As requested in CBTS Review #11387 (Memo of M.I. Rodríguez dated June 2, 1993, D#188219, No MRID #), IR-4, on behalf of the Agricultural Experiment Station of Oregon, is re-submitting a revised Section B for review.
Discussion:

A revised (December 3, 1993) Proposed Supplemental Label for chlorothalonil (2,4,5,6-tetrachloroisophthalonitrile) formulated as Bravo 720 was submitted for review.

In CBTS Review #11387, the petitioner was requested to specify a minimum spray volume of 100 gallons of water per acre for ground applications using the requested application rate of 3 lbs ai/Acre/application.

The revised Proposed Supplemental Label for Bravo 720 submitted for review includes the following changes in the introductory paragraph for Tree and Orchard Crops. The changes are as follows.

-Added the following wording as the third sentence: "Do not apply less than 100 gallons of spray mixture per acre with ground equipment."

-Under "spray volume" in the table, separate spray volumes were listed for ground and air.

The deficiency is considered to be resolved.

Recommendations:

Toxicological considerations permitting, CBTS recommends for the establishment of a tolerance with regional registration for use in Oregon only for the combined residues of the fungicide chlorothalonil (2,4,5,6-tetrachloro-isophthalonitrile) and its metabolite 4-hydroxy-2,5,6-trichloro-isophthalonitrile in or on the raw agricultural commodity filbert at 0.1 ppm.
