Jess Rowland, Chair
DNT Work Group
Health Effects Division (7509P)

I. CONCLUSIONS

The Agency, as stated in the September 10, 1999 Data Call-In notice (Appendix F), is requesting a comparative cholinesterase assay (CCA) to determine the potential sensitivity of cholinesterase inhibition in the neonates as compared to the adult animals
following single and repeated oral (gavage) administration of TCVP.

In addition, the Agency is requesting the registrant to submit a complete report including the raw data for the CCA studies (MRID 46036001) since only summaries of the results of these studies were previously submitted.
