | | | By 2020: <ul style="list-style-type: none"> Over 200,000 net new jobs \$19.4B increase in regional economic output | 2002–2020 | P |
| National: 2002 Energy Efficiency Activities: A Report by the Division of Energy Resources | This study analyzes benefits of \$138 million of ratepayer-based EE investments during 2002 and cumulative EE investments from 1998-2002. It analyzes annual and lifetime benefits to participants and all consumers. The energy cost savings, energy system benefits and emission savings estimated with actual program data, ISO-NE data, other data, DOE's Energy 2020, and a bid-stack model. Macroeconomic effects are modeled with REMI. | Commonwealth of Massachusetts Office of Consumer Affairs and Business Regulation. 2004. 2002 Energy Efficiency Activities: A Report by the Division of Energy Resources. Summer. | <ul style="list-style-type: none"> \$19.4M savings from 1998-2002 (\$5.9M for 2002 only) due to lower wholesale electricity prices 0.5% (48 MW) peak demand reduction in 2002. | 2002 emission reductions: <ul style="list-style-type: none"> 394 tons SO₂ 135 tons NO_x 161,205 tons CO₂ Lifetime effect of 2002 actions: <ul style="list-style-type: none"> 5,516 tons SO₂ 1,890 tons NO_x 2,256,870 tons CO₂ | In 2002: <ul style="list-style-type: none"> 1,778 new jobs \$139M in GSP \$79M disposable income Lifetime effect of 2002 actions: <ul style="list-style-type: none"> 315 permanent jobs, \$22M GSP \$15M in income | 1998–2002 | R |

| National: The Work that Goes Into Renewable Energy | This study analyzes labor requirements for renewable energy deployment in the United States. Labor estimates from construction, installation, and O&M only account for direct effects – indirect multiplier effects not examined. The study is not specific to any particular state and used survey information, not a model. Authors collected primary employment data from companies in the RE and coal sectors. It accounts for jobs in manufacturing, transport, delivery, construction, installation, and O&M and includes a comparison with coal power. | Singh and Fehrs. 2001. The Work that Goes Into Renewable Energy. November. | | | Job effects: <ul style="list-style-type: none"> • 35.5 person-years per MW of solar • 4.8 person-years per MW of wind • 3.8-21.8 person-years per MW of biomass co-firing • 5.7 person-years per \$1M solar or wind cost over 10 years | 2001 | R |
| National: Ancillary Benefits of Reduced Air Pollution in the United States from Moderate Greenhouse Gas Mitigation Policies in the Electric Sector | This study analyzes benefits of GHG and criteria pollutant mitigation, including the value of health impacts from air quality changes. It analyzes various carbon-tax scenarios from 2000-2010. The analysis used the Haiku electricity model to simulate effects on retirement and system dispatch. Emission changes were translated into health effects with damage functions and the TAF atmospheric transport model. Concentration-Response functions were used to estimate health endpoints. | Burtraw et al. 2001. Ancillary Benefits of Reduced Air Pollution in the United States from Moderate Greenhouse Gas Mitigation Policies in the Electric Sector. December. | | <ul style="list-style-type: none"> • NO_x related health benefits in 2010 range from \$315 - \$408M • NO_x related health benefits per ton of carbon emissions reduced, range from \$7.5 - \$13.2 dollars | | 2000–2010 | P |
| New England: Electric Energy Efficiency and Renewable Energy: An Assessment of Existing Policies and Prospects for the Future | This study analyzes benefits of EE and RE in New England from Public Benefits Funds and RPS programs. It assumes that current policies change only as planned, through 2010, and does not cover unplanned scenarios. Authors used actual and estimated data on program expenditures and savings. Air quality and emission benefits were estimated with OTC's Emission Reduction Workbook and macroeconomic effects were modeled with IMPLAN. | Sedano et al. 2005. Electric Energy Efficiency and Renewable Energy: An Assessment of Existing Policies and Prospects for the Future. May. | <ul style="list-style-type: none"> • In 2004, EE reduced peak demand by 1,421 MW | From 2000 – 2010, avoid: <ul style="list-style-type: none"> • 31.7M tons (6%) of CO₂ • 34,200 tons of SO₂ • 22,039 tons of NO_x | From 2000 – 2010, net increase of: <ul style="list-style-type: none"> • \$6.1B economic output • \$1.04M wage income • 28,190 job years | 2005–2010 | P |
| Pennsylvania: Economic Impact of Renewable Energy | This study analyzes benefits of implementing a 10% RPS in PA over the period 2006-2025, which would require \$4.68 billion direct investment. A statewide renewable energy supply curve was created to determine the least-cost portfolio. Authors used a simple linear model with publicly available data, and the BEA's RIMS II model to estimate macroeconomic effects. | Pletka, R. 2004. Economic Impact of Renewable Energy in Pennsylvania. Prepared by Black & Veatch for The Heinz Endowments and Community Foundation for the Alleghenies. March. | | | Over 2006-2015 period: <ul style="list-style-type: none"> • Increase output \$10.1B • Increase earnings \$2.8B • Create 85,000 jobs | 2006–2025 | P |

| Texas: Increasing the Renewable Energy Standard: Economic and Employment Benefits | <p>This study analyzes benefits of increasing Texas' current RPS (requiring 2.7% of sales from new renewable energy by 2009) to a requirement of 20% renewable energy by 2020. It also analyzes a more modest increase to about 8% renewable energy by 2025.</p> <p>Impacts on electricity and natural gas prices and consumer energy bills were examined using the Department of Energy's National Energy Modeling System (NEMS) model. Macroeconomic impacts were quantified using IMPLAN. Expenditure breakdown and local share data for wind projects were based on NREL's Jobs and Economic Development Impacts (JEDI) model</p> | Deyette and Clemmer. 2005. Increasing the Renewable Energy Standard: Economic and Employment Benefits. | <p>By 2025, the 20% RPS achieves:</p> <ul style="list-style-type: none"> • 9% reduction in average electricity prices • 3% reduction in natural gas prices • Residential solar heating systems that offset 390 MW of peak capacity | <p>By 2025, the 20% RPS avoids:</p> <ul style="list-style-type: none"> • 20 million metric tons of CO₂ emissions | <p>By 2020, the 20% RPS achieves:</p> <ul style="list-style-type: none"> • \$950M additional income • \$440M increase in GSP • 24,650 net new jobs (2.8 times more jobs than with fossil fuels) | 2005–2025 | P |
| Washington: The Washington Clean Energy Initiative: Effects of I-937 on Consumers, Jobs and the Economy | <p>This study analyzes the benefits of an RPS that would support 1,300 average megawatts (avgMW) of renewable sources by 2025, along with 1,000 avgMW of cost-effective energy efficiency from 2010–2025. The analysis compares the clean energy initiative with a reference case in which no further energy efficiency and renewable energy investments are made after 2009.</p> <p>Effects on electricity rates, total resource costs, and consumer electricity bills were examined using a spreadsheet model. Macroeconomic impacts were analyzed using IMPLAN. Expenditure breakdown data for construction, O&M of renewable plants was based on a variety of sources, including state and federal agencies, renewable developers, utilities, and NREL's Jobs and Economic Development Impacts (JEDI) model.</p> | Deyette and Clemmer. 2006. The Washington Clean Energy Initiative: Effects of I-937 on Consumers, Jobs and the Economy. | <p>The set of efficiency measures developed under the initiative achieve:</p> <ul style="list-style-type: none"> • An average savings of \$0.54 cents/kWh due to avoided T&D • Avoided construction of six natural gas power plants, operating at an average capacity of 165 MW each. | <p>By 2025, the initiative avoids:</p> <ul style="list-style-type: none"> • 4.6 million metric tons of CO₂ emissions | <p>By 2025, the initiative achieves:</p> <ul style="list-style-type: none"> • \$138M additional income • \$148M increase in GSP • \$30M in income to rural landowners • 1,230 net new jobs in the year 2025 (2.6 times more jobs than would be created using fossil fuels) | 2010–2025 | P |
