7. **CONCLUSIONS:** This study appears scientifically sound and
   fulfills the Guideline requirements for a 96-hour acute flow-
   through toxicity test of freshwater fish. The 96-hour LC50
   based upon mean measured concentrations of Chlorpyrifos
   Technical to bluegill sunfish (*Lepomis macrochirus*) was
   0.0062 mg/L, which classifies it as very highly toxic to
   bluegill sunfish. The NOEC was determined to be 0.0011 mg/L
   after 96 hours.

8. **RECOMMENDATIONS:** N/A
9. BACKGROUND:

10. DISCUSSION OF INDIVIDUAL TESTS: N/A

11. MATERIALS AND METHODS:

A. Test Animals: Bluegill sunfish (Lepomis macrochirus) were obtained from a commercial supplier in Missouri. The fish were reared and maintained at ABC Laboratories in ABC well water and were fed newly hatched brine shrimp or a commercially available fish food daily. Forty-eight hours before the initiation of the test, bluegill sunfish were removed from the culture and placed in the temperature acclimation unit. During this time, the fish were held without food. The bluegill used as the control group during this study had a mean weight of 2.1 (+0.87) grams and a mean length of 41 (+5.5) millimeters at test termination. The biomass loading rate was 1.4 g/L. The laboratory environment was maintained on a 16-hour daylight photoperiod.

B. Test System: A proportional diluter system described by Mount and Brungs, utilizing a Hamilton Micro Lab 420 syringe dispenser, was used for the intermittent introduction of Chlorpyrifos Technical test solutions and diluent water into each test chamber. The proportional diluter system used for the project was set to provide test levels approximately 50 percent dilutions of each other. The diluter delivered one liter of test solution or control water to the test vessels at an average rate of 9.5 times per hour over the course of the study. This flow rate was sufficient to replace the 30-liter volume within the test chambers 7.6 times per day. Five concentrations of the test material with dilution water control and solvent controls were tested. The test chambers were immersed in a temperature controlled water bath held at 22 ± 1°C. The lighting was maintained on a 16-hour daylight photoperiod.

Dilution water for the bluegill sunfish test was a blend of reverse osmosis water and ABC well water characterized as having a pH of 7.1 - 7.9, total hardness of 40 - 48 mg/L as CaCO₃, total alkalinity of 44 - 56 mg/L as CaCO₃ and specific conductance of 100 - 160 umhos/cm.

C. Dosage: 96-hour flow-through acute test.

D. Design: Two static range-finding tests were conducted with Chlorpyrifos. Based on the results of the preliminary testing five concentrations were selected for
definitive testing. Twenty bluegill sunfish were tested per concentration. A control, solvent control, and nominal Chlorpyrifos Technical concentrations of 0.020, 0.010, 0.0050, 0.0025, and 0.0013 mg/L were tested. The nominal concentrations were not corrected as active ingredient. The concentration of acetone in the solvent control (0.03 mL of acetone per liter of water) was approximately equivalent to that received by the highest test concentration. The mean measured concentrations of Chlorpyrifos Technical were 0.0011, 0.0020, 0.0038, 0.0087 and 0.018 mg/L as active ingredient. All concentrations were observed once every 24 hours for mortality and abnormal effects. The water quality parameters (temperature, dissolved oxygen and pH) were measured in the control, low, middle, and high test levels at 0, 48, and 96 hours of testing. Analytical samples were collected from each test level and the diluter stock at 0 and 96 hours.

E. Statistics: The concentration of toxicant lethal to 50% of the population (LC50's) and 95% confidence intervals was determined at 24-, 48-, 72-, and 96-hour exposure periods by the computer program developed by Stephan et al., 1978.

12. REPORTED RESULTS: The 24-, 48-, 72-, and 96-hour LC50 values for Chlorpyrifos were >0.018 (although >0.0087 was reported), 0.0081, 0.0073 and 0.0058 mg/L, respectively, based upon mean measured concentrations. The slope of the 96-hour dose-response line was 3.7 as calculated by probit computer analysis. Behavioral/sublethal effects, observed in all concentrations except the lowest (0.0011 mg/L), included surfacing, labored respiration, fish on bottom of test chamber, loss of equilibrium, quiescence, forward curved pectoral fins and light discoloration. Due to the lack of mortality or behavioral/sublethal effects in the lowest concentration a no-effect concentration of Chlorpyrifos Technical to bluegill sunfish was determined to be 0.0011 mg/L. Table 5 presents mortality and behavioral observations made during the test (attached). There was no mortality in the control or solvent control during the study. The dissolved oxygen concentrations ranged between 7.4 and 8.4 mg/L (88 to 100% saturation at 22°C) during the test.

13. STUDY AUTHOR'S CONCLUSIONS/QUALITY ASSURANCE MEASURES: The 96-hour LC50 value for Chlorpyrifos Technical was calculated by moving average method to be 0.0058 mg/L with 95 percent confidence limits of 0.0047 and 0.0075 based upon mean measured concentrations. The NOEC (No-Observed-Effect Concentration) was 0.0011 mg/L after 96 hours.
"The study was conducted following the intent of the Good Laboratory Practice Regulations and the final report was reviewed by Analytical Bio-Chemistry Laboratories' Quality Assurance Unit." A Quality Assurance Statement was included in the report.

14. REVIEWER'S DISCUSSION AND INTERPRETATION OF STUDY RESULTS:

A. Test Procedure: The test procedures were generally in accordance with protocols recommended by the Guidelines, but deviated from the SEP as follows:

- The SEP recommends that fish be acclimated to study conditions for at least two weeks prior to testing. The bluegill sunfish were removed from the culture tank and placed in the temperature acclimation unit forty-eight hours before the acclimation of the test.

- Six-hour temperature measurements were not recorded as required by the SEP for tests conducted in a water bath.

- The SEP states that each designated treatment group should be exposed to a concentration of toxicant that is at least 60% of the next highest concentration. Each designated treatment group for the test was only 50% of the next highest concentration.

- The SEP recommends a 16-hour light and an 8-hour dark photoperiod with a 15- to 30-minute transition period between light and dark. The report did not state whether a 15- to 30-minute transition period between light and dark was maintained.

B. Statistical Analysis: The reviewer used the Toxanal computer program to calculate the LC50 values. These calculations are attached. The probit method provides a 96-hour LC50 value of 0.0062 mg/L with a 95 percent confidence interval of 0.0049 to 0.0079 mg/L which is similar to that reported by the author. The slope of the toxicity curve was estimated to be 3.7.

C. Discussion/Results: The study results appear to be scientifically valid. The 96-hour LC50 value based upon mean measured concentrations was estimated to be 0.0062 mg/L. Therefore, Chlorpyrifos Technical is classified as very highly toxic to bluegill sunfish (Lepomis macrochirus).
D. Adequacy of the Study:

(1) Classification: Core
(2) Rationale: N/A
(3) Repairability: N/A

Completion of One-Liner for Study: Yes, 11-17-88.
THE BINARY TEST SHOWS THAT .0038 AND .018 CAN BE
USED AS STATISTICALLY SOUND CONSERVATIVE 95 PERCENT
CONFIDENCE LIMITS, BECAUSE THE ACTUAL CONFIDENCE LEVEL
ASSOCIATED WITH THESE LIMITS IS GREATER THAN 95 PERCENT.

AN APPROXIMATE LC50 FOR THIS SET OF DATA IS 6.9777E-03
