Earth Tech Project No. 91895

EXECUTIVE SUMMARY

The objective of this evaluation is to determine the extent to which residents in the vicinity of the National Copper products plant might be exposed to and subsequently at risk from chemicals in air derived from contaminated groundwater. Consistent with a work plan developed in cooperation with USEPA, locations for sampling indoor air, ambient air and soil gas samples were identified. Residents were interviewed and advised of the sampling protocol and objectives of the investigation and samples were collected during February 2006. Samples were analyzed by STL, Inc. laboratories using TO-15 methodology.

As per requests of USEPA, resulting soil gas data were screened against Region 6 soil gas screening levels. Indoor air and ambient air data were screened against Region 9 preliminary remediation goals (PRGs) for ambient air (e.g., residential air). TCE and 1,3 –dichlorobenzene in soil gas exceeded their Region 6 screening criteria suggesting a potential for intrusion into indoor air. Only TCE was detected in both indoor air and soil gas,. Thus, TCE was selected to further characterize risk from potential indoor air exposure to groundwater derived chemicals. The only residence with indoor air requiring such further evaluation exists at 404 Louise Street.

The risk characterization for potential exposure to indoor air chemicals derived from groundwater at 404 Louise Street indicates that the excess cancer risk is less than 1×10^{-5}. Non-cancer hazard, typically expressed as the hazard index, was not evaluated because the cancer risk evaluation, based on the use of USEPA Region 9 preliminary remediation goals, is most restrictive and protective of residential exposure for chemicals detected .

Based on this evaluation, it can be concluded that the risk of residential exposure to chemicals in indoor air derived from contaminated groundwater is less than the benchmark cancer risk promulgated by the Michigan Department of Environmental Quality (MDEQ) under Part 201 of the Michigan Natural Resources Environmental Protection Act. The excess cancer risk is also within the risk range (1×10^{-6} to 1×10^{-4}) defined by USEPA under the National Contingency Plan as acceptable and warranting no further action. These results therefore indicate that no further action is required.

1. BACKGROUND AND OBJECTIVE

National Copper Products Inc. (NC) operates a copper tube casting and re-draw mill at 415 East Prairie Ronde Street in Dowagiac, Michigan (the facility). The real property is owned by Prairie Ronde Realty Company (PRR). The groundwater at the facility is contaminated with volatile organic compounds (VOCs), primarily trichloroethene (TCE). A remediation purge well system has been operating since 1984 under the terms of a consent judgment between the State of Michigan and Sundstrand Heat Transfer. Supplemental remediation systems including a soil vapor extraction (SVE) system and two air sparging systems were installed in the 1990s. These various remedial systems have been effective at removing TCE from the soil and groundwater and the extent of the impacted groundwater plume has decreased and continues to decrease. However concentrations of TCE remain in the groundwater in some areas.

As part of its remedial activities, NC had collected soil gas samples at various locations on and in the vicinity of the National Copper site (Site). The results of the soil gas sampling indicated that chemicals existed in the vapor phase at concentration levels that might intrude into indoor air at concentrations in excess of risk based criteria.

In response to these results, NC was requested by the United States Environmental Protection Agency (USEPA) to collect a series of paired indoor air and soil gas samples to further evaluate the potential for site related vapors to occur in indoor air. In cooperation with USEPA, NC prepared a work plan to sample indoor air, soil gas and ambient air.[a] Figure 1-1 shows the locations of the indoor air samples, soil gas samples and the ambient air sample for this effort. It should be noted that in some cases for gas collection, sampling did not extend to eight hours as described in the work plan. However, the duration of sample collection was greater than six hours and sufficient to obtain an adequate volume of air for detection of chemicals using the defined analytical methodology.

This report documents the approach used and the results obtained in completion of this study.

2. APPROACH

Earth Tech developed an approach that would best assist in understanding the actual risk to potential residential receptors. This approach involved indoor air and soil gas sampling at selected residences and an ambient air sample at the National Copper property. Details of the sampling methodology and analytical methodology are included in the following sections.

2.1 FIELD METHODOLOGY

With minor variations, sampling was performed in accordance with the methodology detailed in the Sampling Work plan. The differences in the sampling and rationale for deviations are listed below:

- Soil Gas Purge Testing: The work plan called for use of a field photo ionization detector (PID) to determine leakage of total VOCs in the soil gas sampling train before and after purging. However, it was determined that the use of the PID would not have provided sufficient detection capabilities to determine the presence of leakage. Therefore, a smoke tube testing protocol was used to determine the potential for leaks at the annulus of the soil gas tube/bentonite grout intersection. Such a method facilitated the direct visual assessment of leaks intruding into the soil gas collection tube at the base of the benonite seal. No leakage was detected at any soil gas sampling location.

- Residual vacuum determination: The work plan called for residual vacuum to be less than 1 inch of mercury after sampling. While the residual vacuum did not reach 1 inch of mercury, it was measured after each sample collection in the field and at the laboratory in order to both determine if leakage had occurred and measure sample volumes.

Sampling methods were consistent with USEPA protocols for the collection of air samples using TO-15 Summa™ canister sampling and analysis methodology (USEPA 1999). Sampling for each air sampling type is discussed below. Each canister was certified cleaned by STL, Inc., Los Angeles laboratory according to its Quality Assurance Project Plan (QAPP).

Pertinent field sampling data are provided in Appendix A. The samples consisted of one indoor air sample and one soil gas sample for each location. Two of the five locations included duplicate sampling for the indoor air. As a control, an ambient air sample was also collected at the National Copper property.

2.1.1 Soil Gas

Near slab samples for soil gas entailed two steps: probe installation and sample collection. Each of these components is discussed below.

Probe Installation for Sub- or Near Slab Vapor Monitoring Points (VMPs)

VMPs were constructed of ¼-inch PVC tubing with 6-inch long, ½-inch diameter implants with woven stainless steel screens. Probes were installed to a depth of 10 feet bgs via a direct push (DP) machine. The installation consisted of attaching the screen to a sacrificial steel point, threading the tubing though the hollow DPT rods, and pushing the point with attached screen and tubing into the ground. Soil type in the general vicinity of the site was almost entirely sand. Soil boring logs representative of soil in the area of VMP locations are presented in Appendix B.

Sample Collection

Each soil gas sample was collected using a 6-liter Summa™ canister fitted with a flow orifice pre-calibrated to collect a 6-liter sample over an eight-hour period. In all instances, sample collection vacuum was determined in the field and the laboratory to ensure an accurate assessment of sample volume. Sample canisters were boxed and shipped to the laboratory for analyses of TO-15 analytes. A brief outline of the sampling protocol is provided.

- Soil vapor probes were purged prior to sampling using a peristaltic sampling pump with low flow capabilities. Flow rates were less than 200 mL/min and purging continued until a volume of approximately two probe volumes were purged.

- At the start and end of the purging period, smoke tubes were used to check for leaks in the sampling tube rather than use of the PID methodology. This modification was made due to a concern that the PID method would not sufficiently detect potential sampling train leakage and associated short circuiting. Rather, leakage was determined using the guidelines of 40 CFR 51, Appendix M, Reference Method 204. Briefly, this approach used a visual assessment of smoke leakage at the base of the sampling tube/bentonite intersection. No leaks were noted during the sampling.

- Initial and final vacuum readings were recorded for the 6-liter Summa™ canister. These readings gave the initial vacuum (pre-sample) and final vacuum (post-sample) for determination of the sampling volume for each location. These data are presented in Appendix A.

- The 6-liter Summa™ canister fitted with an eight-hour calibrated orifice was connected to the tubing for collection of soil gas. Samples were collected over an approximately six-hour period which yielded flow rates of between 8-10 minutes and still allowed collection of sufficient volume for analysis. It should be noted that collection over an eight-hour period ensured that the flow rate was not greater than 200 mL/min (in fact it was less than 100 mL/min), which is the flow threshold above which VOC stripping from soil might occur.

The residual vacuum was verified and the safety cap was tightened.

All data documenting sample collection were entered on field sheets and the canisters were shipped to the laboratory under chain of custody.

2.1.2 Ambient and Indoor Air Sampling

2.1.2.1 Ambient Air Sampling

An ambient air sample was collected using the Summa™ canister methodology. The sample was collected from a location approximately sidegradient (relative to the predominant wind direction) and approximately 250 yards from the API separator and removed from obvious potential emission sources such as automobiles, sewer vents, furnace vents. Wind velocity was moderately high (i.e., 20-30 mph) during the collection period. Specifically, the location of the sample was just north of the Northeast corner of the plant building and south of the API separator. The ambient air sample was taken during the soil vapor sampling activities with a canister placed at a suitable location at about one meter above grade. The ambient air sample was collected as a grab sample with the Summa™ canister intake valve fitted with a 24-hour calibrated orifice. It was opened for a period of approximately 24 hours. Beginning and final pressures were measured to obtain a precise sampling volume. The sample container was closed and shipped to the laboratory under chain of custody.

2.1.2.2 Indoor Air Sampling

A physical survey of the buildings to be sampled was conducted, in conjunction with an interview of the occupants of the buildings. The purpose of the physical survey was to obtain data to allow a qualitative assessment of factors that potentially could influence indoor air quality. The physical survey included collecting information on aspects of the building configuration such as building layout, attached garages, utility entrances into the building, ventilation system design, foundation conditions, presence of foundation sump, building material types (e.g., recent carpeting/linoleum and/or painting), presence of fireplace, location of laundry facilities, etc. The physical survey also included collecting data related to indoor air quality such as use of cleaning products, dry-cleaner use, indoor storage of paints and/or petroleum hydrocarbon products, use of aerosol consumer products, smoking, hobby crafts, etc.

The indoor air samples were collected using a Summa™ canister (6-liter capacity) equipped with a critical orifice flow regulation device sized to allow the collection of an air sample over a 24-hour sampling period. Samples were collected from areas believed to constitute exposure areas for residents of the buildings. Care was taken to deploy the Summa™ canisters away from the direct influence of any forced air emanating from air conditioning units, central air conditioning vents, furnaces or heaters.

The indoor air sampling procedure is described as follows:

- Building spaces were examined to determine a location for deployment of the Summa™ sample canister as close as practical to the center of the space. In the case of a basement deployment, the location was representative of the breathing zone or approximately two meters above the floor level. An attempt was made not to deploy the canister in areas that would have been subject to disturbances, or locations interfering with the occupant's normal activities.

Specific information collected during sampling is discussed below. Field data are summarized on Table A-1 of Appendix A.

- Appendix A provides schematic diagrams of the indoor air sampling locations.
- Air sample canisters were labeled with a unique sample designation number. Both the sample number and the sample location information were recorded.
- The Summa™ canister initial vacuum was measured using an integrated vacuum gauge immediately prior to canister deployment and recorded on field data sheets provided in Appendix A.
- The critical orifice flow controller was installed, as supplied by the laboratory, on the canister and the canister was opened fully at the beginning of the sample collection period (Appendix A).
- The canister valve was fully closed at the end of the sample period (after 24 hours) and the end time recorded on the field data sheet.

2.2 ANALYTICAL METHODOLOGY

All canisters were individually cleaned and certified according to the laboratory QAPP (STL 2006)[b]. The sample canisters were analyzed following the guidelines of TO-15 methodology, including the laboratory specific quality assurance and control (QA/QC) guidelines of the testing laboratory. All Summa™ canister samples were analyzed by STL, Inc. located in Los Angeles, CA using the TO 15 Method in the selective ion monitoring mode.

All chlorinated organics that were analyzed via the use of TO-15 were reported.

2.3 DATA EVALUATION

The analytical data were evaluated for compliance with laboratory specific quality assurance and quality control parameters by STL, Inc. Los Angeles, CA according to the QAPP submitted as a part of the work plan (Earth Tech 2006).

Soil Gas and Indoor Air Evaluation

Subsequent to the evaluation of the QA/QC data, the soil gas and analytical data were evaluated in a sequential process to determine if further evaluation was warranted. Figure 2-1 schematically presents the process that was used to make this evaluation.

USEPA Region 6 publishes concentrations of chemicals in soil gas that can be used to determine the potential for intrusion into indoor air. These levels were provided by USEPA Region 5 as screening levels for the assessment of site specific vapor intrusion. Chemicals detected in soil gas at levels exceeding their respective USEPA Region 6 soil gas screening levels were retained for further evaluation as chemicals that might lead to intrusion into indoor air and potentially result in exposure to residents.

Those chemicals that were identified as a potential indoor air intrusion concern were then selected from the indoor air data for each residence whereupon the indoor air data were compared to USEPA Region 9 preliminary remediation goals (PRGs) for the protection of ambient residential air to determine those constituents requiring further evaluation. It should be noted that the Region 9 PRGs are based on the most sensitive effect (i.e., cancer or non-cancer) for each chemical. Because the chemicals detected in indoor and ambient air at levels above their Region 9 criteria were carcinogens, only the excess lifetime cancer risk was further evaluated.

Excess lifetime cancer risk (ELCR) was calculated for each chemical whose concentration in indoor air was greater than its USEPA Region 9 PRG for ambient air. The ELCR represents the probability that an individual might experience cancer when exposed to site related chemicals under the assumptions specified. In general, such assumptions included relatively long exposures durations (e.g., 30 yrs), continuous daily exposures (e.g., 24 hours) and a chemical dose averaged over a life time (e.g., 70 years).

The numerical expression of an ELCR 1E-05 therefore means that the probability of experiencing cancer is 1 in 100,000 or 0.00001 over and above cancer rates that are due to other lifestyle factors.

Further evaluation was performed if the ELCR or the non-cancer hazard exceeded 1E-05, respectively, in accordance with the Michigan Department of Environmental Quality Part 201 regulations.

Ambient Air Evaluation

Data from the single ambient air sample were compared directly to the USEPA Region 9 PRG for ambient air. Any chemical concentrations exceeding their respective Region 9 criteria were then evaluated against published levels for background chemicals in ambient urban air.

Levels exceeding ambient urban background concentrations were deemed to require further evaluation.

Indoor Air Risk Evaluation

For chemicals that were detected in indoor air and found in soil gas at concentrations exceeding the soil gas screening level, the ELCR was calculated as per Equation 1:

$$ELCR = (C / PRG) \times 1E-06 \times CSF_{R9} / CSF_N \qquad \text{Equation 1.}$$

where,

C	=	the detected concentration of chemical in the indoor air sample (ug/m^3),
PRG	=	the USEPA Region 9 PRG for residential ambient air (ug/m^3),
1E-06	=	the target ELCR upon which the Region 9 PRG is based (unitless),
CSF_{R9}	=	the upper level cancer slope factor from the 2001 draft TCE risk characterization (mg/kg/day)$^{-1c}$, and
CSF_N	=	cancer slope factors from the withdrawn Integrated Risk InformationSystem entry, CalEPA, or the lower level CSF from the 2001 draft TCE risk characterization (mg/kg/day)$^{-1}$.

3. RESULTS

The results section includes the field activities, the analytical data results, and the data evaluation. These sections are detailed below.

3.1 SOIL GAS SAMPLING

It was determined, based upon the length of the sample tubing, that a ten-minute purge duration was adequate to obtain two purge volumes. During this time, a smoke tube testing protocol was utilized in the location where the soils and bentonite met the Teflon tubing. Briefly, a leak could be detected by visually observing smoke collecting in the tube via the negative pressure created by the peristaltic pump. This was performed following the guidelines of 40 CFR 51, Appendix M, Reference Method 204. However, in this sampling event the smoke tubes were deemed as adequate in determination of leakage of the sample train. No smoke was noted on the outlet side of the tubing and no disappearance of the smoke into the tube was observed (out of the monitoring well cavity). It was concluded that the sampling train was intact and did not contain any leaks and the monitoring well screen was sealed off from the surface.

No signs of tampering were noted regarding the sampling apparatus. No problems or issues were noted during sampling of the soil gas samples.

3.1.1 Ambient and Indoor Air Sampling

The ambient air and indoor air samples were collected as detailed in Section 2.1.2. The indoor air samples were collected and diagrams drawn for the areas where the samples were collected (Appendix A). Two duplicate samples for the indoor air sampling were collected at 303 Louise and 404 Louise Street locations.

No obvious signs of tampering were noted regarding the sampling apparatus. No problems or issues were noted that are believed to potentially impact the analytical data or the collection of the sample during sampling of the soil gas samples.

The analytical data generated by STL, Inc. were reviewed in accordance with the QAPP.

No laboratory specific quality assurance and quality control parameters were noted as being of concern. Thus all data were judged to be acceptable for further evaluation. All analytical data are provided in Appendix C.

3.2 SOIL GAS AND INDOOR AIR EVALUATION

Table 3-1 shows those chemicals (as noted in bold font) whose concentrations in soil gas exceeded the USEPA Region 6 screening criteria for the assessment of potential indoor air vapor intrusion concern. Two chemicals, trichloroethene and 1,3 –dichlorobenzene, exceeded their Region 6 screening criteria.

Trichloroethene (TCE) in soil gas collected at 404 Louise Street and 1,3-dichlorobenzene in soil gas collected at 601 Louise Street exceeded the Region 6 soil gas screening levels. No other chemicals detected in soil gas exceeded their respective soil gas screening levels.

Table 3-2 compares the concentrations of chemicals detected in indoor air to the USEPA Region 9 PRG for ambient residential air. When grouped on a medium specific basis (i.e., for all indoor air samples collected and tested) At least one of chemicals listed below were detected.

1,1,1-Trichloroethane
1,2-Dichloroethane
Bromodichloromethane
Carbon tetrachloride
Chloroform
Chloromethane
Methylene chloride
Tetrachloroethene
Trichloroethene
Vinyl chloride

However, of these chemicals, only TCE was detected in soil gas suggesting that the occurrence of other chemicals in indoor air is unrelated to intrusion of chemical vapors from soil gas.

While several chemicals were detected at levels exceeding the Region 9 PRGs, only TCE (noted in Table 3-1 in bold font) detected in the indoor air of 404 Louise Street was found at levels exceeding both the Region 9 PRG and the Region 6 soil gas screening levels.

3.2.1 Ambient Air Evaluation

Data from the single ambient air sample were compared directly to the USEPA Region 9 PRG for ambient air. The six chemicals listed below were detected in ambient air:

1,2-Dichloroethane

Carbon tetrachloride

Chloroform

Trichloroethene

1,1,1-Trichloroethane

Chloromethane

Only TCE and carbon tetrachloride were detected at levels exceeding USEPA Region 9 PRGs for ambient air (Table 3-3). TCE was detected at a concentration of 0.26 ug/m^3 while carbon tetrachloride was detected at a concentration of 0.72 ug/m^3. Background levels of TCE in ambient air however, have been reported as ranging from 0 to 3.0 ug/m^3, indicating that the level detected in the ambient air sample is within the range noted for typical urban air. It should be noted that the indoor air TCE concentrations were 0.11, 0.17, 0.27, 0.49, and 4.6 ug/m^3. All but one of the values is within a factor of 2 of the ambient concentration. For carbon tetrachloride, indoor air concentrations were 0.63, 0.67, 0.68, 0.68 and 0.69 ug/m^3. All of these values are below the ambient air concentration. As for carbon tetrachloride detected in ambient air, the Agency for Toxic Substances and Disease Registry (ATSDR), in its recent update of the toxicological profile for that chemical has noted that "Outdoor measurements in several areas of the United States have reported average concentrations of carbon tetrachloride in air between 0.6 and 1.0 ug/m3."[d]. These data indicate that the concentration of carbon tetrachloride in ambient air near the site is within the range of that determined to be background levels across the United States.

3.2.2 Indoor Air Risk Evaluation

For evaluative purposes, the ELCRs have been calculated using a variety of cancer slope factors (CSFs) that have been widely published and used by both USEPA and California EPA. The ELCR was calculated as 1E-6 times the ratio of sample concentration to the USEPA Region 9 PRG scaled to the relevant CSF.

Table 3-4 summarizes the ELCRs for 404 Louise Street assuming potential daily residential exposure to TCE in indoor air. ELCR ranges from 2E-07 (for ambient air) to 3E-04 (for indoor air) depending on the CSF that is used to make the calculation. Due to the wide variation in calculated risk due to the use of varying TCE slope factors, the median value (calculated using the Windows Excel function) was calculated to better quantify a more representative excess lifetime cancer risk level. The median ELCR value for potential exposure to TCE in indoor air at 404 Louise Street (9E-06) is marginally greater than that assuming exposure to background ambient air (5E-07) but less than 1E-05. This value, 1E-05, is the ELCR level published by MDEQ as acceptable under Part 201 of the Michigan Natural Resources Environmental Protection Act.

4. SUMMARY

Indoor air and soil gas samples were collected from residences located in the vicinity of the National Copper plant in Dowagiac, Michigan. Soil gas data were evaluated relative to USEPA Region 6 screening levels intended to determine the potential for vapors to intrude into indoor air at levels that might pose a risk to residential receptors.

With the exception of TCE detected in soil gas collected from 404 Louise Street, no chemicals were detected at levels exceeding the Region 6 soil screening levels that were also detected in indoor air samples.

The risk characterization for potential exposure to indoor air chemicals derived from groundwater at 404 Louise Streeet indicates that the excess cancer risk is less than 1×10^{-5}. Non-cancer hazard, typically expressed as the hazard index, was not evaluated because the cancer risk evaluation, based on the use of USEPA Region 9 preliminary remediation goals, is most restrictive and protective of residential exposure for chemicals detected .

Neither the State of Michigan nor the USEPA have published permissible levels of TCE in indoor air. However, based on this evaluation, the risk of residential exposure to chemicals in indoor air derived from contaminated groundwater is less than the benchmark cancer risk promulgated by the Michigan Department of Environmental Quality (MDEQ) under Part 201 of the Michigan Natural Resources Environmental Protection Act. The excess cancer risk is also within the risk range (1×10^{-6} to 1×10^{-4}) defined by USEPA under the National Contingency Plan as acceptable and warranting no further action. These results indicate that no further action is required.

RESIDENT QUESTIONNAIRE

National Copper, in cooperation with the U.S. Environmental Protection Agency, will collect indoor air samples from residences in an area near the National Copper Plant, Dowagiac, MI. These samples will be analyzed to detect volatile organic compounds (VOC) vapors inside the residences.

VOCs are found in outside air and in the air inside of buildings. VOCs can be found in solvents and other household items, such as pesticides, insecticides, adhesives, aerosols, paints, coatings, dry cleaning, carpet and drapery cleaning fluids, and household spot removers. Other common VOC sources may include telephone and computer cables, plastic items, vinyl cove molding, PVC plumbing, linoleum, concrete blocks, latex paint, carpet padding, foam rubber, lubricants, and cosmetics.

Your answer to the following questions will help us determine if sources of VOCs exist in your home. Please answer each question to the best of your knowledge.

1. When was the last time dry-cleaned clothes were brought into the house?

   ☐ 0 to 5 days ago ☐ 6 to 10 days ago ☑ More than 10 days ago

2. When was your carpet installed?

   ☐ In the last six months ☑ More than six months ago

3. When was the last time your carpet was cleaned?

   ☐ In the last six months ☑ More than six months ago

4. Do you have any spot removers in the house?

   ☐ Yes ☑ No BUT AMMONIA

5. Do your hobbies include model buildings, arts and crafts, model railroading metal cleaning, or others that require paints, thinners, solvents, or glue?

   ☐ Yes ☑ No

6. Do you perform automotive or other vehicle maintenance or repair at home?

   ☐ Yes ☑ No

7. Are any of the following list in your home.

   ☐ Latex caulk

   ☑ Latex paint WATER BASED NOT OPEN

☐ Vinyl cove molding

☑ Linoleum tile

☐

8. Do you have pesticides in your home?

☐ Yes ☑ No ☐ Unsure

9. Do you have any spray insecticides in your home?

☐ Yes ☑ No ☐ Unsure

10. Have you painted the interior of your home in the last 12 months?

☐ Yes ☑ No

11. Have you painted the exterior of your home in the last 12 months?

☐ Yes ☑ No

12. If you have answered yes to questions 10 or 11, please indicate what paint you used.

☐ Enamel

☐ Vinyl

☐ Latex

☐ Other

13. Where do you store your paint, thinner, pesticides, insecticides?

☑ Garage

☑ Basement

☐ Storage shed

☐ Other

☐ I don't store these items at home.

14. Do you have pets?

☐ Yes ☑ No

9. Do you have any spray insecticides in your home?

☐ Yes ☑ No ☐ Unsure

10. Have you painted the interior of your home in the last 12 months?

☑ Yes living room last 1-2 months ☐ No

11. Have you painted the exterior of your home in the last 12 months?

☐ Yes ☑ No

12. If you have answered yes to questions 10 or 11, please indicate what paint you used.

☐ Enamel

☐ Vinyl

☐ Latex

☐ Other Unknown

13. Where do you store your paint, thinner, pesticides, insecticides?

☐ Garage

☐ Basement

☐ Storage shed

☐ Other

☑ I don't store these items at home.

14. Do you have pets?

☑ Yes ☐ No

1 dog
1 cat

PO/CONTRACT: 70990.01

WILLIAM A. FREZ, Ph.D
Earth Tech, Inc.
36133 Schoolcraft Rd
Livonia, MI 48150

Dear WILLIAM A. FREZ, F

This report contains the a ınder chain of custody by
STL Los Angeles on Febr ed with your NATIONAL
COPPER PROD.- AIR pr uary 28, 2006.

STL Los Angeles certifies ıeet all the requirements
for parameters for which ceptions to NELAP
requirements are noted i n integral part of the
report. NELAP Certificat VE87652.

This report shall not be r approval of the laboratory.

This report

CASE NARRATIVE

Historical control limits for the LCS are used to define the estimate of uncertainty for a method.

All applicable quality control procedures met method-specified acceptance criteria except as noted on the following page.

If you have any questions, please feel free to call me at 714.258.8610.

Sincerely,

Sabina Sudoko
Project Manager
CC: Project File

LOT NUMBER E6B150119

Nonconformance 05-15737

Affected Samples:
E6B150119 (7): 601 LOUISE-IA(1279)
E6B150119 (8): 700 LOUISE-IA(2761)
E6B150119 (9): 504 LOUISE-IA(3061)
E6B150119 (10): AMBIENT(2257)
E6B150119 (11): TRIP BLANK-1(6094)
E6B150119 (12): TRIP BLANK-2(2915)

Affected Methods:
TO-15 SIM

Details:
The percent deviation of all the three dichlorobenzene (1,2-dichlorobenzene, 1,3-dichlorobenzene and 1,4-dichlorobenzene) exceeded the +30% in the daily continuing calibration verification (CCV). The three dichlorobenzene were not detected in the above samples. The data was reported, "as is."

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PO/CONTRACT: 70999.01

WILLIAM A. FREZ, Ph.D
Earth Tech, Inc.
36133 Schoolcraft Rd
Livonia, MI 48150

Dear WILLIAM A. FREZ, Ph.D,

This report contains the analytical results for the three samples received under chain of custody by STL Los Angeles on February 16, 2006. These samples are associated with your NATIONAL COPPER PROD.- AIR project. Preliminary data was provided on March 3, 2006.

STL Los Angeles certifies that the test results provided in this report meet all the requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in the case narrative. The case narrative is an integral part of the report. NELAP Certification Number for STL Los Angeles is 01118CA/E87652.

This report shall not be reproduced except in full, without the written approval of the laboratory.

This report contains 000039 pages.

CASE NARRATIVE

Historical control limits for the LCS are used to define the estimate of uncertainty for a method.

All applicable quality control procedures met method-specified acceptance criteria except as noted on the following page.

If you have any questions, please feel free to call me at 714.258.8610.

Sincerely,

Sabina Sudoko
Project Manager
CC: Project File

LOT NUMBER E6B170329

Nonconformance 05-15661

Affected Samples:
E6B170329 (1): 305 LOUISE-IA-1
E6B170329 (2): 305 LOUISE-IA-2
E6B170329 (3): 305 LOUISE-SG

Affected Methods:
TO-15, TO-15 SIM

Details:
1) The chain of custody (COC) indicates sample "305 LOUISE-IA-1" is associated with canister 3009 and sample "305 LOUISE-IA-2" associated with canister 2671. The Canister Field Data sheets indicate "305 LOUISE IA-1" with canister 2671 and "305 LOUISE IA-2" with canister 3009. The samples were logged in as per the chain of custody.

2) The chain of custody was not received with the samples on 2/16/06. The client sent the COC via email on 2/17/06.

Swart, Terry

Subject: Information for E6B170329

Sample Confirmation for E6B170...

* *

Lot ID: E6B170329
Project Number: 70999.01
Project Name/Site: NATIONAL COPPER PROD.- AIR

Acknowledgement of samples received for National Copper.
Please check the sample confirmation sheet.
Note: COC has "305 LOUISE-IA-1" associated with canister 3009 and "305 LOUISE-IA-2" associated with canister 2671. The Canister Field Data sheets have "IA-1" with Canister 2671 and "IA-2" with Canister 3009.
Samples were logged in per COC.
Note: COC was not received with the samples (02/16/06). Client emailed COC to PM on 02/17/06.
Thank you.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

LABORATORY CONTROL SAMPLE DATA REPORT

GC/MS Volatiles

Client Lot #...: E6B170329 Work Order #...: H0FKX1AC-LCS Matrix.....: AIR
LCS Lot-Sample#: M6C010000-518 H0FKX1AD-LCSD
Prep Date.....: 02/23/06 Analysis Date..: 02/23/06
Prep Batch #...: 6060518 Analysis Time..: 11:49
Dilution Factor: 1 Instrument ID..: MSD
Analyst ID.....: 341569

PARAMETER	SPIKE AMOUNT	MEASURED AMOUNT	UNITS	PERCENT RECOVERY	RPD	METHOD
1,1-Dichloroethene	3.96	3.87	ug/m3	98		EPA-2 TO-15 SIM
	3.96	3.88	ug/m3	98	0.30	EPA-2 TO-15 SIM
Tetrachloroethene	6.77	6.72	ug/m3	99		EPA-2 TO-15 SIM
	6.77	6.80	ug/m3	100	1.2	EPA-2 TO-15 SIM
1,1,1-Trichloroethane	5.45	5.56	ug/m3	102		EPA-2 TO-15 SIM
	5.45	5.70	ug/m3	105	2.3	EPA-2 TO-15 SIM
Trichloroethene	5.36	5.77	ug/m3	108		EPA-2 TO-15 SIM
	5.36	5.79	ug/m3	108	0.27	EPA-2 TO-15 SIM
Vinyl chloride	2.55	2.77	ug/m3	109		EPA-2 TO-15 SIM
	2.55	2.90	ug/m3	113	4.4	EPA-2 TO-15 SIM
Chloroform	4.87	4.88	ug/m3	100		EPA-2 TO-15 SIM
	4.87	4.96	ug/m3	102	1.6	EPA-2 TO-15 SIM
1,1-Dichloroethane	4.04	3.71	ug/m3	92		EPA-2 TO-15 SIM
	4.04	3.83	ug/m3	95	3.2	EPA-2 TO-15 SIM
1,2-Dichloroethane	4.04	4.28	ug/m3	106		EPA-2 TO-15 SIM
	4.04	4.33	ug/m3	107	1.1	EPA-2 TO-15 SIM
Methylene chloride	3.47	3.31	ug/m3	95		EPA-2 TO-15 SIM
	3.47	3.44	ug/m3	99	4.0	EPA-2 TO-15 SIM
1,1,2-Trichloroethane	5.45	5.62	ug/m3	103		EPA-2 TO-15 SIM
	5.45	5.78	ug/m3	106	2.9	EPA-2 TO-15 SIM
cis-1,2-Dichloroethene	3.96	3.94	ug/m3	100		EPA-2 TO-15 SIM
	3.96	3.95	ug/m3	100	0.23	EPA-2 TO-15 SIM
trans-1,2-Dichloroethene	3.96	3.89	ug/m3	98		EPA-2 TO-15 SIM
	3.96	3.94	ug/m3	100	1.4	EPA-2 TO-15 SIM
Bromodichloromethane	6.69	7.53	ug/m3	113		EPA-2 TO-15 SIM
	6.69	7.66	ug/m3	115	1.8	EPA-2 TO-15 SIM
