Memorandum of Conference 8/8/79

H. J. Vostral

Upjohn Co.

M. J. Nelson
T. McLaughlin

HED/RCB
"

The above representative from Upjohn met with RCB to discuss Botran metabolism. In particular, Upjohn has submitted a protocol for a repeat goat metabolism study and wants RCB to review and comment on its applicability to resolve certain deficiencies found in the initial study.

In our letter to Upjohn of 3/5/79, we stated that since 90% of the radiolabeled material transferred to goat milk in the initial study is unidentified, further work would be necessary, such as an attempt to release bound conjugates by enzyme, acid, or other hydrolytic methods. Possibly ~90% unidentified portion could be categorized by the fraction that is ring-opened and the fraction that is bound by conjugates. Also, the presence of any azobenzene compound(s) was to be determined. Furthermore, we required the results of tissue analyses to determine secondary transfer of residues to meat.

Dr. Vostral, in presenting the protocol for a repeat goat metabolism study (see Botran study file), stated that radiolabeled Botran with a higher specific activity than originally employed had been prepared. This should facilitate the isolation and identification of the unidentified portion in goats milk. The protocol submitted was also designed to address the other deficiencies as stated above.

We agreed to review the protocol and respond in writing to Upjohn with our comments concerning the applicability of the protocol towards resolving the deficiencies outlined above.

1023-36

Isp John Co

1023-36

Botran 75W

RF 1365

2,6 - Dichloro-4-Nitroaniline

5/24/73

Use - Post-harvest decay by Rhizopus and Monilia rot

Apply only with fruit wax.

Use flat-fan or flood jet nozzle to uniform spray

Spray fruit during packing line operations.

Collect spray run-off in a drainage ditch

Petition seeks to amend Reg. 1023-36 by

- 1) increasing tolerance of Botran from 1 ppm to 15 ppm
in order to allow post harvest as well as pre-harvest treatment
- 2) and repeat the 15 ppm tolerance on chlorotoluidine
(no longer registered)

NAC 10/26/73 JWA

Rev - Petition appears to be presented and discussed.

70-15 date will be needed when new field and storage

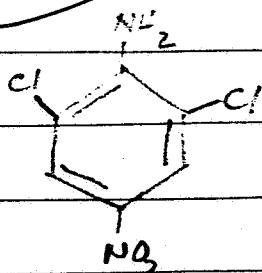

Acknowledgment - Should consider reapplication to be used
when proposed use dictated.

UpJohn Co.

6313-1
Corros

Allisen, DCNA, dichloro, J-200-

molecular wt 207.0

solubility - practically insoluble in water

stability - stable to incineration and
relatively stable to sunlight.

Safety and Toxicological Studies - Synthesis & previous
submitted data.

1) Rat - metabolism studies have shown Corras is in
(1962) rapidly absorbed, metabolized and excreted.
in rats. Not stored in any body tissues.

Metabolized to three metabolites

90% 3,5-dichloro-4-oxo no phenoxide

or 3,5-dichloro-4-oxo no phenoxide

captoproic acid

5% 3,5-dichloro-4'-imino no

5% 3,5-dichloro-4'-imino no

glucuronide

2) Rat - chronic (104 weeks)

Dietary adm 3000, 100, 20 ppm

No effects (with certainty) at 20 and 100 ppm.

3000 ppm had effects - not certain

3

Cont' Botan - Toxicology

3. Dog - chronic (104 weeks). (1964)

Adm 20, 100, 3000 ppm

No effects 20 and 100 except vaginal irritation

cell size in 2/6 at 100 ppm and of
gall bladder change in 1/6 at 20 ppm.

3000 ppm - liver changes, enlargement & ~~enlargement~~

4. Calves - subacute

20 and 80 ppm in diet 28-30 days

No adverse effect

No detectable levels of Botans appear in

liver, kidney, muscle, fat or muscle

5. Dairy cow - range findings

Dosage levels = 100 and 50 mg/kg/day
for five days

100 mg/kg/day

mucoid secretion from vagina) - death for each cow w/ 48 hrs of
rectal bleeding, lacrimation, }
polydipsia, polyuria } the first dose.

50 mg/kg/day

- all cows survived, but showed minor or

- no effect on

cattle should

be more closely

examined under

experimental conditions

new uses are potential
