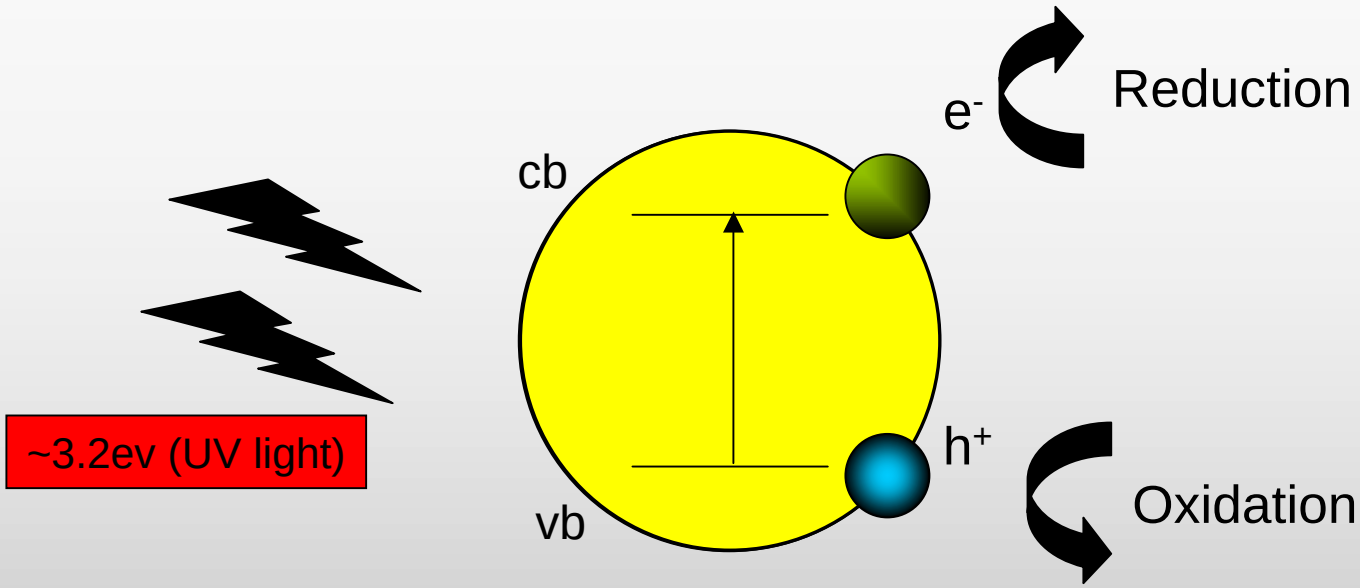
CLEMSON UNIVERSITY Chemistry

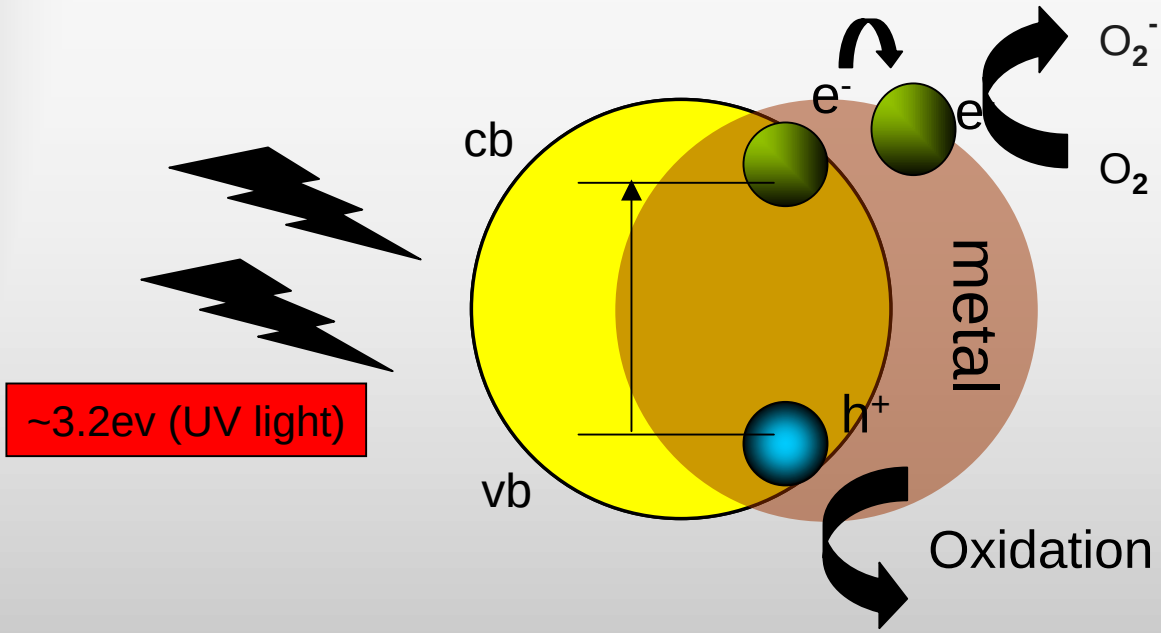
Titania Photocatalyst



Electron-Hole recombination is on the order of < 30ps, hence efficiency is low (< 5%).

Efficiency of photocatalysis depends on how well one can prevent this charge recombination

Role of metal in metal/titania nanocomposites



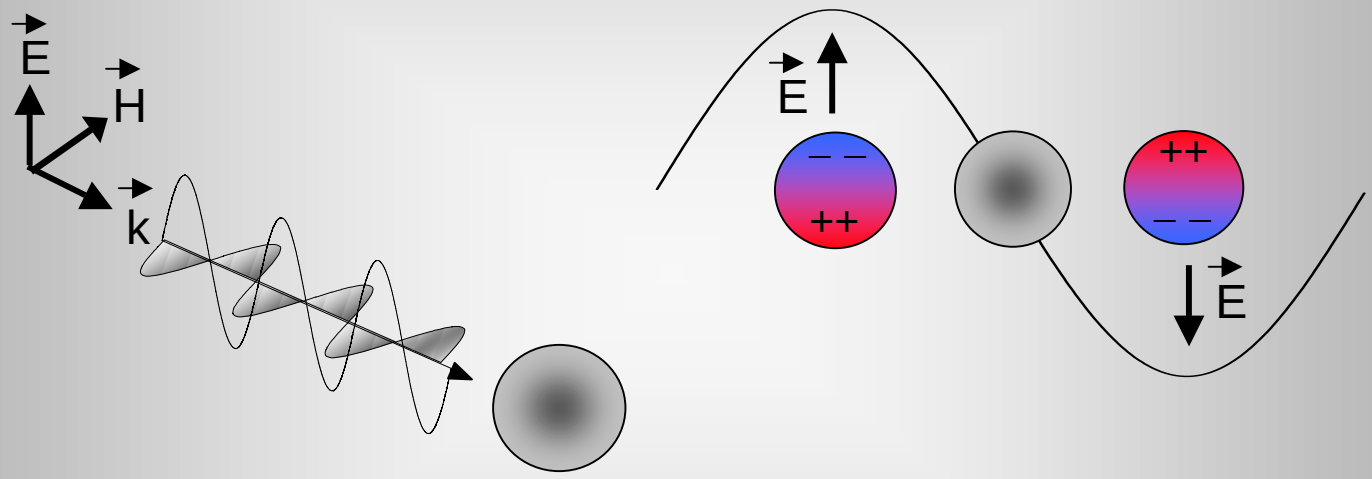
Metal nanoparticles act as an electron sink, promoting interfacial charge transfer reducing charge recombination

P. V. Kamat. *J. Phys.Chem*. B., 2002, 106, 7729-7744

CLEMSON UNIVERSITY Chemistry

Plasmon Resonance (PR) in Metal Nanoparticles

PR – collective oscillations of conducting electrons in metal nanostructures



Ag, Au, Cu nanoparticles exhibit PR in the visible spectral range

$$\omega_p = (ne^2/\varepsilon_0 m_e)^{1/2}$$

$$\varepsilon_{metal}(\omega_p) = 0$$

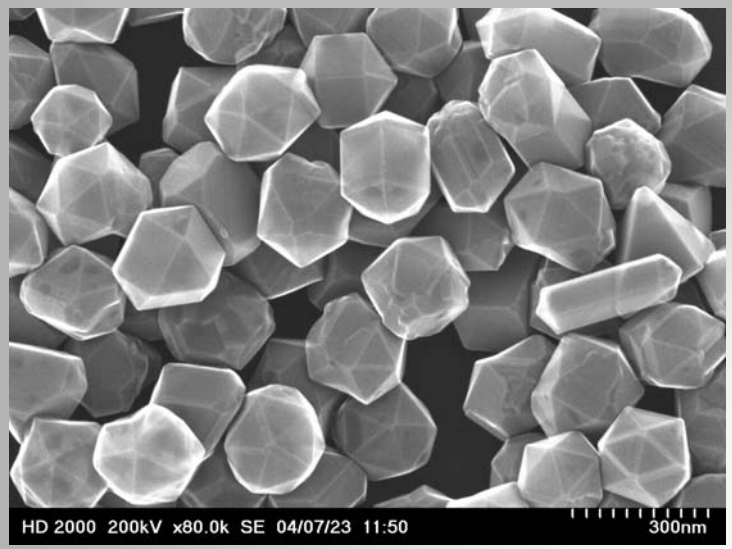
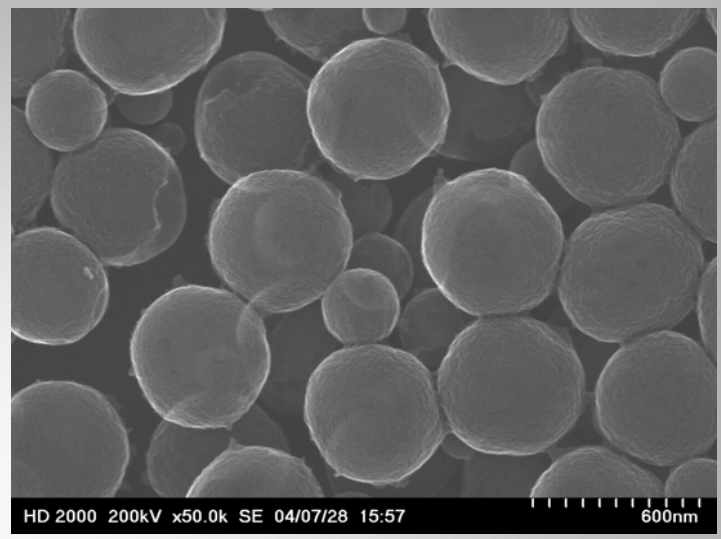
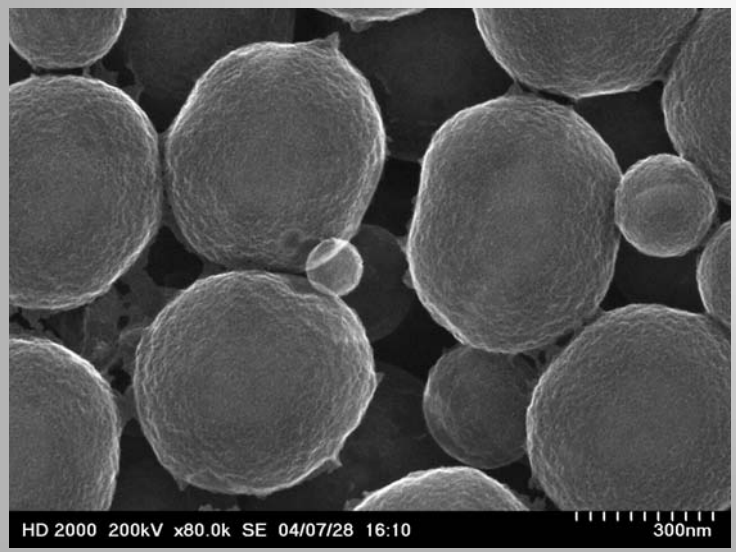
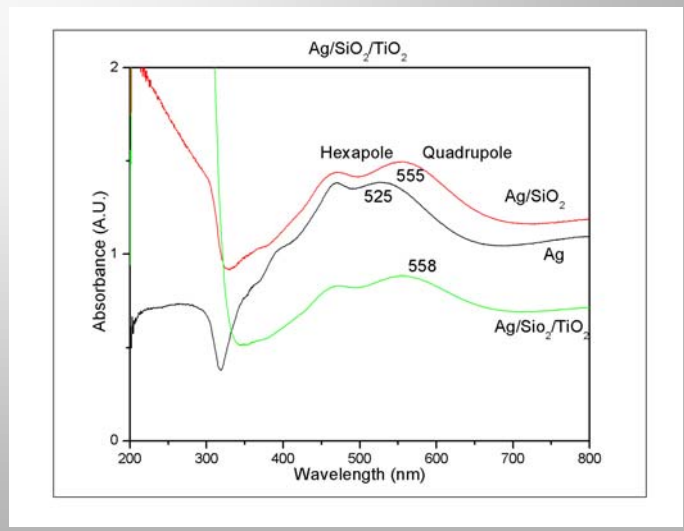
Metal core shortens the electron-hole pairs generated in titania shell

Ag core SiO_2/TiO_2 Nanoparticles



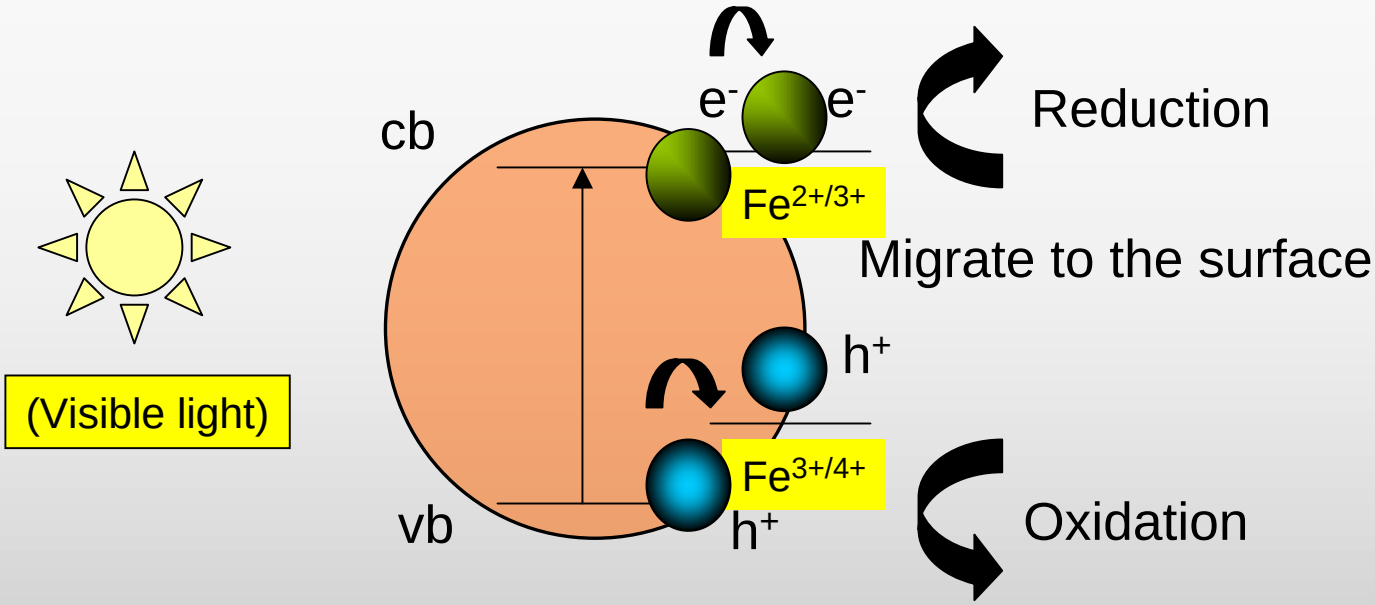






CLEMSON UNIVERSITY Chemistry

Metal Ion Doped-Titania Photocatalyst



Dopants influences intrinsic properties of titania resulting in lowering the band gap and shifting light absorption into visible spectral range

Dopants should be both good electron and hole traps

Efficiency of photocatalysis depends on various charge transfer events and migration of charges to the surface

Synthesis of Fe^{3+}-doped TiO_2

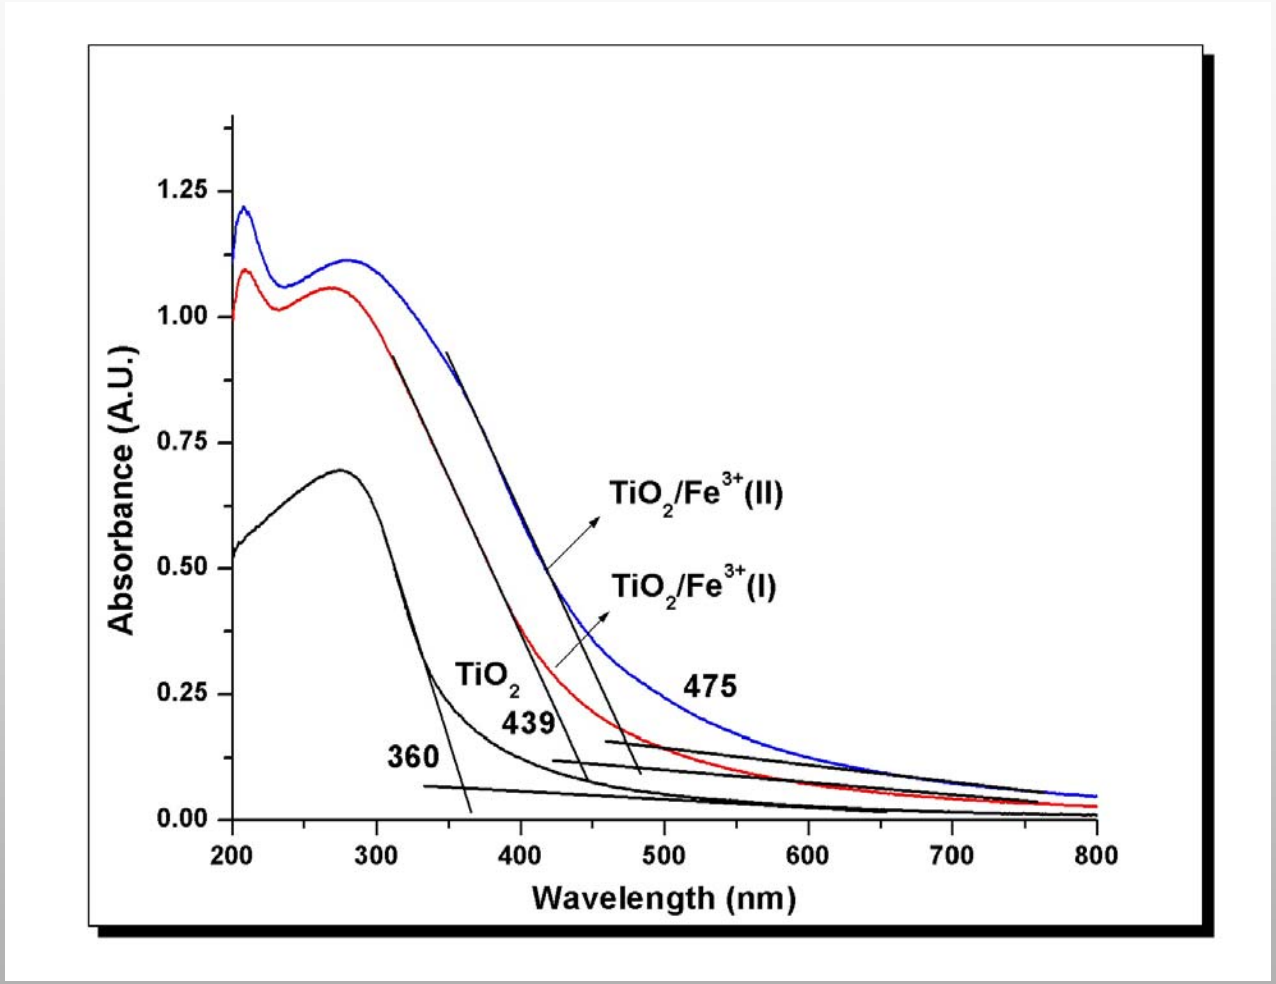
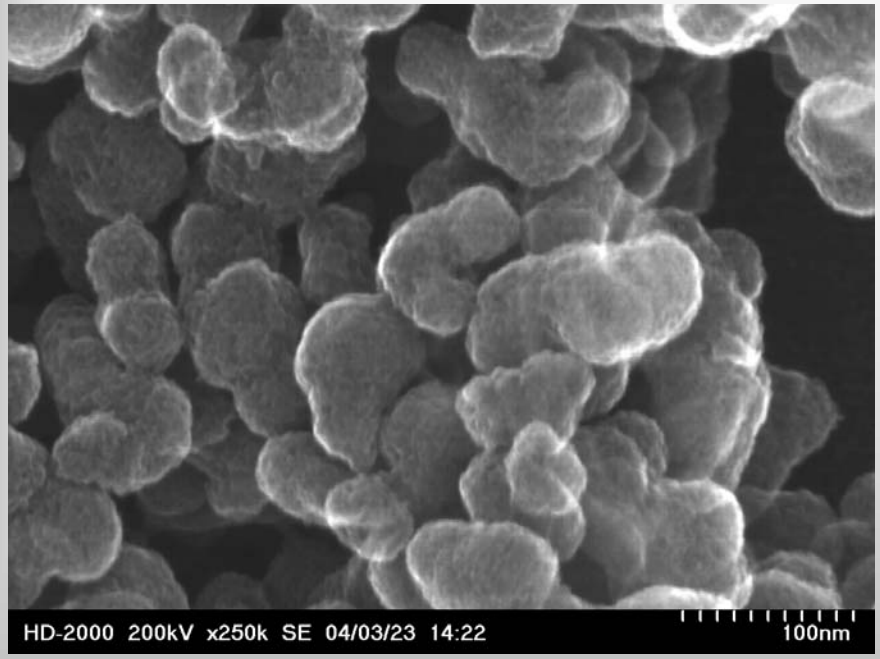
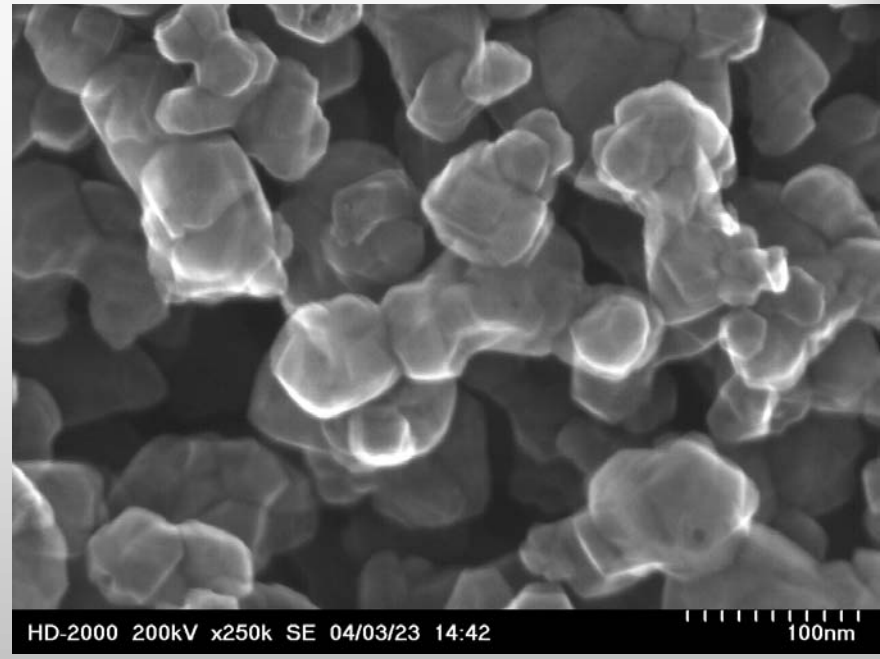
UV-Vis Absorption Spectra of Fe^{3+}-doped TiO_2 : Effect of Fe^{3+} concentration



Electron Microscopy

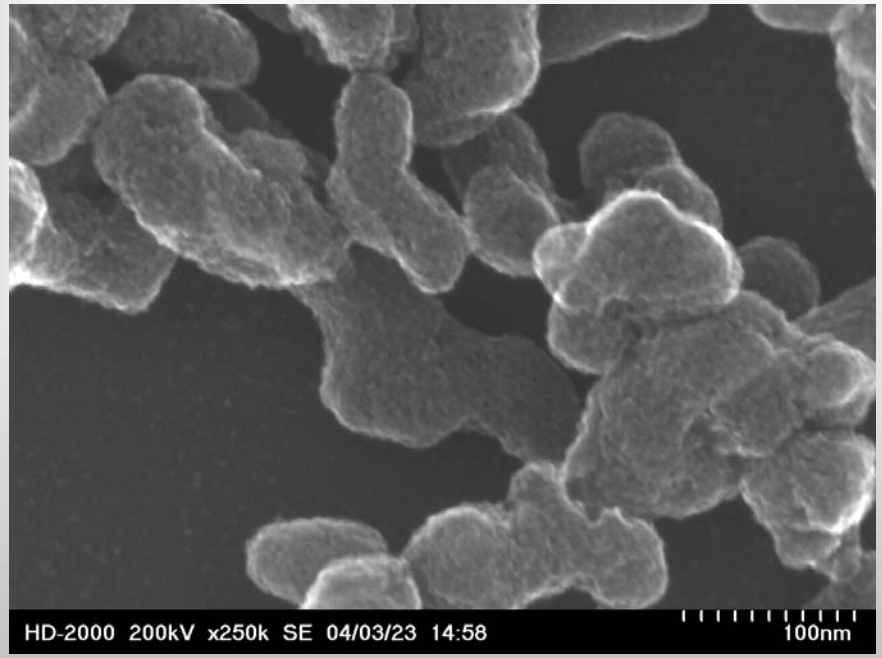


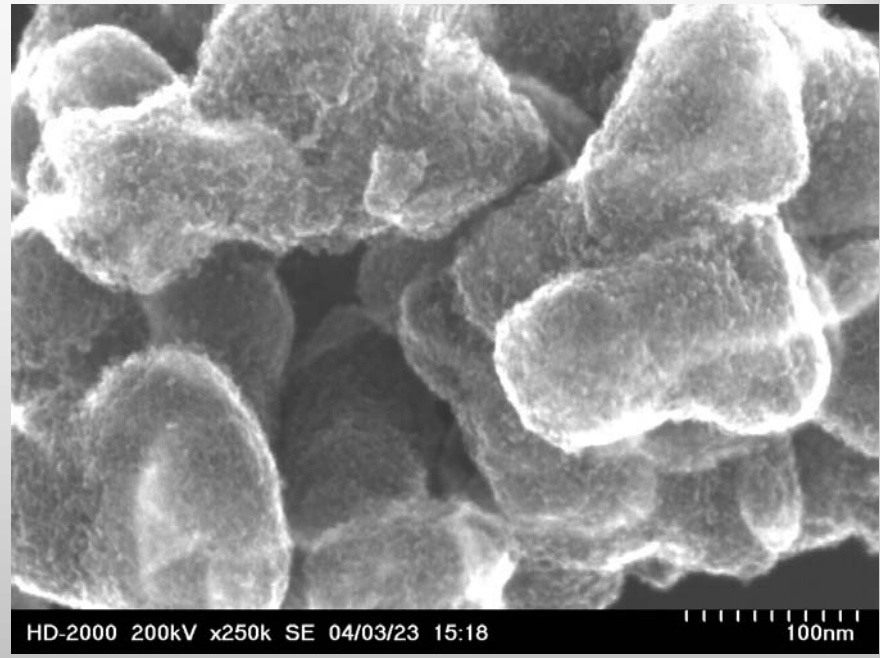
TiO_2 as prepared (amorphous)



TiO_2 after heat treatment (crystalline)

Electron Microscopy



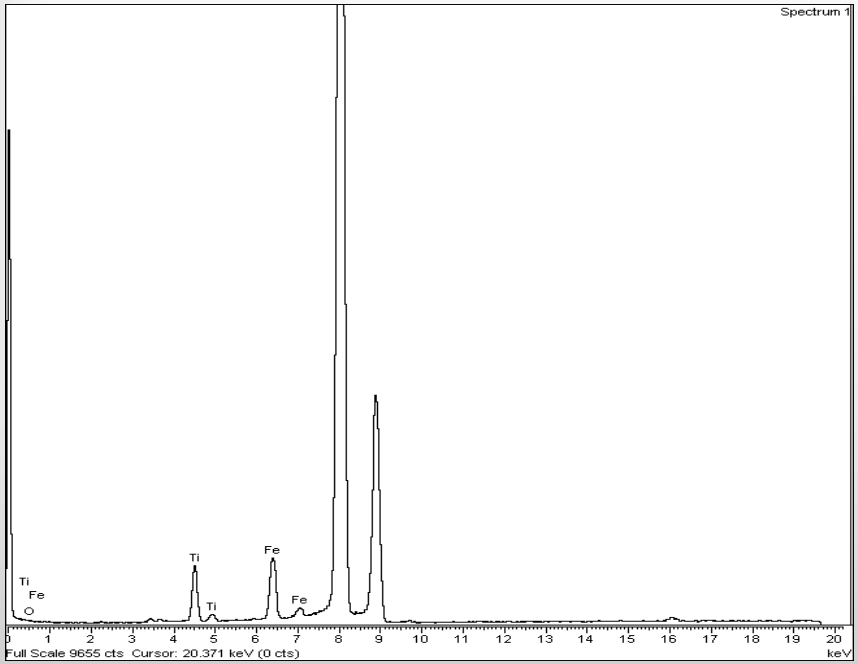


Fe^{3+}/TiO_2 as prepared (amorphous)

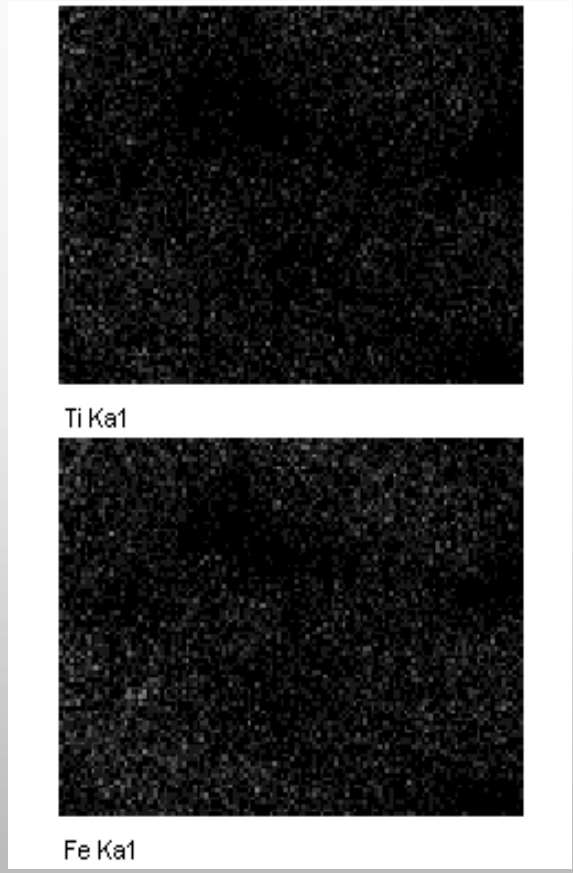
Fe^{3+}/TiO_2 after heat treatment (semi-crystalline)

CLEMSON UNIVERSITY Chemistry

EDX spectra and Mapping of Fe^{3+}-doped TiO_2



EDX spectra shows the presence of iron at >8 atomic % which arises from both surface and bulk Fe^{3+} sites



EDX mapping studies indicate the uniform dispersion of iron within the TiO_2 matrix

CLEMSON UNIVERSITY Chemistry

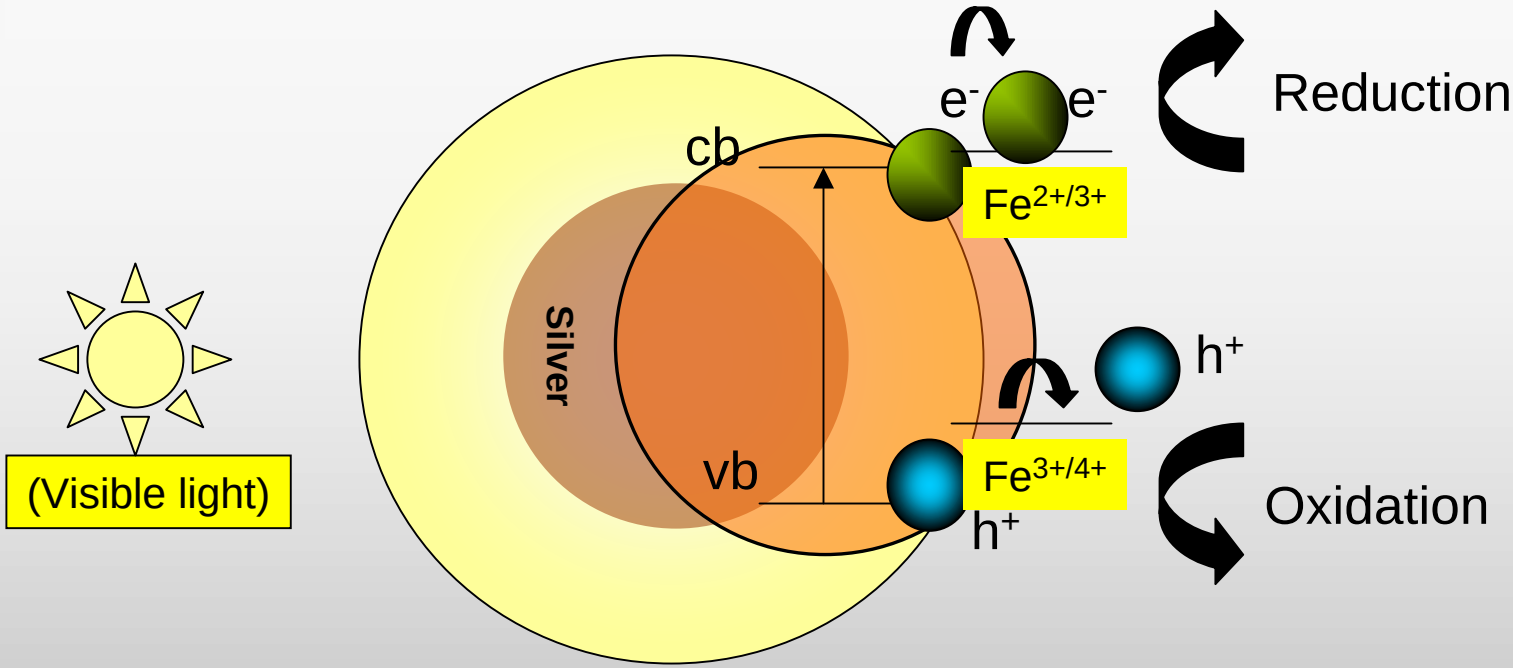
Role of metal in Metal/Doped-Titania Photocatalyst



At the plasmon resonance frequency there would be efficient resonance light absorption.

Band-gap excitation wavelength should reasonably match silver plasmon resonance frequency

Conclusions

Titania coated silver nanoparticles were synthesized using sol-gel technique.

Fe^{3+}- doped Titania that is sensitive to visible light was synthesized.

From the degradation of sulforhodamine dye experiments true doping effect was observed in the Fe^{3+}- doped Titania photocatalyst

Efforts are underway to coat silver nanoparticles with Fe^{3+}- doped Titania .

Photocatalytic activity of Fe^{3+}- doped Titania and silver coated with Fe^{3+}- doped Titania will be compared.
