Attached please find the following review of...

Reg./File No.: 8340-13

Chemical: Endosulfan

Type Product: Insecticide

Product Name: Thiodan

Company Name: American Hoechst

Submission Purpose: Registration Standard

Date Code: ?

Date In: 6.16.83

Date Completed: 8.30.83

Endosulfan
Environmental Fate Summary
(Photolysis and Hydrolysis Studies)

Endosulfan does not appear to readily photolyze (half-life > 200 days).

Endosulfan is stable to hydrolysis at pH 5 (half-life > 1 year).
It hydrolyzes fairly rapidly at pH 7 (half-life of 17-22 days) and
rapidly at pH 9 (half-life < 1 day).

1. Registration standard submission by American Hoechst, Reg./File
Endosulfan
Hydrolysis Study

Reference:

CONCLUSIONS:
This study partially fulfills the registration requirement for hydrolysis by providing the half-life for α- and β- endosulfan at pH 5, 7 and 9 and identifying the degradation product, 1,4,5,6,7,7-hexachloro-bicyclo-(2,2,1)-hept-5-ene-2,3-dimethanol.

It does not fully satisfy the requirement because a material balance was not submitted.

Endosulfan is stable to hydrolysis at pH 5 (half-life >1 year). It hydrolyzes fairly rapidly at pH 7 (half-life of 17-22 days) and rapidly at pH 9 (half-life <1 day).

MATERIALS AND METHODS:
Sterilized water was spiked with an acetone solution of α- or β-endosulfan at 0.151 ppm and 0.187 ppm, respectively, kept at constant pH (5, 7, or 9) and temperature (22°C). Samples were taken at 0 to 120 hours and for 0 to 72 hours for the α- and β-isomers, respectively.

Samples were extracted with methylene chloride with 98% recovery. The analytical method used was HPLC with UV detection (lower limit of detection was 1 ppb).

**DISCUSSION:**

1. Purity of test substance not given.

2. Does not indicate if samples were kept in the dark, but since photolysis is negligible, this is not critical.
Endosulfan

Photolysis on Soil Study

CONCLUSIONS:

This study meets the registration requirement for photodegradation on soil. Endosulfan does not appear to readily photolyze (half-life $>200$ days).

MATERIALS AND METHODS:

- 14C-Radiolabelled a- and B-endosulfan (98% purity) were used.
- Soil TLC plates were prepared and spotted with 500 ug endosulfan and irradiated with a Suntest photoreactor for 4, 8, 16, 32, and 45 hours.
- A dark control was used.

Soil was scraped off and extracted with aceonitrile/toluene.

The non-extractable radioactivity was measured by combustion followed by LSC. Extracts were analyzed by spotting on silica gel TLC plates followed by LSC.

REPORTED RESULTS:

The half-life of endosulfan is $>200$ days.

DISCUSSION:

1. Authors stated that 45 hours' exposure in the photoreactor was equivalent to 30 days' outside exposure but offered no evidence.
2. Soil characteristics were not given.
3. Degradates were not reported.
