OFFICE OF
PESTICIDES AND TOXIC SUBSTANCES

MEMORANDUM

SUBJECT: Diazinon Formulation Samples

FROM: Warren R. Bontoyan, Head *WRB*
Analytical Chemistry Section

THRU: Donald A. Marlow, Chief *DAM*
Analytical Chemistry Branch

THRU: Allen L. Jennings, Director *Allen L. Jennings*
Biological and Economic Analysis Division

TO: Vincent Giordano, Attorney
Toxic Litigation Division
Office of Enforcement and Compliance Monitoring (LE134P)

Attached are the results (Table 1) of the Analytical Chemistry Section's analyses of twenty two Diazinon formulation samples. Of these twenty two samples five have TEPP (O,O-TEPP) levels significantly greater than what is normally expected in formulations with label declarations of 25% Diazinon. Two of the twenty two samples have levels of sulfotepp (S,S-TEPP) one would expect of products manufactured previous to or in the early 1980's. These five samples containing the high levels of O,O-TEPP also have very high concentrations of Thionotepp (O,S-TEPP). The high levels of these two chemicals (O,S-TEPP and O,O-TEPP) which have high acute toxicities are probably due to degradation resulting from storage and the presence of small amounts of water. The low concentration of Diazinon when compared to the label declaration of 25% active ingredient is an obvious additional indication of significant Diazinon degradation.

It is interesting to note that two of those six samples containing less than 0.002% Diazinon have significant levels of O,O-TEPP and O,S-TEPP while the other four have very little.

* It is obvious that the twelve samples containing Diazinon in concentrations which are in general agreement with the label claim did not degrade and have no significant levels of TEPP, Thionotepp or Sulfotepp.

Table 2 (attached) contains information which may help in determining the date of the sample production.
