1. Overview of Corrective Measures Implemented

This *2013 Corrective Measures Implementation Annual Report* (CMI Report) was prepared by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust for the Buick City Site (formerly known as General Motors Corporation [GMC] North American Operations), located in Flint, Michigan (Site).

The *Corrective Measures Implementation Work Plan* (CMI Work Plan) was submitted to the United States Environmental Protection Agency (USEPA) on August 13, 2010 (ARCADIS 2010). The CMI Work Plan was prepared to comply with requirements of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA) and the Hazardous and Solid Waste Amendments, 42 United States Code (§ 6901 et seq., and USEPA regulations 40 Code of Federal Regulations Parts 260-271 and Part 124. This CMI Report was prepared to document and summarize corrective measures completed and implemented during the 2013 calendar year, as well as investigations, testing, and other activities completed in support of corrective measures design and implementation. The corrective measures are being implemented in accordance with the *Final Decision and Response to Comments for Soil and Groundwater Cleanup at the Southend of the Former General Motors Corporation North American Operations* (Final Decision) for the Southend of the Site issued by the USEPA on May 13, 2010 (USEPA 2010).

1.1 Introduction

The Site is located at 902 East Leith Street in Flint, Michigan, in Genesee County, and encompasses 425 acres of land. It is generally bounded to the north by Stewart Avenue and Pierson Road, to the south by Harriet Street, to the east by James P. Cole Boulevard and CSX Corporation (CSX) Railroad, and to the west by Industrial Avenue and North Street. The portion of the Site located north of Leith Street (hereafter referred to as the Northend) was in part occupied by GMC for manufacturing operations until December 6, 2010. Factory demolition has been completed in both the Northend of the Site and the portion of the property located south of Leith Street (hereafter referred to as the Southend). A site location map is included as **Figure 1**.

1.2 Summary of 2013 Corrective Measures

The following corrective measures and other significant Site activities were completed in 2013, and are discussed further in their respective sections of this CMI Report:

- Light non-aqueous phase liquid (LNAPL) investigation and characterization activities were performed during 2013 to define the current extents of LNAPL, and to acquire additional data to aid in the recommendation of remedial technologies for LNAPL present at the Site.
- The Area of Interest (AOI) 09-B multi-phase extraction (MPE) system began operation in April 2013.
- The annual groundwater monitoring event was conducted from June 3 through June 7, 2013. The purpose of the annual groundwater monitoring event is to monitor groundwater quality and flow patterns, as well as LNAPL areas at the Site. Additional groundwater sampling was conducted from September 13 through September 26, 2013 to confirm results of wells that had not been sampled in more than 5 years.
- The National Pollutant Discharge Elimination System (NPDES) Plus Monitoring Program (NPMP) was continued at the Site to evaluate compliance with Michigan Part 201 of the Natural Resources and Environmental Protection Act (NREPA), 1994 Public Act 451, which can be found at Michigan Compiled Laws 324.101 et seq. Groundwater/Surface Water Interface (GSI) criteria for the long-term protection of the Flint River. The NPMP consists of collecting monthly samples from up to 11 Site storm sewers during dry weather flow to assess the impact of groundwater infiltrating into the Site storm sewers.
- Excavation activities were completed on CSX property adjacent to AOI 09-A area in September and October 2013 to remediate the off-site areas of lead- and benzo(a)pyrene-impacted soils. Surface cover was then installed over the on-site lead-impacted soils at AOI 09-A to provide protection from potential direct contact exposure. Quarterly inspections of surface covers have been completed since cover installation. The surface covers protect Site users from near surface soils that exceed direct contact criteria. The engineering controls include maintaining the

surface cover consistent with existing conditions at six AOIs located in the Southend of the Site.

- Select storm sewer mains and laterals were bulkheaded at Outfalls 002, 003, 005, and 007 to minimize or eliminate the Site's contribution.
- The Outfall 003/004 Stormwater Diversion and Treatment System (Outfall 003/004 System) installation was completed in January 2011. The Outfall 003/004 System continues to operate and is maintained by an operations and maintenance technician. Maintenance procedures and events occur based on field observations and levels.
- Outfall containment areas continue to be maintained and inspected for oil/debris accumulation, absorbent boom saturation, and that containment booms are in good condition and functioning properly.
- Soil and/or groundwater sampling activities were performed to delineate impacts at the Northern Parcel, the former Factory 31 basement, and AOI 83/84-3.

2. Light Non-Aqueous Phase Liquid Investigation, Characterization, and Remediation

LNAPL investigation and characterization activities were conducted at the Site during 2013 to delineate the extent of LNAPL and LNAPL-related impacts, as well as to acquire additional Site data to aid in the recommendation of remedial technologies to address LNAPL present at the Site. A brief summary of the investigation and characterization activities are presented below; however, the results and evaluation of the activities will be presented in their entirety in the *Remedy Recommendation Report* (targeted for submission to USEPA by end of August 2014).

LNAPL remediation activities included the installation and operation of an MPE system to extract groundwater, LNAPL, and soil gas from the AOI 09-B Gasoline Area.

2.1 Light Non-Aqueous Phase Liquid Investigation

LNAPL investigation activities were conducted at the Site in accordance with the *LNAPL Investigation Work Plan* (ARCADIS 2013a), *LNAPL Investigation Work Plan #2* (ARCADIS 2013b), *LNAPL Investigation Work Plan #3* (ARCADIS 2013c), and *LNAPL Investigation Work Plan #4* (ARCADIS 2013d).

Soil borings, monitoring wells, and temporary wells were installed to better delineate the extent of LNAPL areas; to investigate impacts identified by the laser-induced fluorescence (LIF) investigation; and to delineate polychlorinated biphenyl (PCB) impacts in LNAPL and soil. While investigating LIF impacts in the Factory 83/84 Area, two additional LNAPL areas were discovered – AOI 83/84-1 and AOI 83/84-5 (**Figure 2a**). In addition, delineation activities determined that the AOI 36-1 mineral seal/hydraulic oil (MS/HO), the AOI 36-2 MS/HO, and the AOI 36-1 gasoline LNAPL areas are a comingled LNAPL area, now referred to as the AOI 36-1/36-2 LNAPL area. **Figure 2a** (Northend) and **Figure 2b** (Southend) present the updated LNAPL extents, as well as the locations of the soil borings, temporary wells, and monitoring wells.

2.2 Light Non-Aqueous Phase Liquid Characterization Activities

2.2.1 Natural Source Zone Depletion Study

The objective of the natural source zone depletion (NSZD) study conducted at the Northend of the Site was to establish ongoing natural attenuation rates of LNAPL as a baseline for comparison to active LNAPL recovery technologies. Due to the shallow depth to groundwater at the Site, NSZD was measured through carbon dioxide traps from Colorado State University (CSU). The carbon traps were installed at grade at eight locations in LNAPL areas AOI 36-2, AOI 81-2, AOI 03-1, AOI 05-1/05-5, and AOI 86-1, as shown on **Figure 3.** The carbon traps were deployed for 30 days to measure the carbon dioxide fluxes in the soil. The carbon traps were then submitted to CSU for analysis.

The results of analysis of the results indicated LNAPL loss rates ranging from 176 gallons per acre per year (AOI 81-2 – west side of the LNAPL area) to 3,448 gallons per acre per year (AOI 81-2 – east side of the LNAPL area) as presented in **Table 1**.

2.2.2 Light Non-Aqueous Phase Liquid Transmissivity Study

The objective of the LNAPL transmissivity study was to quantify relative LNAPL recoverability at the Northend of the Site. LNAPL transmissivity will also be used to focus LNAPL recovery efforts in areas where LNAPL is practical and/or used as a test to establish the practicable limits of LNAPL recovery.

LNAPL baildown tests were completed at the Site in April 2013 and August 2013 in accordance with the *LNAPL Investigation Work Plan* (ARCADIS 2013a). In March 2013, groundwater/LNAPL levels were collected from each of the LNAPL areas located in the Northend to determine which monitoring wells met the requirements of the testing (monitoring wells exhibiting greater than 0.5 foot of in-well LNAPL accumulation where the air/LNAPL and LNAPL/water interfaces are within the well screen). Transmissivity testing that met the requirements was completed at select monitoring wells located in LNAPL areas AOI 36-1/36-2, AOI 10-1/10-4, AOI 05-1, AOI 81-2, AOI 83/84-2, AOI 83/84-4, and AOI 83/84-5.

The transmissivity data are compared to the following criteria to aid in determining whether LNAPL is readily recoverable:

- Interstate Technology & Regulatory Council's (ITRC's) suggested minimum range indicating that LNAPL recovery may be practical is 0.1 to 0.8 square feet per day (ft^2/day; ITRC 2009).
- The Michigan Department of Environmental Quality (MDEQ) has indicated that an LNAPL transmissivity of 0.5 ft^2/day may be established as a draft standard threshold value for recovery to the maximum extent practicable (Swiger 2013), permitting the use of LNAPL transmissivity as a quantitative recoverability metric in the State of Michigan in the absence of risk-based LNAPL concerns.

The majority of the monitoring wells at the Northend of the Site exhibited transmissivities that indicate hydraulic LNAPL recovery is not practicable. At monitoring wells 43-162 and 43-165, transmissivity results were inconclusive due to poor LNAPL recovery. Only three monitoring wells, 20-FP7, MW-83/84-7, and RFI-83/84-53, exhibited transmissivity results that indicate LNAPL recovery may be practicable.

Table 2 summarizes the results of the LNAPL transmissivity study.

2.2.3 Respirometry

Respirometry testing was conducted to determine if soil mixing and/or land farming are viable remedial options. Samples were collected from AOI 02-B at the Southend of the Site for the respirometry testing. Three separate depths were tested: 5 to 10 feet below ground surface (bgs), 10 to 15 feet bgs, and 5 to 15 feet bgs. Soil samples were analyzed for total petroleum hydrocarbons (TPH) prior to being placed in a respirometer soil reactor for 30 days. Soil samples from each of the three depth intervals were treated with microbes (Probiotic Scrubber II and UltraTech UltraMicrobes), creating six total samples. The microbes were added to determine if they would enhance the effectiveness and LNAPL degradation rate. A nutrient (Miracle Gro®) was also added to the UltraTech UltraMicrobes.

The results of the testing indicated that the control sample degraded at a rate similar to the treated samples, with the added nutrients indicating that there are adequate nutrients present in the soil. The control sample contained lower levels of TPH after the incubation period than the treated samples, indicating the highly variable nature of clay soil. Neither microbe produced a significant improvement in degradation. The results indicate the oxygen rate is limited at the Site, and land farming, passive venting, soil vapor extraction, or air sparge may be viable options. **Appendix A** presents the results of the respirometry testing.

2.3 Light Non-Aqueous Phase Liquid Remediation – AOI 09-B Operations and Maintenance

The AOI-09-B MPE system, installed in 2012, was designed to apply vacuum to recovery wells to extract groundwater, LNAPL, and soil gas to remediate the AOI 09-B gasoline area. The system dewaters the more permeable sandy deposits in the shallow saturated zone where most of the LNAPL resides, making these zones accessible for induced air flow. Air flow through the dewatered zone can then volatilize and facilitate recovery of volatile organic compounds (VOCs) present in LNAPL. The MPE system consists of 28 recovery wells, conveyance piping from each recovery well to the MPE system building, an oil/water separator (OWS), an air stripper to treat the discharge from the OWS, granular-activated carbon to treat the groundwater discharge from the air stripper, and a thermal oxidizer to treat the vapors discharged from the MPE wells and air stripper.

2.3.1 Summary of 2013 Operations

The AOI 09-B MPE system started on April 9, 2013 and operated 3,558 hours (148 days) throughout the 2013 operational period (April 9 through November 26, 2013). Monthly operational hours ranged from 125 hours in April 2013 to 646 hours in October 2013 (see **Table 3**). The AOI 09-B MPE system was shut down for the winter on November 26, 2013 to prevent damage to system components due to ambient temperatures consistently below or near freezing temperatures.

Effluent wastewater samples were collected and analyzed in accordance with the City of Flint Use Permit No. 2-02-RBC001 (**Appendix B**). One 24-hour flow-proportional

composite effluent wastewater sample and four individual effluent grab wastewater samples were collected at least monthly during the 2013 operational period. All wastewater samples were submitted, including proper chain-of-custody documentation, to Merit Laboratories, Inc. of East Lansing, Michigan (Merit). **Appendix B** includes the wastewater analytical reports.

Vapor samples were collected and analyzed in accordance with Permit to Install No. 165-11 (**Appendix B**). Vapor sampling of the system, which included collecting influent air samples from the soil vapor extraction and air stripper air streams, was performed during the 2013 operational period. Samples were collected at least monthly and analyzed for individual volatile organic material (VOM) constituents via USEPA Method TO-15 and total non-methane organic compounds via USEPA Method TO-12. All vapor samples were submitted, including proper chain-of-custody documentation, to TestAmerica Laboratories, Inc. of Knoxville, Tennessee. **Appendix B** includes the vapor analytical reports.

2.3.2 2013 System Performance

In 2013, the AOI 09-B MPE system treated and discharged approximately 700,000 gallons of water to the City of Flint publicly owned treatment works (POTW). As discussed in the monthly POTW reports, monthly discharge volumes ranged from 54,686 gallons in April 2013 to 120,354 gallons for the June reporting period. Discharge volumes generally declined through the 2013 operational period as monthly operational time increased and subsurface dewatering of the shallow groundwater formation was maintained (see **Appendix B**).

As discussed above, effluent wastewater samples were collected at least monthly during the 2013 operational period. Effluent concentrations exceeded permit limits for ethylbenzene and total xylenes on April 11, 2013, and for zinc on April 30, 2013. Per the permit conditions, notifications of the exceedances were orally communicated to Tom Hutchings at the City of Flint Water Pollution Control Division within 24 hours of receiving the results, and written notifications were provided to the City of Flint within 5 business days. Corrective actions taken to address the exceedances included decreasing the system flow rates and increasing efficiency of the treatment train. All

other wastewater analytical results for 2013 were within permit limitations. **Appendix B** includes the monthly POTW reports submitted in 2013.

Analysis of the vapor samples, as shown on **Figure 4**, indicated 1,914 pounds of VOM mass was removed in the vapor phase during 2013. Monthly vapor phase VOM mass removal ranged from 879 pounds in April 2013 to 36 pounds in November 2013 (**Table 3**). All vapor emissions were within permit limitations for the 2013 operational period. **Appendix B** includes the monthly VOC emissions reports submitted in 2013.

As shown on **Figure 4**, the system removed 834 pounds (133 gallons) of LNAPL during operation in 2013. Monthly LNAPL removal ranged from 346 pounds (55 gallons) in April 2013 to 0 pounds in October 2013 (**Table 3**). LNAPL volumes collected generally decreased month to month during operations.

As discussed in the *AOI 09-B Remedial Endpoints, Buick City, Flint, Michigan Memo* (ARCADIS 2012a), operation of the MPE system will be discontinued after 2 years of operation or when the LNAPL and vapor mass recovery reaches asymptotic conditions, whichever occurs first. A reasonable endpoint for the AOI 09-B MPE system was determined to be when the daily total mass recovery (liquid and vapor) was less than 0.1% of the prior total mass recovery, indicating that future recovery would be insignificant compared to the mass recovered to date. The monthly ratios for this evaluation generally declined over time, with a maximum of 1.61% observed in July 2013 and a minimum of 0.08% in November 2013 (**Table 3**). November was the only month when the ratio was observed to be less than 0.10%; however, the asymptotic trend is expected to continue with future operation of the system (**Figure 5**).

3. Groundwater Monitoring

Groundwater monitoring is conducted at the Site through two programs: the NPMP and the Annual Groundwater Monitoring Program (AGMP). The NPMP program monitors the Site's storm sewers for impacted groundwater infiltration, while the AGMP monitors the downgradient Site boundary for off-site groundwater migration.

3.1 National Pollutant Discharge Elimination System Plus Monitoring Program

The NPMP has continued to be implemented at the Site to monitor compliance with MDEQ Part 201 GSI criteria for the long-term protection of the Flint River. The monthly NPMP sampling continued to be completed at Site Outfalls 001, 002, 003, 005, 006, 007, 009, 010, 011, and 013 (**Figure 6**). However, as discussed in Section 5.2, the Site's contribution to Outfall 002, 005, and 007 were eliminated in spring 2013 via bulkheading; therefore, NPMP sampling ceased following bulkheading activities. The NPMP monitoring points are co-located with those that have been identified in the current and previous NPDES permits.

On May 29, 2012, the USEPA approved the modifications to the sampling program proposed in the 2011 CMI Annual Report (ARCADIS 2012b). The modifications were implemented at the Site starting in June 2012. **Table 4** presents the currently-approved NPMP sampling program.

All NPMP samples were collected as grab samples during dry-weather flow using a peristaltic pump fitted with tubing, with the exception of the PCB samples that were collected using an automated sampler to collect 24-hour composite samples, as indicated in **Table 4**. The samples were collected and analyzed using the procedures described in the Site's *Field Sampling Plan* (FSP) and *Quality Assurance Project Plan* (QAPP) (Appendix C of the *Resource Conservation and Recovery Act Facility Investigation Work Plan* [RFI Work Plan; Blasland, Bouck & Lee, Inc. {BBL} 2001]).

3.1.1 Summary of Results

Table 5 presents the analytical results of the 2013 NPMP sampling events. Please note that the December 2013 NPMP event was unable to be completed due to the lack of dry weather. **Appendix C** presents the historical NPMP data for reference.

3.1.1.1 Outfall 001 Results Evaluation

Outfall 001 is sampled at MP001, which is located at MH 1-3 (**Figure 6**). Samples were collected during eight out of 11 sampling events in 2013. When compared to MDEQ Part 201 GSI criteria, one sample exceeded for copper, three samples exceeded for mercury, and one sample exceeded for silver. **Table 5** presents the analytical data.

There may be a correlation to total suspended solids (TSS) concentrations and mercury concentrations at Outfall 001. Sample results from February and November 2013 indicate that higher than average TSS concentrations may result in higher than average mercury concentrations. Impacts at Outfall 001 are primarily associated with mercury; however, the August 2011 upstream sampling data indicate that off-site upstream sources are impacting the water discharging at Outfall 001.

3.1.1.2 Outfall 002 Results Evaluation

Outfall 002 is sampled at MP002, which is located at MH 2-19 (**Figure 6**). Samples were collected at MP002 during three out of four sampling events in 2013 (prior to bulkheading). When compared to MDEQ Part 201 GSI criteria, one sample exceeded for arsenic, one sample exceeded for copper, three samples exceeded for cyanide, two samples exceeded for mercury, and one sample exceeded for silver. **Table 5** presents the analytical data.

Outfall 002 was bulkheaded in May 2013 to eliminate site contributions to the Flint River.

3.1.1.3 Outfalls 003 and 004 Results Evaluation

Outfall 003 is sampled at MP003, which is located at MH 3-3 (**Figure 6**). Following the installation of the Outfall 003/004 system in January 2011, the discharge at MP003

became a combined flow from the Outfall 003 and 004 systems. This section presents data from samples of the combined flow. Samples were collected during all 11 sampling events in 2013. When Outfall 003 samples were compared to MDEQ Part 201 GSI criteria, one sample exceeded for copper, one sample exceeded for cyanide, and eight samples exceeded for mercury. **Table 5** presents the analytical data.

In addition, upstream samples collected in 2012 indicated that off-site sources are likely a contributor to the mercury impacts that are being detected at MP003.

Because Outfall 003 drains upstream off-site properties, only laterals were bulkheaded in 2013, to eliminate oil contribution to Outfall 003. Options for addressing the storm sewer mains in Outfall 003 are being developed.

3.1.1.4 Outfall 005 Results Evaluation

Outfall 005 is sampled at MP005, which is located at MH 5-6 (**Figure 6**). Samples were collected at MP005 during four out of four sampling events in 2013 (prior to bulkheading). When compared to MDEQ Part 201 GSI criteria, one sample exceeded for arsenic, one sample exceeded for copper, and two samples exceeded for mercury. **Table 5** presents the analytical data.

As discussed in Section 5.2, the Outfall 005 storm sewer was bulkheaded near the southeastern corner of the former Building 83/84 in May 2013 to eliminate Site contributions to the Flint River.

3.1.1.5 Outfall 006 Results Evaluation

Outfall 006 is sampled at MP006, which is located at MH 6-2 (**Figure 6**). Samples were collected at MP006 during all 11 sampling events in 2013. When compared to MDEQ Part 201 GSI criteria, six samples exceeded for mercury. **Table 5** presents the analytical data.

3.1.1.6 Outfall 007 Results Evaluation

Due to access issues, the primary sampling location (MH 7-1) was changed after the September 2010 sampling event to where Outfall 007 discharges into the Flint River.

This sample location is called MP007 (**Figure 6**). Samples were collected at MP007 during four out of four sampling events in 2013 (prior to bulkheading). When compared to MDEQ Part 201 GSI criteria, three samples exceeded for mercury. **Table 5** presents the analytical data.

Outfall 007 was bulkheaded in May 2013 to eliminate Site contributions to the Flint River.

3.1.1.7 Outfall 009 Results Evaluation

Outfall 009 is sampled at MP009, which is located at MH 11-7 (**Figure 6**). Samples were collected at MP009 during nine of the 11 sampling events in 2013. When compared to GSI criteria, one sample exceeded for arsenic, one sample exceeded for cadmium, one sample exceeded for chromium, one sample exceeded for copper, five samples exceeded for cyanide, one sample exceeded for lead, one sample exceeded for manganese, six samples exceeded for mercury, one sample exceeded for vanadium, and one sample exceeded for zinc. **Table 5** presents the analytical data.

There may be a correlation to TSS concentrations and metals exceedances at Outfall 009. In July 2013, TSS were significantly higher than average at this location, and MDEQ Part 201 GSI criteria exceedances were detected for eight metals that did not exceed criteria at any other time throughout the year.

The Outfall 009 storm sewer joins the Outfall 011 storm sewer at Hamilton Avenue and discharges to the Flint River through Outfall 011. The Outfall 011 storm sewer is sampled at the discharge point, and the Outfall 011 samples do not exceed MDEQ Part 201 GSI criteria.

3.1.1.8 Outfall 010 Results Evaluation

Outfall 010 is sampled at MP010, which is located at MH 10-5 (**Figure 6**). Samples were collected at MP010 during all 11 sampling events in 2013. When compared to MDEQ Part 201 GSI criteria, one sample exceeded for arsenic, one sample exceeded for chromium, two samples exceeded for copper, six samples exceeded for cyanide, one sample exceeded for lead, one sample exceeded for manganese, six samples

exceeded for mercury, and one sample exceeded for zinc. **Table 5** presents the analytical data.

3.1.1.9 Outfall 011 Results Evaluation

Due to access issues, the primary sampling location (Outfall 011) was changed in 2012 to where Outfall 011 discharges into the Flint River. However, the outfall discharge point was only able to be sampled during one of the scheduled 11 sampling events in 2013 due to high water elevation. Per the revised sampling schedule, Outfall 011 was slated for quarterly sampling beginning in July 2012. MDEQ Part 201 GSI criteria were not exceeded in the one sample. **Table 5** presents the analytical data.

3.1.1.10 Outfall 013 Results Evaluation

Outfall 013 is sampled at MP013, which is located at MH 13-6 (**Figure 6**). Samples were collected at MP013 during 10 of the 11 sampling events in 2013. When compared to MDEQ Part 201 GSI criteria, three samples exceeded for copper, one sample exceeded for cyanide, and seven samples exceeded for mercury. **Table 5** presents the analytical data.

There may be a correlation to TSS concentrations and mercury exceedances at Outfall 013. Sample results from July and September 2013 indicate that higher than average TSS concentrations may result in higher than average mercury concentrations.

An upstream sample was collected in July 2012 to evaluate contributions from upstream off-site sources to MP013. The analytical data showed that mercury was detected at the upstream sampling location, as well as at MP013, both exceeded MDEQ Part 201 GSI criteria. These data indicates that off-site sources are likely a contributor to the mercury impacts that are being detected at MP013.

3.1.2 NPDES Plus Monitoring Program Data Evaluation

Appendix C includes the historical NPMP sampling analytical data. These data indicate that the primary constituents of concern (COCs) present in the stormwater are metals, primarily mercury.

3.1.2.1 Evaluation of NPDES Plus Monitoring Program Data Pre- and Post-Demolition

Demolition activities ceased at the Site in May 2012. A review of the NPMP data indicate that the number of metals exceedances and concentrations of exceedances were greater prior to 2012 than after 2012. **Table 6** presents the geometric mean concentrations of mercury based on NPMP samples collected from Site outfalls that could be sampled. Note that the geometric mean mercury concentrations in the Northend of the Site (represented by Outfalls 001, 002, 003, 004, and 005) were greater in the 2010 to 2013 dataset (represents both pre- and post-demolition samples) compared to the 2012 to 2013 dataset (post-demolition). This dataset suggests that the post-2012 data are likely more representative for assessing potential remedies for mercury and other metals in the storm sewers.

3.1.2.2 Evaluation of Metals Exceedances at Remaining Outfalls

As mentioned above, the Site's contribution to Outfalls 002, 005, and 007 were eliminated in 2013 via bulkheading. In addition, the Site's contribution to Outfalls 009 and 010 are currently in the process of being bulkheaded, and, therefore, will not be further evaluated. The remaining outfalls, to which the Site contributes, are Outfalls 001, 003, 006, 011, and 013**.** The *repeatable* MDEQ Part 201 GSI criteria exceedances at each of these storm sewers, as well as with the highest concentration for each COC, are summarized below.

Outfall	MDEQ Part 201 GSI Criteria Exceeded (High Concentration/GSI Criteria) [1]	# of GSI Exceedances	# of Samples
001	Mercury (6.7/1.3 ng/L)	8	18
003	Cyanide (8/5.2 µg/L)	3	23
	Mercury (30/1.3 ng/L)	16	22
006	Mercury (27/1.3 ng/L)	10	21
013	Copper (69/21.6 µg/L)	6	21
	Cyanide (12/5.2 µg/L)	2	21
	Mercury (220/1.3 ng/L)	16	19

Notes:
[1] No exceedances have been detected at Outfall 011.
ng/L = nanograms per liter
µg/L = micrograms per liter

The NPMP data indicate that mercury is the primary COC present in stormwater samples, exhibiting numerous GSI exceedances. The presence of metals in the storm sewer is derived from one or more of the following sources:

- Impacted sediment that has discharged into the sewer over time from on-site industrial activities
- Impacted groundwater and associated solids discharge into sewers, and
- Upstream sources (sewers discharging to Outfalls 001 and 003)

To evaluate the potential impact of metals as a result of sediment discharges to the storm sewers, TSS was also measured in the NPMP samples, to determine the effect that suspended solids may have on metals concentrations. A preliminary evaluation of the TSS data show no definitive correlation between metals and TSS based on these data.

3.1.3 Requested Changes to the Monitoring Plan and Response Plan

Based on the results of the NPMP data evaluation, the following exceedances require additional investigation: Outfall 001 (mercury), 003 (cyanide and mercury), 006 (mercury), and 013 (copper, cyanide, mercury). It is requested that the NPMP monthly sampling be discontinued and the NPMP program transition to an investigation phase to determine the source, extent, and nature of these impacts identified at Outfalls 001, 003, 006, and 013. The investigation sampling will be completed to determine if there are impacts at the GSI compliance point (storm sewer discharge point at the river), to determine whether the metals impacts are associated with sediments and/or groundwater infiltration, to evaluate contributions from upstream sources, and to identify potential on-site source areas. In addition, sampling will be completed to confirm that there are no GSI exceedances downstream of the bulkheads installed within the Outfall 005 storm sewer. The NPMP investigation sampling will include collecting samples from NPMP monitoring points, upstream monitoring points, points along the storm sewers, and/or discharge points to the river and submitting the samples for laboratory analysis of dissolved and total metals (filtered and unfiltered samples, respectively). NPMP investigation activities will also include a desktop review

of available Site data along these sewers to aid in determining potential sources of impacts.

3.2 **Annual Groundwater Monitoring Program**

The 2013 AGMP was completed in accordance with the plan presented in the 2012 CMI Report (ARCADIS 2013e), and the additional groundwater sampling plan presented in the approved *LNAPL Investigation Work Plan #2* (ARCADIS 2013b). The initial 2013 monitoring event was completed in June 2013 and included collecting site-wide groundwater levels, LNAPL presence and thickness measurements, and groundwater quality samples. In September and November 2013, additional groundwater samples were collected to confirm select results from the June event. **Table 7** presents the groundwater level and LNAPL presence/thickness monitoring locations measured during the June 2013 event. **Table 8** presents the groundwater quality monitoring locations included in the 2013 monitoring events.

3.2.1 Monitoring Network Inspection and Maintenance

The 29 monitoring wells added to the 2013 sampling event were inspected and developed prior to sampling to confirm working order. These wells were found to be in good working order, with the exception of RFI-10-05, which could not be located. During the collection of groundwater levels, 27 monitoring wells were unable to be gauged (i.e., water level or LNAPL presence measurement) for the following reasons: wells were not accessible (access agreement not finalized); wells were damaged, blocked, or paved over; wells could not be located; or wells were underwater. **Table 7** notes wells that could not be gauged. Prior to completing the 2014 event, alternate locations will be selected (where possible) to replace wells that were damaged, inaccessible, or could not be found.

Recommendations for repairing, replacement, and/or abandonment of Site monitoring wells will be completed following approval of the 2014 proposed monitoring plan. A list of monitoring wells selected for abandonment will be submitted to the USEPA for review and approval.

3.2.2 Groundwater Level and Light Non-Aqueous Phase Liquid Presence Measurements

As part of the June 2013 monitoring event, a site-wide round of groundwater level and LNAPL presence and thickness measurements were completed, which included measurements from 123 locations in the Northend and 120 locations in the Southend (**Table 7**). **Figure 7** shows monitoring well locations for the Site.

3.2.2.1 Groundwater Level and Flow Evaluation

Table 7 summarizes groundwater level measurements and elevations. Depth to groundwater ranges from approximately 2 to 25 feet bgs in the Northend of the Site and 0 (at ground surface) to 25 feet bgs in the Southend of the Site. Groundwater is encountered in the shallow fill, sand, or silty clay layers.

The **Figure 7** contour map presents groundwater flow at the Site. In general, groundwater flow at the Site is toward the east and southeast, toward the Flint River, which is the local groundwater discharge area for shallow groundwater at the Site. However, local groundwater flow is strongly influenced by the network of storm sewers at the Site. Most of the storm sewer mains were constructed below the water table at the Site. As such, the storm sewers serve as local groundwater discharge points, and groundwater contours are deflected in the upgradient direction. In the Northend, this is evident within the Outfall 003 drainage area along the two sewer mains and one of the laterals. The Outfall 004 and 005 storm sewers also have a significant influence on groundwater (**Figure 7**). In the Southend, the impact of the storm sewers on groundwater flow is evident within the Outfall 011 drainage area. In addition, in the Outfall 009 drainage area, a tunnel located north of the former Building 40 is causing a localized drawdown of the water table and deflection of groundwater contours. As a result of the localized groundwater flow and discharge into the storm sewers, the majority of groundwater beneath the Site likely discharges to the Flint River through the storm sewers.

3.2.2.2 Bulkheading

As further discussed in Section 5.2, a number of storm sewers at the Site were bulkheaded in spring 2013, including Outfalls 002, 005, and 007 and select laterals

along Outfall 003, prior to the 2013 sampling event (**Figure 7**). In addition, historically, Outfall 006 was bulkheaded just west of the railroad tracks on the Site, and Outfall 008 was bulkheaded near the downstream Site boundary.

Bulkheading activities completed at Outfalls 002, 003, and 005 have eliminated the pathway to the Flint River for a number of AOIs, as follows:

- The Outfall 002 storm sewer has been bulkheaded at the Site boundary, therefore, eliminating the pathway to the Flint River from the AOI 36-1/AOI 36-2 LNAPL area (**Figure 8**).
- Select Outfall 003 laterals were bulkheaded to minimize/eliminate infiltration from AOI 05-1/05-5, AOI 10-1/10-4, AOI 83/84-2, and AOI 83/84-5 LNAPL areas (**Figure 8**).
- The Outfall 005 storm sewer has been bulkheaded near the southeastern corner of the former Factory 83/84, therefore, eliminating the potential pathway to the Flint River from AOI 83/84-2 and AOI 83/84-5 LNAPL areas (**Figure 8**).

A bulkhead has the effect of "backing up" the water that formerly flowed through that portion of the storm sewer. This impact can be seen within the Outfall 002 drainage area, beneath the former Factory 36 Area (**Figure 7**), where there appears to be a groundwater mound. This effect is also apparent within the Outfall 006 drainage area. Several new bulkheads have been completed since the time that these groundwater levels were measured; therefore, it is anticipated that future groundwater contours will continue to evolve to reflect changing Site conditions.

The localized groundwater flow into the storm sewers underscores the importance of the NPMP sampling (Section 3.1).

3.2.2.3 Light Non-Aqueous Phase Liquid Presence Evaluation

Figures 8 and **9** present the current extent of LNAPL at the Site, which also show the historical LNAPL footprint as a dashed line for comparison. **Figures 8 and 9** also present locations where LNAPL was measured during the 2013 event in a monitoring well at a thickness of greater than 0.1 feet.

The presence of LNAPL at the Site is related to releases from historical manufacturing operations (including releases from storage tanks). Accounting for water table fluctuations, 2013 LNAPL data are generally consistent with historical data, suggesting LNAPL areas at the Site are stable and are considered unlikely to migrate outside of established footprints. It was noted that at select monitoring wells locations (RFI-36-07 and RFI-86-03), the LNAPL thicknesses have decreased as the groundwater levels have increased over the last 10 years, and LNAPL was no longer detected during the 2013 event.

While the LNAPL areas are stable and not migrating, LNAPL has continued to infiltrate the Outfall 003 storm sewer (from the AOI 05-1 and 10-4 LNAPL areas) and the Outfall 004 storm sewer (from the AOI 12-C, AOI 83/84-1, and AOI 86-1 LNAPL areas).

3.2.3 Groundwater Quality Monitoring Program

The AGMP included the collection and analysis of groundwater samples from 40 groundwater monitoring wells in accordance with the 2012 CMI Report (ARCADIS 2013e), as well as eight additional wells (20-102, 20-105R, 87-FP-3, 87-FP-5, RFI-36-08, RFI-84-10D, RFI-84-10S, and RFI-86-08R) included in the approved LNAPL Investigation Work Plan #2 (ARCADIS 2013b). The additional monitoring wells were included to characterize current concentrations of the dissolved-phase plumes upgradient of the standard monitoring points (that is, closer to probable source area). The initial 2013 monitoring event was completed in June; however, additional samples were collected from select locations in September and November 2013 to confirm select results from the June event prior to recommending remedies to address impacts in these areas.

Of the 48 monitoring wells included in the AGMP, two monitoring wells were not sampled. Monitoring well RFI-10-05 could not be located, and MW-26 was inaccessible. SampleServe.com of Traverse City, Michigan sampled 46 monitoring wells from June 5 to 7, 2013. Additional sampling was performed at 10 monitoring wells (that had been sampled in June 2013) from September 16 to 26, 2013 and at two additional wells on November 1, 2013. **Table 8** presents the monitoring well locations

included in the AGMP, the specific analyses completed for each sampled location, and the rationale for the inclusion of each monitoring well in the program.

The groundwater samples were collected, analyzed, and validated using methods and procedures consistent with those employed previously at the Site, as described in the Site's FSP and QAPP (Appendix C of the RFI Work Plan [BBL 2001]) and the CMI Work Plan (ARCADIS 2010a). Each well was purged until measured field parameters (temperature, specific electrical conductivity, dissolved oxygen, oxidation-reduction potential, pH, and turbidity) stabilized. **Table 9** summarizes these field-measured data. Groundwater samples were then collected; submitted to Merit, as specified in the Site's FSP (Appendix C of the RFI Work Plan [BBL 2001]); and analyzed using the procedures specified in the Site's QAPP (Appendix C of the RFI Work Plan [BBL 2001]).

For the purposes of discussion, the dissolved-phase groundwater data are presented on **Figures 8** and **9** with respect to areas designated: "Groundwater Monitoring Impact Area". These include:

- Northend: Factory 36 Area, Factory 10 Area, and Factory 81 and 85/86 Area
- Southend: Building 84/94 Area, Building 16/40 Area, Building 09 Area

3.2.3.1 Data Evaluation

The criteria for evaluation of groundwater data are based on the following assumptions:

- Land use at the Site will be restricted to non-residential use.
- Groundwater use at the Site will be restricted to sampling and other regulatory testing.
- A groundwater restrictive zone will be instituted in association of the Site, prohibiting the use of shallow groundwater as drinking water.

The laboratory analytical data for the 2013 monitoring event, as well as historical data, were, compared to following the following criteria, defined under the MDEQ Cleanup Criteria Requirements for Response Activity (December 2013):

- GSI
- Non-Residential Groundwater Volatilization to Indoor Air Inhalation (NGVIA)
- Flammability and Explosivity Screening Level (FE)

Monitoring well locations where concentrations above the MDEQ Part 201 GSI criteria were observed were evaluated to determine the relevance of the GSI pathway based on the location of the well and the potential pathway to the Flint River. The MDEQ Part 201 GSI criteria are not considered relevant for monitoring wells located in the groundwater monitoring impact areas where the wells are a significant distance to the Flint River and where outfalls for the storm sewers into which groundwater is infiltrating have been bulkheaded. Bulkheading eliminates the pathway to the Flint River via the storm sewer. The GSI pathway is relevant in bulkheaded areas of the Site where the monitoring wells are in close proximity to the Flint River (e.g., some of the monitoring wells in the Factory 84/94 and Building 09 Areas). The outfall(s) associated with the location of monitoring wells in each groundwater monitoring impact area, with dissolved-phase groundwater concentrations greater than the MDEQ Part 201 GSI criteria, are shown in the following table:

Groundwater Monitoring Impact Area	Associated Outfalls	
	Bulkheaded	**Not Bulkheaded**
Factory 36 Area	002	001, 003
Factory 10 Area	002	003
Factory 81 and 85/86 Area	NA	004, 005 (see Note 1 below)
Factory 16/40 Area	009, 010 (see Note 2 below)	NA
Factory 84/94 Area	007, 008	NA
Building 09 Area	NA	011, 012

Notes:

1 – Outfall 005 is bulkheaded upstream of the Factory 81 and 85/86 area, which has eliminated LNAPL infiltration to this sewer; however, this sewer may be allowing groundwater infiltration near the Factory 81 and 85/86 area.
2 – The Outfalls 009 and 010 storm sewers are in the process of being bulkheaded.
NA = not applicable

3.2.3.2 Summary of Results

Table 10 summarizes laboratory analytical data for the 2013 AGMP. **Appendix D** presents historical groundwater data prior to 2013. Groundwater concentrations are expressed in µg/L, unless otherwise noted. Annual groundwater sampling locations are primarily located along the downgradient Site boundary and off site, and provide an understanding of the behavior of the dissolved-phase impacts downgradient of the Site. Of the 46 monitoring wells sampled, one or more analytes were detected at concentrations exceeding MDEQ Part 201 GSI criteria in 15 of those wells. In general, monitoring well samples with analytes exceeding GSI criteria were those immediately downgradient of LNAPL areas. Concentrations above the NGVIA and FE were not detected at any monitoring wells. A discussion of dissolved-phase constituents that were observed above criteria in groundwater in the Northend and Southend is provided below.

3.2.3.2.1 Northend

Figure 8 shows monitoring wells in the Northend with concentrations greater than the MDEQ Part 201 GSI criteria. For the areas where the associated sewer outfall has been bulkheaded, the direct path to the river is considered to be incomplete, as discussed in Section 3.2.3.1.

Factory 36 Area Summary

Groundwater concentrations above the MDEQ Part 201 GSI criteria were detected at monitoring wells 36-FP1, RFI-36-08, and RFI-36-44 for select VOCs and metals, as shown on **Figure 8**.

Monitoring well 36-FP1 is located within the Site boundary in the drainage area for Outfall 002, which has been bulkheaded. Given the distance to the Flint River, the GSI pathway is not believed complete for this location. However, 36-FP1 is located near the

downgradient Site boundary, and concentrations of 1,1,1-trichloroethane (1,1,1-TCA) have increased from concentrations between 98 and 240 µg/L, prior to 2005, to 3,700 µg/L in June 2013. Monitoring well RFI-36-37 (see **Figure 8**), located sidegradient of 36-FP1 and outside of the bulkheaded area, exhibited concentrations of 1,1,1-TCA below detection and below MDEQ Part 201 GSI criteria for all other analytes. As discussed in detail below, downgradient monitoring well RFI-36-44 exceeds the GSI criterion for vinyl chloride (a degradation product of 1,1,1-TCA); however, concentrations of 1,1,1-TCA at RFI-36-44 are below its corresponding GSI criterion.

RFI-36-08 is located within the Site boundary in the drainage area for Outfall 002, which has been bulkheaded. RFI-36-08 detected benzene, ethylbenzene, and xylene at concentrations exceeding MDEQ Part 201 GSI criteria. Given the distance to the Flint River, the GSI pathway is not believed complete for this location. In addition, a review of historic data (**Appendix D**) collected from RFI-36-08 shows that concentrations of benzene, ethylbenzene, and xylene have decreased by an order of magnitude since monitoring began and toluene, which previously exceeded criteria, no longer exceed the respective criteria. In addition, historic data from downgradient monitoring well RFI-36-20 (**Appendix D**) indicates no detections of benzene, ethylbenzene, toluene, or xylene in any samples collected since 2001.

Monitoring well RFI-36-44 is located downgradient of the Site boundary within the Outfall 001 drainage area, which is not bulkheaded. Vinyl chloride is the only constituent above criteria at monitoring well RFI-36-44, and concentrations of chlorinated ethanes (1,1,1-TCA, 1,1-dichloroethane [1,1-DCA], and chloroethane) are present in groundwater at this location at concentrations above detection, but below all criteria. The limited historical dataset for monitoring well RFI-36-44 suggests that vinyl chloride appears to be increasing, ranging from below detection to 2.1 µg/L between 2002 and 2005 when the well was last sampled, to 20 µg/L in June 2013. Although the vinyl chloride concentration appears to be increasing at this location, the vinyl chloride concentration was below the reporting limit in groundwater at downgradient monitoring well RFI-36-55R (**Figure 8**), indicating groundwater impacts are limited beyond the Site boundary.

Factory 36 Area Recommendations

Continued monitoring of RFI-36-08 is recommended, although the GSI pathway is not complete. The concentrations of COCs have been fluctuating significantly, and do not appear to have stabilized. Therefore, continued monitoring is recommended until concentrations have stabilized or are decreasing.

Continued monitoring of 36-FP1 and RFI-36-44 is recommended as the concentrations of COCs at 36-FP1 are increasing and impacts appear to have migrated off site to RFI-36-44, which is located in the Outfall 001 drainage area (not bulkheaded). Therefore, these wells, as well as their downgradient monitoring points (RFI-36-37 and RFI-36-55R), will continue to be monitored.

Factory 10 Area

Monitoring wells 20-105R and RFI-10-03 detected select VOCs and metals at concentrations above MDEQ Part 201 GSI criteria. However, both of these monitoring wells are located on site in a portion of the Outfall 003 that has been bulkheaded. Also, given the distance to the Flint River, the GSI pathway is not believed complete for these locations.

A review of historic data from 20-105R and RFI-10-03 (**Appendix D**) indicates that concentrations of COCs in these wells appear to be decreasing or stable. COCs were not detected above MDEQ Part 201 GSI criteria in any monitoring wells located downgradient of the Site boundary.

Factory 10 Area Recommendations

Continued monitoring of 20-105R and RFI-10-03 is not recommended based on the following:

- Locations exceed only MDEQ Part 201 GSI criteria; however, bulkheading has been completed in this area and there is no longer a completed GSI pathway
- Concentrations of COCs appear to be decreasing or stable
- Downgradient monitoring wells do not exceed criteria

Factory 81 and 85/86 Area

Concentrations above MDEQ Part 201 GSI criteria were detected at two monitoring wells in the Factory 81 and 85/86 area: 87-FP3 and RFI-86-08R. These two monitoring wells are located upgradient of the Site boundary, and are within the Outfall 004 drainage area, which has not been bulkheaded.

At monitoring well 87-FP3, trichloroethene (TCE) and vinyl chloride were detected at concentrations similar to historical concentrations (**Appendix D**), indicating concentrations at 87-FP3 are stable. Naphthalene had not been analyzed at RFI-86-08R prior to 2013, and was detected above the GSI criterion. Concentrations of arsenic at monitoring well RFI-86-08R were above the GSI criterion during 2013 sampling, but have decreased since the last sampling event in 2003.

Monitoring wells located downgradient of 87-FP3, RFI-86-08R, and the AOI 86-1 LNAPL area do not detect any COCs above MDEQ Part 201 GSI criteria and concentrations appear to be stable based on historical results.

Please note that, as discussed in Section 3.1, GSI compliance for the Site's storm sewers is monitored through NPMP. The NPMP data collected from the Outfall 004 monitoring point and the downstream Outfall 005 monitoring point have not detected any VOCs above MDEQ Part 201 GSI criteria; however, arsenic has intermittently been detected above MDEQ Part 201 GSI criteria at Outfall 005.

Factory 81 and 85/86 Area Recommendations

Continued monitoring of 87-FP3 and RFI-86-08R, as well as their downgradient monitoring points (07-01, RFI-86-06S, RFI-02-08R, 87-FP5) is recommended to confirm that the concentrations of COCs are stabilizing or decreasing. In addition, while the Outfall 004 storm sewer is planned to be bulkheaded in this area, the direction of groundwater flow (generally to the southeast) indicates that the potential exists for infiltration of this groundwater plume into the Outfall 005 storm sewer. The Outfall 005 pathway will be investigated as part of expanded sampling being conducted as part of the NPMP.

3.2.3.2.2 Southend

In the Southend, the dissolved-phase groundwater impacts are closer to the river relative to a comparison to the Northend. Monitoring wells in the Southend of the Site with concentrations greater than the MDEQ Part 201 GSI criteria are shown on **Figure 9**. For areas where the associated sewer outfall has been bulkheaded, the direct path to the river is considered incomplete as discussed in Section 3.2.3.1; however, concentrations at downgradient locations were also reviewed to provide additional evidence that impacted groundwater is not likely affecting surface water quality. A discussion of dissolved-phase groundwater conditions in the Southend is provided below.

Factory 16/40 Area

Concentrations above MDEQ Part 201 GSI criteria were detected at two monitoring wells in the Factory 16/40 area: 40-305 and RFI-40-09. Concentrations of total cyanide are currently above the GSI criterion in monitoring well 40-305, located in the Outfall 009 storm sewer drainage area. This area is in the process of being bulkheaded, which will eliminate the direct pathway to the river. Total cyanide has decreased in comparison to concentrations recorded in 2001 and 2003 at 40-305. In addition, total cyanide concentrations are below reporting limits and/or the total cyanide criterion in monitoring wells downgradient of 40-305.

Monitoring well RFI-40-09 exhibited concentrations of benzene, arsenic, and total cyanide above MDEQ Part 201 GSI criteria. RFI-40-09 is located in the Outfall 010 drainage area and the Outfall 008 drainage area, which is downgradient. The Outfall 008 storm sewer has been bulkheaded, eliminating this pathway to the river. Historical data from RFI-40-09 (**Appendix D**) indicate that concentrations of benzene, arsenic, and cyanide are increasing. Samples from monitoring wells located at the downgradient Site boundary (in the Factory 84/94 area) do not detect benzene; however, as discussed in further detail below, select well samples do exceed MDEQ Part 201 GSI criteria for arsenic and cyanide.

Please note that the sample collected from 40-304 (the downgradient monitoring point for the former Building 40 Tunnel IM) did not detect PCBs, consistent with historical data.

Factory 16/40 Area Recommendations

Continued monitoring of RFI-40-09 is recommended to continue monitoring concentrations of COCs. Additional groundwater monitoring will be completed along the downgradient Site boundary as discussed below.

Factory 84/94 Area

Samples collected from RFI-09-48, RFI-84-06R, RFI-84-10D, RFI-84-10S, and RFI-94-02R exhibited concentrations of dissolved-phase constituents above MDEQ Part 201 GSI criteria. These wells are located in Outfall 007 and Outfall 008 storm sewer drainage areas, which have been bulkheaded, eliminating the pathway to the Flint River via these storm sewers. However, these monitoring well locations (**Figure 9**) are in close proximity to the Flint River; therefore, direct discharge of impacted groundwater may be a concern.

At monitoring well RFI-84-06R, total cyanide was detected at a concentration of 96 µg/L, which exceeds the GSI criterion (5.2 µg/L); however, concentrations since 2003 appear stable. Furthermore, this well is approximately 300 feet from the Flint River. It is likely that the concentration of the groundwater in this area would decrease to a level below the GSI criterion for cyanide when it reaches the river. However, even if the cyanide concentrations remained elevated above the GSI criterion at the river, a mixing zone remedy would be appropriate given the relatively low concentration of cyanide relative to the GSI criterion.

Monitoring wells RFI-84-10S and RFI-84-10D are paired shallow and deep wells, respectively. Arsenic was detected at concentrations of 11 µg/L (RFI-84-10S) and 19 µg/L (RFI-84-10D), which exceeds the GSI criterion (10 µg/L). In addition, vinyl chloride was also detected at a concentration of 19 µg/L (RFI-84-10D), which exceeds the GSI criterion (13 µg/L). Historical data from downgradient monitoring wells RFI-17-02D and RFI-84-09D (**Appendix D**) indicate no detections of vinyl chloride in the samples

collected in 2011 or 2012. Previous samples collected from 2005 to 2010 detected vinyl chloride at a maximum concentration of 3 µg/L.

Monitoring well RFI-09-48 is located within approximately 50 feet of the Flint River. Arsenic was detected at a concentration of 24 µg/L at RFI-09-48, which exceeds the GSI criterion (10 µg/L); therefore, there may be a direct pathway for arsenic-impacted groundwater to discharge to the Flint River in this area. RFI-09-48 was last sampled in 2003 and detected arsenic at a concentration of 49 µg/L; therefore, the concentration of arsenic appears to be decreasing. Furthermore, given the relatively low arsenic concentration exhibited at RFI-09-48 relative to the GSI criterion, it is likely that, if required, a mixing zone remedy would be appropriate in this case.

At monitoring well RFI-94-02R, TCE was detected at a concentration of 1,014 µg/L, which exceeds the GSI criterion for TCE of 200 µg/L. RFI-94-02R is located approximately 200 feet upgradient of the Flint River. The historic TCE concentrations ranged from 510 to 560 µg/L in 2003 to 950 µg/L in 2004, indicating that the concentrations may be stabilizing. Downgradient monitoring wells RFI-94-09, RFI-94-10, and RFI-94-11 are located between RFI-94-02 and the Flint River. Historic results from RFI-94-09 (sampled in 2003 and 2005) and RFI-94-11 (sampled 10 times between 2005 and 2012) did not detect TCE. Historic samples collected from RFI-94-10 (collected in 2003, 2004, and 2011) detected TCE at concentrations ranging from 1 to 3 µg/L), with the lowest concentration detected in the 2011 sample.

A lateral to the Outfall 006 storm sewer is located between RFI-94-02 and the downgradient monitoring wells. Because this lateral could represent a migration pathway, the historical NPMP data from Outfall 006 (**Appendix C**) were reviewed. There were no detections of TCE above its MDEQ Part 201 GSI criterion in the Outfall 006 NPMP data.

Factory 84/94 Area Recommendations

Continued monitoring of RFI-09-48, RFI-84-06R, RFI-94-02, and RFI-94-10 is recommended to continue to monitor COC concentrations.

The exceedances detected at monitoring wells RFI-84-10S and RFI-84-10D will be monitored using downgradient monitoring wells RFI-17-02, RFI-17-02D, RFI-84-09S, and RFI-82-09D, which are located between RFI-84-10S/10D and the Flint River.

Building 09 Area

With the exception of monitoring well RFI-09-55S, COC concentrations were below MDEQ Part 201 GSI criteria for all monitoring wells within the Building 09 area. At monitoring well RFI-09-55S, concentrations of 1,2,4-trimethylbenzene (1,2,4-TMB) and ethylbenzene were detected above their respective MDEQ Part 201 GSI criteria. 1,2,4-TMB has not been previously analyzed at RFI-09-55S. Ethylbenzene was analyzed once, in 2005, and concentrations have increased slightly since the last sampling event. Downgradient of monitoring well RFI-09-55S, concentrations of 1,2,4-TMB and ethylbenzene at monitoring well RFI-09-14 were below detection, when last sampled in 2010. Monitoring well RFI-09-55S is adjacent to the Outfall 011 storm sewer; therefore, there is a relatively high likelihood that the groundwater near this well is infiltrating the storm sewer. Previous NPMP sampling at the river in the Outfall 011 sewer has demonstrated no impacts to the water discharging there. Therefore, while the GSI pathway here may be complete, there is no measureable impact on surface water due to the VOCs found in this monitoring well.

Building 09 Area Recommendations

Continued monitoring of RFI-09-08, RFI-09-44, and RFI-09-55S are recommended to continue to monitor COC concentrations downgradient of the AOI 09-B LNAPL Area.

3.2.3.3 Response Plan

Based on the results of the 2013 monitoring and the revised evaluation criteria outlined Section 3.2.3.1, the 2014 groundwater monitoring plan was developed. In addition to the monitoring locations discussed in Section 3.2.3.2, proposed sampling locations were selected to monitor concentrations downgradient of LNAPL areas at the Site and at the Site boundaries, particularly boundaries that are located adjacent to the Flint River. The proposed groundwater monitoring plan, including analytical

parameters and sampling rationale for each monitoring location, is presented in **Table 11**.

The objectives of the groundwater monitoring plan for 2014, and future events, are to achieve the following:

- Collect sufficient data points for statistical analysis to be completed at key monitoring wells to understand long-term concentration trends, dissolved-phase plume stability, and vapor phase evaluation.
- Monitor groundwater concentrations along the Site boundary.
- Evaluate groundwater conditions where MDEQ Part 201 GSI criteria are exceeded in areas adjacent to the Flint River.

In the Northend of the Site, the primary GSI pathway is via the Site storm sewers. Due to the significant distance to the Flint River, direct discharge is likely incomplete. In the Southend of the Site, the Factory 84/94 area is located adjacent to the Flint River; therefore, the direct discharge of groundwater to the river will also be monitored, in addition to the storm sewer pathway. In drainage areas where the storm sewers have been bulkheaded, groundwater sampling is only recommended if the concentrations show an increasing trend and/or the impacts extend off site. At drainage areas where bulkheading has not been completed, the program will continue to include monitoring locations where the concentrations of dissolved-phase constituents are above MDEQ Part 201 GSI criteria.

In the event that a proposed monitoring well is unable to be sampled, a suitable replacement well will be identified and sampled in its place, if possible.

Table 11 also discusses sampling locations that have been eliminated from the sampling program.

4. Soil Corrective Measures

4.1 Off-Site Soil Excavation Activities

During the RCRA facility investigation (RFI) activities, lead- and benzo(a)pyrene-impacted soils were identified in the shallow soils located at AOI 09-A east and southeast of the Building 09 footprint, as well as on the adjacent CSX property. Per the Final Decision for the Southend of the Site (USEPA 2010), the selected corrective measure to address off-site soil contamination is to excavate contaminated soil at the CSX railroad property.

4.1.1 Summary of Field Activities

Soil excavation activities were performed on CSX property located adjacent to AOI-09A in September and October 2013. The objective of the excavation activities was to remove lead- and benzo(a)pyrene-impacted soils above MDEQ Part 201 Non-Residential Direct Contact Criteria from the CSX property. The excavation activities were conducted in accordance with the CMI Work Plan (ARCADIS 2010), the Final Decision (USEPA 2010), and the AOI-09-A Impacted Soil Removal Work Plan (ARCADIS 2012a), which is included in **Appendix E**.

The excavation limits and confirmation sample locations for the benzo(a)pyrene and lead soil excavations are shown on **Figures 10** and **11**, respectively. Once the initial excavation limits were reached, floor and sidewall soil confirmation samples were collected and submitted to Merit for analysis. Soil confirmation samples from the lead soil and benzo(a)pyrene excavations were analyzed for lead and semivolatile organic compounds (SVOCs), respectively. Additional step-out excavations and confirmation sampling were completed in areas where the initial confirmation samples exceeded cleanup criteria as indicated on **Figures 10** and **11**. Four step-out excavations were completed at the lead soil excavation and two step-out excavations were completed at the benzo(a)pyrene excavation to address the sample locations that exceeded criteria. The size of the step-outs varied based on field observations.

Upon verification that the confirmation samples were below criteria, the excavations were backfilled with clean Class II sand to a depth of 6 inches below grade. The Class

II sand was installed and compacted in 8-inch lifts, and was tested by an independent, third party compaction testing firm to ensure 95% maximum density was achieved. The top 6 inches was backfilled with clean topsoil to grade, and all disturbed areas were seeded to re-establish vegetation.

Three hundred forty-two tons of lead-impacted soil and 127 tons of benzo(a)pyrene-impacted soil were removed from CSX property. Lead-impacted soil was disposed at the EQ Detroit, Inc. disposal facility located in Detroit, Michigan. Benzo(a)pyrene-impacted soil was disposed at the Waste Management, Inc. disposal facility located in Lennon, Michigan.

A summary of the lead soil excavation and benzo(a)pyrene soil confirmation sample analytical results are presented in **Tables 12** and **13**, respectively.

4.2 **Select Surface Covers**

4.2.1 Select Surface Cover Installation

In 2013, select surface covers were installed in the Southend of the Site (AOI-29-A, AOI-12-A, AOI-02-C, AOI-09-A, AOI-09-B [north], and AOI-09-B [south]) in accordance with the *Select Surface Cover Work Plan* (ARCADIS 2012c; **Appendix F**). These areas are referred to collectively herein as the areas requiring surface cover (ARSCs). **Figures 12** and **13** depict locations of the ARSCs.

Prior to installation of additional select surface cover measures, the ARSCs consisted of a combination of pavement, concrete, and/or vegetation. Portions of these ARSCs were vegetated or contained concrete and/or asphalt that had become compromised and subsurface soil was exposed. Additional surface cover was installed to address these areas.

In May 2013, additional surface cover was installed at AOI-12-A, AOI-29-A, and AOI-02-C. In September and October 2013, additional surface cover was installed at AOI-09-A, AOI-09-B (north), and AOI-09-B (south). In general, surface cover installation activities included clearing and grubbing of vegetation, monitoring well framing, manhole capping, installation of non-woven 8-ounce per square foot polypropylene

material and installation of a 6-inch-thick minimum crushed natural stone over top. Please refer to **Appendix F** for additional details regarding the installation of select surface cover in these areas.

4.2.2 Maintenance of Select Surface Covers

Five AOIs (AOI Group 02-C, AOI Group 12-A, AOI Group 29-A, AOI Group 09-A, and AOI Group 09-B) contain six areas where surface cover is inspected and maintained. The baseline conditions of these areas were photographed and visually inspected in July 2010, and each was inspected quarterly. In September 2013, inspections were revised to a semi-annual basis in accordance with the *Select Surface Cover Work Plan* (ARCADIS 2012c; **Appendix F**). As such, inspections for 2013 were performed in March, June, and September. During each inspection, the condition of cover was inspected and documented in an inspection log. Documented items include the type of cover (e.g., concrete, stone, vegetation), the condition of concrete or asphalt cover (good, fair, poor), and whether or not conditions of the cover have changed since the last inspection date. Photos of each inspection area are also included with the inspection log. **Appendix F** includes the inspection logs.

5. Storm Sewers

5.1 Storm Sewer Studies

Absorbent boom studies were conducted in the on-site storm sewers for Outfall 003 to identify areas of potential oil infiltration. The installed absorbent booms were monitored weekly for oil saturation. Upon review of the observations, additional booms were installed upstream or downstream to aid in determining locations of infiltration. Based on the results of the Outfall 003 boom study, evaluation of Site data and design activities for minimizing oil leaving the Site in the line leading to Outfall 003 will be conducted in 2014.

5.1.1 Sewer Video Inspection

In June 2013 and November 2013, storm sewer closed circuit television (CCTV) investigation activities were conducted in the Outfalls 002, 003, and 013 storm sewers to inspect the integrity of the piping, determine size and construction material of piping, determine water flow, and identify areas of staining and potential oil infiltration. Outfall 002 was inspected from the Site boundary where a bulkhead had been previously installed, eliminating Site drainage to the discharge point at the Flint River. Outfall 003 was inspected along areas where LNAPL infiltration was potentially occurring. Outfall 013 was inspected along the main sewer line to verify integrity for the potential Outfall 004 reroute. The results of these investigations can be found in **Appendix G**.

Upon evaluation of the storm sewer CCTV investigation videos, some sections of storm sewer piping were observed to be damaged or cracked with some groundwater infiltration and potential staining. These areas will be evaluated and activities for minimizing oil leaving the Site in the line leading to Outfalls 002, 003, and 013 will be conducted in 2014.

5.1.2 Outfall 004 Reroute Feasibility Study

While assessing remedy options for the LNAPL areas infiltrating the Outfall 004 storm sewer, ARCADIS identified the potential for rerouting Outfall 004's flow upstream of the Site into the Outfall 013 storm sewer as shown on **Figure 14**.

A feasibility study, including an assessment of the existing sewer capacity, hydraulic modeling of the drainage system, and monitoring flow through the systems was conducted. Multiple meetings with the City of Flint were held to discuss their concerns and ensure the necessary information and standard requirements. The *Outfall 004 Preliminary Evaluation Memo* (ARCADIS 2013f; **Appendix H**) was provided to the City of Flint on May 13, 2013. The *Outfall 004 Flow Monitoring Memo* (ARCADIS 2014; **Appendix H**) was submitted to the City of Flint on January 30, 2014.

5.2 Storm Sewer Bulkheading Activities

Bulkheading activities were performed at the Site in February and March 2013 to decrease or eliminate LNAPL infiltration to select on-site storm sewers. The field activities were conducted in accordance with the *Outfall 002 and 005 Storm Sewer Bulkheading Work Plan* (ARCADIS, 2012), *Outfall 002 and 005 Storm Sewer Bulkheading Work Plan – Modification to Outfall 005 Bulkhead Location* (ARCADIS, 2012), and *Outfall 002 and 005 Storm Sewer Bulkheading Work Plan: Addendum No. 1 – Outfall 003 and 007 Storm Sewer Bulkheading* (ARCADIS, 2012) approved by the USEPA on November 9, 2012, December 17, 2012, and December 17, 2012, respectively. **Appendix I** presents the work plans and construction drawings.

The bulkheading/plug locations were selected based on boom studies completed during 2011 and 2012 along Outfalls 002, 003, and 005. The boom studies identified locations where oil was infiltrating the storm sewers and bulkhead or plug locations were selected to decrease/eliminate oil contributions to the outfalls. In addition to the bulkheads/plugs installed at Outfalls 002, 003, and 005 to minimize oil infiltration, a bulkhead was also installed at Outfall 007. The Outfall 007 bulkhead was installed to eliminate the GSI pathway based on exceedances detected during NPMP sampling.

Figures 15 and **16** present the bulkhead and plug locations. The bulkheads completed at Outfalls 002 and 007 eliminated the Site's contribution to the storm sewers via bulkheading at the downstream Site boundary. Additional bulkheads were installed in the on-site Outfall 002 storm sewer system to potentially collect infiltrating oil. As Outfall 003 drains upstream off-site properties, only lateral lines were bulkheaded and options for addressing the main sewers are being developed. Most of the Site's

contribution to Outfall 005 has been eliminated, only leaving the drainage for Leith Street and the drainage from an adjacent property owner.

6. Non-Corrective Measures Implementation Activity Summary

6.1 Outfall Maintenance

Oil absorbent booms and oil containment booms were maintained throughout the year at storm sewer Outfalls 002, 003, 004, and 005 to contain periodic oil sheens at the Flint River. The outfall containment areas were regularly inspected for oil/debris accumulation, absorbent boom saturation, and that the containment booms were in good condition and functioning properly. Based on visual observations, the booms were changed on an as-needed basis to confirm proper working order. In addition, accumulated oil and debris in the outfall containment areas were cleaned via vacuum extraction and/or oil absorbent materials on an as-needed basis to prevent potential environmental releases.

Outfall inspections were conducted on a weekly basis, at a minimum, and as needed per weather predictions and measured rainfall. In 2013, sections of on-site Outfalls 002 and 005 storm sewers were bulkheaded to reduce the amount of LNAPL contribution to the outfalls. Since the installation of bulkheads, amount of oil identified at the outfalls during inspections has decreased noticeably at Outfall 002. Refer to Section 5.2 for details on the Outfalls 002 and 005 storm sewer bulkheading activities.

6.2 Oil Interceptor #2 Maintenance

Oil Interceptor #2 was operated throughout the year by utilizing two rows of oil absorbent booms spanned within the unit perpendicular to the direction of flow. The booms were inspected on a weekly basis for oil/debris accumulation, absorbent boom saturation, and that the absorbent booms were in good condition and functioning properly. Based on visual observations, the booms were changed and debris removed on an as-needed basis to confirm proper working order. In 2013, two maintenance events were performed on Interceptor #2, resulting in the collection and disposal of 21 drums (an estimated 1,640 kilograms) of Toxic Substances Control Act (TSCA) PCB waste.

6.3 Outfall 003/004 Stormwater Diversion and Treatment System

The Outfall 003/004 System serves to remove oils and sediment in the Outfalls 003 and 004 storm sewers prior to reaching the Flint River. The Outfall 003/004 System was operated throughout the year, and was maintained at least once per week. Water levels and oil levels were actively monitored in vaults, BaySeparator™ manholes, and the OWS. Stormwater downstream of the Outfall 003/004 System was monitored in manholes, as well as Flint River outfalls, to check for accumulating oils. Routine maintenance events were scheduled based on field observations and levels, including removal of debris and trash racks from the diversion structures, jetting of high-density polyethylene piping to clear blockage, and a cleaning event of the BaySeparator™ system. The BaySeparator™ cleaning event included removal of 5,577 gallons (TSCA PCBs) and 15,542 gallons (non-TSCA and non-hazardous) oil, water, and sediment utilizing vacuum trucks and power washing the surfaces to ensure all material was removed. Oil, water, and sediment containing TSCA PCBs were transported to the Port Arthur TSDF Incineration Service Center in Port Arthur, Texas for disposal. The remaining oil, water, and sediment were determined to be non-TSCA and non-hazardous and were transported to EQ Detroit, Inc. in Detroit, Michigan for disposal.

6.4 RCRA Waste Management Unit Closures

Closure activities were performed in 2012 for 10 historic RCRA waste management units (WMUs) historically present at the Site. On January 15, 2013, the MDEQ granted closure approval for seven of the 10 WMUs, and deferred follow-up activities for the remaining three WMUs (#3, #7, and #10) to be addressed under RCRA Corrective Action. **Appendix J** presents the MDEQ correspondence regarding closure status of these WMUs.

6.5 Northern Parcel Soil Investigation

The Northern Parcel area is the portion of the Site located north of the former Factory 36 Area and includes the former Factory 38 building footprint. In October 2012 and March through June 2013, soil and groundwater sampling activities were performed at the Northern Parcel to assess Site conditions.

The Northern Parcel investigation activities were completed as outlined in the *Northern Parcel Sampling Results Memorandum* (ARCADIS 2013g; **Appendix K**).

6.6 Former Factory 31 Basement Investigation

The former Factory 31 basement investigation was implemented in response to a 2010 letter received (via the MDEQ and USEPA) from a former GMC employee who claimed that 25 to 30 full drums of various oils and cleaners were dumped in the former Factory 31 Heat Treat basement as it was being backfilled in 1982. The former Factory 31 Heat Treat basement is located beneath the former Factory 83/84 (also known as Factory 31) Area, which is located in the Northend of the Site, just north of Leith Street.

In September 2012, the former Factory 31 basement area was investigated for evidence of drums. Based on impact (strong odor and sheen) noted at one of the initial soil boring locations (F31_Boring 6), four additional soil borings were installed in April 2013. These additional borings were installed approximately 10 feet north, south, east, and west of F31_Boring 6.

Four borings (F31_Boring 6-1, F31_Boring 6-2, F31_Boring 6-3, and F31_Boring 6-4) were completed to depths ranging from 6.5 to 10 feet bgs. Refusal was encountered at F31-Boring 6-3 and F31-Boring 6-4 at depths of 7 feet bgs. At boring F31_Boring 6, a strong odor and sheen were noted just beneath the concrete slab. Non-aqueous phase liquid was noted in F31_Boring 6-1 at 6 feet bgs. Minimal odors were noted in the soil removed from F31_Boring 4, F31_Boring 6-1, F31_Boring 6-2, and F31_Boring 6-4. Black sand was noted in borings F31_Boring 6-1, F31_Boring 6-2, F31_Boring 6-3, and F31_Boring 6-4. Although photoionization detector readings were zero, one soil sample was collected from each of the four borings, and was submitted to the laboratory for analysis of VOCs and SVOCs. No VOCs or SVOCs were detected above applicable criteria in the soil samples; however, laboratory qualifiers indicate that elevated reporting limits were used due to matrix interference. No evidence of impacts or drums was encountered during the investigation.

6.7 AOI 83/84-3 Lead Soil Delineation

Lead-impacted soils, with mean lead concentrations in surface and subsurface soils exceeding the Part 201 Non-residential Direct Contact (NDC) criterion of 900 milligrams per kilogram, were identified at AOI 83/84-3 during the RFI. However, the extent of the lead-impacted soils could not be delineated at the time due to the presence of process-related equipment. In 2012, following the demolition of Factory 83/84, delineation of the lead-impacted soils was initially conducted. Additional delineation samples were collected in April 2013 to complete the delineation.

The results of this investigation are presented in further detail in Appendix Q of the *2014 Remedy Recommendation Report* (targeted for submission to USEPA by end of August 20142014).

6.8 Outfall 002 Passive Recovery Trench

As part of the storm sewer bulkheading activities discussed in Section 5.2 bulkheads were installed at Manholes 2-18 and 2-21 to create two closed sections of pipe. These sections were selected based on the proximity of a known LNAPL area to the pipe, as well as the results of previous boom studies that indicated the LNAPL was infiltrating into these areas. An operation, monitoring, and maintenance (OMM) plan was established that included biweekly and as-needed gauging and inspections of the pipe sections and nearby groundwater monitoring wells. The purpose of the inspections was to identify if LNAPL recovery would be possible from the trench, and at what rate the LNAPL was infiltrating for recovery. During the initial phase of OMM, LNAPL infiltration was observed as indicated in **Table 14**. Based on the amount of LNAPL observed, either 2-gallon or 6-gallon capacity oil-only absorbent booms were installed on June 26, 2013 in order to absorb the observed LNAPL, and to gauge the amount of LNAPL collected. The saturation of the booms was monitored, and the booms were changed out on an as-needed basis. The results of the inspection have shown that the booms can adequately manage the amount of LNAPL infiltration observed to date.

The section of trench between Manholes 2-18 and 2-21 (**Figure 17**) observed steady LNAPL accumulation during the OMM phase. Higher LNAPL recovery rates were

observed during July and December 2013, with 9 gallons of LNAPL removed during the OMM period.

The section of trench upstream of Manhole 2-21 has seen intermittent LNAPL accumulation during the OMM phase. Little to no additional LNAPL accumulation was observed during September and October 2013, while the highest LNAPL recovery was observed during January, with 4.5 gallons of LNAPL removed during the OMM period.

A review of the groundwater elevations observed in monitoring well 20-105R did not provide a correlation between groundwater elevation and LNAPL accumulation.

Table 1. **Natural Source Zone Depletion - Northend Results, 2013 CMI Annual Report**
RACER Trust, Buick City Site, Flint, Michigan

AOI	Nearest well	Sample	Eq. f.f. NAPL Loss Rate (gallons/acre.yr)
AOI 36-2	RFI-36-42	FM-CO2-R4-01	3,217
AOI 81-2	East side of plume	FM-CO2-R4-02	3,448
AOI 81-2	West side of plume	FM-CO2-R4-03	176
AOI 03-1	03-03R	FM-CO2-R4-04	396
AOI 05-1/05-5	43-162	FM-CO2-R4-05	797
AOI 05-1/05-5	43-163	FM-CO2-R4-06	664
AOI 86-1	RFI-86-03	FM-CO2-R4-07	397
AOI 86-1	RFI-86-02	FM-CO2-R4-08	516

NOTES:
The flux equivalence is 1 microMole/(m^2 . S) equals 627 gallons/(acre.yr). This assumes a hydrocarbon density of 0.75 g/mL and a formula of C8H18.

Table 2. LNAPL Transmissivity Evaluation and Results, 2013 CMI Annual Report
RACER Trust, Buick City Site, Flint, Michigan

Test Well ID	Test	Date	Drawdown Adjustment (feet)	Time Cut (minutes)	Initial LNAPL Thickness (feet)	Test Duration (minutes)	Final LNAPL Thickness (feet)	LNAPL Recovery (%)	LNAPL Transmissivity (feet^2/day)

General Notes:

Bold Exceeds 0.1 to 0.8 ft^2/day lower criterion range to produce sufficient LNAPL recoverability (ITRC 2009a).

Acronyms and Abbreviations:

0 = LNAPL transmissivity is assumed to be zero due to negligible LNAPL thickness in well at test commencement.

ft. = feet

LNAPL = light non-aqueous phase liquid

min = minute

NA = not analyzed for various reasons including poor LNAPL discharge from formation to well, minimal LNAPL drawdown, or non-equilibrium conditions at test commencement.

Acronyms and Abbreviations:

NA	Criterion or value is not available or, in the case of background and CAS numbers, not applicable.
SVE	Soil Vapor Extraction
LNAPL	Lighter-than-water, non-aqueous phase liquid

Table 4. Currently Approved NPMP Sampling Program and Rationale, 2013 CMI Annual Report
RACER Trust, Buick City Site, Flint, Michigan

Outfall	Monitoring Point	Current Frequency	Sample Type	Analytes	Sampling Rationale
001	MP001	Monthly	Dry weather - Grab	antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, cyanide, lead, manganese, mercury, nickel, selenium, silver, thallium, vanadium, zinc	Metals and cyanide will continue to be sampled until an upgradient sample can be collected to confirm the source of metals is from sources located upgradient of the Site.
002	MP002	Monthly	Dry weather - Grab	arsenic, chromium, copper, cyanide, mercury, selenium, silver	Rationale 5.
		Quarterly	Dry weather - Grab	lead, vanadium	Rationale 4.
		Annually	Dry weather - Grab	VOC (MDEQ List), barium, cadmium, manganese, zinc	Rationale 2.
003/004	MP003	Monthly	Dry weather - Grab	antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, cyanide, lead, manganese, mercury, nickel, selenium, silver, thallium, vanadium, zinc	Metals and cyanide will continue to be sampled until an upgradient sample can be collected to confirm the source of metals is from sources located upgradient of the Site.
		Monthly	Dry weather - 24-hr Composite	PCB	Requested by the USEPA. Weekly dry weather PCB sampling is also required by the NPDES permit.
005	MP005	Monthly	Dry weather - Grab	arsenic, copper, lead, mercury, silver, zinc	Rationale 5.
		Monthly	Dry weather - 24-hr Composite	PCB	Requested by USEPA.
		Quarterly	Dry weather - Grab	chromium, nickel	Rationale 4.
		Semi-annually	Dry weather - Grab	manganese	Rationale 3.
		Annually	Dry weather - Grab	cadmium, vanadium	Rationale 2.
006	MP006	Monthly	Dry weather - Grab	mercury	Rationale 5.
		Quarterly	Dry weather - Grab	chromium, copper	Rationale 4.
		Semi-annually	Dry weather - Grab	arsenic, lead	Rationale 3.
007	MP007	Monthly	Dry weather - Grab	mercury	Rationale 5.
		Semi-annually	Dry weather - Grab	chromium, lead	Rationale 3.
		Annually	Dry weather - Grab	arsenic	Rationale 2.
009	MP009	Monthly	Dry weather - Grab	arsenic, cadmium, chromium, copper, cyanide, lead, manganese, mercury, vanadium, zinc	Rationale 5.
		Annually	Dry weather - Grab	barium, thallium	Rationale 2.
010	MP010	Monthly	Dry weather - Grab	arsenic, cadmium, chromium, copper, cyanide, lead, manganese, mercury, zinc	Rationale 5.
		Quarterly	Dry weather - Grab	barium	Rationale 4.
		Semi-annually	Dry weather - Grab	nickel, vanadium	Rationale 3.
011	MP011	Quarterly	Dry weather - Grab	copper, mercury	Rationale 4.
		Semi-annually	Dry weather - Grab	lead	Rationale 3.
		Annually	Dry weather - Grab	vanadium	Rationale 2.
013	MP013	Monthly	Dry weather - Grab	arsenic, chromium, copper, cyanide, lead, mercury	Rationale 5.
		Semi-annually	Dry weather - Grab	zinc	Rationale 3.
		Annually	Dry weather - Grab	manganese, vanadium	Rationale 2.

Rationale 1 - If an analyte has not been detected in the past 12 months or has only been detected at concentrations that are less than 25% of the GSI criteria then no additional sampling of that analyte is recommended.
Rationale 2 - If in the past 12 months an analyte was detected in one or more samples at a concentration greater than 25% of GSI criteria then annual sampling is recommended for that analyte.
Rationale 3 - If in the past 12 months one or more samples detected an analyte at a concentration greater than 25% of GSI criteria and the data collected to date show an increasing trend then semi-annual sampling is recommended for that analyte.

Rationale 4 - If in the past 12 months one or more samples detected an analyte at a concentration greater than 75% of GSI criteria then quarterly sampling is recommended for that analyte.

Rationale 5 - If in the past 12 months one or more samples detected an analyte at a concentration exceeding the GSI criteria then continued monthly sampling is recommended.

Notes:
Shaded and Bolded results exceed GSI criteria.
GSI - Groundwater/Surface Water Interface Criteria.
G - GSI criterion depends on the pH or water hardness (or both) of the receiving surface water. Criterion was calculated using a pH of 7 and a water hardness of 280 mg/L $CaCO_3$ for the Flint River.
ID - Insufficient data to develop criterion.
M - Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.
NA - Not analyzed or not applicable
O - Indicates that the analysis was performed by an outside laboratory.
X - GSI crierion in generic tables is not protective of surface water that is used as a drinking water source.
ug/L - micrograms per liter
mg/L - milligrams per liter
PCB samples at Outfall 003 were sampled within one week of the monthly event.

Notes:
Shaded and Bolded results exceed GSI criteria.
GSI - Groundwater/Surface Water Interface Criteria.
G - GSI criterion depends on the pH or water hardness (or both) of the receiving surface
ID - Insufficient data to develop criterion.
M - Calculated criterion is below the analytical target detection limit, therefore, the criterio
NA - Not analyzed or not applicable
O - Indicates that the analysis was performed by an outside laboratory.
X - GSI crierion in generic tables is not protective of surface water that is used a
ug/L - micrograms per liter
mg/L - milligrams per liter
PCB samples at Outfall 003 were sampled within one week of the monthly even

Miscellaneous												
Total Suspended Solids (TSS)	- -	ug/L	4,000	5,000	3,000	1,000	5,000	5,000	70,000	36,000	3,000	8,000

Notes:
Shaded and Bolded results exceed GSI criteria.
GSI - Groundwater/Surface Water Interface Criteria.
G - GSI criterion depends on the pH or water hardness (or both) of the receiving surface
ID - Insufficient data to develop criterion.
M - Calculated criterion is below the analytical target detection limit, therefore, the criterio
NA - Not analyzed or not applicable
O - Indicates that the analysis was performed by an outside laboratory.
X - GSI crierion in generic tables is not protective of surface water that is used a
ug/L - micrograms per liter
mg/L - milligrams per liter
PCB samples at Outfall 003 were sampled within one week of the monthly even

Table 6 **NPMP Mercury Evaluation, 2013 CMI Annual Report**
RACER Trust, Buick City Site, Flint, Michigan

2010-2013		
Outfall	**# Samples**	**Geometric Mean**
001	30	2.08
002	29	3.57
003	39	2.38
004	6	2.74
005	32	1.73
006	38	1.79
007	27	6.59
009	36	5.58
010	39	5.66
011	10	0.65
013	32	8.02

2012-2013		
Outfall	**# Samples**	**Geometric Mean**
001	18	1.34
002	13	2.98
003	22	2.26
004	NA	NA
005	15	1.52
006	21	1.55
007	15	7.44
009	21	4.75
010	24	5.96
011	3	0.75
013	19	13.12

Note: The highlighthed cell represents the higher of the mean total mercury concentration comparing the 2010-2013 vs. 2012-2013 data set.

Notes:
NA - Not Available
NP - No product measured
ft - feet
bgs - below ground surface
LNAPL - light non-aqueous phase liquid

Table 8. **2013 Groundwater Quality Monitoring Locations, 2013 CMI Annual Report**
RACER Trust Buick City Site, Flint, Michigan

Sampling Location	Groundwater Analytical Parameters	Sampling Rationale	Comments
North of Leith Street			
07-01	VOCs	Plume Fringe Well - Located at downgradient edge of a VOC plume. Sampling to monitor concentrations.	AGMP - Sampled in June
RFI-10-03	VOCs Cyanide. Mercury, manganese, and silver	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-10-05	VOCs Cyanide, lead, manganese, silver, and vanadium	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	Unable to be located
RFI-10-11	Cyanide	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-10-26	Cyanide, lead, mercury, selenium, and vanadium	Plume Fringe Well - located along the downgradient edge of metals plume. Sampling to monitor concentrations.	AGMP - Sampled in June
RFI-10-32	VOCs	Off-Site Plume Fringe Well - Located at the downgradient edge of VOC plume. Sampling to monitor concentrations.	AGMP - Sampled in June
RFI-10-33	VOCs Cyanide, lead, manganese, silver, and vanadium	Off-Site Plume Fringe Well - Located at the downgradient edge of VOC and inorganics plume.	AGMP - Sampled in June
RFI-10-37	VOCs	Plume Fringe Well - Monitoring well was installed in 2012 to monitor VOC concentrations at the property boundary. Replaces 20-FP10R as the plume fringe well.	AGMP - Sampled in June
20-102	VOCs	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June and September
20-105R	VOCs Cyanide, lead, manganese, silver, and vanadium	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June and September
20-500R	VOCs	Plume Fringe Well - Located at the downgradient edge of VOC Plume. Sampling to monitor concentrations.	AGMP - Sampled in June
RFI-36-03	Cadmium and Lead	Plume fringe well; to assess cadmium and lead concentrations	AGMP - Sampled in June
RFI-36-08	VOCs	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
RFI-36-35	VOCs Arsenic, chromium, manganese, silver and vanadium	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-36-37	VOCs	Off-Site Plume fringe well - Located at downgradient edge of VOC plume. Sampling to monitor concentrations. Replaces wells RFI-36-19 and RFI-36-20.	AGMP - Sampled in June
RFI-36-44	VOCs	Off-Site Sentinel Well - Located side/downgradient edge of VOC plume. Sampling to monitor concentrations. Replaces well RFI-36-56.	AGMP - Sampled in June
RFI-36-46	Manganese	Plume Well - Monitoring well has not been sampled in 5 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June and September
RFI-36-47R	VOCs Arsenic, chromium, manganese, silver and vanadium	Off-Site Plume Fringe Well - Located at downgradient edge of VOC plumes sampling to monitor concentrations. Off-Site Sentinel Well - Sampling to determine whether historic groundwater impacts have migrated off-Site. Replaces well RFI-36-02.	AGMP - Sampled in June and September
RFI-36-55R	VOCs	Off-Site Plume Fringe Well - Located at downgradient edge of VOC plume. Sampling to monitor concentrations. Replaces well RFI-36-48.	AGMP - Sampled in June
36-FP1	VOCs Arsenic, lead, and manganese	Plume Well - Monitoring well has not been analyzed for VOCs in 7 years. Sampling is proposed to determine current concentrations at the property boundary. Plume Fringe Well - Located downgradient edge of inorganic plume. Sampling to assess arsenic, lead and manganese concentrations.	AGMP - Sampled in June
70-163	VOCs Manganese	Off-Site Sentinel Well - Located downgradient of the VOC plume. Sampling to assess current conditions. Plume well - Sampling to assess a historic manganese exceedance.	AGMP - Sampled in June
70-164R	VOCs Selenium	Off-Site Sentinel Well - Located downgradient of an LNAPL plume. Sampling to assess current conditions. Plume Well - Sampling to assess a historic selenium exceedance.	AGMP - Sampled in June
RFI-81-11	VOCs Arsenic, cyanide, lead, manganese, and mercury	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-81-12R	Mercury and Silver	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-81-33	Mercury	Plume Well - Monitoring well has not been sampled in 9 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June and September
RFI-81-51	VOCs	Plume Fringe Well - Located at downgradient edge of a VOC plume. Sampling to monitor concentrations.	AGMP - Sampled in June

Table 8. **2013 Groundwater Quality Monitoring Locations, 2013 CMI Annual Report**
RACER Trust Buick City Site, Flint, Michigan

Sampling Location	Groundwater Analytical Parameters	Sampling Rationale	Comments
RFI-86-06S	VOCs	Plume Well - Monitoring well has not been sampled in 9 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June and November
RFI-86-08R	VOCs Arsenic and Selenium	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
86-100	VOCs Cadmium, Copper, lead, manganese, nickel, silver, selenium, and zinc	Plume Well - Monitoring well has not been sampled in 9 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
87-FP3	VOCs Arsenic and Selenium	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
87-FP5	VOCs Arsenic and Selenium	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
South of Leith Street			
RFI-02-08R	Arsenic	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June and September
RFI-09-04R	VOCs	Plume Well - Monitoring concentrations at property boundary.	AGMP - Sampled in June
RFI-09-08	VOCs	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions and property boundary. Replaces wells RFI-09-14 and MW-23.	AGMP - Sampled in June and September
RI-09-36R	VOCs	Nearby well RFI-09-01 had a historic exceedance (2003)for vinyl chloride; however, RFI-09-01 will be removed during lead soil excavation activities to be completed in Spring 2013. Therefore RFI -09-36R will be sampled to assess current conditions in this portion of the Site.	AGMP - Sampled in June and September
RFI-09-46	VOCs	Off-Site Plume Well - Monitoring concentrations of plume downgradient of the Site.	AGMP - Sampled in June
RFI-09-48	VOCs and metals	Sentinel Well - Located downgradient of Site.	AGMP - Sampled in June
RFI-09-53	VOCs	Plume Well - Monitoring concentrations at property boundary.	AGMP - Sampled in June
RFI-09-55S	VOCs Manganese	Plume well - Monitoring well has not been sampled in 8 years. Sampling is proposed to determine current conditions and property boundary. Replaces wells RFI-09-14 and MW-23.	AGMP - Sampled in June and November
MW-26	VOCs	Off-Site Sentinel Well - Located downgradient of VOC plume to confirm that plume has not migrated.	No access - Unable to be sampled
RFI-40-03	VOCs	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June and September
RFI-40-09	VOCs Arsenic, beryllium, cyanide, mercury, and silver	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
40-304	VOCs PCBs	Plume well - Monitoring concentrations at property boundary. Sentinel Well - Located downgradient of Building 40 Tunnel (required by EPA 9/13/2005 correspondence).	AGMP - Sampled in June
40-305	Cyanide and lead	Plume Well - Monitoring well has not been sampled in 10 years. Sampling is proposed to determine current conditions at the property boundary.	AGMP - Sampled in June
RFI-84-06R	Cyanide	Plume well - Monitoring concentrations at the property boundary.	AGMP - Sampled in June
RFI-84-10S	VOCs Arsenic, beryllium, cyanide, mercury, and silver	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
RFI-84-10D	VOCs Arsenic, beryllium, cyanide, mercury, and silver	Characterize current concentrations of the dissolved phase plumes.	Additional Sampling Location - Sampled in June
RFI-94-02R	VOCs	Plume Well - Monitoring well has not been sampled in 9 years. Sampling is proposed to determine current conditions at the property boundary. Replaces well RFI-94-11.	AGMP - Sampled in June and September

Note:
AGMP - monitoring well included in the Annual Groundwater Monitoring Program
VOCs = Volatile Organic Compounds.
PCBS = Polychlorinated Biphenyls
LNAPL = light non-aqueous phase liquid.

Notes:
FE - Flammability and Explosivity Screening Level
GSI - Groundwater/Surface Water Interface Criteria
NGVIA - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria
NA - Not Analyzed
ug/L - micrograms per liter
Shaded and Bolded results exceeds one or more criteria.
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X - Elevated reporting limit due to matrix interference.
Y - Elevated reporting limit due to high target concentration.

Notes:
FE - Flammability and Explosivity Screening Level
GSI - Groundwater/Surface Water Interface Criteria
NGVIA - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria
NA - Not Analyzed
ug/L - micrograms per liter
Shaded and Bolded results exceeds one or more criteria.
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X - Elevated reporting limit due to matrix interference.
Y - Elevated reporting limit due to high target concentration.

Notes:
FE - Flammability and Explosivity Screening Level
GSI - Groundwater/Surface Water Interface Criteria
NGVIA - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria
NA - Not Analyzed
ug/L - micrograms per liter
Shaded and Bolded results exceeds one or more criteria.
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X - Elevated reporting limit due to matrix interference.
Y - Elevated reporting limit due to high target concentration.

NA - Not Analyzed
ug/L - micrograms per liter
Shaded and Bolded results exceeds one or more criteria.
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X - Elevated reporting limit due to matrix interference.
Y - Elevated reporting limit due to high target concentration.

Table 11 **2014 Proposed Groundwater Monitoring Plan, 2013 CMI Annual Report**
RACER Trust Buick City Site, Flint, Michigan

Proposed Sampling Location	Sampling Area	Analytical Parameters	Bulkheaded Location	Sampling Rationale
36-FP1	Factory 36	VOCs, arsenic	yes	Evaluate dissolved-phase exceedances; monitoring well located within VOC plume and located on-site.
RFI-36-08	Factory 36	VOCs	yes	Monitor dissolved-phase concentrations.
RFI-36-20	Factory 36	VOCs, mercury	no	Evaluate dissolved-phase concentrations downgradient of exceedances and off-site.
RFI-36-37	Factory 36	VOCs, arsenic	no	Evaluate dissolved-phase concentrations cross-gradient of exceedances and downgradient of LNAPL footprint.
RFI-36-44	Factory 36	VOCs, arsenic	no	Evaluate dissolved-phase exceedances; monitoring well located within VOC plume and located off-site.
RFI-36-47	Factory 36	VOCs, arsenic, chromium, manganese, silver, and vanadium	no	Evaluate dissolved-phase concentrations off-site.
RFI-36-55R	Factory 36	VOCs, arsenic	no	Evaluate dissolved-phase concentrations downgradient of exceedances and off-site.
RFI-36-56	Factory 36	VOCs, arsenic	no	Evaluate dissolved-phase concentrations cross-gradient of exceedances.
70-163	Factory 10	VOCs and manganese	no	Evaluate dissolved-phase concentrations downgradient of exceedances and off-site.
70-164	Factory 10	VOCs and selenium	no	Evaluate disolved-phase concentrations downgradient to property line and LNAPL footprint.
RFI-10-32	Factory 10	VOCs, arsenic, cyanide, selenium and silver	no	Evaluate dissolved-phase concentrations off-site.
RFI-10-33	Factory 10	VOCs, cyanide, lead, manganese, silver, and vanadium	no	Evaluate dissolved-phase concentrations at property boundary.
RFI-10-37	Factory 10	VOCs	no	Evaluate dissolved-phase exceedances; monitoring well located within VOC plume and located adjacent to property line.
07-01	Factory 81 and 85/86	VOCs	no	Evaluate disolved-phase concentrations downgradient of LNAPL footprint.
87-FP3	Factory 81 and 85/86	VOCs, arsenic, and selenium	no	Evaluate dissolved-phase exceedances; monitoring well located within VOC plume and at property boundary.
87-FP5	Factory 81 and 85/86	VOCs, arsenic, and selenium	no	Evaluate dissolved-phase concentrations in area, and near LNAPL plume observed near property boundary.
RFI-02-08R	Factory 81 and 85/86	VOCs and arsenic	yes	Evaluate dissolved-phase concentrations downgradient of plume.
RFI-86-02	Factory 81 and 85/86	VOCs and arsenic	no	LNAPL observed in well - only sample if LNAPL not present
RFI-86-06S	Factory 81 and 85/86	VOCs and arsenic	no	Evaluate disolved-phase concentrations downgradient to property line and LNAPL footprint.
RFI-86-08R	Factory 81 and 85/86	VOCs, arsenic, and selenium	no	Evaluate Dissolved-phase exceedances; monitoring groundwater cross-gradient of LNAPL footprint and evaluate at property boundary.
40-304	Factory 16/40	VOCs and PCBs	yes	Due to the distance to river will continue to monitor dissolved-phase concentrations downgradient of LNAPL footprint.
40-305	Factory 16/40	Cyanide	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-40-03	Factory 16/40	VOCs	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-40-07	Factory 16/40	VOCs, arsenic, beryllium, cyanide, mercury, and silver	yes	Due to distance to river will continue to evaluate dissolved-phase concentrations downgradient of exceedances.
RFI-40-09	Factory 16/40	VOCs, arsenic and cyanide	yes	Due to the distance to river will continue to monitor dissolved-phase concentration exceedances and evaluate groundwater downgradient of LNAPL footprint.
RFI-40-25	Factory 16/40	VOCs, arsenic and cyanide	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-09-48	Factory 84/94	VOCs, arsenic and cyanide	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-84-06R	Factory 84/94	Cyanide	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-84-09S	Factory 84/94	VOCs, arsenic and cyanide	yes	Due to distance to river will continue to evaluate dissolved-phase concentrations downgradient of exceedances.
RFI-84-09D	Factory 84/94	VOCs, arsenic and cyanide	yes	Due to distance to river will continue to evaluate dissolved-phase concentrations downgradient of exceedances.
RFI-17-02S	Factory 84/94	VOCs, arsenic and cyanide	yes	Due to distance to river will monitor dissolved-phase exceedences at well.
RFI-17-02D	Factory 84/94	VOCs, arsenic and cyanide	yes	Due to distance to river will monitor dissolved-phase exceedences at well.
RFI-94-02	Factory 84/94	VOCs	yes	Due to distance to river will continue to monitor dissolved-phase exceedences at well.
RFI-94-10	Factory 84/94	VOCs	no	Due to distance to river will continue to evaluate dissolved-phase concentrations downgradient of exceedances.
RFI-09-08	Building 09	VOCs	no	Evaluate dissolved-phase concentrations at property boundary.
RFI-09-44	Building 09	VOCs	no	Evaluate disolved-phase concentrations downgradient of LNAPL footprint.
RFI-09-47	Building 09	VOCs	no	Evaluate disolved-phase concentrations downgradient of LNAPL footprint.
RFI-09-53	Building 09	VOCs	no	Evaluate dissolved-phase concentrations at property boundary.
RFI-09-55S	Building 09	VOCs	no	Due to distance to river will continue to monitor dissolved-phase exceedences at well.

Notes:
LNAPL = light nonaqueous phase liquid
VOCs = volatile organic compounds
PCBs = Polychlorinated Biphenyls

Table 14 002 Passive Recovery Trench Monitoring Summary, 2013 CMI Report
RACER Trust, Buick City Site, Flint, Michigan

Month	2-18 Location Results/Notes	Accumulated LNAPL Total for 2-18 (Gal.)	2-21 Location Results/Notes	Accumulated LNAPL Total for 2-21(Gal.)	Total Est. LNAPL Accumulated in Booms (Gal.)
Jun-13	6/26 Boom installed. 0.75' LNAPL Thickness	0	6/11 Boom installed. No measurable LNAPL.	0	**0**
Jul-13	Obtained 75% saturation. LNAPL thickness was ~0.1'.	4.5	Obtained 75% saturation. No measurable LNAPL.	4.5	**9**
Aug-13	Boom reached 100% saturation and was changed at beginning of month. Accumulated 20% saturation. No measurable LNAPL.	1.9	Reached 85% saturation and was changed. Then accumulated 10% on the new boom. No measurable LNAPL.	0.8	**2.7**
Sep-13	Saturation of boom increased to 70%. No measurable LNAPL.	1	Saturation of boom increased to 50%. No measurable LNAPL.	0.8	**1.8**
Oct-13	Saturation of boom increased to 80%. No measurable LNAPL.	0.2	Saturation remained at 50%. No measurable LNAPL.	0	**0.2**
Nov-13	Boom reached 100% saturation and was changed. An additional 10% saturation was collected. No measurable LNAPL.	0.6	Saturation remained at 50%. No measurable LNAPL.	0	**0.6**
Dec-13	Saturation of boom increased to 50%. No Measurable LNAPL.	0.8	Saturation increased to 75%. No Measurable LNAPL.	0.5	**1.3**
Jan-14	Saturation of boom increased to 75% and was replaced. An additional 10% was collected. No measurable LNAPL.	0.7	Saturation increased to 100% and was changed twice in January. 1.5' of LNAPL was measured twice (2 days apart) then quickly went down to 0.1' thickness.	2.5	**3.2**
Feb-14	Saturation of boom increased to 20%. No measurable LNAPL.	0.2	Boom which was installed on 1/20 reached 20% saturation. 0.03' LNAPL measured.	0.4	**0.6**
	EST. TOTAL	**9.9**		**9.5**	**19.4**

Notes:
LNAPL = Light non-aqueous phase liquid
Gal = gallons
% = percent
' = feet

LEGEND:

- RACER PROPERTY BOUNDARY
- MONITORING WELL
- ABANDONED MONITORING WELL
- RFI SOIL BORING/GRAB GROUNDWATER SAMPLE LOCATION
- APPROXIMATE HISTORICAL EXTENT OF MEASURABLE LNAPL (>0.5 FEET)
- APPROXIMATE CURRENT EXTENT OF MEASURABLE LNAPL (>0.1 FEET)
- NSZD LOCATION

NOTES:

1. BASE MAP INFORMATION FROM A SURVEY BY BMJ, INC. DATED APRIL 2001, AT A SCALE OF 1:100. AERIAL IMAGE FROM ARCGIS 10 ONLINE MAPPING, ACCESSED 6/12/2013.
2. BASED ON INFORMATION AVAILABLE AS OF 3/19/2014.

Respirometry Report by Environmental Business Specialists

TPH Removal in Soil

Arcadis – Buick City

Introduction

Arcadis contacted Environmental Business Specialists (EBS) in order to perform a soil respirometry study that would study the performance of two soil bioaugmentation products, UltraTech UltraMicrobes (referred to as Archaea in the protocol) in combination with MiracleGro and Probiotic Scrubber II (referred to as Biolynceus in the protocol), in remediating hydrocarbons in soil. A protocol was developed by Arcadis that included the mass of soil to be used and dosing concentrations. Soil was shipped to EBS in narrow mouth amber glass bottles.

Methods

This study was conducted according to Test Plan provided by Arcadis dated October 2013 (see Appendix). Soil/compost reactor columns constructed by Challenge Technology were connected to a RSA PF-8000 Respirometer for collection of oxygen uptake data (Figure 1). The study was run at room temperature of approximately 22°C for 30 days.

Figure 1 - Example of oil/compost reactors used in study

Results and Discussion

The appearance of each soil sample was different from the next. An important point is that each sample had high clay content. This could severely limit aerobic respiration because of the inability of oxygen to diffuse into dense, wet clay. It was noted in the protocol that an attempt to remove larger particles from the soil samples was made at the time of sampling. Additionally, the clay formations make homogenizing the samples very difficult and likely led to the inconclusive results.

Initial and final physical-chemical data on the soil samples can be found below in Table 1. As there are only eight soil cells, the control for 5-15 feet below ground surface (ft. bgs) was not included in the study. From the significant differences in initial TPH, initial moisture, and total solids it appears that the 5-15 ft. bgs initial sample is very different from the other two samples. In comparing the 5-10 ft. bgs and 10-15 ft. bgs treated samples the Probiotic Scrubber II performed best (Figure 2). The contrary is found in the 5-15 ft. bgs samples where the UltraTech UltraMicrobes with nutrient added resulted in lower TPH concentrations. Nutrient addition could be a significant factor in the removal of hydrocarbons as is noted in the protocol but that was not seen in the data collected.

Environmental Business Specialists, LLC * 1930 Surgi Dr., Mandeville, LA 70448
Maxwell@ebsbiowizard.com * 985-674-0660 ext. 105

Respirometry results displayed in Figure 3 are inconclusive. The sample that should have had the highest respiration because of significant TPH removal, 5-15 ft. bgs UltraMicrobes, only had middle of the pack respiration. 5-10 ft. bgs control respirometry results show the highest oxygen uptake but TPH removal data is the exact opposite where we see obvious decrease in the concentration of TPH. Oxygen consumption was very irregular and nonexistent at times. The 5-10 ft. bgs reactor never measured any significant respiration despite having a tight seal to prevent air leakage. The air tight seals in each reactor were checked periodically to ensure that no leaks developed. From time to time, though, it seemed that a leak had developed in reactor but that does not make sense that a leak in plastic and PVC, the material that makes up the soil/compost reactors, would spontaneously develop. This apparent leakage could be due to the combination of aerobic and anaerobic bacteria respiring simultaneously and cancelling each other out or that anaerobic respiration was higher than aerobic at times. Because the respirometer relies on generation of CO_2 by aerobic bacteria coupled with the sequestration of that CO_2 by the NaOH scrubber to generate a vacuum to allow in more O_2, the generation of gases such as CH_4 and H_2S would negate this effect. The effect of this would be that aerobic respiration would be lower to nonexistent, which is what we see in Figure 3. Lastly, due to the density of clay found in the samples the formation of anaerobic zones is very likely. Clay and high moisture concentrations create a matrix that is very dense and allows for little oxygen diffusion.

Table 1 - Physical-chemical data

Depth (ft. bgs)	Initial TPH (mg/kg-dry)	Initial Moisture (%)	Initial Total Solids (%)	Initial Volatile Solids (%)	TPH w/ UltraTech UltraMicrobes (mg/kg-dry)	Moisture w/ UltraTech UltraMicrobes (%)	TPH w/ Probiotic Scrubber II (mg/kg-dry)	Moisture w/ Probiotic Scrubber II (%)	TPH Control (mg/kg-dry)	Moisture Control (%)

Appendix

Test Plan for TPH removal in Soil

October 2013

Objectives:

The objective of this study is to investigate the feasibility of augmentation to enhance the biological removal of total petroleum hydrocarbons (TPH) in soil.

Soil Sampling:

Soil samples could not be sieved due to soil lithology. An effort was made to remove any larger particles prior to placing the samples in soil jars.

Soil sample quantity will be about three pounds for each of the following soil sample intervals:

- 5-10 feet below ground surface (ft bgs)
- 10-15 ft bgs
- 5-15 ft bgs

Test Methods

This study will consist of Initial soil characteristic, and Respirometer test. Initial soil characteristic tests are to measure fundamental information of soil. Respirometer test is to evaluate the feasibility of augmentation to enhance the bioactivity for removal of TPH in soil. This test will simulate the soil remediation site with Challenge respirometer soil/compost reactor columns. After completion of the respirometer test, soil characteristics will be measured again to estimate the removal of TPH.

Initial soil characteristic

Once the soil sample received, TS/VS and TPH will be measured as initial soil characteristic.

Respirometer test

The Challenge respirometer soil/compost reactor will be set up, one control vs. three augmented samples. Each reactor has 100g soil inside cell and 50 ml of DI water in the bottom of the reactor to provide humidity. Oxygen consumption from the reactors will be monitored for 30 days.

Detail set up procedure as below:

1. Place the soil sample in the inner column. Pack the sample by gently tamping the inner column on a solid surface; place the cap on the top of the packed inner soil column; place the inner column into the soil reactor column; place a KOH vial into the depression of the cap; place 5 mL of 30% KOH into the plastic vial; place the o-ring on the top of the outer soil reactor column and tighten the cap snuggly.

2. Position each column in the water bath on the stirring base. Temperature in the water bath will be set with the average temperature of the sampling site. Adjust the stirring speed between 100 and 200 RPM. This will allow the fan to gently circulate air around the sample.

3. Connect the 10cc syringe (plunger at 0cc) and Tygon tubing to the side port of the 3-way valve; adjust the 3-way valve so that all outlets are open; pull back the syringe until a bubble is drawn through the flow-cell and breaks the beam of light. The flow-cell is now zeroed and ready for counting.

4. Turn the handle of the valve so that the valve is open between the flow-cell and the soil reactor column and closed to the syringe.

5. Open oxygen cylinder, start program Challenge AER-ANR, and start data acquisition.

6. After 30 days operation, stop the data acquisition and TS/VS and TPH will be measured from the soil inside the reactor.

Microbe Dosage/Sample Application

Two microbial formulations will be added to the soil samples as part of this testing. Dosage is as follows:

Oppenheimer Biotechnology, Inc - Archaea

0.037 grams (g) microbe formulation + 0.007 g All-Purpose Miracle Gro*/ 100 g soil

Biolynceus

0.039 g microbe formulation/100 g soil

Soil samples will be treated at the above dosages as follows:

- 5-10 ft bgs + Archaea + Miracle Gro*
- 10-15 ft bgs + Archaea + Miracle Gro*
- 5-15 ft bgs + Archaea + Miracle Gro*
- 5-10 ft bgs + Biolynceus
- 10-15 ft bgs + Biolynceus
- 5-15 ft bgs + Biolynceus
- 5-10 ft bgs control (no additions)
- 10-15 ft bgs control (no additions)

*Any all-purpose fertilizer will suffice. Fertilizer will ensure there is no shortage of Phosphorus, so a formulation containing more phosphorus (such as a seed-starting formulation) is preferred.

Subject:
April 2013 Monthly VOC Emissions Report
Revitalizing Auto Communities Environmental Response Trust
Permit No. 165-11
1200 East Hamilton Ave., Flint, Michigan

Date:
May 15, 2013

Contact:
Edward Cote

Phone:
248-994-2295

Email:
Edward.Cote@arcadis-us.com

Our ref:
B0064410.2013.01500

Dear District Supervisor:

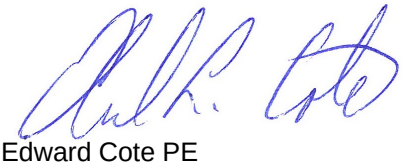
Pursuant to Special Condition VII.1 of Permit No. 165-11, ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER), is submitting the attached monthly data for the RACER facility located at 1200 East Hamilton Avenue in Flint, Michigan [State Registration Number (SRN) A1178]. The monthly data includes the flow rate and total VOC concentration of the vapor streams into the oxidizer, and the VOC emission rates (see attached Table 1).

On 4/9/2013, the remediation system at 1200 East Hamilton Avenue in Flint, Michigan began operation. The system is a multi-phase extraction (MPE) system which includes a soil vapor extraction system (SVE) and an air stripper (AS). April 2013 operations are summarized below:

- The system commenced operations on 4/9/2013 with all 28 MPE wells from three “zones” of wells operating.
- On 4/12/2013, a compressor failed, causing the system to shut down.
- The system was re-started on 4/15/2013, but was once again shut down on 4/16/2013 due to an oil water separator (OWS) high level alarm. A vapor sample was collected on 4/16/2013 prior to shut down (28 wells were operating at the time of sample collection). While the system was shut down, groundwater samples were analyzed and indicated that the MPE system operations needed to be modified in order for the effluent to remain in

compliance with the City of Flint Publically Owned Treatment Works (POTW) wastewater discharge permit.

- Operations recommenced on 4/22/2013 with only 6 wells operational. A vapor sample was collected on 4/22/2013.
- The system has been operating intermittently since 4/22/2013 and additional MPE wells are being brought on line every 1-2 weeks of operation.



During the month of April 2013, the MPE system operated 87 hours from 4/9/2013 through 4/16/2013 (with 28 wells operational) and 38 hours from 4/22/2013 through 4/30/2013 (with 6 wells operational) for a total of 125 operating hours. The thermal oxidizer operated at all times that the MPE system operated and volatile organic compound (VOC) and hazardous air pollutant (HAP) emissions were within the limits of Permit No. 165-11.

As shown in the attached Table 1, the VOC concentrations decreased significantly from the 4/16/2013 sample to the 4/22/2013 sample. This is due to both the reduction in the number of wells operating and the location of the 6 wells (further away of center the source area). As additional wells are added during May 2013, VOC concentrations are expected to increase again. Subsequent samples were collected on 5/3/2013 and 5/10/2013 and will be included in the May 2013 report.

Please call me at 248-994-2295 if you have any questions.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward Cote PE
Principal Engineer

Dear District Supervisor:

Pursuant to Special Condition VII.1 of Permit No. 165-11, ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER), is submitting the attached monthly data for the RACER facility located at 1200 East Hamilton Avenue in Flint, Michigan (SRN A1178). The monthly data includes the flow rate and total volatile organic compound (VOC) concentration of the vapor streams into the oxidizer, and the VOC emission rates (see attached Table 1).

During the month of May 2013, the multi-phase extraction (MPE) system operated a total of 553 hours. Vapor samples were collected on 5/3/2013, 5/10/2013, and 5/17/2013. The 5/17/2013 sample was our fifth weekly sample. Beginning in June 2013, we will commence monthly sampling as allowed under Special Condition VI.3 of the permit.

The thermal oxidizer operated at all times that the MPE system operated and VOC and hazardous air pollutant (HAP) emissions were within the limits of Permit No. 165-11. As shown in the attached Table 1, influent VOC concentrations increased throughout the subsequent samples in May. As additional wells are added during June 2013, influent VOC concentrations are expected to continue to increase.

Please call me at 248-994-2295 if you have any questions.

Dear District Supervisor:

Pursuant to Special Condition VII.1 of Permit No. 165-11, ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) is submitting the attached monthly data for the facility located at 1200 East Hamilton Avenue in Flint, Michigan (SRN A1178). The monthly data includes the flow rate and total VOC concentration of the vapor streams into the oxidizer, and calculations of the VOC emission rates (see Table 1).

During the month of July 2013, the multi-phase extraction (MPE) system operated a total of 396.12 hours. One vapor sample was collected on 7/17/2013, as required under Special Condition VI.3 of the permit. The thermal oxidizer operated at all times that the MPE system operated and VOC and hazardous air pollutant (HAP) emissions were within the limits of Permit No. 165-11.

Sincerely,

ARCADIS G&M of Michigan, LLC

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during April 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of April 2013, 7,310.9 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1).

To monitor system initial performance, upon start-up of the treatment system, an individual effluent grab wastewater sample was collected on April 11, 2013, 2 days after full-scale system operation. The sample was analized for:

- ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E624M,
- total mercury according to USEPA Method EPA 245.1,
- PCBs according to USEPA Method E608,
- pH (field measured),

- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

An additional effluent grab wastewater sample was collected on April 22, 2013 and analyzed for benzene, toluene, ethyl benzene and total xylenes (BTEX) according to USEPA Method E624.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on April 30, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- mmonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E624M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured),
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected during start up and shake down on April 11, 2013 resulted in exceedances for ethylbenzene and total xylenes. Results were reported above permit limitations at 0.16 miligrams per liter (mg/L) for ethylbenzene and 0.6 mg/L for total xylenes respectively. All remaining analytical results of the effluent wastewater samples collected on April 11, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

The City of Flint Water Pollution Control Division was notified of the exceedance orally on April 18, 2013. A written notice of the exceedance was sent out to the City of Flint Water Pollution Control Division on April 30, 2013 and is included in Attachment 3.

Analytical results from the effluent sample collected on April 22, 2013 reported below laboratory method detection limits and/or below permit limitations (see Table 2).

Analytical results from the effluent samples collected on April 30, 2013 during start up and shake down for total zinc were reported above permit limitations at 0.492 mg/L. All remaining analytical results of the effluent wastewater samples collected on April 30, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

The City of Flint Water Pollution Control Division was notified of the exceedance orally on May 17, 2013. A written notice of the exceedance was sent out to the City of Flint Water Pollution Control Division on May 21, 2013 and is included in Attachment 3.

Sincerely,

ARCADIS G&M of Michigan, LLC

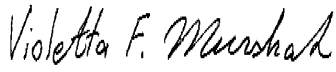
Report Summary



Lab Sample ID(s): S56057.01-S56057.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 04/11/2013
Submitted Date/Time: 04/12/2013 08:00
Sampled by: DNewcom,TSwarthout
P.O. #: B0064410.2013.0

Added Xylenes to .05 per client request

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S56177.01
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 04/22/2013
Submitted Date/Time: 04/23/2013 11:10
Sampled by: DNewcom,TSwarthout
P.O. #: B0064410.2013.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S56262.01-S56262.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 04/30/2013
Submitted Date/Time: 05/01/2013 13:30
Sampled by: DNewcom,TSwarthout
P.O. #: B0064410.2013.0

All analysis complete

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Sample Summary (5 samples)

Report Summary

Lab Sample ID(s): S56057.01-S56057.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 04/12/2013 08:00
Sampled by: DNewcom,TSwarthout
P.O. #: B0064410.2013.0

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-18)
Batch QC Results (Pages 19-35)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

QC Report - Analysis Summary

Lab Sample ID: S56262.02

Sample Tag: AOI-09B-GAC-EFF-GRAB02 (043013)

Collected Date/Time: 04/30/2013 10:30

Matrix: Water

COC Reference: BC041113.1

Analysis	Method	Run Date/Time	Batch ID	Prep ID	Surr	QC Types
Inorganics						
Amenable Cyanide	335.4/4500-CN-G	05/08/13 12:16	CN130508-W1	CN130508-W1	No	BLK/LCS/MS/MSD/DUP
Oil & Grease n-Hexane Extract.	1664A	05/08/13 12:23	OGHEX130508W01	OGHEX130508W01	No	BLK/LCS
Organics - Volatiles						
VOCs, TTO List	E624	05/03/13 15:50	130503A7	VF130503W2	Yes	LCS/BLK/LCSD
Xylenes	E624	05/03/13 15:50	130503A7	VF130503W2	Yes	LCS/BLK/LCSD

QC Report - Analysis Summary

Lab Sample ID: S56262.03

Sample Tag: AOI-09B-GAC-EFF-GRAB03 (043013)

Collected Date/Time: 04/30/2013 11:30

Matrix: Water

COC Reference: BC041113.1

Analysis	Method	Run Date/Time	Batch ID	Prep ID	Surr	QC Types
Inorganics						
Amenable Cyanide	335.4/4500-CN-G	05/08/13 12:18	CN130508-W1	CN130508-W1	No	BLK/LCS/MS/MSD/DUP
Oil & Grease n-Hexane Extract.	1664A	05/08/13 12:23	OGHEX130508W01	OGHEX130508W01	No	BLK/LCS
Organics - Volatiles						
VOCs, TTO List	E624	05/03/13 16:12	130503A7	VF130503W2	Yes	LCS/BLK/LCSD
Xylenes	E624	05/03/13 16:12	130503A7	VF130503W2	Yes	LCS/BLK/LCSD

QC Report - Analysis Summary

Lab Sample ID: S56262.04

Sample Tag: AOI-09B-GAC-EFF-GRAB04 (043013)

Collected Date/Time: 04/30/2013 12:30

Matrix: Water

COC Reference: BC041113.1

Analysis	Method	Run Date/Time	Batch ID	Prep ID	Surr	QC Types
Inorganics						
Amenable Cyanide	335.4/4500-CN-G	05/08/13 12:20	CN130508-W1	CN130508-W1	No	BLK/LCS/MS/MSD/DUP
Oil & Grease n-Hexane Extract.	1664A	05/08/13 12:23	OGHEX130508W01	OGHEX130508W01	No	BLK/LCS

Our ref:
B0064410.2013.01500

Dear Mr. Hutchings:

Per our discussion on April 19th and April 26th regarding the RACER Buick City Sanitary Use Permit #2-02-RBC001, please find the following information regarding a known discharge in exceedance of the daily maximum allowance:

Date/time the sample was collected

- A sample was collected from the system discharge on April 11 at 1:30 PM and submitted for laboratory analysis of:
  - Total arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc;
  - Ammonia and phosphates;
  - BOD and suspended solids;
  - Oil and Grease;
  - VOCs TTO;
  - SVOC TTO; and
  - PCBs.
- This sample was not collected as part of the monthly sampling event. It was a grab sample collected of the system effluent to confirm detections as part of the system startup/shakedown process.

Volume of Water Discharged:

- Approximately 24,200 gallons were discharged between the time of sample collection and the system shut down.

Duration of Discharge:

- The system continued to operate from the time the sample was collected to 9:56 PM on April 12. The system was shut down over the weekend and began operation again at 11:00 AM on April 15 and was shut down again at 19:49 PM on April 16.

Constituents of Concern and Concentrations:

- Ethylbenzene(0.160 mg/L);
- Xylenes (total) (0.600 mg/L);
- Laboratory analytical is attached.

Exceedance Possible Cause:

- Operation of the AOI 09-B system was initiated on April 9, 2013. The system is currently undergoing startup/shakedown where the system operation is balanced and optimized. It is thought that the Granular Activated Carbon (GAC) was overloaded while attempting to balance the system.

Actions:

- The system was shut down on April 16 due to an alarm and upon identification of the exceedance on April 17, the system operator was informed not to restart.
- The analytical data and system operation are being reviewed to identify the potential causes of the GAC overload prior to restarting the system.
- A GAC changeout was performed on April 18, 2013.

Time the Exceedance was Identified:

- Analytical data was received on April 17 at 6:28 PM.
- The data was reviewed and the exceedance was identified at approximately 9:00 AM on April 18.
- Xylenes was requested on April 26th and received the same day. The exceedance was identified at approximately 12:00 PM on April 26th.

Time the Exceedance Orally Reported to the City:

- An initial message was left with Tom Hutchings at 5:20 PM on April 18.
- The issue was discussed via telephone conversation with Tom Hutchings at 8:10 AM on April 19.
- The xylenes exceedance was discussed via e-mail submitted at 2:48 PM on April 26th.

On April 22 the system was restarted and a grab sample of the effluent was collected for BTEX. The system was shut down until the laboratory results were received. The results of that analytical are attached indicating that the discharge is compliance with the permit requirements.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Please let me know if you have any questions or concerns.

Sincerely,

Email:
Edward.Cote@arcadis-us.com

Our ref:
B0064410.2013.01500

Dear Mr. Hutchings:

Regarding the RACER Buick City Sanitary Use Permit #2-02-RBC001, please find the following information regarding a known discharge in exceedance of the daily maximum allowance for zinc. Please note that the system is currently in the startup and system adjustments are underway.

Date/time the sample was collected:

- A sample was collected from the system discharge on April 30 at 1:00 PM and submitted for laboratory analysis of:
  - Total arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc;
  - Ammonia and phosphates;
  - BOD and suspended solids;
  - Oil and Grease;
  - VOCs TTO;
  - SVOC TTO; and
  - PCBs.
- This sample was collected as part of the monthly sampling event.

Volume of Water Discharged:

- Approximately 62,309 gallons were discharged between the time of sample collection and the known discharge in exceedance of the daily maximum allowance.

Duration of Discharge:

- The system continued to operate from the time the sample was collected to 4:26 PM on May 1, 2013. The system was restarted at 5:42 PM May 1, 2013. The system ran on and off from May 1, 2013 to the time of notice for exceedances on May 17, 2013 for roughly 193 hours and continues to operate.

Constituents of Concern and Concentrations:

- Zinc (total) (0.492 mg/L);
- Laboratory analytical is attached.

Exceedance Possible Cause:

- Operation of the AOI 09-B system was initiated on April 9, 2013. The system is currently undergoing startup/shakedown where the system operation is balanced and optimized. It is thought that, as the system has begun to generate silt accumulation within the 25micron bag filters, metals potentially adsorbed to fine silt particles that subsequently passed through the filters in the effluent stream.

Actions:

- The system was left operational on May 17, 2013. Smaller micron bag filters were put in place on May 17, 2013 at approximately 4:00 PM.
- The analytical data and system operation are being reviewed to identify the potential causes of the effluent groundwater exceedance.

Time the Exceedance was identified:

- Analytical data was received on May 17, 2013 at 1:16 PM.
- The data was reviewed and the exceedance was identified at approximately 1:45 PM on May 17, 2013.

Time the Exceedance Orally Reported to the City:

- An initial message was left with Tom Hutchings at 2:40 PM on May 17, 2013. A telephone conversation of the exceedance was discussed Monday, May 20 at 8:45.

Future system sampling is planned for the week of May 27th. Results will be used to indicate whether the discharge is in compliance with the permit requirements.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Please let me know if you have any questions or concerns.

Our ref:
B0644410.2013.01500

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during May 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of May 2013, 13,750.20 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1).

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on May 31, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E624M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured),
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Due to time limitations and system operational issues for this monthly sample, the composite sample was collected over a 6 hour period. Earlier attempts were made to collect the sample but power loss and operational alarms had prevented a full 24 hour composite from being collected. When it was identified the 24 hour time period would not be achievable, the City of Flint was contacted and a shortened collection time was deemed more favorable than attempting another 24 hour period pushing into June. Also, do to timing limitation the composite sample was not submitted within the hold time limit for the Biochemical Oxygen Demand (BOD). This sample was collected in accordance with all other requirements of the composite sample.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on May 31, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Report Summary

Lab Sample ID(s): S56672.01-S56672.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 05/31/2013
Submitted Date/Time: 06/03/2013 14:15
Sampled by: B Lawrence
P.O. #: B0064410.2013.01500

Report split up by COC per client request

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S56672.01-S56672.09
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 06/03/2013 14:15
Sampled by: B Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-10)
Prep Batch Summary (Pages 11-12)
Surrogates per Lab Sample (Pages 13-21)
Surrogates per QC Sample (Pages 22-28)
Batch QC Results (Pages 29-45)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

ENVIRONMENT

Environmental Compliance Inspector
City of Flint Water Pollution Control Division
G-4652 Beecher Road.
Flint, Michigan 48532

Subject:
June 2013 Monthly Discharge Report for Revitalizing Auto Communities Environmental Response Trust, Use Permit No. 2-02-RBC001, 1200 East Hamilton Ave., Flint, Michigan.

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during June 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of June 2013, 16,090.10 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 447 cubic feet (3,343 gallons per day) at an average 14 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on June 28, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E624M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

Date:
July 25, 2013

Contact:
Edward L. Cote, PE

Phone:
248.994.2295

Email:
Edward. Cote@arcadis-us.com

Our ref:
B0644410.2013.01500

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Due to time constraints and system operational issues experienced in June the City of Flint was not able to collect an effluent sample from the MPE system. Multiple attempts were made to collect the sample, but noncontinuous effluent flow and system shut downs prevented the City of Flint from being able to collect the sample in June. Modifications to the treatment system were made following identification of the problems to allow for continuous flow and proper operation prior to ARCADIS collecting the sample on June 28, 2013.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on June 28, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE
Principal Engineer

Report Summary

Lab Sample ID(s): S57071.04-S57071.08
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 06/28/2013
Submitted Date/Time: 06/28/2013 14:30
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Sample .04-.08 per client request

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

KEYS

Preservation Key:
A. H_2SO_4
B. HCL
C. NaOH
D. HNO_3
E. None
F.
G.
H.

Container Information Key:
1. 40 mL VOA
2. 1 L Amber
3. 125 mL Plastic
4. 250 mL Plastic
5. 500 mL Plastic
6. 1 L Plastic
7. 2 oz. Glass
8. 4 oz. Glass
9. 8 oz. Glass
10. Other

Matrix Key:
SE = Sediment
S= Solids
Wipe
A = Air
NL = NAPL / Oil
L= Liquid
SW = Surface

Report Summary

Lab Sample ID(s): S57071.01-S57071.09
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 06/28/2013 14:30
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-10)
Prep Batch Summary (Pages 11-12)
Surrogates per Lab Sample (Pages 13-21)
Surrogates per QC Sample (Pages 22-28)
Batch QC Results (Pages 29-46)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Our ref:
B0644410.2013.01500

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during July 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of July 2013, 11,680.98 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 354 cubic feet (2,648 gallons per day) at an average 15.6 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on July 17, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E625M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on July 17, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2). Dimethyl Phthalate showed detections within the composite sample. It was noted in the lab report this compound was also found in associated method blank.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE
Principal Engineer

Report Summary

Lab Sample ID(s): S57278.01-S57278.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 07/17/2013
Submitted Date/Time: 07/17/2013 14:00
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

0 Result reported as non-detect

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

PARAMETER ANALYSIS & METHOD

KEYS

Preservative	Container	Matrix
A. HCL	1. 40mL VOA	W = Water
B. HNO_3	2. 1L Amber	A = Air
C. H_2SO_4	3. 125 mL Plastic	S = Soil
D. NaOH	4. 250 mL Plastic	SE = Sediment
E. None	5. 32oz Plastic	SL = Solids
F. Hexane	6. 1 L Plastic	NL = NAPL / Oil
	7. 2 oz Glass	SW = Surface Wipe
	8. 4 oz Glass	T = Tissue
	9. 32oz Glass	

REMARKS

Special Instructions/Comments: P.O.No: 126110 - Please email invoices to Christi Kiker (ARCADIS). email addresses:christi.kiker@arcadis-us.com; deborah.newcom@arcadis-us.com; trevor.swarthout@arcadis-us.com; andrea.krevinghaus@arcadis-us.com
Direct bill to ARCADIS **WA007** **Please cc Erin Kozak on sample receipt**

Report Summary

Lab Sample ID(s): S57278.01-S57278.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 07/17/2013 14:00
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-16)
Batch QC Results (Pages 17-30)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Barbara Ball
Quality Assurance Manager

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during September 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of September 2013, 11,451.65 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 382 cubic feet (2,855 gallons per day) at an average 15 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on September 24, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E625M,
- total mercury according to USEPA Method EPA 245.1, and

- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on September 24, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE

Principal Engineer

Report Summary

Lab Sample ID(s): S57627.01-S57627.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 08/14/2013
Submitted Date/Time: 08/14/2013 15:10
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S57627.01-S57627.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 08/14/2013 15:10
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-16)
Batch QC Results (Pages 17-33)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Barbara Ball
Quality Assurance Manager

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during September 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of September 2013, 11,451.65 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 382 cubic feet (2,855 gallons per day) at an average 15 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on September 24, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E625M,
- total mercury according to USEPA Method EPA 245.1, and

- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on September 24, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE

Principal Engineer

Report Summary

Lab Sample ID(s): S58232.01-S58232.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 09/24/2013
Submitted Date/Time: 09/24/2013 14:30
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002)
IN Drinking Water (#C-MI-07), NELAC NY (#11814), NCDENR (#680), NC Drinking Water (#26702)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S58232.01-S58232.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 09/24/2013 14:30
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-16)
Batch QC Results (Pages 17-32)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Barbara Ball
Quality Assurance Manager

Subject:
October 2013 Monthly Discharge Report for Revitalizing Auto Communities Environmental Response Trust, Use Permit No. 2-02-RBC001, 1200 East Hamilton Ave., Flint, Michigan.

ENVIRONMENT

Dear Mr. Robert J. Case:

Date:
November 26, 2013

Contact:
Edward L. Cote, PE

Phone:
248.994.2295

Email:
Edward. Cote@arcadis-us.com

Our ref:
B0644410.2013.01500

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during October 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of October 2013, 8,995.18 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 290 cubic feet (2,170 gallons per day) at an average 13.6 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on October 9, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E625M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on October 9, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE
Principal Engineer

Report Summary

Lab Sample ID(s): S58459.01-S58459.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 10/09/2013 15:00
Sampled by: Ben Lawrence
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-16)
Batch QC Results (Pages 17-30)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Barbara Ball
Quality Assurance Manager

Subject:
November 2013 Monthly Discharge Report for Revitalizing Auto Communities Environmental Response Trust, Use Permit No. 2-02-RBC001, 1200 East Hamilton Ave., Flint, Michigan.

ENVIRONMENT

Dear Mr. Robert J. Case:

Date:
December 27, 2013

Contact:
Edward L. Cote, PE

Phone:
248.994.2295

Email:
Edward. Cote@arcadis-us.com

Our ref:
B0644410.2013.01500

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during November 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

During the month of November 2013, 8,598.28 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flowrates on average were 330 cubic feet (2,474 gallons per day) at an average 11.0 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

In accordance with Use Permit No. 2-02-RBC001, one 24-hour flow-proportional composite effluent wastewater sample and four individual effluent grab wastewater samples were collected on November 20, 2013. The 24-hour flow-proportional composite effluent wastewater sample was analyzed for:

- Ammonia-nitrogen according to United States Environmental Protection Agency (USEPA) Method 4500-NH3 D,
- BOD according to USEPA Method 10360,
- total phosphorous according to USEPA Method 4500-PE,
- total suspended solids according to USEPA Method 2540D,
- total arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc according to USEPA Method E200.8,
- semi volatile toxic organics according to USEPA Method E625M,
- total mercury according to USEPA Method EPA 245.1, and
- PCBs according to USEPA Method E608.

The four effluent wastewater samples were analyzed for:

- pH (field measured) according to USEPA Method 4500HB.
- hexane extractable material (HEM) according to USEPA Method 1664A,
- amenable cyanide according to USEPA Method 335.4/4500-CN-G, and
- volatile toxic organics plus xylenes according to USEPA Method E624.

All samples were submitted, along with proper chain-of-custody documentation, to Merit laboratory in Lansing, Michigan. Laboratory method detection limits and analytical methodology were consistent with the Michigan Department of Environmental Quality (MDEQ) guidelines. The laboratory analytical reports and chain-of-custody documents are included in Attachment 1. The quality assurance/quality control (QAQC) reports for the analytical results can be found in Attachment 2.

Due to the weather trends becoming consistly below or near freezing temperatures, in order to prevent damage to system compoents during the winter months, the treatment system was shut down with no futher effluent discharge on November 26, 2013. The system will remain down during the months of December, January, Feburary and most of March. Start up will depend on weather treands and forcasted conditions. A letter notifiying the City of Flint of system startup will be provided prior to start up.

Groundwater Treatment System Monitoring Results

Analytical results from the effluent samples collected on November 20, 2013 were reported below laboratory method detection limits and/or below permit limitations (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE
Principal Engineer

Report Summary

Lab Sample ID(s): S59095.01-S59095.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Collected Date: 11/20/2013
Submitted Date/Time: 11/20/2013 15:50
Sampled by: Trevor Swarthout
P.O. #: B0064410.2013.01500

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc..

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002)
IN Drinking Water (#C-MI-07), NELAC NY (#11814), NCDENR (#680), NC Drinking Water (#26702)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

KEYS

Preservative	Container	Matrix
A. HCL	1. 40mL VOA	W = Water
B. HNO_3	2. 1L Amber	A = Air
C. H_2SO_4	3. 125 mL Plastic	S = Soil
D. NaOH	4. 250 mL Plastic	SE = Sediment
E. None	5. 32oz Plastic	SL = Solids
F. Hexane	6. 1 L Plastic	NL = NAPL / Oil
	7. 2 oz Glass	SW = Surface Wipe
	8. 4 oz Glass	T = Tissue
	9. 32oz Glass	

Special Instructions/Comments: P.O.No: 126110 - Please email invoices to Christi Kiker (ARCADIS). email addresses:christi.kiker@arcadis-us.com; deborah.newcom@arcadis-us.com; trevor.swarthout@arcadis-us.com; andrea.krevinghaus@arcadis-us.com
Direct bill to ARCADIS **WA007** **Please cc Erin Kozak on sample receipt**

Report Summary

Lab Sample ID(s): S59095.01-S59095.05
Project: B0064410.2013.01500/Buick City Site #1295 Task 1500
Submitted Date/Time: 11/20/2013 15:50
Sampled by: Trevor Swarthout
P.O. #: B0064410.2013.01500

Report Sections

Cover Page (Page 1)
Analysis Summary (Pages 2-6)
Prep Batch Summary (Pages 7-8)
Surrogates per Lab Sample (Pages 9-13)
Surrogates per QC Sample (Pages 14-16)
Batch QC Results (Pages 17-38)

Report Flag Descriptions

*: QC result is outside of indicated control limits
W: Surrogate result not applicable due to sample dilution

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RDL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), DOD/ISO 17025 (#69699), WBENC (#2005110032), Ohio EPA (#CL0002), IN Drinking Water (#C-MI-07), NELAC NY (#11814)
Some analytes reported may not be certified. Full certification lists are available upon request.

Barbara Ball
Quality Assurance Manager

QC Report - Analysis Summary

Dear Mr. Robert J. Case:

This letter report is submitted by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) and summarizes groundwater remediation system operation, monitoring, and maintenance (OM&M) activities conducted during December 2013 at the RACER Buick City AOI-9B Groundwater Remediation System located at 1200 East Hamilton Avenue in Flint, Michigan.

Groundwater Treatment System Operation and Monitoring

To prevent damage to system components during the winter months, the treatment system remained off during the month of December 2013. 0 cubic feet of wastewater was discharged to Outfall 001 of the RACER Buick City AOI-9B Groundwater Remediation System (see Table 1). The daily discharge flow rates on average were 0 cubic feet (0 gallons per day) at an average 0 gallons per minute. Daily discharge flow rates did not exceed 36,000 gallons per day or 25 gallons per minute.

The system will remain down during the months of January, February and most of March. Start up will depend on weather trends and forecasted conditions. A letter notifying the City of Flint of system startup will be provided prior to start up.

Groundwater Treatment System Monitoring Results

No analytical results were collected during the month of December 2013 (see Table 2).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware

that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

ARCADIS G&M of Michigan, LLC

Edward L. Cote, PE
Principal Engineer

Air Permit

RICK SNYDER
GOVERNOR

STATE OF MICHIGAN
DEPARTMENT OF ENVIRONMENTAL QUALITY
LANSING

DAN WYANT
DIRECTOR

April 11, 2012

Mr. Grant Trigger
Revitalizing Auto Communities Environmental Response Trust
2930 Ecorse Road
Ypsilanti, Michigan 48198

RECEIVED APR 13 2012

Dear Mr. Trigger:

This letter is in reference to your Permit to Install application for a multi-phase extraction (MPE) remidation system (State Registration Number A1178) located at 902 East Hamilton Avenue, Flint, Michigan. This application, identified as No. 165-11, has been evaluated and approved by the Air Quality Division (AQD), pursuant to the delegation of authority from the Michigan Department of Environmental Quality (DEQ).

This approval is based upon and subject to compliance with all administrative rules promulgated pursuant to Part 55, Air Pollution Control, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451), and conditions stipulated in the attached supplement. Please review these conditions thoroughly so that you may take the actions necessary to ensure compliance with all of these conditions.

To help us improve the service we provide our customers, we encourage you to complete a *Permit to Install Customer Service Survey* on the following Web page:

http://www.michigan.gov/documents/deq/DEQEval_29-pti-customerservice_287285_7.html

Please contact me if you have any questions regarding this permit.

Sincerely,

D. John Vial

165-11

ISSUED TO
Revitalizing Auto Communities Environmental Response Trust

LOCATED AT
902 East Hamilton Avenue
Flint, Michigan

IN THE COUNTY OF
Genesee

STATE REGISTRATION NUMBER
A1178

The Air Quality Division has approved this Permit to Install, pursuant to the delegation of authority from the Michigan Department of Environmental Quality. This permit is hereby issued in accordance with and subject to Section 5505(1) of Article II, Chapter I, Part 55, Air Pollution Control, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Pursuant to Air Pollution Control Rule 336.1201(1), this permit constitutes the permittee's authority to install the identified emission unit(s) in accordance with all administrative rules of the Department and the attached conditions. Operation of the emission unit(s) identified in this Permit to Install is allowed pursuant to Rule 336.1201(6).

* For High Volume Low Pressure (HVLP) applicators, the pressure measured at the HVLP gun air cap shall not exceed ten (10) pounds per square inch gauge (psig).

GENERAL CONDITIONS

1. The process or process equipment covered by this permit shall not be reconstructed, relocated, or modified, unless a Permit to Install authorizing such action is issued by the Department, except to the extent such action is exempt from the Permit to Install requirements by any applicable rule. **(R 336.1201(1))**

2. If the installation, construction, reconstruction, relocation, or modification of the equipment for which this permit has been approved has not commenced within 18 months, or has been interrupted for 18 months, this permit shall become void unless otherwise authorized by the Department. Furthermore, the permittee or the designated authorized agent shall notify the Department via the Supervisor, Permit Section, Air Quality Division, Michigan Department of Environmental Quality, P.O. Box 30260, Lansing, Michigan 48909, if it is decided not to pursue the installation, construction, reconstruction, relocation, or modification of the equipment allowed by this Permit to Install. **(R 336.1201(4))**

3. If this Permit to Install is issued for a process or process equipment located at a stationary source that is not subject to the Renewable Operating Permit program requirements pursuant to R 336.1210, operation of the process or process equipment is allowed by this permit if the equipment performs in accordance with the terms and conditions of this Permit to Install. **(R 336.1201(6)(b))**

4. The Department may, after notice and opportunity for a hearing, revoke this Permit to Install if evidence indicates the process or process equipment is not performing in accordance with the terms and conditions of this permit or is violating the Department's rules or the Clean Air Act. **(R 336.1201(8), Section 5510 of Act 451, PA 1994)**

5. The terms and conditions of this Permit to Install shall apply to any person or legal entity that now or hereafter owns or operates the process or process equipment at the location authorized by this Permit to Install. If the new owner or operator submits a written request to the Department pursuant to R 336.1219 and the Department approves the request, this permit will be amended to reflect the change of ownership or operational control. The request must include all of the information required by subrules (1)(a), (b), and (c) of R 336.1219 and shall be sent to the District Supervisor, Air Quality Division, Michigan Department of Environmental Quality. **(R 336.1219)**

6. Operation of this equipment shall not result in the emission of an air contaminant which causes injurious effects to human health or safety, animal life, plant life of significant economic value, or property, or which causes unreasonable interference with the comfortable enjoyment of life and property. **(R 336.1901)**

7. The permittee shall provide notice of an abnormal condition, start-up, shutdown, or malfunction that results in emissions of a hazardous or toxic air pollutant which continue for more than one hour in excess of any applicable standard or limitation, or emissions of any air contaminant continuing for more than two hours in excess of an applicable standard or limitation, as required in Rule 912, to the Department. The notice shall be provided not later than two business days after start-up, shutdown, or discovery of the abnormal condition or malfunction. Written reports, if required, must be filed with the Department within 10 days after the start-up or shutdown occurred, within 10 days after the abnormal conditions or malfunction has been corrected, or within 30 days of discovery of the abnormal condition or malfunction, whichever is first. The written reports shall include all of the information required in Rule 912(5). **(R 336.1912)**

8. Approval of this permit does not exempt the permittee from complying with any future applicable requirements which may be promulgated under Part 55 of 1994 PA 451, as amended or the Federal Clean Air Act.

9. Approval of this permit does not obviate the necessity of obtaining such permits or approvals from other units of government as required by law.

10. Operation of this equipment may be subject to other requirements of Part 55 of 1994 PA 451, as amended and the rules promulgated thereunder.

11. Except as provided in subrules (2) and (3) or unless the special conditions of the Permit to Install include an alternate opacity limit established pursuant to subrule (4) of R 336.1301, the permittee shall not cause or permit to be discharged into the outer air from a process or process equipment a visible emission of density greater than the most stringent of the following. The grading of visible emissions shall be determined in accordance with R 336.1303. **(R 336.1301)**
    a) A six-minute average of 20 percent opacity, except for one six-minute average per hour of not more than 27 percent opacity.
    b) A visible emission limit specified by an applicable federal new source performance standard.
    c) A visible emission limit specified as a condition of this Permit to Install.

12. Collected air contaminants shall be removed as necessary to maintain the equipment at the required operating efficiency. The collection and disposal of air contaminants shall be performed in a manner so as to minimize the introduction of contaminants to the outer air. Transport of collected air contaminants in Priority I and II areas requires the use of material handling methods specified in R 336.1370(2). **(R 336.1370)**

13. The Department may require the permittee to conduct acceptable performance tests, at the permittee's expense, in accordance with R 336.2001 and R 336.2003, under any of the conditions listed in R 336.2001. **(R 336.2001)**

SPECIAL CONDITIONS

EMISSION UNIT SUMMARY TABLE

The descriptions provided below are for informational purposes and do not constitute enforceable conditions.

Emission Unit ID	Emission Unit Description (Process Equipment & Control Devices)	Installation Date / Modification Date	Flexible Group ID
EUSOIL	Multi-phase extraction system, vacuum blower(s), and an air flow distribution system equipped with thermal oxidizer and catalytic oxidizer controls.[1]		FGREMED
EUGROUNDWATER	Air stripping tower(s), pump(s), and a groundwater flow distribution system equipped with thermal oxidizer and catalytic oxidizer controls). [1]		FGREMED
Changes to the equipment described in this table are subject to the requirements of R 336.1201, except as allowed by R 336.1278 to R 336.1290.			

Notes:
[1] The system will initially be controlled by a thermal oxidizer. The thermal oxidizer may be replaced with a catalytic oxidizer once the concentration at the inlet to the air pollution control system is less than 2,000 ppmv as allowed under Special Condition FGREMED Section III.1 and 2.

FLEXIBLE GROUP SUMMARY TABLE

The descriptions provided below are for informational purposes and do not constitute enforceable conditions.

Flexible Group ID	Flexible Group Description	Associated Emission Unit IDs
FGREMED	Multi-phase extraction (MPE) system for the remediation of contaminated soil and groundwater. Air pollution control consists of two separate control systems. A "thermal oxidizer" will be used for the high concentration scenario and a catalytic oxidizer will be used during the low concentration scenario.	EUSOIL and EUGROUNDWATER

The following conditions apply to: FGREMED

DESCRIPTION: Multi-phase extraction (MPE) system for the remediation of contaminated soil and groundwater. Air pollution control consists of two separate control systems. A thermal oxidizer will be used for the high concentration scenario and a catalytic oxidizer will be used during the low concentration scenario

Emission Units: EUSOIL and EUGROUNDWATER

POLLUTION CONTROL EQUIPMENT: Thermal oxidizer or catalytic oxidizer

I. EMISSION LIMITS

Pollutant	Limit	Time Period / Operating Scenario	Equipment	Testing / Monitoring Method	Underlying Applicable Requirements
1. VOC	14.3 tpy	12-month rolling time period as determined at the end of each calendar month.	FGREMED	SC VI.2	R 336.1702(a)
2. VOC	3.27 pph	According to monitoring/testing method	FGREMED	SC VI.2	R 336.1225, R 336.1702
3. Each Individual HAP	Less than 8.9 tpy*	12-month rolling time period as determined at the end of each calendar month.	FGREMED	SC VI.2	R 336.1205(3)
4. Aggregate HAPs	Less than 22.4 tpy *	12-month rolling time period as determined at the end of each calendar month.	FGREMED	SC VI.2	R 336.1205(3)
* Beginning on Permit Issuance Date, and continuing for the first 12 calendar months, this limit applies to the cumulative total HAP emissions. Thereafter, the limit shall become a 12-month rolling limit.					

II. MATERIAL LIMITS

N/A

III. PROCESS/OPERATIONAL RESTRICTIONS

1. Based on initial pilot sampling and/or the most recent vapor stream sampling results, the permittee may begin the remediation project (FGREMEDIATION) using either the catalytic oxidizer or the thermal oxidizer. The permittee shall not operate FGREMEDIATION when the VOC concentration at the inlet to the air pollution control system is greater than 2,000 parts per million by volume (ppmv) unless the thermal oxidizer is operating in a satisfactory manner. The permittee shall not operate FGREMEDIATION when the VOC concentration at the inlet to the air pollution control system is less than 2,000 ppmv unless at least either the thermal oxidizer is operating in a satisfactory manner or the catalytic oxidizer is operating in a satisfactory manner. **(R 336.1225, R 336.1702(a), R 336.1910, R 336.1910)**

2. If the remediation system is being controlled by the thermal oxidizer, then the permittee may request that the AQD District Supervisor approve use of the catalytic oxidizers control system upon demonstrating that the

VOC inlet concentration to the control device has stabilized at a value below 2,000 ppmv. The request shall be in writing and the demonstration submittal shall contain data adequate to verify a stabilized inlet concentration below 2,000 ppmv. Following approval of the catalytic oxidizers control system, any VOC concentration monitored at the control system inlet that is greater than 2,000 ppmv shall require an immediate return to the "thermal oxidizer" control device until the permittee go through the process of demonstrating that VOC concentrations have stabilized below 2,000 ppmv and receives permission from the AQD District Supervisor to switch to the catalytic oxidizer. **(R 336.1225, R 336.1702, R 336.1910, R 336.1910)**

3. The permittee shall not operate EUSOIL of FGREMED unless a minimum temperature of 650°F at the inlet of the catalytic oxidizer is maintained. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

4. The permittee shall not operate EUSOIL of FGREMED unless a minimum temperature of 1400°F at the inlet of the thermal oxidizer is maintained. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

5. The permittee shall install, calibrate, maintain and operate in a satisfactory manner, a temperature monitoring device to monitor and record the inlet and outlet temperatures of the catalytic oxidizer catalyst bed/thermal oxidizer on a continuous basis. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

IV. DESIGN/EQUIPMENT PARAMETERS

N/A

V. TESTING/SAMPLING

Records shall be maintained on file for a period of five years. **(R 336.1201(3))**

N/A

VI. MONITORING/RECORDKEEPING

Records shall be maintained on file for a period of five years. **(R 336.1201(3))**

1. The permittee shall complete all required calculations in a format acceptable to the AQD District Supervisor by the 15th day of the calendar month, for the previous calendar month, unless otherwise specified in any monitoring/recordkeeping special condition. **(R 336.1205(3), R 336.1225, R 336.1702(a), R 336.1901)**

2. The permittee shall keep, in a satisfactory manner, monthly and 12-month rolling time period calculations of VOC, individual HAP, aggregate and HAP emission rates for FGREMED, as required by SC I.1 through SC I.4. The permittee shall keep all records on file and make them available to the Department upon request. **(R 336.1205(3), R 336.1225, R 336.1702(a), R 336.1901)**

3. The permittee shall monitor and record, in a satisfactory manner, the flow rate and the total VOC concentration of the vapor stream(s) into either the thermal oxidizer or into the catalytic oxidizer. This shall be done on a weekly basis until four valid samples, which pass all quality assurance and quality control requirements, have been obtained. Thereafter, the permittee shall monitor the vapor stream(s) into either the thermal oxidizer or into the catalytic oxidizer for these parameters on a monthly basis. The permittee shall submit any request for a change in the sampling frequency to the AQD District Supervisor for review and approval. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

4. The permittee shall monitor and record, in a satisfactory manner, the temperature in the combustion chamber of the thermal oxidizer, on a continuous basis, when it is used as the air pollution control device. Temperature data recording shall consist of measurements made at equally spaced intervals, not to exceed 15 minutes per interval. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

5. The permittee shall continuously monitor and record, in a satisfactory manner, the inlet and outlet temperature of the catalytic oxidizer catalyst bed when the catalytic oxidizer is used as the air pollution

control device(s). Temperature data recording shall consist of measurements made at equally spaced intervals, not to exceed 15 minutes per interval. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

VII. REPORTING

1. The permittee shall submit the following to the AQD District Supervisor using Appendix A. or an approved equivalent method:
   a) flow rate
   b) total VOC concentration
   c) VOC concentration of the influent stream(s) to FGREMED
   d) calculations of VOC emission rates.

   The information shall be submitted within 30 days following collection of the initial data, and thereafter within 15 days following the end of the month in which the data were collected. The permittee must submit any request for a change in the reporting frequency to the AQD District Supervisor for review and approval. **(R 336.1225, R 336.1702(a), R 336.1901, R 336.1910)**

VIII. STACK/VENT RESTRICTIONS

The exhaust gases from the stacks listed in the table below shall be discharged unobstructed vertically upwards to the ambient air unless otherwise noted:

Stack & Vent ID	Maximum Exhaust Diameter/ Dimensions (inches)	Minimum Height Above Ground (feet)	Underlying Applicable Requirements
1. SVREMED	14	15	R 336.1225, R 336.1901

IX. OTHER REQUIREMENTS

Dear: Mr. Maffeo,

RE: Revised Sewer Use Permit # 2-02-RBC001

Enclosed, is sanitary sewer use permit number 2-02-RBC0011for Racer Trust, Buick City AOI-9 Groundwater Remediation System, which was in response to the Permit Application, dated November 7, 2011, submitted to the City of Flint by ARCADIS. The effective date of this permit is August 9,2012 and the expiration date is August 8, 2017.

If you have any question or need additional information, please call me, or call Tom Hutchings if I am unavailable, at (810) 766-7210.

Sincerely,

Robert J. Case
Water Pollution Control Supervisor

Enclosure

USPS # 7010 1670 0001 5104 8735

CITY OF FLINT, MICHIGAN

SEWER USE PERMIT

Class 2 - Significant Non-domestic User

Permit Number 2-02-RBC001

In accordance with certain provisions of the Federal Water Pollution Control Act, as amended (33 U.S.C. 1241 et seq; the "Act"), the Michigan Natural Resources and Environmental Protection Act (Act 451 of 1994, as amended; the "State Act"), and the laws regulating use of the publicly owned treatment works (POTW) for sanitary sewage (hereafter POTW Regulations) set forth in Chapter 46, Article V, Division 2 of the Municipal Code (the "Code") of the City of Flint (the "City"), as identified below, the named permittee is hereby authorized to discharge wastewater from a certain parcel into the POTW at a specific location:

Permittee	Racer Trust- Racer Buick City AOI-9 Groundwater Remediation System
Address	1200 East Hamilton Ave.
Parcel No.	41-063-790-009
POTW Pipe No.	I09-40-06-W20

Said authorization is subject to the prohibitions, limits, requirements and conditions stipulated herein. Compliance with this permit does not relieve the permittee of its obligation to comply with any or all applicable pretreatment laws, regulations, standards or requirements under City, State, and Federal laws; this includes any and all such laws, regulations, standards, or requirements that may become effective during the term of this permit and which shall apply to the permittee subsequent to modification of this permit and a reasonable period to achieve compliance. This does not include laws, regulations, standards or requirements that are subject to other chapters of the Code, such as chapters pertaining to the regulation of plumbing and electrical work.

The permittee shall comply with all of the provisions of this permit. A violation of any provision of this permit is a violation of the POTW Regulations, subject to the penalty, damage, compensatory charge, and other enforcement provisions of the POTW Regulations.

This permit shall become effective on ***August 9, 2012*** and shall expire at midnight on ***August 8, 2017***.

If the permittee wishes to continue to discharge after the expiration date of this permit, a written application in accordance with the requirements of the POTW Regulations must be submitted to the City a minimum of one hundred and eighty (180) days prior to the expiration date. Approval or denial of the application for discharge will be in accordance with POTW Regulations.

This permit is based on the information provided in the permittee's application, dated November 09, 2011 and acquired by recent inspections by the City of the permittee's facility. The City shall establish appropriate fees for reimbursement of costs to administer this permit and the associated Industrial Pretreatment Program.

Signed this 20th day of July 2012 by the City of Flint.

Robert J. Case, Water Pollution Control Supervisor
Department of Utilities Water Pollution Control Division

PART I

A. DISCHARGE PROHIBITIONS AND MONITORING REQUIREMENTS

1. Applicability of the POTW Regulations

In addition to the user-specific pollutant limits stipulated in this part, the permittee shall abide by the generally applicable discharge prohibitions and limits set forth in the POTW Regulations (excerpted in the Appendix), except if superceded by this permit or an order of the City Director.

a. The permittee is prohibited from discharging, causing to be discharged, or allowing to be discharged Potentially Harmful Substances or wastewater in amounts that may or do cause problems with the operation and maintenance of the City of Flint publicly owned treatment works (POTW) for sanitary sewage, including, but not limited to: interference with sewage treatment or sludge disposal, pass-through of pollutants, fire or explosion, corrosive structural damage, blockages to the flow of sewage, or unsafe conditions for workers.

b. The permittee is prohibited from increasing the use of potable water or process wastewater in any way for the purpose of diluting a discharge as a partial or complete substitute for adequate treatment before discharge to the POTW to achieve compliance with this part, which includes, by reference, the prohibitions and limitations set forth in the POTW Regulations, except upon prior written approval from the City Director, which approval shall be granted at the sole discretion of the City Director and consistent with State and Federal law.

c. The permittee is prohibited from discharging any wastes or wastewater into the POTW from a vehicle which transported the waste or wastewater to the point of discharge. The preceding sentence does not prohibit the permittee from trucking wastes or wastewater to the permittee's wastewater treatment facility.

2. Applicability of Other Laws

The permittee's discharge shall comply with any and all other applicable City, State, and Federal pretreatment laws, regulations, standards, and requirements. This includes any and all such laws, regulations, standards, or requirements that may become effective during the term of this permit and which shall apply to the permittee subsequent to modification of this permit and a reasonable period to achieve compliance.

a. The permittee shall comply with all Categorical Pretreatment Standards and any other pretreatment requirements established under 307(b), 307(c), or 402(b)(8) of the Act that are applicable to the permittee, as adjusted under the combined wastestream formula in Michigan Rule R 323.2311(7). If a Categorical Pretreatment Standard and another limit contained in this permit or the POTW Regulations or in an applicable State of Michigan pretreatment requirement regulate the same pollutant, then the more restrictive of them shall apply. If the permittee requests that a removal credit be made applicable to itself, then the permittee shall pay all costs associated with supporting, obtaining, and administering the removal credit so that the City incurs no costs. It shall be at the sole discretion of the City whether or not a removal credit shall be established and how a removal credit shall be allocated.

b. If a Categorical Pretreatment Standard is promulgated for a subcategory under which the permittee believes itself to be included, the permittee or the City Director may request from the MDEQ within sixty (60) days after the promulgation date a written determination of whether the permittee does or does not fall within that particular subcategory. Such request shall be made and reviewed in accordance with the procedures set forth in Michigan Rule R 323.2311, as amended. If the permittee adds or changes a process or operation that may be included in a subcategory, the permittee shall request the certification before commencing to

discharge from the added or changed process or operation. If the permittee will become a new source, it shall request the determination before commencing to discharge. If the City requests the determination, then the City shall notify the permittee of the submission and the permittee may provide written comments to the MDEQ within thirty (30) days after notification is sent. The permittee shall achieve compliance with such standard in accordance with and within the time period provided for in Michigan Rule R 323.2311, as amended.

3. Specific Discharge Limits and Monitoring Requirements

The discharge(s) to the POTW via the following outfall(s) shall comply with the following pollutant and/or flow limit(s), and the composition, characteristics and/or flow of the discharge(s) shall be monitored, as follows:

Outfall 001				
Parameter	Monitoring Frequency	Sampling Procedure	Pollutant Discharge Limits	
			Limit	Type
Ammonia-nitrogen	Sample on one (1) day per month.	Collect a 24-hour, flow proportioned composite sample.	37 mg/L	Daily Maximum
BOD	Monthly, as above.	Collect composite sample as above.	427 mg/L	Daily Maximum
Total Phosphorus	Monthly, as above.	Collect composite sample as above.	7 mg/L	Daily Maximum
Total Suspended Solids	Monthly, as above.	Collect composite sample as above.	305 mg/L	Daily Maximum
Total Arsenic	Monthly, as above.	Collect composite sample as above.	0.041 mg/L	Daily Maximum
Total Cadmium	Monthly, as above.	Collect composite sample as above.	0.014 mg/L	Daily Maximum
Total Chromium	Monthly, as above.	Collect composite sample as above.	0.048 mg/L	Daily Maximum
Total Copper	Monthly, as above.	Collect composite sample as above.	0.179 mg/L	Daily Maximum
Total Lead	Monthly, as above.	Collect composite sample as above.	0.322 mg/L	Daily Maximum
Total Mercury	Monthly, as above.	Collect composite sample as above.	0.000012* mg/L	Daily Maximum
Total Nickel	Monthly, as above.	Collect composite sample as above.	0.043 mg/L	Daily Maximum
Total Silver	Monthly, as above.	Collect composite sample as above.	0.023 mg/L	Daily Maximum
Total Zinc	Monthly, as above.	Collect composite sample as above.	0.445 mg/L	Daily Maximum
Hexane-extractable Material	Monthly, as above.	Collect four (4) grab samples, not less than ten (10) minutes apart.	100 mg/L	Daily Maximum
pH @ 25°C	Monthly, as above.	Collect grab samples as above.	10.5 SU	Maximum
			6.0 SU	Minimum
Amenable Cyanide	Monthly, as above.	Collect grab samples as above.	1.195 mg/L	Maximum
			0.005 mg/L	Daily Maximum
Benzene	Monthly, as above.	Collect grab samples as above.	0.174 mg/L	Maximum
			0.001 mg/L	Daily Maximum
Ethyl benzene	Monthly, as above.	Collect grab samples as above.	2.048 mg/L	Maximum
			0.001 mg/L	Daily Maximum
Toluene	Monthly, as above.	Collect grab samples as above.	1.753 mg/L	Maximum
			0.187 mg/L	Daily Maximum
Xylenes, Total	Monthly, as above.	Collect grab samples as above.	2.009 mg/L	Maximum
			0.002 mg/L	Daily Maximum

Outfall 001					
Parameter		Monitoring Frequency	Sampling Procedure	Pollutant Discharge Limits	
				Limit	Type
Toxic Organics	Volatile	Monthly, as above.	Collect grab samples as above.	Shall not violate POTW regulations (see Part I.A.1.a).	Not applicable
	Semi-Volatile	Monthly, as above.	Collect a 24-hour, flow proportioned composite sample.		
PCB		Monthly, as above.	Collect composite sample as above.	0.00000020* mg/L	Daily Maximum
Flow Volume		Continuously during discharge. – total Flow	Not applicable.	36,000 gal/day at a maximum rate of 25 gal/min.	Daily Maximum

* The pollutant shall be undetectable in the discharge, in compliance with the concentration limit in Table 46-146(c) in the appendix of the POTW Regulations.

4. Sampling Location

Samples of the discharge to outfall number 001 shall be collected from the sampling ports (for grab and composite samples) in the groundwater treatment system discharge pipe. The location of the groundwater treatment system and outfall are identified in the site map in the Appendix.

B. REPORTING AND NOTIFICATION REQUIREMENTS

1. Semi-annual Self-monitoring Report

In accordance with the POTW Regulations, the permittee shall submit a monthly Self-monitoring Report to the City by no later than twenty-eight (28) days following the end of the previous month in which monthly discharge monitoring was performed, in accordance with the following requirements:

- The report shall contain all monitoring data obtained by the permittee in accordance with the self-monitoring requirements stipulated in Part I.A.3.
- The report shall be submitted on the City's standard reporting form, which is included in the Appendix.
- The report shall be complete and include the measured discharge volume and the monitoring data for each parameter listed in Part I.A.3., including each individual target analyte for all multiple analyte tests.
- The report shall also clearly identify the analytical methods used, the date on which each analysis was performed, the date on which each sample was collected, and the sampling method used; and it shall also indicate the total number of samples collected and the total number of reported values that exceeded the limitations established in Part I.A.3 for each parameter specified thereunder.

In addition, the monthly Self-monitoring Report shall be accompanied by sample custody records and a quality assurance/quality control (QA/QC) report. The sample custody records shall include the following information:

- the exact place, date, and time of sampling;
- the individual(s) who performed the sampling;
- the dates analyses were performed; and
- the person(s) who performed the analyses.

The QA/QC report shall include all data needed for assessing the validity of the monitoring data presented in the PRCC, which shall specifically include individual test results and statistical data for the analysis of:

- reagent blanks,

- calibration check standards, and
- replicate samples.

If the permittee monitors any pollutant more frequently than required by this permit, using procedures corresponding to those specified in this permit, the result of such monitoring must be utilized in the calculations of average/maximum pollutant discharge and included in the discharge report.

2. Annual Significant Non-domestic User Report

The permittee shall submit, on a form provided by the City, an annual significant non-domestic user report. The report shall provide updated information about the permitee's manufacturing and business activities, materials used or stored, materials which are or may be discharged to the POTW, pre-treatment systems, slug discharge control plans and procedures (if required), and any other information required under the POTW Regulations in an application for a use permit. The permittee shall submit the annual significant non-domestic user report by the 15th day of February of each year for the preceding calendar year (January through December), unless exempted from this requirement, in the use permit or other writing, by the City Director.

3. Categorical Baseline Monitoring Report (As Applicable)

Within one hundred eighty (180) days after the effective date of a national categorical pretreatment standard or the final administrative decision made upon a category determination submission under 40 CFR 403.6(a)(4) whichever is later, which is applicable to any existing or planned discharge made, or to be made, by the permittee, a baseline monitoring report (BMR) shall be submitted to the City. The BMR shall be in accordance with any and all applicable state and federal pretreatment rules and regulations and provide the following information:

- the name and address of the facility, including the name of the operator and owners
- a list of any environmental control permits held by or for the facility;
- a brief description of the nature, average rate of production, and Standard Industrial Classification of the operation or operations carried out by the permittee, including a facility drawing and schematic diagram that indicates points of discharge to the POTW and from which processes the discharges originate;
- the pretreatment standards, including federal, state, and local standards, applicable to each regulated process;
- information showing the measured average daily and maximum daily flow, in gallons per day, to the POTW from regulated process streams and other streams as necessary to allow use of the combined wastestream formula specified in the federal and state pretreatment regulations and rules;
- information showing the measured average daily and maximum daily flow, in gallons per day, to the POTW from regulated process streams and other streams as necessary to allow use of the combined wastestream formula specified in the federal and state pretreatment regulations and rules;
- results of sampling and analysis identifying the nature and concentration or mass, where required by the standard or City, of regulated pollutants in the discharge from each regulated process, including both daily maximum and average concentration or mass, where required;
- the time, date, and place of sampling and the methods of analysis and a statement certifying that the sampling and the methods of analysis is representative of normal work cycles and expected pollutant discharges to the POTW; and
- a statement, reviewed by an authorized representative of the permittee and certified by a qualified professional, indicating whether pretreatment standards are being met on a consistent basis and, if not, whether additional operation and maintenance or additional pretreatment is required for the permittee to meet the pretreatment standards and requirements.

In the event that any new source of discharge that will be regulated by a national categorical pretreatment standard is to be commenced by the permittee, not less than ninety (90) days prior to commencing the new discharge, a BMR, shall be submitted to the City. A BMR for a new source shall contain all applicable information required above, except that estimates shall be submitted in lieu of monitoring data.

If additional pretreatment or operation and maintenance will be required to meet the pretreatment standards, the permittee shall submit to the City, in writing, the shortest schedule by which the permittee will provide such additional pretreatment or operation and maintenance, concurrently with the BMR. The completion date in the schedule shall not be later than the compliance date established for the applicable pretreatment standard. All of the following conditions shall apply to compliance schedules:

- The schedule shall contain increments of progress in the form of dates for the commencement and completion of major events leading to the construction and operation of additional pretreatment required for the permittee to meet the applicable categorical standards, which may include the hiring of an engineer, completing preliminary plans, completing final plans, executing contracts for major components, commencing construction, completing construction, and other similar major events.
- No planned increment of progress shall exceed nine (9) months.
- Not later than fourteen (14) days following each date in the schedule and the final date for compliance, the permittee shall submit a progress report to the City, including, at a minimum, whether or not the permittee complied with the increment of progress to be met on a particular date and if not, the date on which the permittee expects to comply with the increment of progress, the reason for delay, and the steps being taken by the permittee to return the construction to the schedule established.
- Not more than nine (9) months shall elapse between progress reports to the City.

Sampling and analysis shall be performed as follows:

- Samples shall be representative of daily operations.
- A minimum of four (4) grab samples shall be used for pH, cyanide, total phenols, oil and grease, sulfide, and volatile organics.
- For all other pollutants, 24-hour composite samples shall be obtained through flow-proportional composite sampling techniques where feasible. The City may waive flow-proportional composite sampling, provided that the permittee demonstrates flow-proportional sampling is infeasible. In such cases, samples may be obtained through time-proportional composite sampling techniques or through a minimum of four (4) grab samples where the permittee demonstrates that this will provide a representative sample of the effluent being discharged.
- Except where multiple grab sampling is required above, a minimum of one (1) representative sample for obtaining the required data for the baseline monitoring report shall be taken.
- Samples shall be taken immediately downstream from pretreatment facilities if the facilities exist or immediately downstream from the regulated process if pretreatment facilities do not exist. If other wastewaters are mixed with the regulated wastewater before pretreatment, the permittee shall measure the flows and concentrations necessary to allow use of the combined wastestream formula specified in the federal and state pretreatment regulations and rules. Where an alternate concentration or mass limit has been calculated in accordance with the federal and state pretreatment regulations and rules, the adjusted limit and supporting data shall be submitted to the City.
- Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR Part 136. Where 40 CFR Part 136 does not contain sampling and analytical techniques for the pollutant of concern, or where the U.S. Environmental Protection Agency determines that the Part 136 sampling and analytical techniques are inappropriate fro the pollutant of concern, sampling and analysis shall be performed by using validated analytical procedures,

including procedures suggested by the City or other parties, approved by the U.S. Environmental Protection Agency.

If the permittee is involved in a category determination request, or any other permitting process which is required to properly apply the Categorical Standard, the BMR due date shall be stayed until such actions are completed.

4. **Categorical 90-Day Compliance Report (As Applicable)**

Within ninety (90) days following the date for final compliance with a promulgated national pretreatment standard which is applicable to the permittee, or in the case of a new source, following commencement of the discharge into the POTW, a 90-day compliance report shall be submitted to the City. This report shall be in accordance with any and all applicable state and federal pretreatment rules and regulations and provide the following information:

- the average and maximum daily wastewater flows to the POTW, as well as flows from any process regulated by such pretreatment standard;
- the concentration (or mass, where applicable) of any pollutant regulated by such pretreatment standard discharged to the POTW from any process regulated by such pretreatment standard; and
- a statement, reviewed by an authorized representative of the permittee and certified by a qualified professional, indicating whether pretreatment standards are being met on a consistent basis and, if not, whether additional operation and maintenance or additional pretreatment is required for the permittee to meet the pretreatment standards and requirements.

Where direct measurement of the discharge from the regulated process is not physically possible, equivalent concentrations (or mass) may be calculated via mass balance principles; however, this approach must be pre-approved by the City and details of the calculation are also to be included in the report.

5. **Exceedance Notice**

The permittee shall orally report to the City, within twenty-four (24) hours of becoming aware of any discharges, whether intentional or accidental, which are known or reasonably suspected by the permittee to violate Part I of this permit, which includes, by reference, the prohibitions and limitations set forth in the POTW Regulations. The permittee shall, if the exceedance was based on an analyzed sample, re-sample and analyze the discharge and submit the results to the City, as soon as possible, but no later than thirty (30) days after becoming aware of such discharge. Such oral notice shall be given in advance whenever possible and shall contain information regarding the volume, duration, constituents, cause, loading and concentrations, actions taken or to be taken to prevent future exceedances, and such other available information as may be necessary to determine what impact such discharge may have on the POTW. The permittee shall provide a written follow-up notice within five (5) days of the oral notice that contains the same information provided orally and all other relevant information.

6. **Slug Discharge Notice**

The permittee shall immediately notify the City after obtaining knowledge that the permittee has discharged or will discharge wastewater which could cause interference or pass-through in the POTW or which is a slug discharge. Such notice shall be oral and shall be followed by a written notice within five (5) days. The written notice shall describe measures which the permittee will take to prevent such discharges.

7. **Bypass Notice**

(a) If the permittee knows in advance of the need for a bypass, it shall give notice to the city if

possible, at least ten (10) days before the date of the bypass, but in no case less than 24 hours.

(b) A permittee shall give oral notice of an unanticipated bypass that exceeds applicable categorical pretreatment standards and other applicable discharge limits to the city within twenty-four (24) hours from the time the permittee becomes aware of the bypass. A written submission shall also be provided by the permittee to the city within five (5) days of the time the permittee becomes aware of the bypass. The written submission shall contain:

- a description of the bypass and its cause;
- the duration of the bypass (including exact dates and times); and, if the bypass has not been corrected, the anticipated time it is expected to continue; and
- the steps taken or planned to reduce, eliminate, and prevent reoccurrence of the bypass.

The City may waive the written report if the oral report has been received within twenty-four (24) hours.

8. Changed Discharge Notice

The permittee shall notify the City at least one hundred and eighty (180) days in advance of any anticipated substantial change in the volume of or in the type or amount of pollutants in its discharge to the POTW. Such notice shall be in writing. For purposes of this notice, a substantial change in the discharge to the POTW includes, but is not limited to:

- the initial discharge of any unpolluted water, non-contact cooling water, storm water, surface water, or groundwater, including any groundwater purged for remedial action and groundwater that infiltrates into the POTW;
- an increase or decrease in volume of 20% or more;
- the discharge of pollutants not previously disclosed to the City;
- a change in the amount or type of listed or characteristic hazardous wastes discharged for which the permittee has submitted a notification to the City under part;
- an increase in the amount of any pollutants discharged which may result in a violation of Part I, which includes, by reference, the prohibitions and limits set forth in the POTW Regulations, or a violation of any order of the City Director.

9. Hazardous Waste Notice

If the permittee discharges to the POTW any substance which, if disposed of other than by discharge to the POTW, would be a hazardous waste under 40 CFR 261 or under the rules promulgated under the Michigan Hazardous Waste Management Act, Part 111 of the Natural Resources and Environmental Protection Act ("Michigan Rules"), the permittee shall notify the City Director, the EPA Region V Waste Management Division Director, and the Chief of the Waste Management Division of the Michigan Department of Environmental Quality of such discharge. The notice shall be given within one hundred and eighty (180 days) after the discharge first occurs. The notice shall be in writing and shall include the name of the hazardous waste set forth in 40 CFR 261 or the Michigan Rules, the hazardous waste number, and the type of discharge (continuous, batch, or other). If the permittee discharges more than one hundred (100) kilograms of such waste per calendar month to the POTW, the notice shall also contain the following information to the extent such information is known and readily available to the permittee:

- an identification of the hazardous constituents contained in the wastes;
- an estimation of the mass and concentration of such constituents in the discharge during that calendar month; and
- an estimation of the mass of constituents expected to be discharged during the following 12 months;

Notification must be submitted for each hazardous substance discharged, but is not required for pollutants already reported under self-monitoring by the permittee under Categorical Pretreatment Standard reporting requirements. The permittee is exempt from notification during a calendar month in which it discharges no more than fifteen (15) kilograms of hazardous wastes unless the wastes are acute hazardous wastes as specified in 40 CFR 261.30(d) and 261.33(e). Where a new regulation first defines a substance as a hazardous waste, notification shall be given within ninety (90) days of the effective date of such regulation. In any notice submitted under this part, the permittee shall certify that it has a program in place to reduce the volume and toxicity of hazardous wastes generated to the degree it has determined to be economically practical.

10. Radioactive Materials Notice

If the permittee's discharge contains or could contain radioactive materials, the permittee shall notify the City Director of that fact as soon as possible after becoming aware of it.

11. New Pretreatment Facilities Notice

The permittee or its authorized agent shall notify the City in writing, at least fifteen (15) days before the installation of new pretreatment facilities, of the date it intends to commence operation thereof.

12. Written/Verbal Submittals

(a) All written reports and notices required to be submitted under this part shall be directed to:

Environmental Compliance Inspector
City of Flint Water Pollution Control Division
G-4652 Beecher Road, Flint, Michigan 48532

(b) All verbal reports and notices required to be made under this part shall be directed to the Environmental Compliance Supervisor (8:00 a.m. to 5:00 p.m., Monday through Friday) or to the Operations Foreman on duty, via the Water Pollution Control Division's 24-hour telephone number at (810) 766-7210.

(c) All written reports and notices required to be submitted to the City under this part shall be properly signed and certified. The person signing reports and notices shall make the following certification in the report or notice:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations."

Before any person signing any report or notice may submit the same to the City, the permittee shall inform the City in writing and with particularity how the individual meets the criteria for persons who are eligible to do so under Michigan Rule R 323.2310(11).

PART II

A. GENERAL RESPONSIBILITIES

1. Monitoring Procedures

a. The prohibitions and limits in this permit and the POTW Regulations, shall apply at the point where wastewater and pollutants are discharged into the POTW. Required pretreatment and sampling for analysis of parameters specified in a use permit, discharge limit, CPS, or any discharge prohibition, limitation, or standard shall be effected before such point is reached.

b. All measurements, sampling, tests, and analyses of the discharge shall be determined in accordance with the EPA-approved methods contained in 40 CFR, Part 136. In cases where 40 CFR 136 procedures are not available for or do not apply to the pollutant involved, other sources such as "Standard Methods for the Examination of Water and Wastewater," published by the American Public Health Association, or the most current methods published by the American Society for Testing Material (ASTM) or another method accepted by the City Director may be used.

c. All samples shall be collected at a time and in a manner that ensures they are representative of the wastewater discharged when the Permittee's normal operations are occurring, except when required by the city to be collected at another time or in another manner.

d. Sampling to measure the instantaneous concentration shall be done by collecting one grab sample.

e. Sampling to measure the daily concentration shall be done by collecting a 24-hour, flow-proportioned composite sample, except that a minimum of 4 grab samples shall be collected in lieu of a 24-hour, flow-proportioned composite sample for pH, cyanide, Total Phenols, Hexane-extractable Material, sulfide, and volatile organic compounds. If it is not feasible to obtain a flow-proportioned composite sample, a time-proportioned composite sample or a minimum of 4 grab samples may be used in lieu of the flow-proportioned composite sample if the permittee demonstrates to the City Director that a representative sample will be obtained. Samples shall be collected during a single 24-hour period.

f. The date when a sample is taken, start time, stop time, sample type, sample location, sampler programming information, persons involved in the sampling, and any other data specified in advance by the City Director, shall be recorded by the Permittee.

g. The permittee shall calibrate and perform appropriate maintenance procedures, in accordance with any and all instructions, specifications, and/or recommendations of the manufacturer, on all monitoring equipment and analytical instrumentation, where applicable, whenever and as often as needed for ensuring accurate measurements.

2. Spill Prevention and Remediation (if applicable)

If the permittee uses or stores liquid material at its facilities, it shall, at its expense:

- provide a storage or use area at its facilities which is capable of containing the liquid material so that liquid material cannot escape therefrom by gravity through private sewers, underground percolation and infiltration, or otherwise into the POTW in an amount which would result in a prohibited discharge to the POTW; and
- establish and follow procedures for preventing, managing, and remediating accidental spills, leaks, or escapes of liquids.

3. Posting of Use Permit and Notice of Exceedance Information (if applicable)

If the permittee stores substances which potentially could be discharged to the POTW in concentrations which exceed any discharge prohibition in the POTW Regulations, the permittee shall post a clearly legible set of instructions in the area where the wastewater is managed so that the report and notice requirements in Part I.B are made known and are available to the permittee's employees. The permittee shall also post this permit along with these instructions. The permittee shall instruct its employees who have wastewater responsibilities on these reporting and notice requirements.

4. Requirement for Interceptors

Interceptors or more elaborate pretreatment systems shall be properly installed, used, and maintained by the permittee for the proper pretreatment of wastewater containing, or potentially containing, floating or suspended hexane-extractable material or viscous or dense substances which, if discharged, would be a prohibited discharge under Part I, in accordance with the POTW regulations.

5. Pretreatment Facilities Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control, and related appurtenances, which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance includes, but is not limited to the following: effective performance, adequate funding, adequate operator staffing and training, as well as adequate laboratory and process controls including appropriate quality assurance procedures. The permittee shall utilize back-up or auxiliary facilities, or a similar system, when necessary to achieve compliance with the conditions of this permit. A new pretreatment facility shall not be placed in regular operation until tests have been conducted by the permittee to establish that the discharges will be in compliance with this permit. A representative of the City shall be permitted to witness the tests upon prior written request. The cost of the tests shall be paid by the permittee.

6. Pretreatment System Bypass

Pretreatment system bypass is prohibited, and the City may take enforcement action against the permittee for a bypass, unless:

- bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
- there were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime; and
- the permittee gave notice as required in Part I.B of this permit.

This exception is not applicable if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance.

The City may approve an anticipated bypass, after considering its adverse effects, if the City determines that it will meet the 3 conditions listed above.

7. Duty to Control Production or Discharges

The permittee shall control production or all discharges to the extent necessary to maintain compliance with Categorical Pretreatment Standards and other applicable discharge limits upon

reduction, loss, failure, or abnormal condition of its process or treatment facility until the process and facility are restored or an alternative method of treatment is provided. This requirement applies in the situation where, among other things, the primary source of power of the premittee's treatment facility is reduced, lost, or fails.

8. Retention of Records

The permittee shall maintain copies of all reports, information records, and all other information pertaining to those reports and to any sampling and analyses activities. Such reports, records, and information shall be retained by the permittee for at least three (3) years. This period shall be extended during the course of any unresolved litigation regarding the permittee or the POTW pretreatment program or when requested by the City Director, the State Director, or EPA. It the permittee has records regarding its generation, treatment, storage, or disposal of hazardous waste or solid waste, the permittee shall maintain such records for such period and make them available to the City for inspection and copying, subject to the provisions of the POTW Regulations. The terms "hazardous waste" and "solid waste" shall have the same definition as provided in the Michigan Hazardous Waste Management Act, as amended, and rules promulgated thereunder.

C. GENERAL CONDITIONS

1. Definitions

Unless the context specifically indicates otherwise, the meaning of terms used in this permit shall be in accordance with definitions set forth in the POTW Regulations or hereto as follows:

a. **Act** means the Federal Water Pollution Control Act, also known as the Clean Water Act, as amended, 33 U.S.C 1251, et seq., and all rules promulgated thereunder.
b. **Bypass** means the intentional diversion of waste streams away from any portion of a user's treatment facility needed for compliance with pretreatment standards to a point of discharge.
c. **Categorical pretreatment standards** means pollutant limits for discharges to POTWs, promulgated by the EPA in 40 CFR Chapter I, Subchapter N, Parts 405, et seq., in accordance with 307(b) and (c) of the Act, which are applicable to a non-domestic user which engages in a category or categories of industry that are subject to regulations listed in the definition for "categorical pretreatment standards" in the POTW Regulations.
d. **City** means the City of Flint, Michigan, a municipal corporation.
e. **City Director** means the director of the Department of Utilities of the City or other person or persons designated by that person or by the city administrator to exercise control over City collection system and the POTW treatment plant or certain matters relating to the city collection system or the POTW treatment plant.
f. **CFR** means the Code of Federal Regulations.
g. **Code** means the Code of the City of Flint, Michigan.
h. **Cooling water** means the water discharged from any use in which the only pollutant added is heat, shall be considered non-contract cooling water. Water discharged from any use in which heat and other pollutants have been added, shall be considered as contact cooling water.
i. **Daily concentration** means the sum of all concentration measurements for any 24-hour period divided by the number of such measurements.
j. **Discharge** means the introduction (including infiltration) of pollutants into the POTW which is either intentional or unintentional.
k. **Grab sample** means a sample which is taken from a discharge with no regard to the flow which is collected over a period of time not exceeding 15 minutes.
l. **Groundwater** means water which is pumped or otherwise captured from the ground and which is not used in a process. Mere treatment of groundwater is not use in a process.
m. **EPA** means the United States Environmental Protection Agency or its successor.
n. **Hexane-extractable material** means any material, such as fat, oil, or grease, which is

recoverable from wastewater by extraction with n-hexane, using epa test method 1664, revision a, and as defined therein.

o. **Instantaneous concentration** means the concentration in any grab sample.

p. **Interceptor** means a structure or device designed for removing floating or suspended hexane-extractable material and other viscous or dense substances from wastewater, by physical separation, prior to discharging the wastewater into the POTW.

q. **Interference** means a discharge which, alone or in conjunction with a discharge or discharges from other sources, both: (i) inhibits or disrupts the POTW, its treatment processes or operations, or its sludge processes, use or disposal; and, (ii) therefore, is a cause of a violation of any requirement of the NPDES permit for the POTW, the Act, or State Act (including an increase in the magnitude or duration of a violation) or of the prevention of sewage sludge use or disposal in compliance with the following statutory provisions and regulations or permits issued thereunder (or any more stringent state or local regulations): Section 405 of the Act, the Solid Waste Disposal Act (SWDA) (including Title II, more commonly referred to as the Resource Conservation and Recovery Act (RCRA), and including state regulations contained in any state sludge management plan prepared pursuant to Subtitle D of the SWDA), the Clean Air Act, the Toxic Substances Control Act, and the Marine Protection, Research, and Sanctuaries Act.

r. **mg/L** means milligrams per liter.

s. **ug/L** means micrograms per liter.

t. **MDEQ** means the Michigan Department of Environmental Quality or its successor.

u. **Pass through** means a discharge which exits the POTW into Waters of the State in quantities or concentrations which, alone or in conjunction with a discharge or discharges from other sources, cause a violation of any requirement of the Act or State Act.

v. **Pollutant** means any material which is discharged to the POTW or is proposed for discharge to the POTW. The term also includes properties of such materials such as pH and heat.

w. **Potentially Harmful Substance (PHS)** means:
   - Corrosive substances which have a pH of less than or equal to 2.0 Standard Units or greater than or equal to 12.0 Standard Units.
   - Ignitible substances which have a closed-cup flash point of less than 140° F (60 °C).
   - Reactive substances which are normally unstable and readily undergo violent change without detonating; react violently with water; form potentially explosive mixtures with water; when mixed with water, generate toxic gases, vapors, or fumes in a quantity sufficient to endanger humans; or are capable of detonation or explosive reaction.
   - Biocides which eradicate organisms (i.e., disinfectant, insecticide, rodenticide, herbicide, etc.).
   - Carcinogens which cause an increased incidence of benign or malignant neoplasms in animals or humans or that substantially decreases the time in which neoplasms develop in animals or humans.
   - Any substance listed in the Register of Potentially Harmful Substances in the Appendix.
   - Any other substance which, if discharged in an excessive amount, would violate Part I.

x. **POTW** means a publicly owned treatment works, as defined by Section 212 of the Act, which are owned by the City and the collection system. The term also means the City or its authorized representative. This term includes any devices, processes, and systems used by or for the City in the storage, treatment, recycling, or reclamation of wastewater or sludge from the treatment works or the collection system.

y. **POTW Regulations** means Chapter 46, Article V, Division 2 of the Municipal Code of the City of Flint.

z. **Pretreatment** means the reduction of the amount of pollutants, the elimination of pollutants, or the alteration of the nature of pollutant properties in wastewater prior to or in lieu of discharging or otherwise introducing such pollutants into the POTW. The reduction or alteration may be obtained by physical, chemical, or biological processes, process changes, or by other means, except for the use of dilution, unless expressly authorized by an applicable pretreatment standard or requirement.

aa. **Process wastewater** means any water which, during manufacturing or processing, comes

into direct contact with, or results from, the production or use of any raw material, intermediate product, finished product, byproduct, or waste product.

bb. **Severe property damage** means substantial physical damage to property, damage to the treatment facilities of a user which causes them to become all or partially inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

cc. **Slug discharge** means a discharge of a non-routine, episodic nature, including, but not limited to, an accidental spill or a non-customary batch discharge.

dd. **State Act** means Part 31 Water Resources Protection of the Michigan Natural Resources and Environmental Protection Act, Act 451 of 1994, as amended, and all rules promulgated thereunder.

ee. **Toxic Organics** means the compounds listed as "Toxic Organics" in the Appendix.

ff. **Wastewater** means Water discharged to the POTW by a user which may or may not contain other pollutants. This term does not include storm water, surface runoff, or non-contaminated groundwater and non-contact cooling water.

2. Right of Entry

Authorized representatives of the City exhibiting proper credentials and identification shall be permitted at all reasonable times, and at any time in an emergency, to enter the permittee's property without delay for the purposes of inspection, observation, measurement, sampling, and testing in connection with the administration and enforcement of this permit and the POTW Regulations.

3. Limitations of Permit Transfer

This permit shall not be assigned, transferred, or sold to a new owner without approval of the City. As described in the Code, in the event of any change in ownership of facilities from which the authorized discharge emanates, written notification of proposed permit transfer must be provided to the City. Included shall be an agreement specifying a date for transfer of permit responsibility, and coverage between the current and new permittee which acknowledges liability for any violation which occurs before and after that date.

This permit is issued to the permittee for a specific operation at a specific location and it is, therefore, not assignable to another sewer user or transferable to any other location without prior written approval of the City Director. The City Director shall approve a use permit transfer and make the necessary minor modifications to the use permit to show the transferee as the permittee, if the transferor demonstrates to the city the following conditions exist:

- the transferor has not violated any provision on this permit or of the POTW Regulations during the 6-month period preceding the date of the transfer;
- as of the date of the transfer, there are no unpaid charges or fees due to the city from the transferor related to use of the POTW;
- the application for the use permit filed by the transferor remains the same with respect to the discharge, facilities, and activities of the transferee, except as to the identity of the discharger; and
- the transferor provides written evidence to the City Director that a copy of the use permit has been provided to the transferee.

If these conditions are not met, then no transfer shall occur and a new use permit is required.

4. Permit Term

The term of this use permit shall not to exceed five (5) years. The permittee shall apply for re-issuance of this use permit by submitting a complete application at least one hundred and eighty

(180) days before the expiration of this use permit. If application for renewal is timely submitted, the existing use permit shall continue until final action is taken by the City Director on the application for renewal. Otherwise, the existing use permit shall expire on its stated expiration date and the permittee shall cease its discharge.

5. Permit Modification

The City Director shall have the right to modify this permit in order to:

- assure compliance by the POTW with applicable laws and the POTW NPDES permit;
- account for changes in discharges by the permittee;
- account for new information concerning the pollutants discharged by the permittee;
- reflect changes in federal or state laws and regulations or in City ordinances;
- accommodate operational changes at the POTW that, as determined by the City Director, require revision of the use permit;
- modify or terminate any special arrangement contained in a use permit; or
- assure compliance by the permittee with this permit , the POTW Regulations, or other applicable laws.

The permittee shall be informed of any modifications in this permit at least thirty (30) days prior to the effective date of the modification, unless a shorter time is necessary to meet applicable law or to protect human health, the environment, or the POTW.

6. Revocation of Permit

The City Director may revoke this permit during its term or deny its renewal if:

- the permittee has failed to comply with any condition of this permit;
- the permittee fails, in the use permit application or during the use permit issuance process, to disclose fully all relevant facts to the City, or the permittee misrepresents any relevant fact at any time to the City;
- the City Director determines that the permitted discharge endangers human health, the environment, or the POTW and the threat can only be abated by revocation or denial of this permit;
- a change in any condition that requires either a temporary or permanent reduction or elimination of the discharge;
- the permittee is in default, after having received written notice of such default, in the payment of fees or other amounts owed to the City related to wastewater matters; or
- non-compliance by the permittee with any provision of the POTW Regulations.

Upon revocation or denial of this permit, the permittee shall immediately terminate its discharge to the POTW.

7. Property Rights Exclusion

The issuance of this permit conveys neither any property rights in either real or personal property, nor any exclusive privileges. It also authorizes neither any injury to private property or invasion of personal rights, nor infringement of Federal, State, or local laws or regulations.

8. Severability

If any provision, paragraph, word, or part of this permit is invalidated by any Code revision or any court of competent jurisdiction, the remaining provisions, paragraphs, words and parts shall not be affected and shall continue in full force and effect.

9. Monitoring/Inspection Fees

The permittee shall reimburse the City for any and all expenses incurred as a result of any monitoring or inspection conducted by or for the City at the permittee's facility.

10. Penalties for Violations

The permittee shall comply with all of the provisions of this permit. A violation of any provision of this permit is a violation of the POTW Regulations, subject to the penalty, damage, compensatory charge, and other enforcement provisions of the POTW Regulations, as follows:

a. *Continuing Violations.* Each day on which a violation of this permit, an order, or the POTW Regulations occurs shall be a separate violation. Every violation of each part of this permit shall be a separate violation.

b. *Civil Judicial Relief.* The City Director, through the City Attorney, may pursue an action at law or in equity to enjoin, abate, or prosecute any violation of this permit. The City Director may seek temporary or permanent injunctive relief, damages, compensatory charges, and/or civil penalties under the POTW Regulations; and such other relief as a court may order.

c. *Civil Penalties.* In an action brought by the City against the permittee for violation of this permit, a court may impose a civil penalty of up to five thousand dollars ($5,000) per day per violation. In calculating the amount of the penalty, the court shall consider the frequency of the violation; the impact on the POTW, human health, and the environment; the magnitude and duration of the violation; the economic benefit to the permittee from the violation; the compliance history of the permittee; and other factors deemed appropriate by the court.

d. *Municipal Civil Infraction; Civil Fine.* The City Director and City Enforcement Officers are authorized to issue a municipal civil infraction citation ("citation"). For any violation of this permit, except for certain criminal violations. The civil fine for any violation of this permit shall be up to five thousand dollars ($5,000) per violation per day. In calculating the amount of the civil fine, the City Director or the court, as applicable, shall consider the frequency of violation by the permittee, the impact on the POTW and human health and the environment of the violation, the magnitude and duration of the violation, the economic benefit to the permittee gained by the violation, the compliance history of the permittee, and other factors deemed appropriate by the court or the City Director as applicable.

e. *Cumulative Remedies.* The imposition of a single civil penalty, civil fine, criminal fine, order, damage, or compensatory charge upon the permittee for a violation of this permit shall not preclude the imposition by the City or a court of additional sanctions and remedies with respect to the same violation except that the permittee shall not have both a civil penalty and a civil fine imposed on it for the same violation. Prosecution of a criminal action against the permittee shall not be stayed pending the outcome of a civil action involving the same violation.

f. *Compensatory Charges.* In addition to prosecution and the imposition of penalties and fines for violations of this permit, the permittee shall be subject to one or more compensatory charges in accordance with the POTW Regulations.

g. *Violation Constitutes a Public Nuisance.* Violations of this permit are a public nuisance.

h. *Criminal Violations.* If the permittee willfully or intentionally violates any provision of this permit, the permittee shall, upon conviction, be guilty of a misdemeanor, punishable as provided in the Code. If the permittee knowingly makes any false statements, representations, or certifications in any application, record, report, plan, or other document filed or required to be maintained pursuant to this permit; or if the permittee falsifies, tampers

with, or knowingly renders inaccurate any monitoring device or method required under this permit or the POTW Regulations, the permittee shall, upon conviction, be guilty of a misdemeanor punishable as provided in Code. Each day of violation is a separate offense.

PART III

A. SPECIAL TERMS AND/OR REQUIREMENTS

1. Soil-cleanup Groundwater Discharge Variance

a. This permit establishes a variance to Section 46-146(b)(12) of the POTW Regulations for discharging groundwater to the POTW, per written request from the sanitary sewer application ("the request"), dated November 7, 2011, submitted to the City by the permittee, which provided specific information about proposed discharges.

b. The permittee is hereby **ONLY** authorized to discharge soil cleanup groundwater pumped from the sources and contaminated with the pollutants specifically identified in the requests. This permit does **NOT** authorize the discharge of water from any other source.

c. The permittee shall temporarily withhold the groundwater discharge for up to ninety-six (96) hours upon request by the City, after which the discharge may be resumed upon prior oral notification to the City. This does not preclude the City from requiring the permittee to withhold the groundwater discharge for longer than ninety-six (96) hours.

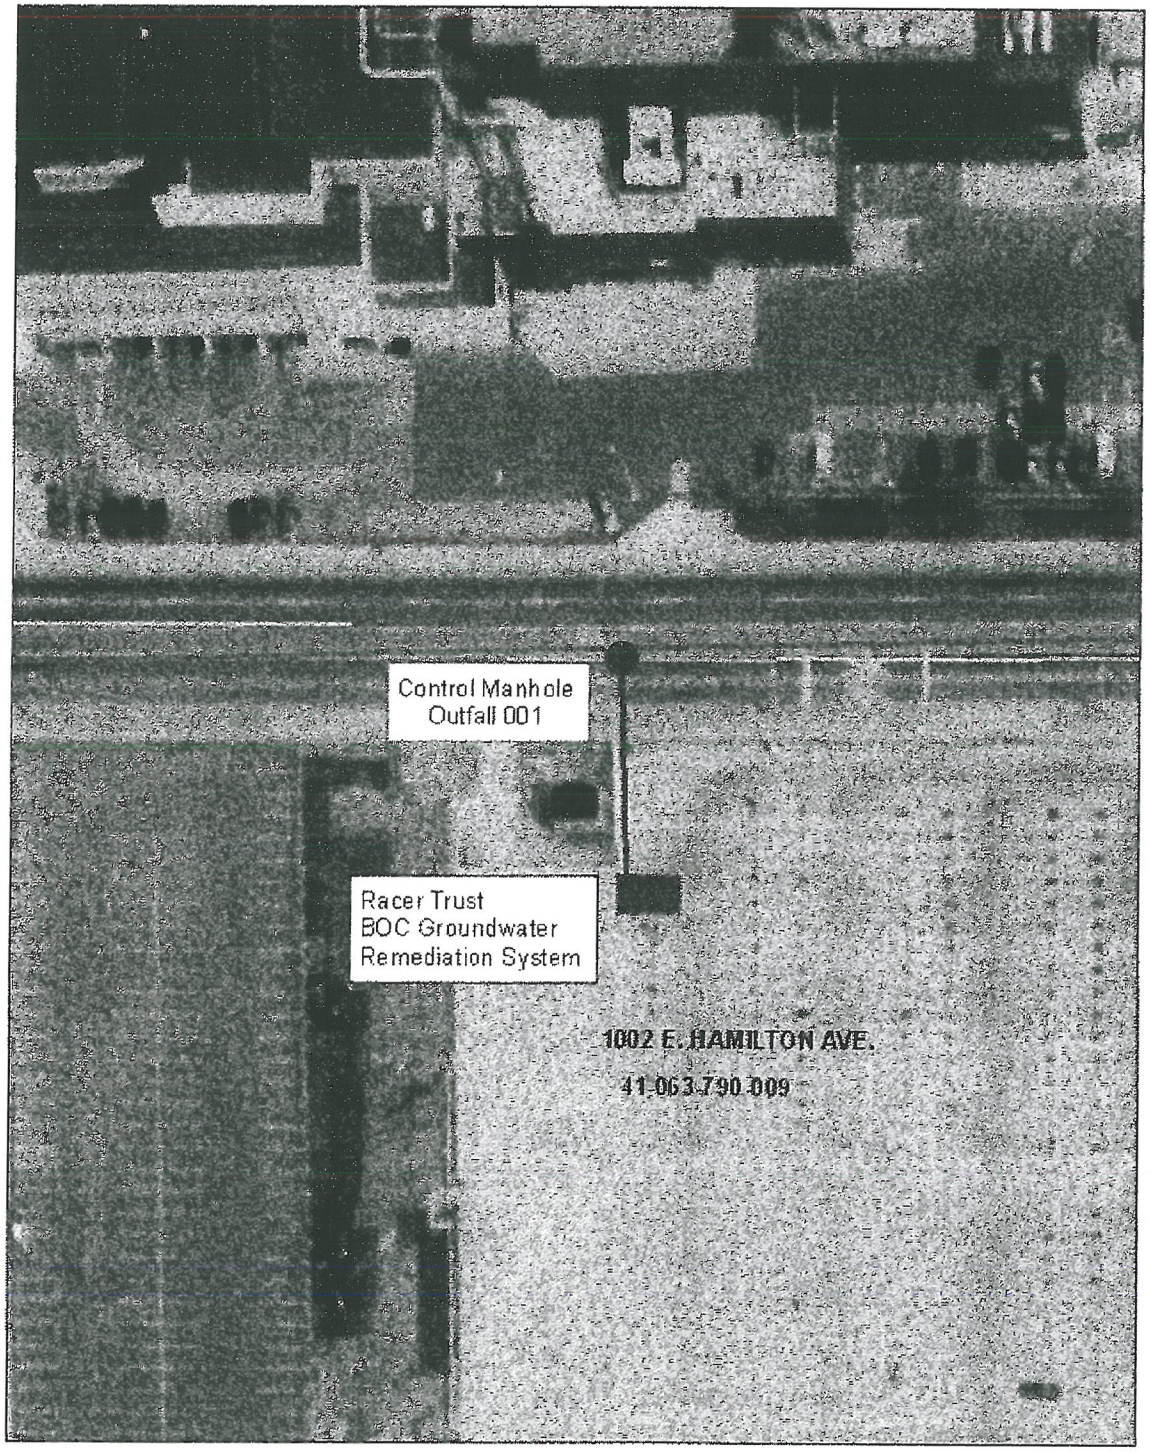
2. Controlling the Discharge Rate

The permittee's discharge to the POTW shall not cause or contribute to hydraulic overloading at any point in the POTW.

- The permittee shall immediately reduce or temporarily withhold the discharge, during wet weather events equivalent to 1 inch of rain per 24 hour period or greater, and as needed for preventing or abating hydraulic overloading, upon receipt of a written or oral request by the City WPC Supervisor.

- The permittee shall have a written plan, reviewed and accepted by the City, for controlling the discharge in a timely, reliable manner. The City may require the permittee to revise this plan, whenever needed.

- The permittee shall not exceed the maximum daily flow rate of 25 gallons per minute or exceed the daily maximum flow volume of 36,000 gallons per day.



2. Discharge Metering

The permittee shall, at all times, meter the rate and daily volume of its discharge to the POTW, using a flow metering system approved by the City Director.

USE OF THE PUBLICLY OWNED TREATMENT WORKS

§ 46-142 PURPOSE AND SCOPE.

(a) *Purpose.* The purpose of this Division is to establish standards, rules, and regulations with respect to the use of the POTW; to provide for certain rates and charges for use of the system and to prevent pollution of the environment.

(b) *Scope.* This Division shall apply to the City of Flint. Any other municipality, drainage district, or other political subdivision of the State that discharges into the POTW which has the power to enact ordinances shall adopt an ordinance which is substantially similar to this Division and which is approved by the City as being sufficiently similar. This Division provides for the regulation of discharges into the POTW through the issuance of use permits to significant non-domestic users, through monitoring and enforcement activities, and through required discharger reporting.

§ 46-143 DEFINITIONS.

For the purposes of this Division, the following words and phrases shall have the meanings described in this Section, unless the context in which they are used specifically indicates otherwise.

ACT. The term "Act" means the Federal Water Pollution Control Act, also known as the Clean Water Act, as amended, 33 U.S.C l *1251,* et seq, and all rules promulgated thereunder.

BEST MANAGEMENT PRACTICES (BMPS). Schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to implement the prohibitions listed in 40 CFR, Chapter I, Subchapter N, Part 403.5(A)(1) and (B). BMPs also includes treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw materials storage, any of which may enter the POTW.

BIOCHEMICAL OXYGEN DEMAND. The quantity of oxygen utilized in the biochemical oxidation of organic matter and biologically oxidizable inorganic matter under standard laboratory procedures for 5 days, at 20 degrees celsius, expressed in milligrams per liter concentration, using method 5210 B in *Standard Methods for the Examination of Water and Wastewater,* current edition.

CATEGORICAL PRETREATMENT STANDARDS (CPS). Pollutant limits for discharges to POTWs, promulgated by US EPA in 40 CFR Chapter I, Subchapter N, Parts 405, et seq, in accordance with 307(b) and (c) of the Act, which are applicable to a non-domestic user which engages in a category or categories of industry that are subject to the following regulations:

Effluent Guidelines and Standards for Electroplating (40 CFR 413)
Effluent Guidelines and Standards for Organic Chemicals, Plastics, and Synthetic Fibers (40 CFR 414)
Effluent Guidelines and Standards for Inorganic Chemicals (40 CFR 415)
Effluent Guidelines and Standards for Fertilizer Manufacturing (40 CFR 418)
Effluent Guidelines and Standards for Petroleum Refining (40 CFR 419)
Effluent Guidelines and Standards for Iron and Steel Manufacturing (40 CFR 420)
Effluent Guidelines and Standards for Nonferrous Metals (40 CFR 421)

Effluent Guidelines and Standards for Steam Electric Power Generating (40 CFR 423)
Effluent Guidelines and Standards for Leather Tanning and Finishing (40 CFR 425)
Effluent Guidelines and Standards for Glass Manufacturing (40 CFR 426)
Effluent Guidelines and Standards for Rubber Processing (40 CFR 428)
Effluent Guidelines and Standards for Timber Products (40 CFR 429)
Effluent Guidelines and Standards for Pulp, Paper and Paper Board (40 CFR 430)
Effluent Guidelines and Standards for Metal Finishing (40 CFR 433)
Effluent Guidelines and Standards for Centralized Waste Treatment (40 CFR 437)
Effluent Guidelines and Standards for Pharmaceutical Manufacturing (40 CFR 439)
Effluent Guidelines and Standards for Transportation Equipment Cleaning (40 CFR 442)
Effluent Guidelines and Standards for Waste Combustors (40 CFR 444)
Effluent Guidelines and Standards for Landfills (40 CFR 445)
Effluent Guidelines and Standards for Pesticide Chemicals Manufacturing (40 CFR 455)
Effluent Guidelines and Standards for the Battery Manufacturing Point Source Category (40 CFR 461)
Effluent Guidelines and Standards for Metal Molding and Casting (40 CFR 464)
Effluent Guidelines and Standards for Coil Coating (40 CFR 465)
Effluent Guidelines and Standards for Porcelain Enameling (940 CFR 466)
Effluent Guidelines and Standards for Aluminum Forming (40 CFR 467)
Effluent Guidelines and Standards for Copper Forming (40 CFR 468)
Effluent Guidelines and Standards for Electrical and Electronic Components (40 CFR 469)
Effluent Guidelines and Standards for Nonferrous Metals Forming and Metal Powders (40 CFR 471)

COOLING WATER. The water discharged from any use in which the only pollutant added is heat, shall be considered non-contract cooling water. Water discharged from any use in which heat and other pollutants have been added, shall be considered as contact cooling water.

CPS. Categorical Pretreatment Standards.

DAILY CONCENTRATION The sum of all concentration measurements for any 24-hour period divided by the number of such measurements.

DISCHARGE. The introduction (including infiltration) of pollutants into the POTW which is either intentional or unintentional.

FLASHPOINT. The minimum temperature at which vapor comubustion will spread away from its its source of ignition.

GRAB SAMPLE. A sample which is taken from a discharge with no regard to the flow which is collected over a period of time not exceeding is minutes.

GROUNDWATER. Water which is pumped or otherwise captured from the ground and which is not used in a process. Mere treatment of groundwater is not used in a process.

HEXANE-EXTRACTABLE MATERIAL.
Any material, such as fat, oil, or grease, which is recoverable from wastewater by extraction with N-Hexane, using EPA Test Method 1664, Revision A, and as defined therein.

HAZARDOUS SUBSTANCE. Any substance as defined in Part 201 of the Michigan Natural

mg/L. Milligrams per liter.

INSTANTANEOUS CONCENTRATION. The concentration in any grab sample.

INTERFERENCE. A discharge which, alone or in conjunction with a discharge or discharges from other sources, both: (i) inhibits or disrupts the POTW, its treatment processes or operations, or its sludge processes, use or disposal; and, (ii) therefore is a cause of violation of any requirement of the NPDES permit for the POTW, the Act, or State Act (including an increase in the magnitude or duration of a violation) or of the prevention of sewage sludge use or disposal in compliance with the following statutory provisions and regulations or permits issued thereunder (or any more stringent state or local regulations): Section 405 of the Act, the Solid Waste Disposal Act [SWDA] (including Title II, more commonly referred to as the Resource Conservation and Recovery Act [RCRA], and including state regulations contained in any state sludge management plan prepared pursuant to Subtitle D of the SWDA, the Clean Air Act, the Toxic Substances Control Act, and the Marine Protection, Research, and Sanctuaries Act.

MAXIMUM ALLOWABLE INDUSTRIAL LOADING. The daily maximum mass of a pollutant, in pounds per day, which may be allowed by the City to be discharged to the POTW by the aggregate of all non-domestic users.

ug/L. Micrograms per liter.

NON-DOMESTIC USER. A user that discharges pollutants other than, or in addition to, sanitary sewage, but not including a user that is a municipality, drainage district, or other political subdivision of the state that only discharges from its own collection system to the City's collection system.

NPDES PERMIT. A permit issued pursuant to the National Pollutant Discharge Elimination System to regulate the discharge of wastewater into the surface waters of the state.

PASS THROUGH. A discharge which exits the POTW into waters of the state in quantities or concentrations which, alone or in conjunction with a discharge or discharges from other sources, cause a violation of any requirement of the Act or State Act.

PERSON Any individual, firm, municipality, company, association, society, corporation, partnership, or group, including their officers and employees who have responsibility for or actual involvement in the matters regulated by this Division.

pH. The logarithm (base 10) of the reciprocal of the concentration of Hydrogen ions in moles per liter of solution.

POLLUTANT. Any material which is discharged to the POTW or is proposed for average dry weather hydraulic or organic capacity of the POTW.

POTW. Publicly Owned Treatment Works, as defined by Section 212 of the Act, which are owned by the City and the collection system. The term also means the City or its authorized representative. This term

includes any devices, processes, and systems used by or for the City in the storage, treatment, recycling, or reclamation of wastewater or sludge from the treatment works or the collection system.

POTW TREATMENT PLANT. The POTW exclusive of the collection system.

PREMISES. A lot or parcel of land, generally, or each lot or parcel of land, or building, having any connection, direct or indirect, to the POTW, as the context of the word within this Division dictates.

SANITARY SEWAGE. Wastewater or pollutants from toilet, kitchen, laundry, bathing, or other facilities all of which are used for household purposes or for non-commercial purposes at a commercial location.

SEVERE PROPERTY DAMAGE. Substantial physical damage to property, damage to the treatment facilities of a user which causes them to become all or partially inoperable, or substantial and permanent loss of natural resources occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

SEWER. A pipe or conduit for carrying wastewater, storm water, surface runoff, or groundwater.

SLUDGE. Solids or other residue, either of which are separated from wastewater and generated by any treatment process, or solids or other residue directly separated from a production process.

SOURCE. Any building, structure, facility, vehicle, or installation from which there is or may be a discharge to the POTW.

STATE ACT. Part 31 Water Resources Protection of the Michigan Natural Resources and Environmental Protection Act, Act 451 of 1994, as amended, and all rules promulgated thereunder.

TOTAL SUSPENDED SOLIDS. Solids that either float on the surface of; or are in suspension in, wastewater and which can be recovered by standard laboratory filtering, using Method 2540 D in *Standard Methods for the Examination of Water and Wastewater,* current edition.

US EPA. The United States Environmental Protection Agency or its successor.

USER. A person who discharges into the POTW and a municipality or drainage district whose collection system discharges into the POTW.

WASTEWATER. Water discharged to the POTW by a user which may or may ot contain other pollutants. This term does not include storm water, surface runoff, or non-contaminated groundwater and non-contact cooling water.

§ 46-146 DISCHARGE PROHIBITIONS AND LIMITS.

(a) *Discharge Prohibitions.* The provisions in this Section are intended to:

(1) prohibit the discharge to the POTW of wastewater which may cause pass-through or interference or which could have detrimental effects on the physical structures or operating personnel of the POTW, or on the general public or the environment, and

(2) restrict the discharge to the POTW of storm water, groundwater, and non-contact cooling water.

(b) *Prohibited Discharges.* No user shall discharge, cause to be discharged, or allow to be discharged into the POTW any of the following:

(1) pollutants which may or do create a fire or explosion hazard in the POTW, including, but not limited to, pollutants or wastewater with a closed cup flashpoint of less than 140° Fahrenheit (60° Celsius), as determined by a Pensky-Martens closed cup tester, using the test method specified in ASTM Standard D-93-79 or D-93-80K (incorporated by reference, see 40 CFR § 260.21) or a Setaflash closed cup tester, using the test method specified in ASTM Standard D-3278-78 (incorporated by reference, see 40 CFR § 260.21), and pollutants which exceed 10% of the lower explosive limit (LEL) at any point within the POTW;

(2) pollutants which result in the presence of toxic gases, vapors, or fumes within the POTW in a quantity that may cause acute or chronic health and safety problems for workers or exceed any applicable occupational health or safety standard;

(3) pollutants which may or do cause corrosive or abrasive structural damage to the POTW;

(4) solid or viscous pollutants in amounts which may or do obstruct flow or cause interference in the POTW;

(5) wastewater having an instantaneous pH less than 6.0 or greater than 10.5;

(6) any pollutant, including oxygen-demanding pollutants, released in a discharge at a flow rate and/or pollutant concentration which may or do cause interference in the POTW;

(7) pollutants which may or do cause:

a. Restriction of hydraulic capacity of structures in the POTW;

b. Unsafe conditions to personnel in the operation, inspection, or maintenance of the POTW or unsafe conditions to the general public, with respect to the collection system;

c. Exceptional or unreasonably burdensome effort, attention, or expense in the operation or maintenance of the POTW.

d. Heat in amounts which will inhibit biological activity in the POTW, resulting in interference, but in no case heat such that the temperature at the discharge to the collection system exceeds 150° Fahrenheit (66° Celsius) or the influent at the POTW treatment plant exceeds 104° Fahrenheit (40° Celsius).

(8) pollutants which may or do cause pass-through or interference.

(9) any pollutants which exceed, for that user, the limitations set forth in a Categorical Pretreatment Standard, as adjusted under the Combined Wastestream Formula in Michigan Rule R 323.2311(7), which may be expressed as concentration limits, mass limits, or both, as provided in Michigan Rule R 323.2311(5). A Categorical Pretreatment Standard shall be adjusted if 40 CFR 403.15 applies and the criteria of 40 CFR 403.15(b) and (c) are met (net/gross calculation).

(10) any liquids, gases, or solids which either singly or by interaction with other substances may or do create a public nuisance.

(11) any pollutant introducing colors not removed in the POTW treatment process, such as but not limited to, dye wastes and vegetable tanning solutions.

(12) any unpolluted water, non-contact cooling water, storm water, groundwater or surface water, unless the City Director gives written permission to the user for the discharge of such waters based on available hydraulic capacity and potential impacts on the POTW treatment capability. The scope and duration of the discharge of such waters shall be determined at the sole discretion of the City Director.

(13) any radioactive wastes in harmful quantities as such quantities are defined by applicable State and Federal regulations.

(14) any grease or other pollutants that will become solid or viscous at a temperature of 140° Fahrenheit (60° Celsius) or below after being discharged into the POTW.

(15) hazardous substances that were not listed or disclosed in the user's application for a use permit that:

a. May or do cause or contribute to a violation of State or Federal water quality standards in the receiving waters to which the POTW discharges; or

b. Result in or contribute to a liability of the City under Part 201 of the Michigan Natural Resources and Environmental Protection Act, Act 451 of 1994, as amended, or the Federal Comprehensive Environmental Response Compensation and Liability Act of 1980, as amended (CERCLA). Nothing in this paragraph determines the percentage share or allocation share amount of a user's Part 201 or CERCLA liability.

(16) hazardous substances in quantities exceeding the numerical limit in a user's use permit which:

a. May or do cause or contribute to a violation of State or Federal water quality standards in the receiving waters to which the POTW discharges; or

b. Result in or contribute to a liability of the City under Part 201 of the Michigan Natural Resources and Environmental Protection Act, Act 451 of 1994, as amended, or the federal comprehensive environmental response compensation and liability Act of 1980, as amended (CERCLA). Nothing in this paragraph determines the percentage share or allocation share amount of a user's Part 201 or CERCLA liability.

(17) sludge, unless the City Director has determined that it is amenable to treatment by the POTW and does not otherwise violate any discharge prohibition.

(18) any new or used petroleum oil or grease, non-biodegradable cutting oil, or products of mineral oil origin, in amounts that may or do cause interference or pass-through.
Concentration limits for specific pollutants.

(c) *Pollutant Concentration Limits.*

(1) discharges made by non-domestic users having concentrations of specific pollutants greater than the pollutant concentration limits described in table 404(c) in the appendix at the end of this Division are prohibited, except as regulated under Subsection d of this Section.

(2) *Measurement of Pollutant Concentrations.*

a. The instantaneous concentration limit for a specific pollutant shall apply to the instantaneous concentration of the pollutant measured by sampling in accordance with § 46-149(a)(3)a.

b. The daily concentration limit for a specific pollutant shall apply to the daily concentration of the pollutant measured by sampling in accordance with § 49-149(a)(3)b.

(d) *Special Arrangements.* The City Director may establish a special arrangement between the City and a user in a use permit or an order that allows discharges to the POTW that are otherwise prohibited by this Section. A special arrangement shall not cause the City to violate any NPDES permit provisions. The special arrangement may include special alternative limits (SALs) that are greater or less than the discharge limits in Subsection (c) of this Section. A special arrangement may also include requirements for best management practices (BMPs) in addition to, but not in lieu of, any discharge limit. BMPs shall be established in a use permit if the user is a Significant Non-domestic User. The decision to establish a special arrangement shall be made at the sole discretion of the City Director. The special arrangement may be terminated or modified at will at any time by the City. A special arrangement shall not create any vested rights or property rights in the user. A special arrangement shall create no rights to discharge to the POTW that the user would not have had in the absence of a special arrangement. Provisions relating to termination or modification of a special arrangement may be more fully set forth in the special arrangement document. As a condition precedent to the entry into a special arrangement, the City shall require the user to sign an acknowledgement and acceptance of the provisions of this Subsection. Any special arrangement may contain provisions for the user to pay a compensatory charge to the City. A special arrangement shall not allow a discharge that exceeds a Categorical Pretreatment Standard unless a removal credit or a fundamentally different factor variance applies to allow the user to exceed the otherwise applicable Categorical Pretreatment Standard. In such case, the special arrangement shall not allow a discharge that exceeds the limit allowed by the removal credit or variance. A violation of the terms of a special arrangement, including any SALs, BMPs, or special pretreatment requirements shall be a violation of this Division.

(1) *Procedures for Establishing Special Alternative Limits.* In determining a SAL, the City Director shall allocate a share of the maximum allowable industrial loading for the pollutant of concern as set forth in Paragraph (2) of this Subsection among one or more non-domestic users in amounts and on terms and conditions deemed appropriate by the City Director.

(2) *Maximum Allowable Industrial Loadings.* The total mass of a pollutant of concern used by or allocated to all non-domestic users, including mass allocated by the City Director in establishing SALs for the pollutant, shall not exceed in the aggregate for all non-domestic users the maximum allowable industrial loadings described in Table 46-146(d)2 in the Appendix at the end of this Division.

(e) *Local Initiative Limits.* The City Director may impose limits on a user for pollutants not specifically listed in Table 46-146(c) in the Appendix at the end of this Division, which may be in a use permit or in an order. In determining a local initiative limit (LIL), the City Director shall consider available data on acceptable POTW pollutant loading based on POTW design, treatability of the pollutant, the potential for pass-through or interference, current POTW pollutant loading, the properties of the pollutant, and other relevant factors deemed appropriate by the City Director. The City Director may also establish generally applicable LILs by rulemaking. A generally applicable LIL may be established and shall be enforceable as a discharge prohibition, provided the City Director first publishes notice of the proposed LILs in the newspaper in the City with the largest circulation, provides written notice to users who are known to the City Director to discharge a significant mass or concentration of the pollutant, and provides for an opportunity to interested persons to submit written comments. If significant public comments are received, the City Director shall hold a public hearing to take additional oral and written comments. After these procedures are completed, the City Director shall publish the final enforceable LILs in the same newspaper along with the effective date of the LILs.

(f) *Categorical Pretreatment Standards.* A user shall comply with all Categorical Pretreatment Standards and any other pretreatment requirements, established under 307(B), 307(C), or 402(B)(8) of the Act that are applicable to that user, as adjusted under the Combined Wastestream Formula in Michigan Rule R 323.2311(7). If a Categorical Pretreatment Standard and another limit contained in this Division or in an applicable State of Michigan pretreatment requirement regulate the same pollutant, then the more restrictive of them shall apply. If a user requests that a removal credit be applicable to that user, then such user shall pay all costs associated with supporting, obtaining, and administering the removal credit so that the City incurs no costs. It shall be at the sole discretion of the City whether or not a removal credit shall be established and how a removal credit shall be allocated.

(g) *Trucked Wastes.* No wastes or wastewater shall be discharged by any user or person into the POTW from a vehicle which transported the waste or wastewater to the point of discharge. The preceding sentence does not prohibit a user from trucking wastes or wastewater to the user's treatment facility.

(h) *Future Conditions.* Future conditions imposed on the City by government agencies with proper jurisdiction may require subsequent amendment of this Division by the City. Where federal- or state-promulgated pretreatment standards require limits on parameters not covered in this Division or limits more stringent than those specified in the Division, the state or federal limits shall have precedence and take effect with respect to the applicable user on the later of their promulgation date or the date specified for compliance with such standards.

(i) *Reserved Right of Revision.* The City reserves the right to establish by ordinance, rule, order, or use permit more stringent limitations or requirements on discharges to the POTW.

§ 46-147 DILUTION.

No user shall increase the use of potable or process water or in any other way attempt to dilute a discharge as a partial or complete substitute for adequate treatment before discharge to the POTW to achieve compliance with the standards set forth in this Division, except upon prior written approval from the City Director. Such approval shall be granted at the sole discretion of the City Director and consistent with federal and state law.

Appendix

Table 46-146(c) Pollutant Concentration Limits
Table 46-146(d)(2) Maximum Allowable Industrial Loadings

Table 46-146(c)

Pollutant Concentration Limits		
Pollutant	Instantaneous Concentration Limits	Daily Concentration Limits
Biochemical Oxygen Demand		427 mg/L
Hexane-Extractable Material		100 mg/L
Ammonia-Nitrogen		37 mg/L
Total Phosphorus		7 mg/L
Total Suspended Solids		305 mg/L
Total Arsenic		12 ug/L
Total Cadmium		14 ug/L
Total Chromium		48 ug/L
Hexavalent Chromium		5 ug/L
Total Copper		179 ug/L
Available Cyanide	1,195 ug/L	5 ug/L
Total Lead		107 ug/L
Total Mercury		0.012[1] ug/L
Total Nickel		43 ug/L
Total Silver		23 ug/L
Total Zinc		445 ug/L
Total PCB		0.00020[2] ug/L
Benzene	174 ug/L	1 ug/L
Toluene	1,753 ug/L	187 ug/L
Ethylbenzene	2,048 ug/L	1 ug/L
Total Xylenes	2,009 ug/L	2 ug/L

[1] Mercury sample collection, preservation, and handling procedures and analytical protocol for compliance monitoring shall be in accordance with us EPA Method 245.1 or 245.2 or Method 1631, as determined by the City Director. Whenever the quantification level is less than or equal to the discharge limit, the discharge limit shall apply directly. However, whenever the quantification level is above the discharge limit, the discharge of mercury at or above the quantification level shall represent an exceedance of the limit. The quantification level under Methods 245.1 and 245.2 shall be 0.2 ug/L, unless a higher level is appropriate due to matrix interference. If the concentration of the discharge sample is less than the quantification level when Method 245.1 or 245.2 are applicable, the user shall be considered to be in compliance with the mercury limit for the period that the sample represents, provided that the user is also in full compliance with any mercury minimization requirements applicable to that user. The quantification level under Method 1631 shall be 0.5 ng/L, unless a higher level is appropriate due to matrix interference. Justification for higher quantification levels shall be submitted to the City Director within 30 days of such determination. This footnote does not authorize the discharge of mercury at levels which interfere with the POTW or which constitute a threat to public health, welfare, or the waters of the state. [2] Total PCB shall be defined as the sum of the concentrations of Aroclors 1016, 1221, 1232, 1242, 1248, 1254, and 1260. In addition, any detected Aroclor-specific measurements shall be reported. Total PCB sample collection, preservation and handling procedures and analytical protocol for compliance monitoring shall be in accordance with US EPA Method 608. The quantification level shall not exceed 0.2 ug/L, unless a higher level is appropriate due to sample matrix interference. Whenever the quantification level is less than or equal to the discharge limit, the discharge limit shall apply directly; however, whenever the quantification level is above the discharge limit, the discharge of Total PCB at or above the quantification level shall represent an exceedance of the limit. If the concentration of the discharge sample is less than the quantification level, the user shall be considered to be in compliance with the Total PCB limit for the period that the sample represents, provided that the user is also in full compliance with any Total PCB minimization requirements applicable to that user. Any Aroclor analytical result which is less than the quantification level shall be considered as a zero in the summation of the Aroclor results for the sample. This footnote does not authorize the discharge of total PCB at levels which interfere with the POTW or which constitute a threat to public health, welfare or the waters of the state.

Table 46-146(d)(2)

Maximum Allowable Industrial Loadings	
Pollutant	Maximum Allowable Industrial Loading
Biochemical Oxygen Demand	79,216 Pounds/Day
Hexane-Extractable Material	17,589 Pounds/Day
Ammonia Nitrogen	3,762 Pounds/Day
Total Phosphorus	522 Pounds/Day
Total Suspended Solids	45,636 Pounds/Day
Total Arsenic	5.29 Pounds/Day
Total Cadmium	4.12 Pounds/Day
Total Chromium	162 Pounds/Day
Hexavalent Chromium	7.18 Pounds/Day
Total Copper	39.4 Pounds/Day
Available Cyanide	2.66 Pounds/Day
Total Lead	28.7 Pounds/Day
Total Mercury	0.000229 Pounds/Day
Total Nickel	34.7 Pounds/Day
Total Silver	3.90 Pounds/Day
Total Zinc	84.8 Pounds/Day
Total PCB	0.00000390 Pounds/Day
Benzene	148 Pounds/Day
Toluene	205 Pounds/Day
Ethylbenzene	31.7 Pounds/Day
Total Xylenes	43.0 Pounds/Day

ANALYTICAL REPORT

REVISED

PROJECT NO. B0064410.2013.01500

Buick City/Racer, Flint, MI

Lot #: H3D180404

Andrea Krevinghaus

ARCADIS U.S., Inc.
28550 Cabot Drive
Suite 500
Novi, MI 48377

TESTAMERICA LABORATORIES, INC.

Terry Wasmund
Project Manager

May 1, 2013

ANALYTICAL METHODS SUMMARY

H3D180404

PARAMETER	ANALYTICAL METHOD
Volatile Organics by TO15	EPA-2 TO-15

References:

EPA-2 "Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air", EPA-625/R-96/010b, January 1999.

SAMPLE SUMMARY

H3D180404

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
M0MFF	001	AOI-09B-OXIDIZER-EFF (041613)	04/16/13	18:45
M0MFH	002	AOI-09B-AS-OWS-INF (041613)	04/16/13	18:50
M0MFJ	003	AOI-09B-SVE-INF (041613)	04/16/13	18:55

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PROJECT NARRATIVE
H3D180404
Revised 05/01/13

Revision Note: This lot has been reissued to report results to the MDL.

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

The sample IDs for all samples were revised per client request.

Subcontract

The following analyses were performed by the TestAmerica Costa Mesa Laboratory (NELAP Accrediting Authorities: FLDOH, Lab ID E87652; Louisiana, Lab ID 01948; New York, Lab ID 11851; Oregon, Lab ID CA2000013; Utah, Lab ID CA000032012-1), 3585 Cadillac Avenue, Suite A, Costa Mesa, CA 92626, (714) 258-8610, Malcolm Moody, Laboratory Director: Volatile Organic Compounds in Ambient Air, Cryogenic Pre-Conc Techniques (EPA TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Quantitation for methylcyclohexane was previously based on a one-point calibration standard at the reporting limit. Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.

PROJECT NARRATIVE

H3D180404

Revised 05/01/13

- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Results relate only to the items tested and the sample(s) as received by the laboratory. The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters; exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.
B	Method blank contamination. The associated method blank contains the target analyte at a reportable level.

Air - GC VOA

Qualifier	Qualifier Description
LW	Quantitated against gasoline

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3D240404

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

The chain of custody listed sample IDs as AOI-9B-AS-OWS-INF (042213) and AOI-9B-SVE-INF (042213), however the sample containers labels listed the IDs as AIO-09B-AS-OWS-INF (042213) and AOI-09B-SVE-INF (042213). The samples were logged the samples according to the chain of custody. Subsequently, the IDs were changed to AOI-09B-AS-OWS-INF (042213) and AOI-09B-SVE-INF (042213), per client request by email.

Subcontract

The following analyses were performed by the TestAmerica Costa Mesa Laboratory (NELAP Accrediting Authorities: FLDOH, Lab ID E87652; Louisiana, Lab ID 01948; New York, Lab ID 11851; Oregon, Lab ID CA2000013; Utah, Lab ID CA000032012-1), 3585 Cadillac Avenue, Suite A, Costa Mesa, CA 92626, (714) 258-8610, Malcolm Moody, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Quantitation for methylcyclohexane was previously based on a one-point calibration standard at the reporting limit. Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.

PROJECT NARRATIVE
H3D240404

- A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Detection Summary

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: H3D240402

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)		✓		☒ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	1A AOI-9B-AS-OWS-INF(042213) Labeled as AIO-09B-AS-OWS-INF(042213) Log per COC 1A AOI-9B-SVE-INF(042213) Labeled as AIO-09B-SVE-INF(042213) Log per COC
2. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)			✓	☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?	✓			☐ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☐ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information	
17. Is the date/time of sample collection noted?	✓			☐ **15a** Incomplete information	
18. Is the client and project name/# identified?	✓			☐ **15a** Incomplete information	
19. Was the sampler identified on the COC?		✓		☐ **19a** Other

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.
a	Spiked analyte recovery is outside stated control limits.
ME	The percent recovery of the analyte is outside the control limits but within marginal exceedance limits.

Air - GC VOA

Qualifier	Qualifier Description
LW	Quantitated against gasoline

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3E060407

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

Subcontract

The following analyses were performed by the TestAmerica Costa Mesa Laboratory (NELAP Accrediting Authorities: FLDOH, Lab ID E87652; Louisiana, Lab ID 01948; New York, Lab ID 11851; Oregon, Lab ID CA2000013; Utah, Lab ID CA000032012-1), 3585 Cadillac Avenue, Suite A, Costa Mesa, CA 92626, (714) 258-8610, Malcolm Moody, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

For this method, the continuing calibration verification standard and the LCS are the same sample. While the result for carbon tetrachloride is flagged as being outside limits for batch 3127079, the results met the acceptance criteria which allows for two analytes to be within marginal exceedence limits.

Quantitation for methyl cyclohexane based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.

PROJECT NARRATIVE
H3E060407

- A method detection limit study has not been performed. The detection of the analyte is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3E060407

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: 440-160407

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	
2. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)			✓	☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?	✓			☐ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☐ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.

Air - GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3E130402

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

Custody seals were not present.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Quantitation for methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3E130402

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-16634-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 05/24/2013; the samples arrived in good condition.

TPH GRO
Samples AOI-09B-SVE-INF(051013) and AOI-09B-AS-OWS(051013) were analyzed for TPH GRO in accordance with EPA Method TO-3. The samples were analyzed on 05/24/2013 and 05/25/2013.

Samples AOI-09B-SVE-INF(051013)[45X] and AOI-09B-AS-OWS(051013)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The analysis of sample AOI-09B-SVE-INF(051013) yielded internal standard reponses that were outside control criteria due to the nature of the sample matrix.

The canister dilution information used for calculation of results was based on information provided by TestAmerica Knoxville.

No difficulties were encountered during the TVOC analyses.

Detection Summary

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: 430-31402

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	NA
2. Is the cooler temperature within limits? (> freezing temp. of water to 6°C, VOST: 10°C)			✓	☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?		✓		☑ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☐ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information	
17. Is the date/time of sample collection noted?	✓			☐ **15a** Incomplete information	
18. Is the client and project name/# identified?	✓			☐ **15a** Incomplete information	
19. Was the sampler identified on the COC?		✓		☐ **19a** Other

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.

Air - GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3E180408

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

Custody seals were not present.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Quantitation for methylcyclohexane was previously based on a one-point calibration standard at the reporting limit. Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3E180408

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-16759-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 05/31/2013; the samples arrived in good condition.

TPH-GRO

Samples AOI-09B-SVE-INF (051713) and AOI-09B-AS-OWS-INF (051713) were analyzed for TPH-GRO in accordance with EPA Method TO-3. The samples were analyzed on 06/04/2013.

Samples AOI-09B-SVE-INF (051713)[149X] and AOI-09B-AS-OWS-INF (051713)[21X] required dilution prior to analysis. The reporting limits have been adjusted accordingly. The canister dilution information used for calculation of results was based on information provided by TestAmerica Knoxville.

The analyses of sample the samples referenced above yielded internal standard reponses that were outside control criteria due to the nature of the sample matrix.

Detection Summary

TestAmerica Job ID: H3F120437

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
a	Spiked analyte recovery is outside stated control limits.
ME	The percent recovery of the analyte is outside the control limits but within marginal exceedance limits.
J	Estimated result. Result is less than RL.

Air - GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3F120437

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

Custody seals were not present.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

For this method, the continuing calibration verification standard and the LCS are the same sample. While the result for carbon tetrachloride is flagged as being outside limits for batch 3165013 and benzene and toluene for batch 3163057, the results met the acceptance criteria which allows for two analytes to be within marginal exceedence limits.

The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria. Even though the calibration verification analyzed on 6/13/13 exhibited a % difference of > 30% for 1,2,4-trichlorobenzene, the results were within the LCS acceptance limits.

Quantitation for methylcyclohexane was previously based on a one-point calibration standard at the reporting limit. Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.

PROJECT NARRATIVE
H3F120437

- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analyte is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3F120437

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-17140-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 06/20/2013; the samples arrived in good condition.

TOTAL VOLATILE ORGANIC CARBON

Samples AOI-09B-SVE-INF (061113) and AOI-09B-AS-OWS-INF (061113) were analyzed for total volatile organic carbon in accordance with EPA Method TO-3. The samples were analyzed on 06/25/2013.

Samples AOI-09B-SVE-INF (061113)[40.9X] and AOI-09B-AS-OWS-INF (061113)[13.6X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the TVOC analysis.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
E	Estimated result. Result concentration exceeds the calibration range.
J	Estimated result. Result is less than RL.
B	Method blank contamination. The associated method blank contains the target analyte at a reportable level.
D	Result was obtained from the analysis of a dilution.

Air - GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3G190411

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria. Even though the calibration verification analyzed on 7/19/13 exhibited a % difference of > 30% for 1,2-dichloro-1,1,2,2-tetrafluoroethane, the results were within the LCS acceptance limits.

The concentration of methylcyclohexane in sample AO1-09B-SVE-INF(071713) exceeded the calibration level of the instrument. The sample was analyzed at a dilution to bring the concentration of the compound into the instrument calibration range. The results for both analyses are reported in order to provide the lowest possible reporting limits.

Quantitation for methylcyclohexane was previously based on a one-point calibration standard at the reporting limit. Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.

PROJECT NARRATIVE
H3G190411

- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3G190411

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-17674-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 07/26/2013; the samples arrived in good condition.

TPH - GRO

Samples AOI-09B-SVE-INF (071713) and AOI-09B-AS-OWS-INF (071713) were analyzed for TPH-GRO in accordance with EPA Method TO-3. The samples were analyzed on 07/30/2013.

Samples AOI-09B-SVE-INF (071713)[586X] and AOI-09B-AS-OWS-INF (071713)[53.9X] required dilution prior to analysis. The reporting limits have been adjusted accordingly. The canister dilution factors provided by TestAmerica Knoxville were used to calculate the sample results.

No difficulties were encountered during the GRO analysis.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.

Air - GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3H160434

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Quantitation methylcyclohexane was based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analyte is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

PROJECT NARRATIVE
H3H160434

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-18256-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 09/04/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 21.0 C.

TOTAL VOLATILE ORGANIC CARBON

Samples AOI-09B-SVE-INF(081413) and AOI-09B-AS-OWS-INF(081413) were analyzed for total volatile organic carbon in accordance with EPA Method TO-3. The samples were analyzed on 09/05/2013.

Samples AOI-09B-SVE-INF(081413)[99X] and AOI-09B-AS-OWS-INF(081413)[14X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the TVOC analysis.

All quality control parameters were within the acceptance limits.

200-18256-1

Comments

No additional comments.

Receipt

The samples were received on 9/4/2013 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 21.0º C.

Air Toxics

Method(s) TO3: Internal standard responses were outside of acceptance limits for the following sample: AOI-09B-SVE-INF(081413) (200-18256-1). The sample shows evidence of matrix interference.

No other analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated result. Result is less than RL.
B	Method blank contamination. The associated method blank contains the target analyte at a reportable level.

Air - GC/MS VOA

Qualifier	Qualifier Description
*	ISTD response or retention time outside acceptable limits
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

PROJECT NARRATIVE
H3I250434

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

Subcontract

The following analyses were performed by the TestAmerica Burlington Laboratory (NELAP Accrediting Authority: NJDEP; Lab ID VT972), 30 Community Drive, Suite 11, South Burlington, VT 05403, (802) 660-1990, William Cicero, Laboratory Director: Volatile Organic Compounds in Ambient Air (EPA Method TO3).

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Quantitation for methylcyclohexane was based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for this additional analyte is fully established:

- The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
- There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
- The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
- The LCS recovery criteria are set at 20% to 180%.
- A method detection limit study has not been performed. The detection of the analyte is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

Job ID: H3I250434

Laboratory: TestAmerica Burlington

Narrative

CASE NARRATIVE

Client: TestAmerica Laboratories, Inc.

Project: Racer Buick City

Report Number: 200-18722-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 10/02/2013; the samples arrived in good condition.

TPH-GRO
Samples AOI-09B-SVE-INF(092413) and AOI-09B-AS-OWS-INF(092413) were analyzed for TPH-GRO in accordance with EPA Method TO-3. The samples were analyzed on 10/03/2013.

Samples AOI-09B-SVE-INF(092413)[55X] and AOI-09B-AS-OWS-INF(092413)[1.98X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Internal standard responses were outside of acceptance limits for the following sample(s): AOI-09B-SVE-INF(092413) (200-18722-1). The sample(s) shows evidence of matrix interference.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	ISTD response or retention time outside acceptable limits
*	LCS or LCSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 10/10/2013 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Air - GC/MS VOA
Method(s) TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Although the tune is flagged outside control for mass 176 at 94.29% in batch 299, the mass met the requirement for TO-15 analysis, which has a limit of 93-101%.

Method(s) TO-15: The continuing calibration verification (CCV) associated with batch 299 exhibited % difference of > 30% for the following analyte(s): Chloromethane and 1,2-dichlorotetrafluoroethane; however the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method(s) TO-15: Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for these additional analytes is fully established:

• The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
• There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
• The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
• The LCS recovery criteria are set at 20% to 180%.
• A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

No other analytical or quality issues were noted.

Air Toxics
Method(s) TO3: Internal standard responses were outside of acceptance limits for the following sample(s) AOI-09B-SVE-INF (100913) (140-253-1). The sample(s) shows evidence of matrix interference.

No other analytical or quality issues were noted.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 11/22/2013 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Except:

The Chain-of-Custody (COC) was not properly filled out. The asset numbers were switched for samples 1 and 2 on the COC. Sample 1 should have a asset number of 09512 and sample 2 should have a asset number of 10525. Both samples were logged with the correct asset number.

Air - GC/MS VOA
Method(s) TO-15: The continuing calibration verification (CCV) associated with batch 486 exhibited % difference of > 30% for the following analyte(s) dichlorodifluoromethane and 1,2-dichlorotetrafluoroethane, however the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method(s) TO-15: A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for two analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 486 had trichlorofluoromethane outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Method(s) TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Methylcyclohexane was quantitated based on a minimum 5-point calibration curve. The following interim criteria are being used until the method performance for these additional analytes is fully established:

• The initial calibration acceptance criteria is set at 40% RSD. Any compound greater than 40% RSD was changed to a linear or quadratic model with an r2 ≥ 0.990 acceptance criteria.
• There are no criteria for second source standard verification % D. The second source standard was independently prepared from the same parent mixture (as the primary source).
• The continuing calibration verification criteria are set at 50% D. Any compound greater than 50% D must pass the LCS criteria.
• The LCS recovery criteria are set at 20% to 180%.
• A method detection limit study has not been performed. The detection of the analytes is demonstrated by detection of the calibration standard at the reporting limit. No estimated results are reported below the reporting limit.

No other analytical or quality issues were noted.

Air Toxics
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	N/A	CHECKED IN LAB
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	N/A	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Zinc (Dissolved)	ug/L	260	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Appendix C. **2010 to 2012 NPMP Sampling Results**

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory

Notes:
GSI - Groundwater/Surface Water Interface Criteria
NA - Not Analyzed
ug/L - micrograms per liter
ng/L - nanograms per liter
Shaded and Bolded results exceed GSI criteria
U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit
O - Indicates that the analysis was performed by an outside laboratory
