FROM: Toxicology Branch  
Registration Division

TO: Joseph Tavano  
Product Manager #31

Recommendation

The acute dermal LD<sub>50</sub> study is adequate and has been designated Core-Minimum Data.

\*No RPAR criteria have been exceeded.

Review

1. Acute Dermal LD<sub>50</sub> of Disinfectant Cleaner 71-30 - (Leberco Laboratories, Assay #73136, 3/8/77, submitted by Lonza on 4/5/77, Acc.#232263)

4 female rabbits had 10% of their hair removed from their backs with an electric clipper. The test material was applied at 5 ml/kg, which was the largest amount that could be applied. The test sites were occluded for 24 hours, after which the wrapping was removed and any residual test material was washed off the skin. The animals were observed for 14 days.

Results

LD<sub>50</sub> > 5 ml/kg (1/4 animals died)  
Toxic Signs: not reported; (animal lost weight)  
Necropsy: none performed  
TOX Category: III  
Classification: Core-Minimum Data

- (1) necropsies were not performed; toxic signs if any, were not reported; however, since this was the largest dose that could be applied the dermal toxicity of the test material has been adequately characterized in female rabbits.
