1. Overview of Corrective Measures Implemented

This 2010 Corrective Measures Implementation (CMI) Annual Report was prepared by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust for the southern portion of the former General Motors Corporation (GMC) North American Operations facility (otherwise known as Buick City) (the Site), located in Flint, Michigan. On April 1, 2011 the environmental remediation of the property was transitioned from Motors Liquidation Corporation (MLC) to RACER Trust.

The CMI *Work Plan - Southend of the Former General Motors Corporation North American Operations Facility (Otherwise Known as Buick City)* (CMI Work Plan) was submitted to the United States Environmental Protection Agency (USEPA) on August 13, 2010. The CMI Work Plan was prepared to comply with requirements of the Solid Waste Disposal Act as amended by the Resource Conservation and Recovery Act of 1976 (RCRA) and the Hazardous and Solid Waste Amendments of 1984 (HSWA), 42 U.S.C. § 6901 et seq., and USEPA regulations at 40 C.F.R. Parts 260-271 and Part 124. This annual report was prepared to document and summarize corrective measures completed and implemented during the previous year as well as investigations, testing and other activities completed in support of corrective measures design and implementation. The corrective measures are being implemented in accordance with the *Final Decision and Response to Comments* (Final Decision) for the Southend of the Site issued by the USPEA on May 13, 2010.

1.1 Introduction

The Site is located at 902 East Leith Street in Flint, Michigan, in Genesee County and encompasses approximately 452 acres of land. It is generally bounded to the north by Stewart Avenue and Pierson Road, to the south by Harriet Street, to the east by James P. Cole Boulevard and CSX Railroad, and to the west by Industrial Avenue and North Street. The portion of the Site located north of Leith Street (hereafter referred to as the Northend) was in part occupied by GMC for manufacturing operations until December 6, 2010. The buildings located in the Northend of the Site are either undergoing decommissioning/demolition or are slated for demolition. Building demolition has been completed in the portion of the property located south of Leith Street, which is referred to as the Southend. A Site Location map is included as Figure 1.

1.2 Summary of 2010 Corrective Measures

The following Corrective Measures were implemented in 2010 and are discussed further in their respective sections of the report.

- A Laser Induced Fluorescence (LIF) investigation was performed at the Site from August 2 through August 21, 2010. The purpose of the LIF investigation was to define the vertical and horizontal extent of Light Non Aqueous Phase Liquid (LNAPL) impacts in the Southend of the Site from historic Site operations.

- The annual groundwater monitoring event was conducted from October 10 through October 28, 2010. The purpose of the annual groundwater monitoring event is to monitor groundwater quality and flow patterns, and LNAPL plumes at the Site

- The "NPDES Plus" monitoring program (NPMP) was implemented at the Site to evaluate compliance with Michigan Part 201 GSI criteria for the long-term protection of the Flint River. The NPMP consists of collecting monthly samples from up to 11 Site storm sewers during dry weather flow to assess the impact of groundwater infiltrating into the Site storm sewers.

- The lead soil impact delineation activities were completed from August 16 and August 20, 2010. A sampling program was implemented at Area of Interest (AOI)-09A to delineate areas of elevated lead and benzo(a)pyrene concentrations.

- Quarterly inspections of surface cover in select areas were completed in order to protect future Site users from near surface soils that exceed direct contact criteria. The engineering controls include maintaining the surface cover consistent with existing conditions at five AOIs located in the Southend of the Site.

- Site-wide use restrictions were prepared as part of the overall final corrective action for the Site. RACER Trust intends to establish restrictions in the property deed (restrictive covenant) to limit future use of the Site. Site-wide use restrictions are currently in draft form and pending the review of RACER Trust.

In addition to the above corrective measures this report also includes a brief summary of the following significant activities completed at the Site in 2010:

- The Outfall 003/004 Storm Water Diversion and Treatment System was constructed in order to remove oil from Outfall 003 and 004 storm sewer systems.

- Accumulated sediment was removed from Oil Interceptor #2 to improve its ability to collect oil from along the Outfall 003 storm sewer system.

1.3 Revised Generic Michigan Department of Environmental Quality (MDEQ) Screening Criteria

On December 14, 2010, February 17, 2011 and March 25, 2011 the MDEQ issued revisions to the Part 201 Generic Cleanup Criteria and Part 213 Risk-Based Screening Levels. A brief summary of the revisions are included below:

- Generic groundwater cleanup criteria and screening levels (R 299.5744, Table 1) were revised.
- Generic soil cleanup criteria and screening levels (R 299.5746 and R 299.5748, Tables 2 and 3, respectively) were revised.
- Footnotes for the generic cleanup criteria tables (R 299.5750) were revised.
- Toxicological and chemical-physical properties values (R 299.5752, Table 4) were revised.
- Groundwater Surface Water Interface (GSI) criteria and GSI Protection (GSIP) criteria were revised for soil and their respective footnote (R 299.5750) were revised
- The industrial and commercial land use categories were replaced, in name, by the nonresidential land use category. The criteria that were formerly presented as the industrial criteria are now the nonresidential criteria. This changed the land use designations of the cleanup criteria presented in the groundwater and soil tables to residential and nonresidential and resulted in the elimination of the commercial III and IV subcategories of the soil direct contact criteria.
- Inhalation-based cleanup criteria have been developed for some hazardous substances previously footnoted with an “ID” (i.e., insufficient data). Inhalation-based toxicity endpoints were developed pursuant to Part 55, Air Pollution Control, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended, and the rules promulgated under that part, and, where all necessary chemical-specific data were available, inhalation-based cleanup criteria were developed (R 299.5706a(11)). These criteria are effective March 25, 2011, and replace the “ID” footnote where previously listed in the inhalation-based criteria columns of the tables.

The data presented in this report were compared to the revised MDEQ criteria. The revised MDEQ criteria categories were reviewed in conjunction with Section 4.1 of the *RCRA Facility Investigation (RFI) Phase I Report* (Blasland, Bouck, and Lee [BBL],

2002)(RFI Phase I Report),which specifies the generic MDEQ screening criteria that have been used for comparison during Site RFI activities. The following text summarizes revised criteria category names for the MDEQ criteria applicable for the Site.

On-Site surface and subsurface soil analytical data were compared to the following generic MDEQ criteria:

- Non-residential Direct Contact (NDC);
- Non-residential Soil Volatilization to Indoor Air Inhalation (NSVIA);
- Non-residential Infinite Source Volatile Soil Inhalation (NVSIC); and
- Non-residential Particulate Soil Inhalation (NPSIC).

Groundwater analytical data were compared to the following generic MDEQ criteria:

- Non-residential Drinking Water Criteria (NDW);
- Non-residential Groundwater Volatilization to Indoor Air (NGVIA);
- Groundwater Contact (GCC);
- Groundwater Acute Inhalation (GAI);
- Flammability and Explosivity (FE); and
- GSI criteria – for monitoring wells located within 500 feet of the Flint River.

The NPMP monitoring data collected from the Site storm sewers were compared to GSI criteria.

Off-Site surface and subsurface soil analytical data collected during the lead soil investigation were compared to residential and non-residential generic MDEQ criteria.

2. LNAPL Characterization and Pilot Testing

LNAPL characterization and pilot testing activities were completed at the Southend of the Site consistent with the LIF Work Plan dated July 20, 2010 and the CMI Work Plan, prepared by ARCADIS.

2.1 LIF Investigation

The LIF investigation was completed to further delineate the vertical and lateral extent of the LNAPL areas located in the Southend of the Site. The LNAPL areas included in this investigation are located at AOI 02-B, AOI 09-B, AOI 12-A, -B, and –C, AOI 16-C, and AOI 40-A and –B. As further discussed in Section 2.1.4.1 below, while delineating the extent of LNAPL at AOI 09-B, evidence of LNAPL impacts at AOI 09-A were identified. Although LNAPL remediation at AOI 09-A is not contemplated in the Remediation Cost Estimate (RCE), the extent of on Site LNAPL impact at AOI 09-A was delineated during this investigation.

2.1.1 Summary of Field Activities

ARCADIS and Matrix Environmental, LLC of Osseo, Minnesota (Matrix) conducted the LIF investigation from August 2 through August 21, 2010. The purpose of the LIF investigation was to further define the vertical and horizontal extent of LNAPL impacts at the Southend of the Site from historic Site activities. Matrix provided the LIF equipment and advanced LIF soil probes under the direct supervision of ARCADIS personnel.

A total of 143 LIF borings were advanced at the Southend of the Site to a depth of approximately 26 feet below ground surface (bgs). The LIF borings were completed at five areas in the Southend of the Site known to be impacted by LNAPL, as indicated below.

Area of Interest	AOI 02-B	AOI 09-A and –B	AOI 12-A, -B, and -C	AOI 16-C	AOI 40-A and -B
Number of Borings	22	34	44	18	25

LIF boring locations were concentrated in the areas where LNAPL was previously observed during the RFI activities (based on the presence of LNAPL in monitoring wells) in order to further delineate the extent of LNAPL in the soil. Additional “step out” borings were completed to delineate impacts. Please note that the presence of LNAPL has not been detected in monitoring wells located at AOI 09-A. As discussed above

evidence of LNAPL impacts were identified at AOI 09-A, while conducting LIF investigations at AOI 09-B. Figure 2 presents the locations of the LIF borings.

2.1.2 Description of LIF Technology

LIF investigations are conducted by advancing an ultraviolet optical sensing tool (UVOST®) probe in areas of known or suspected LNAPL impact. The UVOST® probe emits an ultraviolet excitation light and captures returning fluorescence. Polycyclic aromatic hydrocarbon (PAH) compounds, which are a component of common petroleum fuels, readily fluoresce when exposed to ultraviolet light. The magnitude of fluorescence is proportional to the LNAPL saturation within the soil. The fluorescence observed is quantified by comparison to the response of a standard reference solution, known as the reference emitter; the results are expressed as a percentage of reference emitter (%RE) response. Instrument response is expected in areas with no LNAPL impacts due to the fluorescent properties of native soil materials. However, background fluorescence is typically weak as compared to LNAPL fluorescence and does not greatly diminish instrument sensitivity.

The UVOST® probe detects four distinct fluorescent light wavelengths; the relative returns of each wavelength at a given depth are collectively referred to as a waveform. Differences in waveform patterns may indicate differences in the subsurface environment or in LNAPL composition. Waveform changes are indicated by color shifts in the LIF boring log; snapshots of waveforms at selected depths are presented as callouts on each log.

The return (fluorescent) light signal is analyzed in real time by onsite equipment. As the probe is advanced downward, the fluorescence data form a vertical profile of LNAPL impact present at the soil boring location. Results were reviewed after completing each LIF boring and considered when selecting subsequent locations.

An electrical conductivity (EC) point is advanced along with the UVOST® probe at each boring location. EC is the measure of the soils ability to conduct an electrical current measured on the UVOST® probe. Each boring log includes the vertical profile of the EC data recorded in milliseimens per meter (mS/m) in addition to the fluorescence data. The soil type can be determined by the EC data since soil is in the pathway of the electrical current flow. The grain size can thus be determined by comparing the EC log to a soil boring. Conductivity data in the 100s mS/m indicate smaller grain material such as clay, and data in the 10s of mS/m indicate larger grain material such as sand and gravel. The EC data has not been correlated to Site specific soil types, however the data is used to assist in the evaluation of LNAPL distribution.

2.1.3 LIF Investigation Methodology

The following methods/practices were employed during implementation of the investigation event:

- The UVOST® probe was advanced using a track-mounted direct-push rig.
- The first five feet of all borings were advanced using a hand auger or air-knife; therefore, LIF responses from 0 to 5 ft bgs were not included in the analysis.
- Based on a correlation of the observed fluorescence with field data indicative of LNAPL it was determined that LIF readings of less than 5 %RE were attributable to background fluorescence and/or insignificant.
- Boreholes were abandoned with bentonite chips after completion and sealed with cement.

2.1.4 Summary of Results

The LIF logs were analyzed to determine the lateral and vertical extent of LNAPL in the subsurface and LNAPL speciation. Visual observations and interpretations of the 143 LIF logs established a site-specific “background” fluorescence response. If a response was less than 5%RE or the max %RE was at a depth less than 5 feet bgs (the area that was hand cleared in the boring), these responses were considered attributable to “background”. LIF responses greater than this “background” level were considered indicative of LNAPL impact. The table below displays the number of borings performed and the number of borings observed above background. Borings that exhibit LIF responses below background are areas not affected with LNAPL and assist in delineating the horizontal extent of LNAPL.

Refusal was encountered in a number of borings before reaching the target the depth, as shown in the table below. If refusal was encountered and LIF responses greater than background were observed, the boring was included in the analysis on a limited basis. These borings were used as an indicator that the area is affected by LNAPL; however, nothing could be concluded about vertical delineation.

Location	AOI 02-B	AOI 09-A and –B	AOI 12-A, -B, and -C	AOI 16-C	AOI 40-A and -B
Total # of Borings	22	34	44	18	25
# of Borings Above Background	13	21	25	12	16
# of Borings Where Refusal was Encountered	4	2	11	4	7

LIF borings were identified as LIF, followed by the AOI number in which the boring was located, followed by the boring number (the order that the borings were drilled in that AOI) as LIF-XX-YYY. As an example, the 17th LIF boring drilled in AOI 40 would be identified as LIF-40-017.

2.1.4.1 Areal Distribution of Impacts

AOI 09-A and -B

AOI 09-A and -B are located south of Hamilton Ave between Industrial Ave and the decommissioned CSX railroad tracks. The LIF investigation was planned in this area to delineate the extent of the AOI 09-B LNAPL plume. While completing step-out borings for the AOI 09-B delineation, evidence of LNAPL impacts at AOI 09-A were identified. Although LNAPL remediation at AOI 09-A was not contemplated in the RCE, the extent of on Site LNAPL impact at AOI 09-A was delineated during this investigation.

At AOI 09-A, the LIF response was much higher than AOI 09-B, due to a different LNAPL species. The greatest LIF impacts at AOI 09-A were primarily located near the property boundary at AOI-09-017, AOI-09-018, AOI-09-020, and AOI-09-021 (441.52, 230.31, 259.18, 259.26, 565.26 %RE; respectively) (Figure 2). At AOI 09-B, the greatest LIF responses were much lower than the responses at other AOIs in the Southend. This is because the LNAPL speciation (discussed further in Section 2.1.4.3) in the soil is different at AOI 09-B than what was observed throughout the rest of the Site. The highest LIF impact at AOI 09-B, was observed in boring LIF-09-027 (69.84%RE) as shown on Figure 2.

AOI 12-A, -B, and -C

AOI 12-A, -B, and -C are located south of Leith Street, north of Hamilton Avenue, east of Division Street (vacated) and west of Industrial Avenue. The greatest LIF responses were observed between AOI12-B and AOI 12-C near the intersection of Leith Street and Industrial Avenue. In particular, LIF-12-011, LIF-12-016, LIF-12-020, LIF-12-022, and LIF-12-024 were much higher than the majority of the borings, with RE percentages of 511.22, 241.64, 440.39, 336.33, and 513.89; respectively (Figure 2).

AOI 02-B, AOI 40-A and -B, and AOI 16-C

AOI 02-B is located between Division Street (vacated) and the CSX railroad tracks. AOI 40-A and –B are located south of AOI 02-B between Division Street (vacated) and the CSX railroad property and AOI 16-C is southwest of AOI 40-B along Division Avenue (vacated). The extent of contamination at AOI 02-B , AOI 40-A and -B , and AOI 16-C (Figure 2) appear to create one comingled area of impact. This area extends approximately 1400 feet northwest to southeast, from the CSX railroad, west to Division Street (vacated). The greatest LIF impacts were observed along the railroad (LIF-02-006, LIF-02-018, LIF-40-004, and LIF-40-006) and in the center of the impacted area at LIF-40-008, LIF-40-009, and LIF-40-018. In the vicinity of AOI 16-C, borings LIF-16-013 and LIF-16-017 exhibited the greatest LIF responses. These elevated LIF observations were all greater than 200% RE. Elevated impact was also observed at LIF-40-004. This boring is believed to have been advanced into the backfill of a historical tunnel at the Site. It is assumed that the tunnel was filled with a sandy backfill. The higher conductivity of the fill relative to the surrounding soil allowed LNAPL to collect in the pore space.

The maximum fluorescence range observed at each boring location is depicted in Table 1. LIF boring logs that graphically present the output generated by the LIF equipment are included as a Direct Sensing Report by Matrix Environmental in Appendix A. Figure 2 shows the aerial distribution of LIF response as color coded dot based on the LIF response.

2.1.4.2 Vertical Distribution of Impacts

AOI 09-A and -B

The vertical distribution at AOI 09-A and -B is more complex than at other AOIs due to its heterogeneity. The LIF impacted soil is typically in the range between 6 to 14 feet bgs, with a few observations as deep as 24 feet bgs.

AOI 12-A, -B, and -C

The vertical range of LIF impact at AOI 12-A, -B, and -C is typically 6 to 15 feet bgs. There are several instances where the impact extends to depths of 22 to 28 feet bgs.

AOI 02-B

The majority of the LIF borings observed above background at AOI 02-B were from 5 to 12 feet bgs. The vertical distribution of impact was not observed deeper than 12 feet bgs.

AOI 16-C

At AOI 16-C, the typical vertical distribution was 7 to 13 feet bgs, with a few exceptions where the LIF impact was observed down to 23.5 feet. In all borings that reached the target bottom depth (26 feet bgs), the LIF responses returned to background levels.

AOI 40-A and -B

Like the surrounding AOIs, AOI 40-A and -B exhibited a general LIF impact from 5 to 16 feet bgs. At three particular LIF borings, however, LIF responses extend to 30 feet bgs. It is believed the LIF-40-004, LIF-40-003, and LIF-40-014, were advanced through a tunnel that had been backfilled with a sandy soil that acted as a sink for LNAPL.

Visual interpretations of the vertical impacts are presented in cross-sections in Figures 3 through 7.

2.1.4.3 LNAPL Speciation

The LIF waveform signatures observed at the site are consistent with the known LNAPLs at the AOIs. AOI 02-B and AOI12-A, -B and -C have responses consistent with hydraulic oil. LIF responses in AOI 16-C and AOI 40-A and -B are consistent with a fuel oil response. AOI 09-B exhibits responses consistent with weathered gasoline with a smaller area, denoted as AOI-09A, exhibiting responses similar to diesel.

2.1.4.4 Correlation of LIF Data to Monitoring Well Data

Where appropriate, LIF data was compared to fluid-level data in nearby monitoring wells to determine the degree that the LNAPL smear zone observed in the LIF borings correlates to observations of LNAPL accumulation in monitoring wells. The comparison

indicates that LIF responses greater than background have co-located wells with some degree of LNAPL observations; however, LNAPL observations in monitoring wells do not clearly correlate to the degree of impact observed in LIF borings. For example, a four foot thick smear zone of elevated response was observed at boring LIF-02-018 with a maximum fluorescence of 335.48%, and LNAPL has not been observed greater than a trace in neighboring monitoring well RFI-02-012. In contrast, a smear zone approximately 3.5 feet in thickness and a maximum fluorescence of 65.24% was observed in boring LIF-02-014, while LNAPL has historically accumulated in neighboring monitoring well RFI-02-019 to thicknesses of over 3.48 feet. Data from co-located LIF borings and monitoring wells are compared in Table 2. It is important to note that while the LIF technology is effective in delineating the presence of LNAPL in the subsurface, it does not predict the recoverability of the oil.

The comparison of LIF results and monitoring well gauging data demonstrate that:

- LIF borings with elevated responses do show some degree of LNAPL in neighboring monitoring wells.
- The magnitude of LNAPL accumulation in site monitoring wells is not an accurate measure of the degree of LNAPL impact near those wells.
- LIF investigations provide additional delineation of the vertical and horizontal extent of LNAPL in the subsurface.

2.1.5 Conclusions and Future Activities

The LIF investigation event yielded valuable data on the areal and vertical extent of LNAPL impacts. Delineation of LNAPL impacts were complete if the LIF response at a boring are at background levels for areal extent or returns to background levels for vertical extent. Additionally, areal delineation is inferred using multiple lines of evidence including reduction of LIF response intensity and vertical response over distance, and changes in LIF response type. The following conclusions were made based on review and analysis of the investigation and historical site data:

AOI 09-A and -B

- On-Site areal LNAPL delineation is inferred to be complete at AOI 09-A.
- Areal LNAPL delineation at AOI 09-B is inferred based on declining LIF response and changes in response type.

- Vertical LNAPL delineation is complete at AOI 09-A and -B, with the bottom of the LIF impacted zone identified in the boring logs.
- Additional research of potential source areas should be performed to determine possible sources of impacts.
- The magnitude of LNAPL accumulation in site monitoring wells is not an accurate measure of the degree of LNAPL impact near those wells.
- Weathered diesel is thought to be the predominant product type at AOI 09-A.
- Gasoline is thought to be the predominant product type at AOI 09-B.

AOI 02-B and AOI 12-A, -B, and -C

- Areal LNAPL delineation at AOI 02-B along the rail line is not complete.
- Areal LNAPL delineation on Site is not complete along the corner of Leith Street and Industrial Avenue. This portion of the AOI 12-B/12-C LNAPL plume should be further investigated to delineate the LNAPL area.
- Areal LNAPL delineation on Site is inferred at AOI 12-A. Additional investigation is recommended to verify this assumption.
- Vertical LNAPL delineation at each AOI is complete, with the bottom of the LIF impacted zone identified in the boring logs.
- Additional research of potential source areas should be performed to determine possible sources of impacts.
- The magnitude of LNAPL accumulation in site monitoring wells is not an accurate measure of the degree of LNAPL impact near those wells.
- Hydraulic oil is thought to be the predominant product type.

AOI 40-A and -B and AOI 16-C

- Areal LNAPL delineation at each AOI is not complete.

- Vertical LNAPL delineation is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- Additional research of potential source areas should be performed to determine possible sources of impacts.

- The magnitude of LNAPL accumulation in site monitoring wells is not an accurate measure of the degree of LNAPL impact near those wells.

- Fuel oil is thought to be the predominant product type.

Additional assessment is recommended to further understand the LNAPL distribution, potential sources, and associated risks at the Site. Additional investigation may be required to delineate the extent of impact along the CSX railroad property. Determining the extent of horizontal impact will help determine whether off Site migration is occurring.

2.2 AOI 09-B Multi-Phase Extraction Pilot Testing

Multi-phase extraction (MPE) testing was completed at AOI 09-B (former Hamilton avenue tank Farm) in August 2010. The objectives of the field testing activities were to collect the data necessary to facilitate the design of a full scale extraction and treatment system capable of recovering LNAPL from the subsurface and reducing concentrations of contaminants of concern (COCs) in soil and groundwater.

The results of the AOI 09-B MPE pilot testing activities are summarized in the *Multi-Phase Extraction Test Summary and Basis for Full-Scale System Design* report which was submitted to the USEPA on November 19, 2010.

3. Groundwater Monitoring

3.1 Groundwater Level and LNAPL Presence Measurements

As part of the 2010 annual groundwater monitoring event, ARCADIS completed a site-wide round of groundwater level and LNAPL presence and thickness measurements from October 10 to 13, 2010. An attempt was made to collect measurements at each of the 146 locations listed in Table 3 (Northend) and 131 locations listed in Table 4 (Southend). The monitoring well locations for the Northend and Southend are shown on Figures 8 and 9, respectively. Due to the ongoing decommissioning and demolition activities at the Site and limited access, 212 monitoring wells were monitored for groundwater elevation and LNAPL thickness.

Groundwater level measurements were used to generate site-wide groundwater elevation contour maps (Figures 8 and 9) and are summarized in Table 5. The groundwater flow directions are consistent with historical observations. As shown on Figures 8 and 9, groundwater flow is locally influenced by the presence of storm sewers that traverse the Buick City property. This is particularly apparent at the south end of Building 70 (Figure 8), along Leith Street where it passes beneath the railroad tracks (Figures 8 and 9), and at AOI 40-A (Figure 9). Additionally, the Building 40 tunnel (AOI 40-D, Figure 9) appears to distort the groundwater contours, and the basement of Building 20 (Figure 8) appears to create a sump, with local groundwater flow direct into the basement.

The 2010 groundwater level measurements were also compared to historic groundwater level data collected from July 2005 through October 2010. The evaluation did not reveal any obvious trends with the exception of two wells in the Factory 84 area (RFI-84-09S and RFI-84-09D) which showed a decrease in water levels of 5.95 feet and 4.69 feet, respectively.

The LNAPL presence and thickness measurements were compared to historical measurements generated as part of the RFI Phase I Report and RFI Phase II Report (BBL, 2006), the CA 750 groundwater monitoring program, and the *Revised Corrective Measures Proposal (CMP) Addendum No.2 – Northend Corrective Measures and Site-wide Groundwater Monitoring* (ARCADIS, 2010) (CMP Addendum No. 2 - Northend). LNAPL presence and thickness measurements at the Site were consistent with historical data, except as noted below.

North of Leith Street

AOI 03-1 (Figure 8)

During the groundwater monitoring event LNAPL was not detected at monitoring well 03-03R. Historically, LNAPL had been detected at 03-03R from 2004 through 2008 at thicknesses ranging from 0.05 to 2.94 feet. Historically, the AOI 03-1 LNAPL plume has only been detected at 03-03R and the well that it replaced, 03-03. Monitoring well 03-03R will continue to be monitored as part of the annual monitoring events.

AOI 10-1 (Figure 8)

During the groundwater monitoring event LNAPL was not detected at monitoring well 20-168. Historically, LNAPL had been detected at 20-168 from 2003 through 2008 at thicknesses ranging from 0.01 to 2.26 feet. Historically, the AOI 10-1 LNAPL plume has only been detected at monitoring wells 20-167 and 20-168. Monitoring wells 20-167 and 20-168 will be monitored as part of the annual monitoring events.

AOI 86-1 (Figure 8)

During the groundwater monitoring event LNAPL was not detected at monitoring wells RFI-86-02 and RFI-86-03. Historically, LNAPL had been detected at RFI-86-02 and RFI-86-03 from 2004 through 2005. Historic LNAPL thicknesses ranged from 0.01 to 2.39 feet at RFI-86-02 and 0.01 to 0.54 foot at RFI-86-03. Historically, the AOI 86-1 LNAPL plume has only been detected at monitoring wells RFI-86-02 and RFI-86-03. These wells will continue to be monitored as part of the annual monitoring events.

South of Leith Street

AOI 02-B (Figure 9)

During the groundwater monitoring event LNAPL was detected in monitoring wells RFI-02-12, RFI-02-16, RFI-02-17, RFI-02-18 and RFI-02-23 for the first time. The measured thickness of LNAPL at each of these wells was 0.01 foot. These wells were last evaluated for the presence of LNAPL in 2009 (RFI-02-17), 2008 (RFI-02-12), and 2005 (RFI-02-16, RFI-02-18, and RFI-02-23). Historically, LNAPL at the AOI 02-B area was only detected in nearby monitoring wells RFI-

02-14, RFI-02-15 and RFI-02-19. These wells will continue to be monitored as part of the annual monitoring program, along with downgradient wells RFI-02-22, RFI-02-24, RFI-40-13, RFI-40-14R, and RFI-40-15 to evaluate plume stability. The AOI 02-B LNAPL plume will also be addressed as part of LNAPL removal activities planned at the Site.

AOI 12-A (Figure 9)

During the groundwater monitoring event LNAPL was detected in monitoring wells RFI-12-07R2 and RFI-12-27 for the first time. The measured thickness of LNAPL was 0.01 foot at RFI-12-07R2 and 0.02 feet at RFI-12-27. RFI-12-07R2 and RFI-12-27 were last evaluated for the presence of LNAPL in 2008 and 2005, respectively. In addition, LNAPL re-appeared at RFI-12-01R (0.01 foot), RFI-12-15 (0.01 foot) and RFI-12-26 (0.02 foot). LNAPL was previously detected at RFI-12-01R from 2003 through 2005 at thicknesses ranging from 0.01 to 1.72 feet. LNAPL was previously detected at RFI-12-15 once in 2005 at a thickness of 0.01 foot. LNAPL was previously detected at RFI-12-26 from 2003 through 2006 at thicknesses ranging from 0.01 to 0.39 foot.

Additionally, LNAPL was not detected at monitoring wells RFI-12-02R and RFI-12-22R. Historically, LNAPL had been detected at RFI-12-02R from 2003 through 2008 at thicknesses ranging from 0.01 to 4.27 feet. LNAPL had been detected at RFI-12-22R from 2004 through 2005 at thicknesses ranging from 0.01 to 0.16 feet.

These wells will continue to be monitored as part of the annual monitoring events. The AOI 12-A LNAPL plume will also be addressed as part of LNAPL removal activities planned at the Site.

AOI 12-C (Figure 9)

During the groundwater monitoring event LNAPL was detected in monitoring well RFI-12-11S for the first time. The measured thickness of LNAPL was 0.01 foot. RFI-12-11S was last evaluated for the presence of LNAPL in 2008. In addition, LNAPL re-appeared at RFI-12-14R with thicknesses of 0.01 foot. LNAPL was previously detected at RFI-12-14R, once in 2004, at a thickness of 0.01 foot. These wells will continue to be monitored as part of the annual monitoring events. The AOI 12-C LNAPL plume will also be addressed as part of LNAPL removal activities planned at the Site.

AOI 16-C and AOI 40-D (Figure 9)

During the groundwater monitoring event LNAPL was detected in several monitoring wells located at AOI 16-C and AOI 40-D for the first time. AOI 40-D is located downgradient of AOI 16-C and the Building 40 Tunnel. A thickness of 0.01 foot of LNAPL was measured at AOI 16-C monitoring wells RFI-16-01, RFI-16-04R, RFI-16-09, RFI-16-12, RFI-16-20 and RFI-16-24 and AOI 40-D monitoring wells 40-303R, 40-304, and 40-305. These wells were last evaluated for the presence of LNAPL in 2008. The AOI 16-C and AOI 40-D monitoring wells will continue to be monitored as part of the annual monitoring events. Additionally, this area will be further evaluated during the LNAPL investigation and removal activities planned at the Site.

AOI-40-B (Figure 9)

During the groundwater monitoring event LNAPL was detected in monitoring wells RFI-40-03, RFI-40-10R and RFI-40-20 for the first time. The measured thickness of LNAPL at each of these wells was 0.01 foot. RFI-40-03, RFI-40-10R and RFI-40-20 were last evaluated for the presence of LNAPL in 2003, 2008 and 2005, respectively. In addition, LNAPL re-appeared at RFI-40-26 with thicknesses of 0.01 foot. LNAPL was previously detected at RFI-40-26 in 2005 at thicknesses ranging from 0.03 to 0.05 foot. These monitoring wells will continue to be monitored as part of the annual monitoring events. Additionally, this area will be further evaluated during the LNAPL investigation and removal activities planned at the Site.

These monitoring wells will remain in the annual monitoring program and if the LNAPL thickness increases, additional investigation or monitoring will be proposed. Additional wells may be installed for monitoring LNAPL at the existing LNAPL plumes, depending on the results of the LIF investigations (see Section 2) and the subsequent remedial actions taken in those areas. These wells will be installed, as necessary, following EPA approval of the remedial design of each of the LNAPL plumes.

3.2 Monitoring Network Inspection and Maintenance

An inventory was completed in October 2010 of all the monitoring wells at the Site. The inspection included an assessment of the physical condition of the monitoring well protective casing, j-plug and lock, and confirmation of the total depth of the monitoring well (wells included in CMI monitoring program only). Results of the well inventory are provided in Table 6.

The following issues were noted during the inspection:

- 145 monitoring wells missing locks.
- 19 monitoring wells missing covers.
- Three monitoring wells missing J-plugs.
- 17 monitoring well covers missing bolts.
- 11 monitoring wells may need to be redeveloped to remove silt.
- Five monitoring wells were destroyed, including CMI monitoring wells: RFI-10-28, RFI-36-55 and RFI-36-14.
- 20 monitoring well surface completions damaged.

The Site monitoring wells will be evaluated to determine which wells will be needed for future monitoring or which wells should be abandoned. Monitoring wells selected for further monitoring will be repaired as needed. The monitoring well network will also be evaluated to determine if any existing wells are suitable to be substituted in the CMI Groundwater Quality Monitoring Program for RFI-10-28, RFI-36-55, and RFI-36-14. Monitoring wells not selected for further monitoring will be submitted to EPA for review and the wells will be properly abandoned upon receipt of EPA approval.

3.3 Groundwater Quality Monitoring Program

Forty-six monitoring wells were included in the groundwater monitoring program (Table 7) as identified in the CMI Work Plan. Table 7 presents the monitoring locations included in the groundwater quality monitoring program; the specific analyses to be completed at each sampled location; and the rationale for the inclusion of each monitoring well in the sampling program. The monitoring wells included in the sampling program were selected based on analytical data generated as part of the RFI Phase I Report (BBL, 2002), the RFI Phase II Report (BBL, 2006), the CA 750 groundwater monitoring program, and the CMP Addendum No.2 - Northend (ARCADIS, 2010).

The USEPA has provided comments received on the groundwater monitoring plan as presented in the CMP Addendum No.2 – Northend. These comments are currently being evaluated in conjunction with the results of the 2010 Groundwater Monitoring Program and proposed modifications to the monitoring well network will be addressed

in the CMP Addendum No. 2 – Northend, Response to USEPA Comments document, which is currently being prepared and is expected to be submitted to EPA by June 2011.

The following considerations were used to develop this groundwater sampling program:

Samples will be collected near the downgradient edge of areas previously found to be associated with concentrations above the pertinent generic MDEQ PA 451, Part 201 screening criteria. For example, if a plume exhibiting elevated benzene concentrations was identified during a previous sampling event at a series of wells, the well or wells located close to the downgradient extent of the benzene-impacted area will be sampled.

- Samples will be collected along the edge of the site, downgradient of areas previously associated with concentrations above the pertinent generic MDEQ criteria, and at downgradient off Site locations.

- Samples will be collected at locations near the Flint River with historical detections above the GSI criteria.

- Three monitoring wells have been included in the monitoring program to monitor possible discharges to the storm sewers in the Outfall 010 drainage area. Cyanide was detected above GSI criteria in the grab samples collected from Outfall 010 and Outfall 013 in March 2010. Cyanide was not detected above GSI criteria in monitoring wells in the Outfall 013 drainage area; however, it was detected above GSI criteria in the monitoring wells in the Outfall 010 drainage area.

3.3.1 Sample Collection and Laboratory Analysis

Groundwater samples were collected, analyzed and validated using methods and procedures consistent with those employed previously at the site, as described in the Site's Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP) (Appendix C of the RFI Work Plan [BBL, 2001]).

The following monitoring wells were redeveloped prior to collecting groundwater analytical samples because the monitoring wells have not been sampled in the last 5 years: 04-03, 07-01, MW-23, RFI-02-05, RFI-02-22, RFI-36-20, RFI-44-05, RFI-81-08 and RFI-86-01R.

To support the groundwater analyses, one sample delivery group (SDG) was reported by the laboratory at Level 3 and the remainder at Level 2. The data was verified/validated as described in the FSP/QAPP based on the USEPA's (1995) approach for data review on one SDG at a Tier II and the remainder at Tier I.

To maintain consistency with prior sampling efforts, the samples collected for inorganic and PCB analyses were submitted for dissolved and/or total inorganic and dissolved and/or total PCB analyses based on the turbidity of the sample. If the turbidity was less than 10 nephelometric turbidity units (NTUs), the sample was submitted for total inorganic or total PCB analyses only. If sample turbidity was above 10 NTUs, samples were filtered. Both unfiltered and filtered aliquots were submitted for total and dissolved inorganic and PCB analyses, respectively. Monitoring wells were sampled using low-flow purge and sampling methods to reduce turbidity in the samples.

3.3.2 Summary of Field Activities

Of the 46 monitoring wells included in the groundwater monitoring program, eight monitoring wells were not sampled. Five wells had been destroyed or damaged (RFI-02-05, RFI-10-28, RFI-17-02D, RFI-36-55 and RFI-36-14), two wells (RFI-36-56 and MW-26) were dry, and one monitoring well (RFI-36-04) was not accessible. As mentioned in Section 3.3 proposed modifications to the monitoring well network will be addressed in the CMP Addendum No. 2 – Northend, Response to USEPA Comments document. The remaining 38 monitoring wells were sampled from October 13 to 28, 2010. Table 7 summarizes the monitoring wells sampled in October 2010 and the associated laboratory analytical parameters.

The monitoring wells were sampled using low-flow sampling methods in accordance with the FSP (BBL, 2001). The static groundwater level in each well was measured to the nearest 0.01 foot using an oil/water interface probe prior to sampling. Each well was purged until measured field parameters (i.e., temperature, specific electrical conductivity, dissolved oxygen, oxidation/reduction potential, pH and turbidity) stabilized. These field-measured data are summarized in Table 8. Groundwater samples were then collected; submitted to Merit Analytical Laboratories of East Lansing, Michigan, as specified in the FSP (BBL 2001); and analyzed using the procedures specified in the QAPP (BBL 2001).

3.3.3 Summary of Results and Response Plan

The laboratory analytical data for the October 2010 monitoring activities, as well as historical data for these locations, are summarized in Table 9. Figures 10 and 11 present

current and historical data for select parameters at each of the locations sampled during the October 2010 event. Results of the October sampling event are generally consistent with the results of prior monitoring events, except as noted below.

70-165, AOI 81-2 (Figure 10)

During the October 2010 monitoring event, lead was detected at a concentration of 0.38 milligram per liter (mg/L) in the field sample and 0.083 mg/L in the field duplicate sample collected from 70-165. This represents an increase in lead concentration from 2009 (0.049 mg/L). Concentrations in 2009 and 2010 exceeded the MDEQ Part 201 Non-residential Drinking Water Criteria (NDW) of 0.004 mg/L.

In response to the increasing concentrations of lead in 70-165, downgradient CMI monitoring wells RFI-81-50 will be sampled annually for lead. Monitoring well RFI-81-50 was sampled for lead in 2009 as part of the CMI monitoring program and lead was not detected above 0.003 mg/L.

07-01, AOI 7-03 (Figure 10)

Tetrachloroethene was detected at a concentration of 0.028 mg/L in 2010, which is above the MDEQ Part 201 NDW criterion of 0.005 mg/L. Monitoring well 07-01 was only sampled once before for volatile organic carbons (VOCs) in 2001 and tetrachloroethene was not detected above the reporting limit of 0.001 mg/L.

Tetrachloroethene was not detected in 2001; therefore, concentrations of tetrachloroethene in 07-01 will be monitored in 2011 and future recommendations will be included in the 2011 annual monitoring report, if needed. Additionally, tetrachloroethene was not detected in downgradient monitoring point RFI-86-16R.

20-500R, AOI 36-5 (Figure 10)

n-Propylbenzene was detected at a concentration of 0.24 mg/L, which is just above the MDEQ Part 201 NDW criterion of 0.23 mg/L. n-Propylbenzene was not historically included in the analyte list.

n-Propylbenzene was detected at a concentration just above the Part 201 NDW criteria; therefore, no additional monitoring is proposed.

20-FP10R, AOI 10-4 (Figure 10)

Benzene was detected at a concentration of 0.006 mg/L, which is just above the MDEQ Part 201 NDW criterion of 0.005 mg/L. Benzene was detected at a concentration of 0.003 mg/L in 2009.

Benzene will be monitored in monitoring well 20-FP10R in 2011 and, based on the 2011 analytical results, recommendations for additional monitoring will be included in the 2011 annual monitoring report, if needed.

In addition, trichloroethene was detected at a concentration of 0.002 mg/L which is below NDW criteria of 0.005 mg/L. The 2008 and 2009 samples collected from this location had exceeded NDW for trichloroethene.

RFI-36-37, AOI 36-1 (Figure 10)

Benzene was detected at a concentration of 0.048 mg/L, which is above the MDEQ Part 201 NDW criterion of 0.005 mg/L. This represents an increase in benzene concentrations from 2009 (0.015 mg/L).

Downgradient monitoring wells RFI-36-56 was destroyed and will be replaced and sampled in 2011. Based on the analytical results from the replacement downgradient monitoring well, additional recommendations will be included in the 2011 annual report, if needed.

RFI-84-06R, AOI 84-D (Figure 11)

Cyanide was detected at a concentration of 0.008 mg/L in the field sample and 0.086 mg/L in the field duplicate sample collected from RFI-84-06R. The MDEQ GSI criterion is 0.0052 mg/L.

In response to the cyanide detected in RFI-84-06R, downgradient CMI monitoring well RFI-09-48 will be sampled for cyanide in 2011 and additional recommendations will be included in the 2011 annual monitoring report, if needed.

RFI-09-46, AOI 09-B (Figure 11)

Naphthalene was detected at a concentration of 0.016 mg/L, which is above the MDEQ Part 201 GSI criterion of 0.011. Napthalene was not previously analyzed in this well.

Naphthalene was not detected in downgradient monitoring well MW-23 in 2010. No additional sampling is proposed.

3.4 **NPDES Plus Monitoring Program**

The NPDES Plus Monitoring Program (NPMP) was implemented at the Site to ensure compliance with Michigan Part 201 GSI criteria for the long-term protection of the Flint River. The USEPA and MDEQ have agreed to the approach of sampling of the Site storm sewers as a means to address potential GSI impacts. As discussed in further detail below, the NPMP consists of collecting monthly samples from up to 11 Site storm sewers during dry weather flow to evaluate the impact of the groundwater infiltrating into the Site storm sewers.

Storm sewers associated with the following National Pollutant Discharge Elimination System (NPDES) outfalls are included in the NPMP: Outfalls 001, 002, 003, 004, 005, 006, 007, 009, 010, 011, and 013 (see Figure 12). The NPMP primary Monitoring Points (MP) are co-located with the monitoring points which have been identified in the current and previous Site NPDES permits. Please note that Outfalls 008 and 012 are not included in the NPMP. The Outfall 008 storm sewer has been permanently bulkheaded immediately downstream of MP 008. The bulkhead was installed because of a no flow condition due to the collapsed storm sewer line. Outfall 008 no longer receives drainage from the Site; therefore, it is not included in the NPMP. During a previous dry weather sampling activity an attempt was made to collect a sample from MP 012, located on the Outfall 012 storm sewer. However, there was only a small puddle of water in the storm sewer at the time of sampling indicating that significant groundwater infiltration to Outfall 012 is unlikely; therefore, Outfall 012 was not included in the NPMP (ARCADIS, 2010).

3.4.1 Summary of Field Activities

A sampling event was conducted on March 31, 2010, April 1, 2010 and June 10, 2010 for the purpose collecting data for the NPDES permit application for the Site. The samples were collected as grab samples during dry weather flow using a peristaltic pump fitted with tubing. However, the PCB samples were collected using an automated sampler to collect 24-hour composite samples. The samples were collected and analyzed using the procedures described in the Site FSP and QAPP (Appendix C of the RFI Work Plan). The storm sewer samples were submitted for laboratory analysis of Target Compound List (TCL) VOCs, semi-volatile organic compounds (SVOCs), PCBs, cyanide, and/or select metals. The analytical data from this sampling event is included in the NPMP as a baseline.

The NPMP sampling activities were conducted at the Site on a monthly basis beginning in September 2010. The NPMP samples were collected as grab samples during dry weather flow using a peristaltic pump fitted with tubing. However, the PCB samples were collected using an automated sampler to collect 24-hour composite samples as indicated on Table 10. The samples were collected and analyzed using the procedures described in the Site FSP and QAPP (Appendix C of the RFI Work Plan). The storm sewer samples were submitted for laboratory analysis of TCL VOCs, SVOCs, PCBs, cyanide, and/or select metals as summarized in Table 10.

To support the NPMP, sample analyses were reported by the laboratory at Level 2. As discussed in the CMI Work Plan, Level 2 data consists of modified reporting including some supporting documentation, but not full "Contract Laboratory Program"-type (CLP-type). These data were not subjected to verification/validation.

3.4.2 Summary of Results

The results of the reference and NPMP sampling events are summarized below and presented in Table 11. The sample results are compared to the Revised MDEQ GSI criteria.

A review of the NPMP analytical data collected since September 2010 indicates that VOCs and PCBs have not been detected above GSI criteria; however, select metals have been detected at concentrations exceeding GSI criteria at Outfalls 001, 002, 003, 004, 005, 006, 007, 009, 010, and 013. Additional samples were collected during the February 2011 sampling event and submitted for laboratory analysis of dissolved metals and total suspended solids (TSS) in order to evaluate whether the detected metals concentrations where associated with solid phase of the samples. Therefore, this section of the CMI Annual Report presents and interprets data from January and February 2011, in addition to the 2010 data to provide a more accurate evaluation of the data set. The data from seven sampling events (Baseline – March/April 2010 and September 2010 – February 2011) are evaluated below.

3.4.2.1 Outfall 001

Outfall 001 is sampled from MP001, which is located at manhole MH 1-3. Due to the demolition activities occurring at nearby Factory 38, Outfall 001 was not able to be sampled during four sampling events (October 2010 through January 2011). Therefore, samples were collected during three of the seven sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - No exceedances
- September 2010
  - Mercury
- February 2011
  - Total Chromium
  - Dissolved Chromium
  - Total Copper
  - Total Cyanide
  - Total Mercury

TSS was also detected in the February 2011 sampling event at a concentration of 64 mg/L. An evaluation of the February 2011 data indicates that the exceedances of GSI criteria for copper and mercury may be associated with solids in the sample. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.2 Outfall 002

Outfall 002 is sampled from MP002, which is located at manhole MH 2-19. Samples were collected at MP002 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - Arsenic
  - Silver
- September 2010
  - Mercury
- October 2010
  - Arsenic
  - Mercury
- November 2010
  - Arsenic
  - Total Chromium
  - Copper
  - Lead
  - Mercury
  - Silver
  - Zinc

- December 2010
  - Arsenic
  - Total Chromium
  - Copper
  - Total Cyanide
  - Lead
  - Mercury
  - Vanadium
  - Zinc
- January 2011
  - Arsenic
- February 2011
  - Total Selenium
  - Dissolved Selenium

The February 2011 analytical results also detected TSS at a concentration of 7 mg/L. An evaluation of the NPMP data collected from Outfall 002 show that the concentrations of metals in the samples vary by up to two orders of magnitude with the highest concentrations of metals detected during the November and December 2010 sampling events. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.3 Outfall 003

Outfall 003 is sampled from MP003, which is located at manhole MH 3-3. Samples were collected at MP003 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - No Exceedances
- September 2010
  - Mercury
- October 2010
  - Mercury
- November 2010
  - Mercury
- December 2010
  - No Exceedances

- January 2011
  - No Exceedances
- February 2011
  - Total Cyanide
  - Total Mercury

As detailed in the Outfall 004 discussion below, the February sample collected from MP003 is from the combined flow of Outfall 003 and 004. The concentrations of metals in the February combined flow sample are similar to previous samples collected from Outfall 003. The February 2011 analytical results detected TSS at a concentration of 15 mg/L. An evaluation of the February 2011 data indicates that the exceedance of GSI criteria for mercury may be associated with solids in the sample. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.4 Outfall 004

Outfall 004 is sampled from MP004, which is located at manhole MH 4-5. Due to the installation of the Outfall 003/004 Oil Removal System which began operation on January 12, 2011, sample collection at Outfall 004 was discontinued. The dry-weather flow from Outfall 003 and Outfall 004 are combined and directed through a common oil-water separator and the flow is discharged to manhole MH 3-3 on the Outfall 003 storm sewer. Therefore, there is no longer dry weather flow at manhole MH 4-5. Samples were collected during six of the seven sampling events, with the following samples exceeding the GSI criteria:

- Baseline 2010
  - No Exceedances
- September 2010
  - No Exceedances
- October 2010
  - Mercury
- November 2010
  - Mercury
- December 2010
  - No Exceedances
- January 2011
  - Total Chromium
  - Copper
  - Lead

- Mercury
- Zinc

The Outfall 004 storm sewer flow will continue to be monitored as part of the Outfall 003 sampling.

3.4.2.5 Outfall 005

Outfall 005 is sampled from MP005, which is located at manhole MH 5-6. Samples were collected at MP005 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - No Exceedances
- September 2010
  - No Exceedances
- October 2010
  - No Exceedances
- November 2010
  - Arsenic
  - Total Chromium
  - Copper
  - Lead
  - Nickel
  - Zinc
- December 2010
  - Arsenic
  - Lead
- January 2011
  - Arsenic
- February 2011
  - No Exceedances

The February 2011 analytical results also detected TSS at a concentration of 6 mg/L. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.6 Outfall 006

Outfall 006 is sampled from MP006, which is located at manhole MH 6-2. Samples were collected at MP006 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - Mercury
- September 2010
  - No Exceedances
- October 2010
  - Selenium
- November 2010
  - Mercury
- December 2010
  - No Exceedances
- January 2011
  - No Exceedances
- February 2011
  - Total Mercury

The February 2011 analytical results also detected TSS at a concentration of 1 mg/L. An evaluation of the February 2011 data indicates that the exceedance of GSI criteria for mercury may be associated with solids in the sample. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.7 Outfall 007

Due to access issues, the primary sampling location (MH 7-1) was changed after the September 2010 sampling event to where Outfall 007 discharges into the Flint River. However, this secondary location could not be sampled during three sampling events (October 2010, December 2010, and January 2011) due to the river level being up to the outfall discharge point and safety concerns resulting from ice and snow, making an accurate grab sample not possible. Therefore, samples were collected during four of the seven sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - Mercury

- September 2010
  - Mercury
- October 2010
  - No Exceedances
- November 2010
  - Mercury
- December 2010
  - No Exceedances
- January 2011
  - No Exceedances
- February 2011
  - Mercury
  - Dissolved Mercury

The February 2011 sample was non-detect for TSS at a concentration of 1 mg/L. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.8 Outfall 009

Outfall 009 is sampled from MP009, which is located at manhole MH 11-7. Samples were collected at MP009 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - Mercury
- September 2010
  - Mercury
- October 2010
  - Total Cyanide
  - Mercury
  - Selenium
- November 2010
  - No exceedances
- December 2010
  - Mercury
- January 2011
  - Arsenic
  - Cadmium
  - Total Chromium

  - Copper
  - Lead
  - Mercury
  - Vanadium
  - Zinc
- February 2011
  - No exceedances

TSS was detected in the February 2011 sampling event at a concentration of 23 mg/L. TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.9 Outfall 010

Outfall 010 is sampled from MP010, which is located at manhole MH 10-5. Samples were collected at MP010 during all of seven of the sampling events with the following samples exceeding the GSI criteria:

- Baseline 2010
  - Total Cyanide
  - Mercury
- September 2010
  - Total Cyanide
- October 2010
  - Total Cyanide
  - Mercury
  - Selenium
- November 2010
  - No Exceedances
- December 2010
  - No Exceedances
- January 2011
  - No Exceedances
- February 2011
  - Total Cyanide

TSS was also detected in the February 2011 sampling event at a concentration of 23 mg/L. TSS will be added to the monthly NPMP parameter list and correlation of TSS

and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.10 Outfall 011

Due to access issues, the primary sampling location (MP011) was changed to where Outfall 011 discharges into the Flint River. However, this secondary location could not be sampled during two sampling events (October 2010 and December 2010) due to the river level being up to the outfall discharge point and safety concerns resulting from ice and snow, making an accurate grab sample not possible. Therefore, samples were collected during five of the seven sampling events, and no samples exceeded the GSI criteria.

- June 2010
  - No Exceedances
- September 2010
  - No Exceedances
- November 2010
  - No Exceedances
- January 2011
  - No Exceedances
- February 2011
  - No Exceedances

3.4.2.11 Outfall 013

Outfall 013 is sampled from MP013, which is located at manhole MH 13-6. Due to access issues, MP013 could not be sampled during the February 2011 sampling event. Therefore, samples were collected during six of the seven sampling events with the following samples exceeding the GSI criteria:

- March 2010
  - Total Cyanide
  - Mercury
- September 2010
  - Mercury
- October 2010
  - Mercury
  - Selenium
- November 2010
  - Copper
  - Mercury
  - Silver

- December 2010
    - No Exceedances
- January 2011
    - No Exceedances

TSS will be added to the monthly NPMP parameter list and correlation of TSS and metals detections, along with trends of metal concentrations will continue to be evaluated.

3.4.2.12 February 2011 Dissolved Metals Sampling Summary

As discussed in the *NPMP Sampling Notification and Response Plan* letter submitted to the USEPA – Region 5 on March 18, 2011, in response to the GSI exceedances the samples collected during the February 2011 sampling event were submitted for additional analysis of TSS and dissolved metals (including low level mercury) to evaluate if the GSI exceedances are associated with the solid phase of the samples. Please note that Outfall 013 could not be sampled due to access issues during the February 2011 sampling event, but will have the additional analyses completed on the next sampling event completed at Outfall 013.

Based on the review of February 2011 data, the total suspended solids were at or below detection (<1 mg/L) at four sampling locations (Outfall 006, Outfall 007, Outfall 010, and Outfall 011). The remaining sampling location concentrations ranged from 6 mg/L (Outfall 005) to 64 mg/L (Outfall 001). The metal concentrations were all lower in the dissolved samples, suggesting that the metals appear to be associated with the solids portion of the liquid sample. In fact, the total metal concentrations exceeded the GSI at six sampling locations, while the dissolved metal concentrations only exceeded the GSI at three of the sampling locations (Outfall 001, Outfall 002, and Outfall 007).

3.4.3 Response Plan

Ten of the 11 outfalls sampled during the NPMP detected select metals at concentrations exceeding GSI criteria. The following recommendations are made to respond to these metals exceedances.

1) Determine whether any of the metals impacts identified in those outfalls which include off Site drainage areas (Outfall 001, 003, 004, 005, 006, 011, and 013) can be attributed to upgradient sources. ARCADIS is currently evaluating access to determine if samples can be collected from upgradient locations.

2) Review groundwater and surface soil data in the drainage areas for Outfalls 002, 007, 009, and 010 and prepare a plan to move the sampling locations upstream each month to try to determine the source area of the GSI impacts. This activity may also be completed for the remaining outfalls, pending the outcome of the upgradient sampling event discussed in #1.
3) Add TSS to the monthly NPMP parameter list to aid in the correlation of TSS and metals concentrations.

3.4.4 Requested Changes to the Monitoring Plan

Based on the NPMP sampling results to date the following changes to the NPMP monitoring plan are requested.

1) VOCs have not been detected above GSI criteria in any of the NPMP samples collected to date. The detected VOCs are well below criteria and to date the concentrations do not show a significant upward trend. It is requested that VOC analysis be reduced to quarterly sampling.
2) No exceedances of criteria have been detected at Outfall 011. The detected VOCs and metals are well below criteria and to date the concentrations do not show a significant upward trend, with the exception of total chromium. Total chromium was detected in one sample at a concentration of 10 ug/L, the GSI criteria for total chromium is 11 ug/L It is requested that sampling at Outfall 011 be reduced to quarterly, with the exception of total chromium which will continue to be monitored monthly.

If the sampling frequency reductions are granted the analyte trends will continue to be monitored. In the event that two consecutive monitoring events showing an increase in analyte concentrations at a sampling location and the detections are nearing the criteria, then the analyte will be added back into the monthly sampling program for that location.

4. Soil Corrective Measures

4.1 AOI-09A Lead Soil Impact Delineation Activities

The primary objective of the AOI-09A investigation was to delineate the extent of lead and benzo(a)pyrene impacted soils. As presented in the 2008 *RCRA Revised Corrective Measures Plan* (Revised CMP) (ARCADIS BBL, 2008), the constituents of concern (COCs) identified in the AOI-09A impacted area are lead and benzo(a)pyrene in soil. The Revised CMP indicates that the lead impacts were detected in shallow soils at AOI -09A, located east and southeast of the Building 09 footprint as well as on the adjacent CSX property. Lead soil impacts were detected at concentrations up to 120,000 milligrams per kilogram (mg/kg). Additionally, benzo(a)pyrene was detected in an off Site soil boring in shallow soils at a concentration of 56 mg/kg. Figure 13 presents the approximate areas of the soil impacts at AOI -09A.

Per the Final Decision for the Southend of the Site, the selected corrective measure to address off Site soil contamination is to excavate contaminated soil at the CSX railroad property to unrestricted use standards. The selected remedy to address on Site soil contamination is engineering controls and additional institutional controls above the Site-wide institutional controls. As such, the analytical data collected during the AOI 09-A delineation activities were compared to residential (off Site) and non-residential (on Site) generic MDEQ criteria, as discussed in Section 1.3.

4.1.1 Summary of Field Activities

The field sampling program was established to refine the delineation of the impacted areas identified during the RFI investigation. In the area of the benzo(a)pyrene impact borings were completed in select locations to better define the extent of impact. The sampling program in the lead impacted area included establishing a rectangular sample grid system (approximately 20 ft by 20 ft) over the impacted area. In previously identified areas of elevated lead concentration a sub-grid was used to refine the delineations. The approximate boundaries of the grid area were determined by extending the grid to the nearest soil boring location where lead impact was detected below criteria.

Between August 16, and August 20, 2010 a total of 54 boring locations were completed using hand augering to five feet bgs and completed to a depth of 10 feet bgs using direct push technology (DPT) drilling. The boring locations are presented on Figure 14.

Eight delineation soil borings were completed at the benzo(a)pyrene impacted area. Soil samples were collected from 0 to 2 ft bgs and 2 to 4 ft bgs at each boring location. Soil samples from the 0 to 2 foot interval were submitted for laboratory analysis for SVOCs on a 24-hour turn-around time. Samples collected from the 2 to 4 ft interval were placed on hold and analyzed pending 0 to 2 ft interval results. Soil boring logs are included in Appendix B.

Soils collected from the lead impacted soil area were scanned the length of the boring in the field with an x-ray florescence (XRF) device and the field readings were recorded. Soil borings were advanced a minimum of 5 ft bgs or until the XRF readings indicated that lead was not detected.

Based on the XRF soil sample intervals were selected from a range of lead concentrations for laboratory analysis of total lead and/or toxicity characteristic leaching procedure (TCLP) analysis. The XRF measurements and laboratory data were compared to gain an understanding of the correlation between XRF field measurements for lead and the laboratory total lead data. In addition, the TCLP data were compared to the total lead data to establish a correlation between TCLP and total lead concentrations to determine the extent of hazardous soils and to evaluate potential treatment methods during the soil removal phase.

To support the soil analyses the samples were reported by the laboratory at Level 3. The data was verified/validated as described in the FSP/QAPP based on the USEPA's (1995) approach for data review of one SDG at a Tier II and the remainder at Tier I.

Soil boring locations were biased in the field based on field observations. Protocols for the completion of sampling and analysis activities were presented in the FSP/QAPP provided as Appendix C of the RFI Work Plan and in the Health and Safety Plan (HASP) provided as Appendix E of the RFI Work Plan.

4.1.2 Summary of Results – Benzo(a)pyrene Impacts

Eight soil borings were completed at the benzo(a)pyrene impacted area (SB-09-01 through SB-09-04, and SB-09-33 through SB-09-36) to better define the extent of impact. One boring (SB-09-01) was completed on Site, while the remaining seven borings were completed on the adjacent CSX property. The soil boring locations are shown on Figure 14 and the analytical data is presented on Table 12. Laboratory analytical results are included in Appendix C.

Two of the soil borings completed on CSX property (SB-09-02 [0 to 2 ft bgs] and SB-09-36 [1 to 2 ft bgs]) detected multiple SVOCs at concentrations exceeding MDEQ Part 201 Residential and Non-Residential criteria. Concentrations in soil samples collected from SB-09-02 and SB-09-36 from the 2 to 4 ft bgs intervals did not exceed MDEQ Part 201 Residential criteria.

The SVOC impacts are vertically delineated in this area and horizontally delineated to the west, south, and east. The approximate extent of benzo(a)pyrene impacted soil is shown on Figure 14. The estimated volume of benzo(a)pyrene impacted soils is approximately 40 cubic yards.

4.1.3 Summary of Results – Lead Impacts

Forty-six soil borings were completed to refine the delineation of the lead impacted soil area (SB-09-05 through SB-09-32 and SB-09-37 through SB-09-54). Twenty-five soil borings were completed on Site, while the remaining 21 soil borings were completed on the adjacent CSX property. The soil boring locations are presented on Figure 14. The laboratory analytical data and field XRF data are presented on Table 13 and Table 14, respectively. Laboratory analytical results are included in Appendix C.

As discussed in Section 4.1.1 soil borings were scanned with an XRF and based on the readings soil sample intervals were selected from a range of XRF readings (33 parts per million [ppm] to 117,000 ppm) for laboratory analysis of total lead and/or TCLP analysis. In addition, one sample was submitted for analysis of fine and coarse lead fractions.

Evaluation of the XRF and total lead laboratory data showed that in general XRF readings and total lead laboratory concentrations were comparable based on trends. High XRF readings typically showed high laboratory total lead concentrations and low XRF readings showed low laboratory total lead concentrations. However, XRF readings were not comparable to laboratory data on a point by point basis.

The XRF readings and total lead data indicate that the lead impacts are primarily located in the 0 to 3 ft bgs interval. Lead impacts were present at a lesser extent in the 3 to 5 ft bgs interval. Lead impacts were not identified below 5 ft bgs. The approximate extent of lead impacted soil is indicated on Figure 14. The estimated volume of lead impacted soils is approximately 1,000 cubic yards.

The TCLP lead analytical data will be reviewed to determine proper soil disposal options and potential soil stabilization methods prior to disposal.

4.2 Maintenance of Select Surface Covers

This section addresses the engineering controls that will protect future Site users from near surface soils that exceed direct contact criteria. The engineering controls include a chain link fence surrounding the perimeter of the Site (access to the Site controlled by security) and maintaining the surface cover consistent with existing conditions at five AOIs located in the Southend of the Site. In the areas where a concrete slab or asphalt pavement already exists, these areas will be maintained, as necessary, to ensure that the surface cover remains as a barrier for potential direct contact and/or particulate inhalation exposure. In areas where an asphalt or concrete cover does not currently exist; the area will be covered and maintained. ARCADIS is currently evaluating options (soil, stone, concrete, asphalt) to cover these areas as well as cost, maintenance and life of the surface cover.

4.2.1 Summary of Field Activities

The five AOIs discussed below contain six areas where surface cover is inspected and maintained. The locations of these areas are depicted on Figure 15 and include:

- **AOI Group 02-C**: This AOI (one area) is associated with former Building 02, and relates to a former sump in the former Materials Laboratory.

- **AOI Group 12-A**: This AOI (one area) is associated with former Building 12, and relates primarily to several press pits and associated sumps, pits, trenches, and traps.

- **AOI Group 29-A**: This AOI (one area) is associated with the former Building 29, and relates to a pit for a cable-operated elevator and former work pads with oil staining.

- **AOI Group 09-A**: This AOI (one area) is associated with the former Building 9, and relates to a floor trench and underground storage tank (UST) system.

- **AOI Group 09-B:** This AOI includes two separate areas, one of which is associated with the Former Building 31/Hamilton Avenue Tank Farm, and the other is in the general vicinity of this former tank farm.

The above mentioned areas were photographed and visually inspected as a baseline in July 2010 and thereafter inspected and photographed on a quarterly basis. Inspections were performed in July and October 2010. During each inspection the condition of cover was inspected and documented in an inspection log. Documented items include the type of cover (concrete, stone, vegetation, etc.), the condition of concrete or asphalt cover (good, fair, poor), and whether or not conditions of the cover have changed since the last inspection date. Photos of each inspection area are also included with the inspection log.

4.2.2 Summary of Results

Inspections reveal broken concrete and sparsely vegetated spots in several of the AOIs, thus posing a potential risk for direct contact with soils. Consideration of long term solutions for providing adequate cover to the areas is ongoing. Such solutions include the installation of concrete or asphalt, installation of stone cover of a medium grade such as 21AA stone, or installation of clean fill with a vegetative cover. July and October 2010 inspection logs and photographs are located in Appendix D.

4.2.3 Plan Modifications

AOI Group 09-A was not included in the CMI Work Plan. This area was being evaluated for possible excavation; however, it was determined that this area would addressed by deed restriction and maintain a cover. AOI Group 09-A was added to the inspection log for the October 2010 inspection. AOI Group 09-A is currently photographed and inspected with the other areas.

5. Site-Wide Use Restriction Implementation

Corrective measures were designed with the consideration that certain baseline Site-wide use restrictions would be applied as part of the overall final corrective action for the Site.

5.1 Status of Groundwater Use Restriction

A legal survey was completed in August 2010 and the restrictive covenant prohibiting the use of groundwater for any purpose, beyond sampling and other related investigatory testing was prepared. The document is currently under review by RACER Trust and will be filed with the local county register of deeds in accordance with Section 1 of the Recording Requirements Act, 1937 PA 103, as amended (Act 103), MCL 565.201 pending review.

5.2 Status of Site Restrictions

A legal survey was completed in August 2010 and the restrictive covenants for AOIs Group 12-A, Group 02-C, Group 29-A, Group 09-B, Group 09-A and Group 40-D including specific restrictions regarding excavation and/or notification of the presence of hazardous constituents in soil in these areas and limiting future use of the Site to Industrial/Commercial II, III, and IV activities only, in accordance with the Final Decision for the Southend of the Site was prepared. The document is currently under review by RACER Trust and will be filed with the local county register of deeds in accordance with Section 1 of the Recording Requirements Act, 1937 PA 103, as amended (Act 103), MCL 565.201 pending review.

6. Non-CMI Activity Summary

6.1 Outfall 003/004 Diversion and Treatment System

The Outfall 003/004 Storm Water Diversion and Treatment System (System) was installed to minimize the amount of oil in the Outfall 003 and 004 storm sewers from reaching the Flint River. The oil infiltrates the storm sewers, which are located below the groundwater table, in the former manufacturing areas of the Site. The storm sewers are not water tight and as such, allow oil and groundwater to infiltrate. The oil then migrates east from the former manufacturing areas downstream to Outfalls 003 and 004 located at the Flint River. Oil-absorbent booms have historically been employed to prevent oil releases into the river and the oil has subsequently been removed by vacuum extraction behind the booms. Construction of the storm water diversion and treatment system upstream of the river serves as a more practical solution to the ongoing maintenance of control measures at the outfalls.

The general concept of the System was to modify two existing storm water vaults to divert water into a newly constructed treatment system and finally return treated water to the storm sewer network. Major system components include an oil-water separator, BaySeparator™ debris removal system, high density polyethylene (HDPE) conveyance piping, overflow weirs, and above ground structures (bollards, fencing, etc.). Storm water enters the System via a 12-inch and an 8-inch HDPE pipe inlet diverted from two existing storm water vaults (manholes MH 3-6 and 4-6, respectively). Steel overflow weirs were installed in each vault to aid in the diversion process. Sediment, debris, and oils are then captured in the BaySeparator™ consisting of a duel manhole system. Water then travels through an oil-water separator removing floating and emulsified oils. Finally, treated water is returned to the Outfall 003 storm sewer for discharge into the nearby Flint River. As-built-drawings are included in Appendix E.

Installation of the system was performed between October 2010 and January of 2011. The majority of the construction work consisted of general earthwork (excavation and trenching) and mechanical construction including fusion welding, manhole construction, concrete coring, torch cutting, and confined space entry work. Additional professional services rendered included the use of a licensed surveyor to verify the correct placement of System structures and HDPE conveyance piping as well as the use of an air-knifing contractor to locate subsurface utilities.

The System is now operational and is being maintained by an operations and maintenance technician. Water levels and oil levels are actively being monitored in vaults, the BaySeparator™ manholes, and the oil-water separator. Storm water

downstream of the System is also being monitored in manholes as well as the Flint River outfalls to check for accumulating oils. Site restoration including seeding and mulching to restore vegetation is scheduled for completion in spring 2011.

6.2 **Oil Interceptor #2 Sediment Removal**

Oil Interceptor #2 serves as an oil removal system and storm water sedimentation basin within the Outfall 003 storm sewer system in the north end of the Site. The interceptor is located upstream of the Storm Water Diversion and Treatment System described in Section 6.1, and is approximately 90 feet long by 20 feet wide with a depth of approximately 14 feet. Storm water enters the interceptor via a 66-inch storm water sewer and exits the through a 66-inch sewer which ties back into the Outfall 003 storm sewer system. Storm water entering the interceptor experiences an increased hydraulic retention time allowing for oil to be captured from the water surface via a tube skimmer. In addition to oil removal, Interceptor #2 also serves as a settling basin, removing suspended sediment from storm water flow as suspended particles settle out of suspension due to decreased storm water velocity within the Interceptor.

Historically, the interceptor has received minimal operations and maintenance efforts in regards to removing accumulated sediment from the interceptor floor. As a result, approximately 270 cubic yards of sediment had accumulated on the floor thus inhibiting normal operations flow within the interceptor.

On January 28, 2010 and March 3, 2010 PCBs were detected in the weekly sample collected at MP003A, which is located downstream of the interceptor. It was decided that the accumulated sediments would be removed from the interceptor to improve the operation of the interceptor and minimize the potential for detections of PCBs downstream.

Removal of accumulated sediments was performed in the summer of 2010. Approximately 285 tons of sediment was removed from the interceptor via means of hand digging in combination with vacuum extraction using a vacuum truck. Bypass pumping and confined space entry were necessary to complete the sediment removal. Excavated sediment was characterized and sent off site for disposal. A sample was collected from the water removed from the interceptor and submitted for laboratory analysis of metals and PCBs. The analytical data indicated that select metals were detected at concentrations that did not exceed criteria and PCBs were not detected; therefore, the water was returned to interceptor.

As a result of the sediment removal activities normal flow conditions have returned to the interceptor and the presence of PCBs has not been detected in the weekly downstream samples collected since the sediment was removed.

Table 7. Groundwater Quality Monitoring Locations
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

Area of Interest (AOI)	Sampling Location	Groundwater Analytical Parameters	Sampling Rationale
North of Leith Street			
7-03	07-01	VOCs	Sentinel location downgradient of LNAPL plume.
10-2	RFI-10-24	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-2	RFI-10-29	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-2	RFI-10-33	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-2	RFI-10-35	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-2	RFI-10-36	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-3	20-500R	VOCs	Sentinel location at downgradient edge of VOC impacted area
10-3	RFI-10-28	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
10-4	20-FP10R	VOCs	Sentinel location at downgradient edge of VOC impacted area
10-4	RFI-10-26	VOCs	Sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-04	VOCs	Monitoring VOCs downgradient of LNAPL plume.
36-1	RFI-36-19	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-37	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-47	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-48	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-55	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-56	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
36-1	RFI-36-20	VOCs	Sentinel location at downgradient edge of VOC impacted area
36-5	RFI-36-14	VOCs	Sentinel location downgradient of LNAPL plume.
81-2	70-165	VOCs and lead	Sentinel location downgradient of LNAPL plume and historical lead exceedance.
81-2	RFI-81-50	VOCs	Sentinel location downgradient of LNAPL plume.
81-3	RFI-81-08	VOCs	Sentinel location at downgradient edge of VOC plume
86-1	RFI-86-16R	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
86-1	RFI-86-01R	VOCs, lead, and manganese	Sentinel location at downgradient edge of VOC and inorganic impacted area
South of Leith Street			
02-E	RFI-02-05	VOCs	Sentinel location at downgradient edge of VOC impacted area
04-D	04-4	Cyanide	Sentinel location upgradient of storm sewer
04-D	04-3	Cyanide	Sentinel location upgradient of storm sewer
09-A	RFI-09-04R	VOCs	Monitoring TCE to confirm stable concentrations.
09-A	RFI-09-53	VOCs	Monitoring to confirm stable concentrations of VOCs.
09-A	MW-26	VOCs	Off-site; sentinel location to confirm VOC plume has not migrated
09-B	RFI-09-14	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
09-B	RFI-09-48	VOCs	Sentinel location at downgradient edge of VOC impacted area.
09-B	RFI-09-46	VOCs	Monitoring benzene concentrations to confirm stable concentrations
17-A	RFI-17-02	VOCs and selenium	Sentinel location at downgradient edge of VOC impacted area and GSI monitoring point
40-D	40-304	VOCs and PCBs	Sentinel location downgradient of building 40 Tunnel (PCBs required by 9/13/2005 EPA letter)
44-A	RFI-44-05	Cyanide	Sentinel location upgradient of storm sewer
84-A	MW-23	VOCs	Off-site; downgradient of VOC impacted area
84-D	RFI-17-02D	VOCs and selenium	Monitoring vinyl chloride to confirm stable concentrations and GSI monitoring point
84-D	RFI-84-06R	VOCs, cyanide, selenium, and silver	Sentinel location at downgradient edge of VOC impacted area and GSI monitoring point
84-D	RFI-84-06RD	VOCs	Sentinel location at downgradient edge of VOC impacted area
84-D	RFI-84-09D	VOCs	Sentinel location at downgradient edge of VOC impacted area
84-D	RFI-84-09S	VOCs	Sentinel location at downgradient edge of VOC impacted area
84-D	RFI-84-11S	VOCs	Sentinel location at downgradient edge of VOC impacted area
84-D	RFI-84-12	VOCs and selenium	Sentinel location at downgradient edge of VOC impacted area and GSI monitoring point
94-B	RFI-94-11	VOCs	Off-site; sentinel location at downgradient edge of VOC impacted area
94-D	RFI-02-22	VOCs	Sentinel locations, downgradient of LNAPL plumes

Note:

VOCs = Volatile Organic Compounds.

LNAPL = light non-aqueous phase liquid.

04-4	10/28/2010	17.90	6.85	0.536	2.59	1.21	87.1

Notes:
ºC = Celsius.
mg/L = milligrams per liter.
mV = millivolts.
NTUs = Nephelometric Turbidity Units.
SU = Standard Units.
mS/cm = milliSiemens per centimeter.
NS = not sampled.

Table 9. 2010 Annual Groundwater Sampling Event and Historical Groundwater Analytical Data

Table 9. 2010 Annual Groundwater Sampling Event and Historical Groundwater Analytical Data
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

General Notes:

Samples were collected by ARCADIS., and submitted Merit Laboratories, for analysis of MDEQ List volatile organic compounds, select inorganics and PCBs
Duplicate results are presented in brackets.
Groundwater concentrations are presented in milligrams per liter (mg/L)
Total Xylenes reported as the sum of m&p-Xylene and o-Xylene
Highlighted cells represent constituent concentrations that exceed at least one of the listed Michigan Part 201 Criteria

RDW = Residential Drinking Water criteria, updated March 2011.
NDW = Non-Residential Drinking Water criteria, updated March 2011
GSI = Groundwater/Surface Water Interaction criteria, updated December 2010
GCC = Groundwater Contact criteria, updated March 2011.
GAI = Groundwater Acute Inhalation Screening Level, updated March 2011
RGVIA = Residential Groundwater Volatilization to Indoor Air Inhalation criteria, updated March 2011.
NGVIA = Non-Residential Groundwater Volatilization to Indoor Air Inhalation criteria, updated March 2011.
FE = Flammability and Explosivity Screening Level, updated March 2011

Data Qualifiers:

U = Not detected. The value represents the associated detection limit
NS = Not analyzed for this constituent.
D = Concentration is based on a diluted sample analysis
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only
E = Measured concentration exceeded the linear range of the instrument. A diluted sample analysis was run; however, the undiluted result was chosen as representative of the sample concentratior
R = Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data shall not be used for any qualitative or quantitative purpose
Y = Elevated reporting limit due to high target concentration

MDEQ Criteria Qualifiers:

ID = *Inadequate data* to develop criterion.
NA = Criterion or value is *not available* or, as is the case for Csat, *not applicable*.
{A} = Criterion is the State of Michigan Drinking Water Standard established pursuant to Section 5 of the Safe Drinking Water Act, Act No. 399 of the Public Acts of 1976
{D} = Calculated criterion exceeds 100%, hence it is reduced to 100% (i.e., 1.0E+9 ppb). Evaluation of free phase contaminant, environmental impacts, adverse aesthetics and acute or local toxicity is required.
{E} = Criterion is the aesthetic drinking water value, as required by Sec. 20120(1)(5). A Notice of Aesthetic Impact may be employed as an institutional control mechanism where groundwater concentrations exceed the aesthetic DWC but do not exceed the applicable health-based DWC. Health-based DWC are provided in the table below

Hazardous Substance	CAS #	Residential Health-Based DWC	Non-Residential Health-Based DWC
Aluminum	7429905	300	4,100
Copper	7440508	1,400	4,000
Diethyl ether	60297	3,700	10,000
Ethylbenzene	100414	700	700
Iron	7439896	2,000	5,600
Manganese	7439965	860	2,500
Methyl-tert-butyl ether (MTBE)	1634044	240	690
Toluene	108883	1,000	1,000
1,2,4-Trimethylbenzene	95636	1,000	2,900
1,3,5-Trimethylbenzene	108678	1,000	2,900
Xylenes	1330207	10,000	10,000

{G} = GSI criterion is pH or water hardness dependent. The Final Chronic Value (FCV) for the protection of aquatic life must be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO3/L, use 400 mg CaCO3/L for the FCV calculation. The FCV formula provides values in units of ug/L (ppb). The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 X GSI and the GSI soil-water partition values using the GSI criteria developed with the procedur described in this footnote.

Hazardous Substance	FCV Formula (ug/L)	FCV Conversion Factor (CF)	WV (ug/L)	HNDV (ug/L)
Barium[x]	EXP(1.0629*(LnH)+1.1869)	NA	NA	1.6E+5
Beryllium	EXP(2.5279*(LnH)-10.7689)	NA	NA	1,200
Cadmium[x]	(EXP(0.7852*(LnH)-2.715))*CF	1.101672-((LnH)*0.04184)	NA	130
Chromium (III)[x]	(EXP(0.819*(LnH)+0.6848))*CF	0.86	NA	9,400
Copper	(EXP(0.8545*(LnH)-1.702))*CF	0.96	NA	64,000
Lead[x]	(EXP(1.273*(LnH)-3.296))*CF	1.46203-((LnH)*0.14571)	NA	190
Manganese	EXP(0.8784*(LnH)+2.226)	NA	NA	59,000
Nickel	(EXP(0.846*(LnH)+0.0584))*CF	0.997	NA	2.1E+5
Pentachlorophenol[x]	EXP(1.005*(pH)-5.134)	NA	NA	2.8
Zinc	(EXP(0.8473*(LnH)+0.884))*CF	0.986	NA	22,000

Where,

EXP(x) = The base of the natural logarithm raised to power x (e^x).
LnH = The natural logarithm of water hardness in mg $CaCO_3$/L.
SS = Total suspended solids in mg/L.
* = The multiplication symbol.
[x] = The GSI criterion developed here may not be protective for surface water that is used as a drinking water source. Refer to footnote {X} for further guidance.

Table 9. 2010 Annual Groundwater Sampling Event and Historical Groundwater Analytical Data
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

MDEQ Criteria Qualifiers (Cont'd.):

A spreadsheet that may be used to calculate GSI and GSI PC for {G} footnoted hazardous substances is available at http://www.deq.state.mi.us/erd.

{I} = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 CFR 261.21
{J} = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to criteria
{M} = Calculated criterion is below the analytical Target Detection Limit (TDL), therefore, the criterion defaults to the TDL
{R} = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 CFR 261.23
{S} = Criterion defaults to the chemical-specific water solubility limit
{W} = Concentrations of trihalomethanes in groundwater must be added together to determine compliance with the State of Michigan Drinking Water Standard of 100 ug/L. Concentrations of trihalomethanes in soil must be added together to determin compliance with the DWPC of 2,000 ug/kg.
{X} = The GSI criterion shown is not protective for surface water that is used as a drinking water source. For groundwater discharges to the Great Lakes and their connecting waters or discharges in close proximity to water supply intake(s) in inlan surface waters, the generic GSI criterion is the Surface Water Human Drinking Water Value (HDV) listed in the table below except for those HDV indicated with an asterisk. For HDV with an asterisk, the generic GSI criterion is the lesser of th HDV, the WV and the calculated FCV (see formulas in footnote {G}). Soil protection criteria based on the HDV are listed below except for those values with an asterisk. Soil GSI protection criteria for compounds with an asterisk are the greater o the 20 X GSI and GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote

Hazardous Substance	Chemical Abstract Service Number	Surface Water Human Drinking Water Values (HDV) (ug/L)	Soil GSI Protection Criteria for HDV (ug/Kg)
Acrylonitrile	107131	2.0 (M); 0.87	100 (M); 17
Alachlor	15972608	3.5	91
Antimony	7440360	2	1,400
Arsenic	7440382	50	23,000
Atrazine	1912249	4.3	86
Barium	7440393	1,900*	*
Benzene	71432	12	240
bis(2-Chloroethyl)ether	111444	1 (M); 0.79	100 (M); 20
Bromate	15541454	10 (M); 0.5	200 (M); 10
Butyl benzyl phthalate	85687	6.9	13,000
Cadmium	7440439	2.5*	*

Table 10. NPMP Monitoring Points and Rationale
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

Outfall	Monitoring Point	Frequency	Sample Type	Analytes	Sampling Rationale
001	MP001	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 001 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 001will be analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 001 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 001 drainage area; therefore, the NPMP samples collected from Outfall 001 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 001 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 001 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 001 drainage area; therefore, a yearly sample will be collected from Outfall 001 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
002	MP002	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 002 in support of the permit; therefore, the NPMP samples collected from Outfall 002 will be analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 002 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 002 drainage area; therefore, the NPMP samples collected from Outfall 002 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 002 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 002 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 002 drainage area; therefore, a yearly sample will be collected from Outfall 002 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
003	MP003	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select metals were detected in the sample collected from Outfall 003 in support of the permit; therefore, the NPMP samples collected from Outfall 003 will be analyzed for metals [1]. VOCs and cyanide were not detected in the sample from Outfall 003 in support of the permit; however, VOCs and cyanide were detected above criteria in groundwater samples collected from the Outfall 003 drainage area; therefore, the NPMP samples collected from Outfall 003 will be analyzed for VOCs and cyanide in order to monitor the storm sewers for possible infiltration of impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 001 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Monthly	Dry weather - 24-hr Composite	PCBs	PCBs were not detected in the sample collected from Outfall 003 in support of the permit. However due to the presence of PCB-containing LNAPL in the Outfall 003 drainage area and the presence of oil in the storm sewer, the NPMP samples collected from Outfall 003 will be analyzed for PCBs.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 003 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 003 drainage area; therefore, a yearly sample will be collected from Outfall 003 and analyzed for SVOCs(MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
004	MP004[3]	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 004 in support of the permit; therefore, the NPMP samples collected from Outfall 004 will be analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 004 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 004 drainage area; therefore, the NPMP samples collected from Outfall 004 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 004 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Monthly	Dry weather - 24-hr Composite	PCBs	PCBs were not detected in the sample collected from Outfall 004 in support of the permit. However due to the presence of PCB-containing LNAPL in the Outfall 004 drainage area and the presence of oil in the storm sewer, the NPMP samples collected from Outfall 004 will be analyzed for PCBs.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 004 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 004 drainage area; therefore, a yearly sample will be collected from Outfall 004 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.

Table 10. NPMP Monitoring Points and Rationale
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

Outfall	Monitoring Point	Frequency	Sample Type	Analytes	Sampling Rationale
005	MP005	Monthly	Dry weather - Grab	Metals [1] Cyanide	Select metals were detected in the sample collected from Outfall 005 in support of the permit; therefore, the NPMP samples collected from Outfall 005 will be analyzed for metals [1]. Cyanide was not detected in the sample collected from Outfall 005 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 005 drainage area; therefore, the NPMP samples collected from Outfall 005 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 005 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Monthly	Dry weather - 24-hr Composite	PCBs	PCBs were not detected in the sample collected from Outfall 005 in support of the permit. However due to the presence of PCB-containing LNAPL in the Outfall 005 drainage area and the presence of oil in the storm sewer, the NPMP samples collected from Outfall 005 will be analyzed for PCBs.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 005 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 005 drainage area; therefore, a yearly sample will be collected from Outfall 005 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
006	MP006	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select metals were detected in the sample collected from Outfall 006 in support of the permit; therefore, the NPMP samples collected from Outfall 006 will be analyzed for metals [1]. VOCs and cyanide were not detected in the sample from Outfall 006 in support of the permit; however, VOCs and cyanide were detected above criteria in groundwater samples collected from the Outfall 006 drainage area; therefore, the NPMP samples collected from Outfall 006 will be analyzed for VOCs and cyanide in order to monitor the storm sewers for possible infiltration of impacted groundwater.
007	MP007	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 007 in support of the permit; therefore, the NPMP samples collected from Outfall 007 will be analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 007 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 007 drainage area; therefore, the NPMP samples collected from Outfall 007 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 007 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 007 drainage area; therefore, a yearly sample will be collected from Outfall 007 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
009	MP009	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 009 in support of the permit; therefore, the NPMP samples collected from Outfall 009 will be analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 009 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 009 drainage area; therefore, the NPMP samples collected from Outfall 009 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 009 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 009 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 009 drainage area; therefore, a yearly sample will be collected from Outfall 009 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
010	MP010	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs, metals and cyanide were detected in the sample collected from Outfall 010 in support of the permit; therefore, the NPMP samples collected from Outfall 010 will be analyzed for VOCs (MDNRE list) and metals[1]. Oil and grease was not detected in the sample collected from Outfall 010 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 010 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 010 drainage area; therefore, a yearly sample will be collected from Outfall 010 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
011	DP011	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs, metals and cyanide were detected in the sample collected from Outfall 011 in support of the permit; therefore, the NPMP samples collected from Outfall 011 will be analyzed for VOCs (MDNRE list) and metals[1]. Oil and grease was not detected in the sample collected from Outfall 011 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 011 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 011 drainage area; therefore, a yearly sample will be collected from Outfall 011 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
013	MP013	Monthly	Dry weather - Grab	Metals [1] Cyanide	Select metals and cyanide were detected in the sample collected from Outfall 013 in support of the permit; therefore, the NPMP samples collected from Outfall 013 will be analyzed for metals [1] and cyanide.

1. Metals analysis to include - Ag, As, Ba, Be, Cd, Cr (total), Co, Cu, Hg, Mn, Ni, Pb, Sb, Se,T, V, and Zn

2. SVOCs will be collected on a yearly basis for the first three years of the NPMP.

3. Following the installation of the oil-water separator and debris removal system in the Outfall 003 and 004 storm sewers, the dry-weather flow from these sewers will be combined into the Outfall 003 storm sewer; thereafter there will be no dry-weather flow in the Outfall 004 storm sewer.

Table 12. AOI 09 A Soil Investigation - Benz(a)pyrene Delineation
2010 CMI Annual Report, RACER Trust, NAO Flint Operations Site, Flint, Michigan

Notes:
mg/kg - milligrams per kilogram
CSAT - Soil Saturation Concentration Screening Levels
GCCP - Groundwater Contact Protection Criteria
GSIP - Groundwater Surface Water Interface Protection
NDC - Non-Residential Direct Contact Criteria
NPSIC - Non-Residential Particulate Soil Inhalation Criteria
NSVIA - Non-Residential Soil Volatilization to Indoor Air Inhalation Criteria
NVSIC - Non-Residential Infinite Source Volatile Soil Inhalation Criteria
RDC - Residential Direct Contact Criteria
RDWP - Residential Drinking water Protection Criteria
RPSIC - Residential Particulate Soil Inhalation Criteria
RSVIA - Residential Soil Volatilization to Indoor Air Inhalation Criteria
RVSIC2 - Residential Finite VSIC for 2 Meter Source Thickness
RVSIC5 - Non-Residential Finite VSIC for 5 Meter Source Thickness
RVSIC - Residential Infinite Source Volatile Soil Inhalation Criteria
U - analyzed for but not detected.

LEGEND:

- MONITORING WELL
- RECOVERY WELL
- PIEZOMETER LOCATION
- RFI SOIL BORING/GRAB GROUNDWATER SAMPLE LOCATION
- RACER PROPERTY BOUNDARY
- PROPERTY PREVIOUSLY OWNED BY RACER (STILL SUBJECT TO RCRA CORRECTIVE ACTION)
- APPROXIMATE AOI BOUNDARY
- BASEMENT/TUNNEL AREA
- DEMOLISHED BUILDING
- ESTIMATED CURRENT LIMITS OF MEASURABLE LNAPL
- ESTIMATED AREA WHERE VOCs AND/OR SVOCs EXCEED MICHIGAN PART 201 GENERIC INDUSTRIAL SCREENING CRITERIA IN GROUNDWATER
- ESTIMATED AREA WHERE INORGANICS EXCEED MICHIGAN PART 201 GENERIC INDUSTRIAL SCREENING CRITERIA IN GROUNDWATER
- 726 GROUNDWATER ELEVATION CONTOUR (IN FEET)
- GENERALIZED FLOW DIRECTION
- EXCEEDS MICHIGAN PART 201 GENERIC NON-RESIDENTIAL SCREENING CRITERIA:

NDW – NON-RESIDENTIAL DRINKING WATER

NOTES:

1. BASE MAP INFORMATION FROM A SURVEY BY BMJ, INC. DATED SEPTEMBER 2001, AT A SCALE OF 1:100.
2. WATER TABLE ELEVATION CONTOURS MEASURED ON OCTOBER 10–13, 2010.
3. ALL LOCATIONS ARE APPROXIMATE.
4. CONSTITUENTS PRESENTED HERE ARE THOSE WHICH EXCEED ONE OR MORE MICHIGAN PART 201 GENERIC RESIDENTIAL IN GROUNDWATER SAMPLES COLLECTED IN THE AREA SHOWN ON THIS FIGURE.
5. ALL CONCENTRATIONS PRESENTED IN MILLIGRAMS PER LITER (mg/L).
6. ND (1.0)–CONSTITUENT NOT DETECTED. ASSOCIATED DETECTION LIMIT PRESENTED IN PARENTHESES.
7. DUPLICATE ANALYSES SEPARATED BY SLASHES (/).
8. NS–NOT ANALYZED FOR THIS CONSTITUENT.
9. J–ESTIMATED CONCENTRATION.
10. D–CONCENTRATION BASED ON A DILUTED SAMPLE ANALYSIS.
11. RDW–EXCEEDS MICHIGAN PART 201 RESIDENTIAL DRINKING WATER CRITERIA.
12. GSI CRITERIA COMPARED TO SAMPLES LOCATED WITHIN 500 FEET OF THE FLINT RIVER.
13. ANALYTICAL DATA SHOWN ARE FROM MOST RECENT SAMPLING EVENT AT EACH LOCATION.

NOTES:
1. BASE MAP INFORMATION FROM A SURVEY BY BMJ, INC. DATED SEPTEMBER 2001, AT A SCALE OF 1:100.
2. WATER TABLE ELEVATION CONTOURS MEASURED ON OCTOBER 10–13, 2010.
3. ALL LOCATIONS ARE APPROXIMATE.
4. CONSTITUENTS PRESENTED HERE ARE THOSE WHICH EXCEED ONE OR MORE MICHIGAN PART 201 GENERIC RESIDENTIAL IN GROUNDWATER SAMPLES COLLECTED IN THE AREA SHOWN ON THIS FIGURE.
5. ALL CONCENTRATIONS PRESENTED IN MILLIGRAMS PER LITER (mg/L).
6. ND (1.0)–CONSTITUENT NOT DETECTED. ASSOCIATED DETECTION LIMIT PRESENTED IN PARENTHESES.
7. DUPLICATE ANALYSES SEPARATED BY SLASHES (/).
8. NS–NOT ANALYZED FOR THIS CONSTITUENT.
9. J–ESTIMATED CONCENTRATION.
10. D–CONCENTRATION BASED ON A DILUTED SAMPLE ANALYSIS.
11. RDW–EXCEEDS MICHIGAN PART 201 RESIDENTIAL DRINKING WATER CRITERIA.
12. GSI CRITERIA COMPARED TO SAMPLES LOCATED WITHIN 500 FEET OF THE FLINT RIVER.

-Direct Sensing Report-

Client:	**ARCADIS**
Project Name:	**Flint MLC-Buick City**
Location:	**Flint, MI**
Project Number:	**100-MNDS-10UV**

The analysis and opinions expressed in this report are based upon data obtained from UVOST logs generated (and samples collected for emulations if applicable) at the location specified, and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying discussion if applicable. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted practices. Reported results shall not be reproduced, except in full, without written approval of the lab. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

LIF SYSTEM DESCRIPTION & ANALYSIS

UVOST

Fluorescence is a property of some compounds where absorbed UV light stimulates the emission of photons (light) of a longer wavelength relative to the source emission. The release of the photons can be used to detect small amounts of substance (i.e. polycyclic aromatic hydrocarbons or PAHs) in a larger matrix (soil). This method of detection has been used in laboratories for decades. Now, with the availability of lasers and optical fibers, this technology can be applied down hole in the field.

The UVOST system sends light (via 308 nm laser) through a fiber optic cable strung within probe rods. The light, reflected by a parabolic mirror, then exits through a sapphire window in the side of the probe. As the probe is advanced, the soil is exposed to the UV laser light. If PAHs are present (compounds in POLs that fluoresce, i.e. LNAPL) longer wavelength light is emitted by the contaminants. This "signal" light is transmitted through a return fiber, back up hole to be analyzed. Responses are indicated in real-time on a graph of signal vs. depth. The UVOST log displays "color mixed" signal logs (contributions from 4 channels) and waveforms ("fingerprint" of multi-wavelength) to aid in identification and relative quantity of the contaminant present.

Prior to every log the UVOST system is checked for optical quality by observing the background signal for sources of signal in the fiber, filter, mirror and sapphire window. Also, the reference emitter (a standard proprietary NAPL mixture called the "RE") is placed on the window to determine the qualitative and semi-quantitative properties of the laser system. This is to assure that the RE response has the correct shape and intensity and that the UVOST system is ready to log. Typically the RE will fall between 10,000 and 12,000 pVs (picovolt-seconds, a measure of waveform area) and the background can vary from 0.1% to 1% (area of about 0-100 pVs). It is important to remember that the relationship between the NAPL in the ground and the RE depends on that particular NAPL. The calibration of the system is not to a concentration, but to a known fluorescence signature.

EC (Electrical Conductivity)

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the LIF/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the UVOST probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

Appendix B

AOI-09 Soil Boring Logs

Date Start/Finish: 8/16/10
Drilling Company: Boart Longyear
Driller's Name:
Drilling Method: Direct Push
Sampling Method: Geoprobe
Rig Type: NA

Northing: NA
Easting: NA
Casing Elevation: NA

Borehole Depth: 4' bgs
Surface Elevation: NA

Descriptions By: Jay Read

Well/Boring ID: **SB-09-01**

Client: Motors Liquidation Company

Location: MLC Buick City
Flint, Michigan

DEPTH / ELEVATION	Sample Run Number	Sample/Int/Type	Recovery (feet)	PID Headspace (ppm)	Geologic Column	Stratigraphic Description	Well/Boring Construction
0 / 0	1	0-2'	2.0'	0.0		FILL; asphalt, slag, loose; dry, gray.	Borehole backfilled with soil cuttings.
				0.0		FILL; sandy silt, some gravel; dry, dark brown.	
				0.0		SAND; fine, silty, little gravel; dry to slightly moist, brown.	
	2	2-4'	2.0'	0.0		SAND; very fine to fine, silt, somewhat cohesive, soft, some gravel and cobbles, loose, soft; slighty moist, light brown.	
				0.0		SAND; silty, somewhat cohesive, trace cobbles, loose to slightly dense; slighty moist, light brown.	
				0.0		SAND; silty, trace clay, somewhat cohesive, soft, trace cobbles, loose to slightly dense; wet, light brown.	
5 / -5						End of boring at 4' bgs.	

ARCADIS
Infrastructure, environment, buildings

Remarks: bgs = below ground surface

Soil samples collected at 0-2' and 2-4' bgs for laboratory analysis
Groundwater encountered at 3.5' bgs
No ordor or staining observed

Project: Flint NAO Flint, MI
Collected Date: 08/16/2010
Submitted Date/Time: 08/16/2010 16:30
Sampled by: Michael Mathiah
P.O. #: B0064410.2010 0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Sample Summary (13 samples)

Report Summary

Lab Sample ID(s): S45342.01-S45342.04
Project: Flint NAO Flint, MI
Collected Date: 08/19/2010
Submitted Date/Time: 08/19/2010 14:30
Sampled by: Michael Mathiah
P.O. #: B0064410

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
""Not detected"" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified.Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S45343.01-S45343.04
Project: Flint NAO Flint, MI
Collected Date: 08/19/2010
Submitted Date/Time: 08/19/2010 14:30
Sampled by: Michael Mathiah
P.O. #: B0064410

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Beth,
Here are my notes.

Area	Groundcover	Condition	Photo Notes	Corresponding AOI
A	Mix of concrete, vegetation, building debris, soil and stone	Concrete is fair	Taken facing north	AOI 29-A
B	Mix of concrete, vegetation, building debris, soil and stone	Concrete is fair	Taken facing southeast	AOI 12-A
C	Mix of concrete and vegetation	Concrete is fair to poor	Taken facing northwest	AOI 02-C
D	Area includes Division Street; Mix of concrete vegetation, building debris and stone	Concrete is poor to fair	Taken facing north in succession from west to east	AOI 40 -B
E	Mostly concrete, vegetation growing in expansion joints, two areas with trees	Concrete is good to fair	Taken facing northwest	AOI 09-B - Area 1
F	Mostly concrete, vegetation growing in expansion joints	Concrete is good to fair	Taken facing north	AOI 09-B - Area 1
G	Concrete and broken asphalt, with vegetation	Concrete in good in some locations, poor in others	Taken facing southeast	AOI 09-A
H	Mainly asphalt with vegetation growing in larger cracks	Asphalt fair to poor	Taken facing southeast	AOI 09-A
I	Mix of vegetation and soil with some areas of broken asphalt and concrete	Area overall in fair condition	Taken facing south	AOI 09-B - Area 2

I hope this is what you are looking for.
Thanks.
Deb

GENERAL NOTES

1. BASE MAP INFORMATION FROM A SURVEY BY BMJ, INC. DATED SEPTEMBER 2001, AT A SCALE OF 1:100.
2. EXISTING FACILITIES, STRUCTURES, AND UTILITIES HAVE BEEN PLOTTED FROM AVAILABLE PLANS, RECORDS, AND SURVEYS, AND THEREFORE, THEIR LOCATIONS, MATERIALS, AND TYPE OF USE MUST BE CONSIDERED APPROXIMATE ONLY. OTHER UNDERGROUND STRUCTURES AND UTILITIES MAY EXIST, THE LOCATIONS OF WHICH ARE PRESENTLY UNKNOWN. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING ALL STRUCTURES AND UTILITIES.
3. OVERHEAD LINES MAY OR MAY NOT BE DEPICTED ON THE CONTRACT DRAWINGS. THE CONTRACTOR SHALL VERIFY ACTUAL FIELD CONDITIONS.
4. REFER TO THE CONTRACT DOCUMENTS REGARDING APPLICABLE PERMITS, ASSOCIATED REQUIREMENTS, AND CONDITIONS OF WORK.
5. THE ENGINEER/OWNER SHALL BE RESPONSIBLE FOR OBTAINING A NPDES PERMIT, AND THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY AND ALL OTHER PERMITS (INCLUDING THOSE NOT SPECIFICALLY LISTED IN THE CONTRACT DOCUMENTS), AS REQUIRED FOR COMPLETION OF THE WORK.
6. THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR THE SAFETY OF WORKERS AND OTHERS ON THE PROJECT SITE, AS WELL AS OVERALL SITE SECURITY.
7. AT NO TIME SHALL THE CONTRACTOR'S WORK IMPEDE OR RESTRICT IN ANY WAY, EMERGENCY AND/OR MAINTENANCE VEHICLES. THE CONTRACTOR SHALL FULLY COORDINATE ALL WORK EFFORTS WITH LOCAL EMERGENCY AGENCIES AND REGULARLY UPDATE SUCH AGENCIES AS TO THE PROGRESS OF SUCH WORK.
8. CONTRACTOR SHALL COORDINATE WORK HOURS, UTILIZE FLAG PERSONS, ETC. IN HIGH–TRAFFIC ZONES TO ENABLE MLC TO OPERATE TRUCKS, TRAILERS, ETC., AS NORMAL.
9. UNLESS OTHERWISE SHOWN OR DIRECTED, ALL EXISTING SEWERS, UTILITIES, AND TRANSPORTATION FACILITIES ARE TO REMAIN IN SERVICE AND SHALL BE PROTECTED FROM DAMAGE AS DIRECTED BY THE UTILITY AND/OR FACILITY OWNER.
10. ALL ORGANIC MATERIAL AND TOPSOIL SHALL BE CLEARED, STOCKPILED, AND PROTECTED ON SITE DURING CONSTRUCTION FOR REPLACEMENT ON THE PROJECT SITE, AS APPLICABLE. STOCKPILED SOIL SHALL BE TESTED BY ENGINEER FOR PCBs PRIOR TO REPLACEMENT.
11. EXISTING MATERIAL TO REMAIN AS SUBGRADE FOR PROPOSED FACILITIES SHALL BE PROTECTED FROM DISTURBANCE. IF DISTURBED FOR ANY REASON, SUCH MATERIALS SHALL BE REMOVED AND REPLACED WITH COMPACTED FILL MATERIAL AT NO COST TO THE OWNER.
12. REFER TO SPECIFICATION SECTION FOR DETAILS REGARDING SEDIMENT AND EROSION CONTROL PLAN. THE CONTRACTOR'S ATTENTION IS ALSO DIRECTED TO SPECIFICATION SECTION FOR INFORMATION AND REQUIREMENTS REGARDING STORMWATER POLLUTION PREVENTION. ALL SEDIMENT AND EROSION CONTROL AND STORMWATER POLLUTION PREVENTION CONTROLS SHALL BE PROPERLY INSTALLED AND FULLY FUNCTIONAL PRIOR TO ANY DISTURBANCE OF ADJACENT, UPGRADIENT LANDS.
13. CONTRACTOR SHALL PROTECT ALL OPEN EXCAVATIONS IN ACCORDANCE WITH THE CONTRACT DOCUMENTS. NO EXCAVATIONS SHALL BE LEFT UNPROTECTED AT THE END OF THE WORK DAY. BARRICADES, FENCING, ROAD PLATES, ETC. SHALL BE INSTALLED IN ACCORDANCE WITH ALL REQUIREMENTS.
14. ANY TRAFFIC CONTROL, INFORMATIONAL, DIRECTION, OR STREET NAME SIGNS REMOVED BY THE CONTRACTOR TO ALLOW CONSTRUCTION SHALL BE IMMEDIATELY REPLACED, EITHER PERMANENTLY OR TEMPORARILY, AS PRACTICAL, BY THE CONTRACTOR AT NO ADDITIONAL COST TO THE OWNER, UNLESS OTHERWISE DIRECTED BY THE OWNER OR ENGINEER.
15. ANY INTRUSIVE WORK SHALL BE PROCEEDED BY PROPER UTILITY LOCATE PROCEDURES PER ARCADIS AND MLC REQUIREMENTS. THE CONTRACTOR SHALL REPAIR ALL EXISTING UTILITIES DAMAGED AS RESULT OF THE CONTRACTOR'S WORK AT NO ADDITIONAL COST TO THE OWNER UNLESS DIRECTED OTHERWISE BY THE OWNER.
16. ALL PREVIOUSLY DEVELOPED AREAS, INCLUDING NATURAL OR MAN–MADE FEATURES OCCURRING THEREIN, SHALL BE RESTORED, REPAIRED, AND/OR REPLACED TO THE SAME OR SUPERIOR CONDITION TO THAT WHICH EXISTED PRIOR TO CONSTRUCTION DISTURBANCE TO THE SATISFACTION OF THE OWNER UNLESS DIRECTED OTHERWISE BY THE OWNER.
17. THE CONTRACTOR IS RESPONSIBLE FOR REPLACING ALL PAVEMENTS, INCLUDING DRIVEWAYS AND SIDEWALKS, DAMAGED DURING CONSTRUCTION ACTIVITIES.
18. THE CONTRACTOR SHALL AT ALL TIMES MAINTAIN POSITIVE DRAINAGE AWAY FROM ALL ROADWAYS.
19. THE CONTRACTOR SHALL CONTAIN HIS WORK AND ACTIVITIES WITHIN THE LIMITS OF CONSTRUCTION.
20. THE CONTRACTOR SHALL CONTROL ODORS, DUST, AND VAPORS THAT RESULT FROM THE CONSTRUCTION ACTIVITIES IN ACCORDANCE WITH THE DESIGN DRAWINGS, TECHNICAL SPECIFICATIONS, AND APPLICABLE FEDERAL, STATE, AND LOCAL REGULATIONS. THE CONTRACTOR SHALL MONITOR AMBIENT AIR AS OUTLINED IN THE CONTRACTOR'S HASP. PERIMETER AIR MONITORING LOCATIONS WILL BE DETERMINED IN THE FIELD BASED ON WIND DIRECTION AND LOCATED WITHIN THE PROJECT LIMITS. THE CONTRACTOR SHALL PERFORM PERIMETER AIR MONITORING AS OUTLINED IN ITS HASP.
21. THE MATERIALS SUBJECT TO HANDLING AS PART OF THE CONSTRUCTION WORK MAY CONTAIN HAZARDOUS CONSTITUENTS OR CHEMICALS AND SHOULD BE HANDLED IN ACCORDANCE WITH APPLICABLE REGULATIONS. THE CONTRACTOR SHALL BE RESPONSIBLE FOR DEVELOPING AND IMPLEMENTING APPROPRIATE HEALTH AND SAFETY MEASURES FOR ITS EMPLOYEES, SUBCONTRACTORS, CONSTRUCTION OVERSIGHT PERSONNEL, AND SITE VISITORS, AND FOR PROTECTION OF THE ENVIRONMENT AND SURROUNDING COMMUNITY. THE CONTRACTOR'S HASP SHALL BE DEVELOPED AS SPECIFIED AND IN ACCORDANCE WITH APPLICABLE OSHA, FEDERAL, STATE, AND LOCAL REGULATIONS AS WELL AS NATIONAL GRID'S HEALTH AND SAFETY PROTOCOLS.
22. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE LOADING, TRANSPORTATION, AND OFFSITE DISPOSAL/TREATMENT OF ALL WASTE MATERIAL GENERATED AS A RESULT OF CONSTRUCTION ACTIVITIES AT APPROPRIATE DISPOSAL/TREATMENT FACILITIES PRE–APPROVED BY THE OWNER, EXCEPT FOR SOILS/GROUNDWATER/SURFACE WATER AS IMPACTED BY HAZARDOUS MATERIALS AS DESCRIBED ABOVE. CONTRACTOR SHALL BE RESPONSIBLE FOR IDENTIFYING SUSPECTED IMPACTED MATERIALS, NOTIFYING THE OWNER OR DESIGNATED REPRESENTATIVE, AND MANAGING THE SUSPECTED IMPACTED MATERIALS AS DIRECTED.
23. THE CONTRACTOR SHALL COLLECT, CONTAINERIZE, AND APPROPRIATELY DISPOSE/TREAT WATER GENERATED FROM EQUIPMENT, PERSONNEL CLEANING, MATERIAL STAGING, AND DEWATERING ACTIVITIES.
24. THE CONTRACTOR SHALL NOT INITIATE ANY SITE ACTIVITIES THAT COULD POTENTIALLY GENERATE DUST WITHOUT FIRST CONFIRMING THAT THE PERIMETER AIR MONITORING PROGRAM IS ONGOING.
25. ANY DAMAGE TO STRUCTURES/EQUIPMENT CAUSED BY THE CONTRACTOR WILL BE REPAIRED/REPLACED TO MATCH EXISTING SITE CONDITIONS AT NO ADDITIONAL COST TO THE OWNER.
26. ANY SOIL FILL OR TOPSOIL BROUGHT ON SITE MUST BE TESTED FOR CONTAMINATION AND APPROVED BY OWNER.
27. CONTRACTOR'S HASP MUST BE REVIEWED BY ENGINEER OR OWNER PRIOR TO COMMENCING WORK.
28. CONTRACTOR SHALL MAINTAIN ALL FLOWS THROUGH EXISTING SEWERS THROUGHOUT CONSTRUCTION ACTIVITIES IN ACCORDANCE WITH SPECIFICATIONS.
