Meaningful Involvement Summary	123

Executive Summary

This screening report is a companion piece to the final Clean Power Plan. In the final Clean Power Plan the EPA has designed an integrative approach that helps to ensure that vulnerable communities are not disproportionately impacted by this rulemaking.¹ The proximity analysis that is outlined in this screening report provides information that states can use in a variety of ways to help to ensure that this rulemaking will not have disproportionate impacts on vulnerable communities. The agency envisions that states can use this information as they engage with communities in the development of their plans, as they work to consider a multi-pollutant approach when devising their plans, help low-income communities access energy efficiency (EE) EE/ renewable energy (RE) and financial assistance programs and assess the impacts of their state plans on potentially overburdened communities.

As outlined in the Clean Power Plan in the Community and Environmental Justice Considerations section (IX) and in the Executive Order 12898 section (XII.J) the proximity analysis included in this report provides detailed demographic information on the communities located within a 3-mile radius of each affected power plant within the United States.² The analysis shows a higher percentage of minority and low-income communities living near power plants than national averages. It is important to note that the impacts of power plant emissions are not limited to a 3-mile radius and the impacts of both potential increases and decreases in power plant emissions can be felt many miles away. The actions that the agency outlines in the final Clean Power Plan were developed in part as a result of the extensive outreach that the agency conducted with communities and other stakeholders throughout the rulemaking process. The EPA recommends that readers of this document also review the Community and Environmental Justice Considerations section of the Clean Power Plan. A copy of the rulemaking is available at: www.epa.gov/cleanpowerplan.

¹ The agency uses “vulnerable” and “overburdened” communities to refer to low-income, minority communities, and indigenous communities.

² The proximity analysis was conducted using the EPA’s environmental justice mapping and screening tool, EJSCREEN.

About the Data

EJSCREEN

The data presented in this report are from the EPA tool EJSCREEN (www2.epa.gov/ejscreen). EJSCREEN is an environmental justice screening and mapping tool that utilizes standard and nationally-consistent data to highlight places that may have higher environmental burdens and vulnerable populations. The tool offers a variety of powerful data and mapping capabilities that enable users to access environmental and demographic information, at high geographic resolution, across the entire country; displayed in color-coded maps and standard data reports. These maps and reports show how a selected location compares to the rest of the nation, EPA region, or state. The tool also combines environmental and demographic indicators to create EJ indexes.

An EJ Index is a way of combining demographic information with a single environmental indicator – such as proximity to traffic – that can help identify communities that may have a high combination of environmental burdens and vulnerable populations.

EJSCREEN is a pre-decisional screening tool, and was not designed to be the basis for agency decision-making or determinations regarding the existence or absence of EJ concerns. It also should not be used to identify or label an area as an “EJ Community.” Instead, EJSCREEN is designed as a starting point, to highlight the extent to which certain locations may be candidates for further review or outreach. EJSCREEN’s initial results should be supplemented with additional information and local knowledge whenever appropriate, for a more complete picture of a location. Additional considerations and data, such as national, regional, or local information and concerns, along with appropriate analysis, should form the basis for any decisions.

Caveats and Limitations of EJSCREEN

EJSCREEN, as a screening tool, is more limited than a detailed analysis in two key ways. First, it has data on only some of the relevant issues, and second, there is uncertainty in the data it does have. It is important to understand each of these limitations.

The first limitation arises because a screening tool cannot capture all the relevant issues that should be considered (e.g., other local environmental concerns). Any national screening tool must balance a desire for data quality and national coverage against the goal of including as many important environmental factors as feasible given resource constraints. Many environmental concerns are not yet included in comprehensive, nationwide databases. For example, data on environmental factors such as local drinking water quality and indoor air quality were not available with adequate quality, coverage and/or resolution to be included in this national screening tool. EJSCREEN cannot provide data on every environmental impact and demographic factor that may be important to any location.

The second important limitation is that EJSCREEN relies on demographic and environmental estimates that involve substantial uncertainty. This is especially true when looking at a small geographic area, such as a single Census block group. A single block group is often small and has uncertain estimates. A buffer that is roughly the same size as a block group or smaller will introduce additional uncertainty because it has to approximate the locations of residences. Therefore, it is typically very useful to summarize EJSCREEN data for a larger area, covering several block groups, in what is called a “buffer” or “study area” report, as explained in the EJSCREEN technical documentation. There is a tradeoff between resolution and precision: Detailed maps at high resolution can suggest the presence of a local “hotspot,” but are uncertain. Estimates based on larger areas will provide more confidence and precision, but may overlook local “hotspots” if not supplemented with detailed maps.

The demographic estimates, such as percent low-income, come from the American Community Survey (ACS) from the United States Census Bureau. The ACS is comprised of surveys, not a full census of all households. This means the Census Bureau may estimate that a block group is 30% low-income, for example, but it might actually be 20% or 40% in some cases (see Appendix B in the EJSCREEN technical documentation for a discussion of uncertainty in demographics).

Related to the issue of uncertainty is that the environmental indicators are only screening-level proxies for actual exposures or health risks. This is particularly true for the proximity indicators, for example. Even for the indicators that directly estimate risks or hazards, as with the air toxics cancer risk indicator, estimates have substantial uncertainty because emissions, ambient levels in the air, exposure of individuals, and toxicity are uncertain. Brief details are provided on each environmental indicator below with the EJSCREEN technical documentation having full discussion on each.

In summary, as with any screening tool, the indicators in EJSCREEN cannot address all the considerations that may be relevant to a given situation, they are often only a screening-level proxy for a given issue, and in any case, there is significant uncertainty involved, particularly for a single block group. For these types of reasons, among others, it generally is not appropriate to rely on any screening tool as the basis for a key decision. It is often very useful to obtain information on other issues not included in EJSCREEN, updated information when available, as well as local knowledge, data, and concerns.

Demographic Index

The Demographic Index in EJSCREEN is created using the two demographic factors that were explicitly named in E.O. 12898, low-income and minority. For each Census block group, these two factors are simply averaged together.

$$\text{Demographic Index} = (\% \text{ minority} + \% \text{ low-income}) / 2$$

EJ Index

The EJ index is a combination of environmental and demographic information. The environmental portion of the EJ index is drawn directly from the environmental indicators and the demographic information from the demographic indicators above.

To calculate a single EJ Index, EJSCREEN combines a single environmental indicator with demographic information. It considers the extent to which the local demographics are above the national average. It does this by looking at the difference between the demographic composition of the block group, as measured by the Demographic Index, and the national average (which is approximately 35%). It also considers the population of the block group.

Mathematically, the EJ Index is constructed as the product of three items, multiplied together as follows:

$$\begin{aligned} \text{EJ Index} = & \\ & (\text{Environmental Indicator}) \\ & \times (\text{Demographic Index for Block Group} - \text{Demog. Index for US}) \\ & \times (\text{Population count for Block Group}) \end{aligned}$$

Note that the EJ Index raw value itself is not reported in EJSCREEN reports – it is reported in percentile terms, to make the results easier to interpret. If one is calculating the actual raw values using the formula, the EJ Index value can be a positive or negative number. A positive number occurs where the local Demographic Index is above the US average, and this means the location adds to any excess in environmental indicator values among the specified populations (minority and low-income) nationwide. A positive number increases the difference between groups by adding net environmental indicator points to the specified populations. A negative value occurs where the local Demographic Index is below the US average, and it means the location offsets the other locations, reducing any excess in nationwide average environmental indicator values among minority and low-income populations relative to others. Most EJSCREEN users will not work directly with EJ Index raw values, however, positive raw values for an EJ Index will be presented as higher percentiles and negative raw values will appear as lower percentiles. Further discussion can be found in the EJSCREEN technical documentation.

Demographic Indicators¹

Percent Minority

The number or percent of individuals in a block group who list their racial status as a race other than white alone and/or list their ethnicity as Hispanic or Latino. That is, all people other than non-Hispanic white-alone individuals. The word “alone” in this case indicates that the person is of a single race, since multiracial individuals are tabulated in another category – a non-Hispanic individual who is half white and half American Indian would be counted as a minority by this definition.

Percent Low Income

The number or percent of a block group’s population in households where the household income is less than or equal to twice the federal “poverty level.”

Percent Less than High School

The number or percent of people age 25 or older in a block group whose education is short of a high school diploma.

Percent Linguistic Isolation

The number or percent of people in a block group living in linguistically isolated households. A household in which all members age 14 years and over speak a non-English language and also speak English less than “very well” (have difficulty with English) is linguistically isolated.

Percent Under Age 5

The number or percent of people in a block group under the age of 5.

Percent Over Age 64

The number or percent of people in a block group over the age of 64.

¹ At this time, data is not available for Puerto Rico, US Virgin Islands and territories.

Environmental Indicators

Key Medium	Indicator	Details	Source	Data Year
Air	NATA air toxics cancer risk	Lifetime cancer risk from inhalation of air toxics	NATA update pending	
Air	NATA neurological hazard index	Air toxics neurological hazard index (ratio of exposure concentration to health-based reference concentration)		
Air	NATA respiratory hazard index	Air toxics respiratory hazard index (ratio of exposure concentration to health-based reference concentration)		
Air	NATA diesel PM	Diesel particulate matter level in air, $\mu\text{g}/\text{m}^3$		
Air	Particulate matter	PM _{2.5} levels in air, $\mu\text{g}/\text{m}^3$ annual avg. (2011)	EPA, OAR (fusion of model and monitor data). For methods, see http://www.epa.gov/esd/land-sci/lcb/lcb_fagsd.html	2011
Air	Ozone	Ozone summer seasonal avg. of daily maximum 8-hour concentration in air in parts per billion (2011)	EPA, OAR (fusion of model and monitor data). For methods, http://www.epa.gov/esd/land-sci/lcb/lcb_fagsd.html	2011
Air/other	Traffic proximity and volume	Count of vehicles (AADT, avg. annual daily traffic) at major roads within 500 meters, divided by distance in meters (not km)	Calculated from 2011 U.S. DOT traffic data, retrieved 4/2012 http://www.rita.dot.gov/bts/sites/rita.dot.gov/bts/files/publications/national_transpiration_atlas_database/2011/index.html	2011
Dust/ lead paint	Lead paint indicator	Percent of housing units built pre-1960, as indicator of potential lead paint exposure	Calculated based on Census/ACS data, retrieved 2014 http://www2.census.gov/acs2012_5yr/su/mmaryfile/	2008-2012
Waste/ air/ water	Proximity to Risk Management Plan (RMP) sites	Count of RMP (potential chemical accident management plan) facilities within 5 km (or nearest one beyond 5 km), each divided by distance in kilometers	Calculated from EPA RMP database, retrieved 11/2013 http://www.rtknet.org/db/rmp	2013
Waste/ air/ water	Proximity to Hazardous waste Treatment, Storage and Disposal Facilities (TSDFs)	Count of TSDFs (hazardous waste management facilities) within 5 km (or nearest beyond 5 km), each divided by distance in kilometers	Calculated from EPA RCRAInfo database, retrieved 11/2013 http://www.epa.gov/enviro/facts/rcrainfo/search.html	2013
Waste/ air/ water	Proximity to National Priorities List (NPL) sites, Superfund program	Count of proposed or listed NPL sites within 5 km (or nearest one beyond 5 km), each divided by distance in kilometers	Calculated from EPA CERCLIS database, retrieved 11/12/2013 http://cumulis.epa.gov/supercpad/cursites/srchsites.cfm	2013
Water	Proximity to major direct water dischargers, National Pollutant Discharge Elimination System (NPDES)	Count of NPDES major direct water discharger facilities within 5 km (or nearest one beyond 5 km), each divided by distance in kilometers	Calculated from EPA PCS/ICIS database, retrieved 12/2013 http://www.epa.gov/enviro/facts/pcs-icis/search.html	2013
Note: EJSCREEN's EJ Indexes also include demographic information that is obtained from the U.S. Census Bureau's American Community Survey (ACS). The 2015 version of EJSCREEN includes 2008-2012 ACS 5-year summary file data, which is based on 2010 Census boundaries.				

EJSCREEN Summary Statistics

Environmental Indicator	Missing	Minimum	25%ile	50%ile (median)	Pop. Mean	75%ile	80%ile	90%ile	95%ile	99%ile
PM 2.5	1664	4.3	8.8	9.9	9.8	11	11	12	12	13
Ozone	1664	25	42	46	46	51	51	54	57	66
NATA DPM										
NATA cancer risk										
NATA respiratory HI										
NATA neurological HI										
% pre-1960 (lead paint)	0	0.00	0.05	0.21	0.30	0.50	0.59	0.77	0.87	0.96
Proximity Traffic	253	0.00	11	35	110	100	130	250	430	1,200
Proximity NPL	0	0.00	0.02	0.05	0.10	0.10	0.12	0.19	0.31	0.88
Proximity RMP	0	0.00	0.08	0.14	0.31	0.30	0.39	0.76	1.2	2.4
Proximity TSDF	0	0.00	0.01	0.02	0.05	0.05	0.07	0.11	0.18	0.53
Proximity NPDES	0	0.00	0.08	0.13	0.25	0.24	0.30	0.55	0.89	1.9

Note: Population percentiles (and means) are shown, not block group percentiles (or means), so 80%ile means 80% of the population has a lower (or exactly tied) block group score. Values in table have been rounded to two significant digits, except for PM, ozone, and DPM, which use three significant digits. Numbers may differ slightly from those in EJSCREEN reports. Summary statistics for a given environmental factor exclude block groups where that environmental indicator was not available (missing).

Demographic Indicator	Missing	Minimum	25%ile	50%ile (median)	Pop. mean	75%ile	80%ile	90%ile	95%ile	99%ile
Demographic index	0	0	17%	29%	35%	50%	57%	71%	80%	90%
% low-income	0	0	17%	30%	34%	48%	53%	65%	74%	87%
% minority	0	0	9%	26%	36%	60%	69%	89%	96%	100%
% less than high school	0	0	5%	11%	14%	21%	24%	33%	42%	60%
% linguistic isolation	0	0	0%	1%	5%	6%	8%	16%	25%	44%
% under 5	0	0	4%	6%	7%	9%	10%	12%	14%	18%
% over 64	0	0	7%	12%	13%	17%	19%	23%	28%	44%
Supplementary demog. index	0	0	11%	16%	18%	24%	27%	34%	39%	47%

Note: Population percentiles (and means) are shown, not block group percentiles (or means), so 80%ile means 80% of the population has a lower (or exactly tied) block group value. Values in table have been rounded to an integer percentile 0-100. Numbers may differ slightly from those in EJSCREEN reports.

Study Area

“Study area” refers to the buffer applied around a geographic point. The buffer will aggregate appropriate portions of the intersecting block groups, weighted by population, to create a representative set of data for the entire buffer area, honoring variation and dispersion of the population in the block groups within it. For each indicator, the result is a population-weighted average, which equals the block group indicator values averaged over all residents who are estimated to be inside the buffer.

To gain a better understanding of the existing stationary sources and near-source populations, the EPA conducted a proximity analysis of study areas, each defined as the area within 3 miles of a given facility in the source category. A 3 mile study area/buffer is used for this national-level screening report given usage in other environmental justice literature and studies.² Study areas in close proximity to one another may result in overlapping buffers, thus the possibility of double counting near-source populations.

Statistical Summary

Category Totals and T-Tests

The EPA compares aggregated study area demographics to U.S. demographics in three tables within this section:

- Table 1 – Demographic totals for the entire source category and U.S. demographic totals
- Table 2 – Demographics averaged across study areas vs. U.S. average demographics
- Table 3 – Proportion of study areas with populations exceeding U.S. median demographics

Table 1 is simply calculated by summing the demographic data in the study areas; however, urban study areas can often skew the data.¹ Therefore, Tables 2 and 3 use statistical inference to answer two additional and specific questions:

1. On average, how much do the demographics within the study areas differ from the U.S. population?
2. How often do the demographics within the study areas exceed U.S. median demographics?

Table 2 – Hypothesis Test for Question 1 (T-test for population average)²

- Null Hypothesis (H_0): The proportion of the population in demographic category X within a given study area is a normally-distributed random variable with mean EQUAL TO the U.S. average.
- Alternative Hypothesis (H_1): The proportion of the population in demographic category X within a given study area is a normally-distributed random variable with mean NOT EQUAL TO the U.S. average.
- Test statistic: $T = (\text{Study area average \%} - \text{U.S. average \%}) / \text{Standard Error}$
- If H_0 is true, then T has a T-distribution with mean = 0 and degrees of freedom = # study areas – 1. The p-value is the probability that H_0 is true given the value of T calculated from the demographic data.
- Statistical Conclusions:
 - If the p-value is large (≥ 0.05): The average proportion of the study area population in demographic category X is not significantly different from the U.S. average.
 - If the p-value is small (< 0.05) and the T-statistic is POSITIVE: The average proportion of the study area population in demographic category X is significantly greater than the U.S. average.
 - If the p-value is small (< 0.05) and the T-statistic is NEGATIVE: The average proportion of the study area population in demographic category X is significantly less than the U.S. average.
- Study areas with fewer than 100 total residents are ignored.

Table 3 – Hypothesis Test for Question 2 (T-test for occurrence)²

- Null Hypothesis (H_0): The proportion of study areas having population in demographic category X exceeding the U.S. median is EQUAL TO 50%.
- Alternative Hypothesis (H_1): The proportion of study areas having population in demographic category X exceeding the U.S. median is NOT EQUAL TO 50%.
- Test statistic: $T = (\% \text{ of study areas} > \text{U.S. median} - 50\%) / \text{Standard Error}$
- If H_0 is true, then T has a T-distribution with mean = 0 and degrees of freedom = # study areas – 1. The p-value is the probability that H_0 is true given the value of T calculated from the demographic data.
- Statistical Conclusions:
 - If the p-value is large (≥ 0.05): The proportion of study areas having population in demographic category X exceeding the U.S. median is not significantly different from 50%.
 - If the p-value is small (< 0.05) and $T > 0$: The proportion of study areas having population in demographic category X exceeding the U.S. median is significantly greater than 50%.
 - If the p-value is small (< 0.05) and $T < 0$: The proportion of study areas having population in demographic category X exceeding the U.S. median is significantly less than 50%.
- Study areas with fewer than 100 total residents are ignored.

A qualitative summary on the statistical significance immediately follows the tabular data in this section. However, large sample sizes can result in differences regarded as statistically significant, but may not actually be large enough to be meaningful.

¹ Table 1 uses population counts, population-weighting, to derive a demographic % whereby urban study areas may have more influence on the results than rural areas.

² T-tests are used when the number of study areas exceeds 50. Other tests may be used in place of T-tests for Tables 2 and 3 when there are fewer than 50 study areas.

Category Totals and T-Tests

Table 1 - Category-wide Total

STATISTICAL SIGNIFICANCE LEVEL

No Significance (P $\geq$ 0.05)

Significant (P < 0.05)

Significantly Less (P < 0.05 and T Stat is negative)

Statistical Summary (Category Totals and T-Tests)

Demographic Category

Minority

Table 1 indicates that nationally, 52% of the people living within 3 miles of the study areas are Minority. This is 16 point(s), or 44.4%, greater than the national average of 36%.

Table 2 indicates that on average, 32% of the people living in the study areas are Minority. The -4.3 point difference in the average proportion is significantly less when compared to the national average.

Table 3 indicates that 47% of study areas have a greater Minority population than the national median. This is not significant from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) of Minority populations living in the study areas is greater than the national average; however, the average proportion (Table 2) is significantly less than the national average indicating a large amount of variability among the study areas. Furthermore, 47% of the study areas have Minority populations greater than the national median (Table 3). This suggests that the average proportion of Minority populations living in the study areas is significantly less than the national average, but the proportion of study areas that have Minority populations greater than the national median is not significantly different from 50%.

Demographic Category

Low Income

Table 1 indicates that nationally, 39% of the people living within 3 miles of the study areas are Low Income. This is 5 point(s), or 14.7%, greater than the national average of 34%.

Table 2 indicates that on average, 37% of the people living in the study areas are Low Income. The 3.1 point difference in the average proportion is significant when compared to the national average.

Table 3 indicates that 67% of study areas have a greater Low Income population than the national median. This is significant from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) and average proportion (Table 2) of Low Income populations living in the study areas are both greater than the national average. Furthermore, 67% of the study areas have Low Income populations greater than the national median (Table 3). This suggests that the proportion of Low Income populations living in the study areas is significantly greater than the national average, and significantly greater than 50% of study areas have Low Income populations greater than the national median.

Statistical Summary (Category Totals and T-Tests)

Demographic Category

Linguistically Isolated

Table 1 indicates that nationally, 9% of the people living within 3 miles of the study areas are Linguistically Isolated. This is 4 point(s), or 80%, greater than the national average of 5%.

Table 2 indicates that on average, 4% of the people living in the study areas are Linguistically Isolated. The -1.3 point difference in the average proportion is significantly less when compared to the national average.

Table 3 indicates that 45% of study areas have a greater Linguistically Isolated population than the national median. This is significantly less from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) of Linguistically Isolated populations living in the study areas is greater than the national average; however, the average proportion (Table 2) is significantly less than the national average indicating a large amount of variability among the study areas. Furthermore, 45% of the study areas have Linguistically Isolated populations greater than the national median (Table 3). This suggests that the proportion of Linguistically Isolated populations living in the study areas is significantly less than the national average, and significantly less than 50% of study areas have Linguistically Isolated populations greater than the national median.

Demographic Category

Without a HS Diploma

Table 1 indicates that nationally, 19% of the people living within 3 miles of the study areas are Without a HS Diploma. This is 5 point(s), or 35.7%, greater than the national average of 14%.

Table 2 indicates that on average, 17% of the people living in the study areas are Without a HS Diploma. The 2.8 point difference in the average proportion is significant when compared to the national average.

Table 3 indicates that 68% of study areas have a greater Without a HS Diploma population than the national median. This is significant from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) and average proportion (Table 2) of Without a HS Diploma populations living in the study areas are both greater than the national average. Furthermore, 68% of the study areas have Without a HS Diploma populations greater than the national median (Table 3). This suggests that the proportion of Without a HS Diploma populations living in the study areas is significantly greater than the national average, and significantly greater than 50% of study areas have Without a HS Diploma populations greater than the national median.

Statistical Summary (Category Totals and T-Tests)

Demographic Category	Age 0 - 4
----------------------	-----------

Table 1 indicates that nationally, 7% of the people living within 3 miles of the study areas are Age 0 - 4. This is approximately equal to the national average of 7%.

Table 2 indicates that on average, 6% of the people living in the study areas are Age 0 - 4. The -0.6 point difference in the average proportion is significantly less when compared to the national average.

Table 3 indicates that 45% of study areas have a greater Age 0 - 4 population than the national median. This is significantly less from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) of Age 0 - 4 populations living in the study areas is approximately equal to the national average; however, the average proportion (Table 2) is significantly less than the national average. Furthermore, 45% of the study areas have Age 0 - 4 populations greater than the national median (Table 3). This suggests that the proportion of Age 0 - 4 populations living in the study areas is significantly less than the national average, and significantly less than 50% of study areas have Age 0 - 4 populations greater than the national median.

Demographic Category	Age 65+
----------------------	---------

Table 1 indicates that nationally, 12% of the people living within 3 miles of the study areas are Age 65+. This is - 1 point(s), or -7.7%, compared to the national average of 13%.

Table 2 indicates that on average, 14% of the people living in the study areas are Age 65+. The 0.7 point difference in the average proportion is significant when compared to the national average.

Table 3 indicates that 57% of study areas have a greater Age 65+ population than the national median. This is significant from the 50% we would expect if the study areas were randomly distributed across the U.S.

In summary:

The national proportion (Table 1) of Age 65+ populations living in the study areas is less than the national average; however, the average proportion (Table 2) is significantly greater than the national average, indicating a large amount of variability among the study areas. Furthermore, 57% of the study areas have Age 65+ populations greater than the national median (Table 3). This suggests that the proportion of Age 65+ populations living in the study areas is significantly greater than the national average, and significantly greater than 50% of study areas have Age 65+ populations greater than the national median.

Aggregated Data: Statistical Summary

Demographic	National	Study Area Total (Table 1)	Study Areas vs. National		Hypothesis 1 Average Population T-Test (Table 2)		Hypothesis 2 Occurrence T-Test (Table 3)	
			The point difference is...	The % difference is...	Average %	The average % is...	% study areas > national median	The occurrence is...
Population	309,138,711	36,336,812						
Minority	36%	52%	16	44%	32%	Statistically Significantly Less	47%	Statistically Not Significant
Low Income	34%	39%	5	15%	37%	Statistically Significant	67%	Statistically Significant
Linguistically Isolated	5%	9%	4	80%	4%	Statistically Significantly Less	45%	Statistically Significantly Less
Without a HS Diploma	14%	19%	5	36%	17%	Statistically Significant	68%	Statistically Significant
Age 0 - 4	7%	7%	0	0%	6%	Statistically Significantly Less	45%	Statistically Significantly Less
Age 65+	13%	12%	-1	-8%	14%	Statistically Significant	57%	Statistically Significant

Percentage Comparisons to National Averages

Nearby Overall % (from table 1) is calculated by summing population counts, population-weighting, to derive a demographic % whereby urban study areas may have more influence on the results than rural areas.
Nearby Average % (from table 2) is calculated by averaging the study area percentages (when the total population ≥ 100) as an alternative to the population-weighting method.

The above (from table 3) plots each study area (when the total population >=100) into one of four quadrants according to its low income and minority percentages.

Spearman Correlation Coefficients

	% Minority	% Low Income	% Linguistically Isolated	% Without a HS Diploma	% Age 0 - 4	% Age 65+
% Minority	1	0.44	0.66	0.53	0.38	-0.48
% Low Income	0.44	1	0.22	0.72	0.30	-0.07
% Linguistically Isolated	0.66	0.22	1	0.33	0.35	-0.43
% Without a HS Diploma	0.53	0.72	0.33	1	0.26	-0.14
% Age 0 - 4	0.38	0.30	0.35	0.26	1	-0.41
% Age 65+	-0.48	-0.07	-0.43	-0.14	-0.41	1

Correlation measures how closely two variables are related to one another. In the above table, values near 1 indicate a strong positive relationship (i.e., an increase in one variable is associated with an increase in the other variable), values near -1 indicate a strong negative relationship (i.e., an increase in one variable is associated with a decrease in the other variable), and values near 0 indicate no relationship.

Percentile (%ile) Summary Statistics

	Minimum	25%ile	50%ile (Median)	Mean	80%ile	90%ile	95%ile	Max
% Minority	0%	9%	24%	32%	56%	72%	81%	100%
% Low Income	7%	27%	37%	37%	48%	56%	60%	81%
% Linguistically Isolated	0%	0%	1%	4%	6%	11%	15%	32%
% Without a HS Diploma	2%	10%	15%	17%	23%	28%	33%	59%
% Age 0 - 4	0%	5%	6%	6%	8%	9%	10%	15%
% Age 65+	2%	11%	13%	14%	17%	20%	22%	32%

The column headers (80%ile) are percentiles, whereas the values within the table are percentages. If we look at the minority demographic percentage of 56% under the 80%ile column, this means that 80% of the study areas have a value lower, or are equal to, 56%.

Meaningful Involvement Summary

Meaningful Involvement

Outreach and Materials

- Created a central website for the rulemaking.
 - www.epa.gov/cleanpowerplan
- Created and published numerous fact sheets, a comment guide and blogs.
 - www.epa.gov/cleanpowerplan
- Broadcast rulemaking notices to various tribal contacts and the EJ listserv, in addition to listing on the publically available websites Regulations.gov, Reginfo.gov and the [Action Initiation List \(AIL\)](#).
 - EJ Listserv: https://lists.epa.gov/read/all_forums/subscribe?name=epa-ej
 - EPA Tribal Consultations: <http://tcots.epa.gov/oita/TConsultation.nsf/TC?OpenView>

Outreach Conducted – Pre-Proposal for the Clean Power Plan¹

- Provided information on the authorities the EPA has under section 111(d) to regulate greenhouse gases and received feedback from the public on what should be included in a rulemaking that addresses climate change.
 - August 27, 2013 – Building a Common Understanding: Clean Air Act and Upcoming Carbon Pollution Guidelines for Existing Power Plants – Held two back to back afternoon sessions
 - September 9, 2013 – Held with state and tribal officials only
 - September 9, 2013 – Held a call with industry and environmental groups
 - October 29, 2013 – Held two conferences calls with state, tribal and local stakeholders
 - December 11, 2013 – Held with tribes only
- Held various listening sessions.
 - October 23, 2013 – Held two sessions – EPA Region 2 – New York, NY
 - October 23, 2014 – Held two sessions – EPA Region 4 – Atlanta, GA
 - October 30, 2014 – EPA Region 8 – Denver, CO
 - November 4, 2013 – EPA Region 1 Boston, MA
 - November 4, 2013 – EPA Region 7, Lenexa, KS
 - November 5, 2013 – EPA Region 9, San Francisco, CA
 - November 7, 2013 – EPA Headquarters, Washington, DC
 - November 7, 2013 – EPA Region 6 – Dallas, TX
 - November 7, 2013 – EPA Region 10 – Seattle, WA
 - November 8, 2013 – EPA Region 5, Chicago, IL
 - November 8, 2013 – EPA Region 3, Philadelphia, PA
- Submitted consultation letters to tribal leadership.
 - August 8, 2013 – Sent to five tribes
 - November 1, 2013 – Sent to 566 tribes

Outreach Conducted – Post-Proposal for the Clean Power Plan

- Held a 120 day public comment period on the proposed rulemaking.
- Held a 30 day public comment period on the supplemental proposal.

¹Please note this is not an exhaustive list; the EPA participated in numerous meetings with a variety of stakeholders in the pre-proposal stage of this rulemaking.

- EPA Held five public hearings to take oral comment on the rulemakings.
 - Atlanta, GA – July 29-30, 2014 (on CPP)
 - Denver, CO – July 29-30, 2014 (on CPP)
 - Washington, DC – July 29-30, 2014 (on CPP)
 - Pittsburgh, PA – July 31 – August 1, 2014 (on CPP)
