1. CHEMICAL:

Common name:
Methomyl.

Chemical name(s):
S-Methyl N-[(methylcarbamoyl)oxy]thioacetimide.
S-Methyl ester N-[(methylcarbamoyl)oxy]thioacetimidic acid.
Methyl O-(methylcarbamoyl)thiolactoethyromate.
Methyl ester N-[(methylamino)carbonyl]oxyethanimidothioic acid.
O-(Methylcarbamoyl)oxime-3-thiobutane-2-one.

CAS No:
16752-77-5

Trade name(s):
Lannate, NuDrin, DuPont 1179, IN 1179, Insecticide 1179,
Mesomile, SD 14999, WL 18236, Lanox, and Nu-Bait II.

Structure:

```
NCH₃
   |
H₃-C=NOC=O
   |
SCH₃
```

Formulations:
Soluble concentrate/liquid.
Soluble concentrate/solid.

Physical/Chemical properties:

Molecular formula: C₅H₁₀N₂O₂S.
Molecular weight: 162.2.
Physical state: White crystalline solid; slight sulfurous odor.
Melting point: 78-79 C.
Vapor pressure (25 C): 6.65 mPa, 5.0x10⁻⁵ torr.
Solubility (25 C): 58 g/kg water; 720 g/kg acetone;
420 g/kg ethanol; 1 kg/kg methanol;
30 g/kg toluene.

Octanol/Water Partition Coefficient: 0.11 (log)

7. CONCLUSION:

The Soil Field Dissipation (164-1) data requirement was fulfilled by the submission of two acceptable studies; therefore, EFGWB screened this study.

This study provides supplemental information about the soil field dissipation of methomyl.

Methomyl dissipated with a half life of 4-6 days when applied at a rate of 4 lb ai/A to a loam soil planted to cabbage in Mississippi. Methomyl was 0.91-1.1 ppm immediately posttreatment and decreased to <0.037 ppm at day 30 in the upper 15 cm of soil. Methomyl remained primarily in the upper 1-15 cm of the soil. It was only detected in the 15-30 cm soil depth, immediately posttreatment, with 0.040-0.059 ppm.

A wide range of half lives was observed among the studies submitted. Methomyl is moderately persistent in soils, but the persistence appears to be tied to the soil conditions. The aerobic soil metabolism half lives range from 15 to 45 days. One field dissipation study conducted in California shows a half life of 54 days. The registrant attributed the longer half life in this study to the low moisture content of the soil, which reduces its bioactivity.

The study conducted in Mississippi shows a short half-life (4-6 days). The authors of the study attribute this behavior to the bioactive medium of the
soil tested and the climate at the test site. However, no data was provided to support this assumption. The soil averaged 16% moisture over the first 15 days of the study, but the meteorological data provided was incomplete. The registrant should address this inconsistency and provide the missing meteorological information.

8. RECOMMENDATIONS:

Inform the registrant that the submitted Soil Field Dissipation Study (MRID# 42288001) provides supplemental information about the soil field dissipation of methomyl. EFGWB screened the study since the Soil Field Dissipation data requirement had been previously fulfilled. EFGWB thoroughly integrated this information into its files and the One-Liner database.

Inform the registrant that it is required to address all the inconsistent field data results and provide complete meteorological information on the field study conducted in Mississippi.

9. BACKGROUND:

Methomyl is a broad-spectrum insecticide registered for use on a variety of terrestrial food (vegetables, soybeans, cotton, other field crops, and certain fruits) and nonfood crops (tobacco, ornamental plants, and lawn turf). Single active ingredient formulations include soluble concentrate/liquid and soluble concentrate/solid. The general use patterns of methomyl are terrestrial non-food, terrestrial food, and aquatic non-food uses. The status of the data requirements for methomyl appears in the table attached. A LUIS report for this chemical is scheduled for January of 1993.

EFGWB received one package containing a Soil Field Dissipation Study. The study was run to satisfy requirements imposed by the California Groundwater Protection Act. Results of previous studies are as follows:

1. Methomyl, applied at 4 lbs ai/A decreased from 91% at day 0, to 55% at day 15, and to 33% at 30 days. Methomyl decomposed in a sandy loam soil in a greenhouse with a half-life of less than 30 days. The cause of decomposition, microbial or physico-chemical, could not be determined from this study because there was no sterile control soil and no measurement of $^{14}$CO$_2$ evolved. The incubation was presumably in the light in the greenhouse.

2. In light textured soils, methomyl did not leach more than 11 and 15 inches over 3 and 5 months, respectively. Very little surface runoff of methomyl occurred from sandy soils under normal field use

---

conditions. Methomyl would likely remain in the upper 6 inches of treated soil.

3. No residues were detected in muck soil (52% organic matter; pH 5.4) 7-32 days after application.

4. Methomyl dissipated with a half-life of 54 days when it was applied at a rate of 9 lb ai/A to a sandy loam soil planted to cabbage in Madera, CA. Methomyl remained primarily in the top 15 cm of soil, with deepest consistent soil penetration of 15-30 cm.

10. **DISCUSSION OF INDIVIDUAL TESTS OR STUDIES:**

Refer to attached review.

11. **COMPLETION OF ONE-LINER:**

EFGWB updated the One-Liner data base with this report.

12. **CBI APPENDIX:**

The registrant does not consider all data reviewed here as "company confidential."

---

</table>
1. Methomyl was relatively stable in pH 5 and 7 solutions at 25°C. A half-life of 30 days was observed for the pH 9 solution. The only degradate was S-methyl-N-hydroxythioacetimidate (MRID# 00131249).

2. Methomyl photodegraded with a half-life of 1 day in sterile aqueous pH 5 solution. The major degradate was acetonitrile, the minor degradate is S-methyl-N-hydroxythioacetimidate (MRID# 00161885).

3. Methomyl photodegraded with a half-life of 34 days on silty clay loam soil irradiated with natural sunlight at 24-28°C. The major degradate was acetonitrile (MRID# 00163745).

4. The vapour pressure of methomyl is 5.4x10^-4. EFGWB concurs with a waiver for the data requirement (EFGWB # 90765).

5. Methomyl degraded with a half-life of 30-45 days in silt loam soil incubated at 25°C. The major degradate was ¹⁴CO₂. A minor degradate was S-methyl-N-hydroxythioacetimidate (MRID# 00008568).

6. Methomyl degraded fast under anaerobic soil conditions. In the early stages methomyl was not detected and acetonitrile was the initial degradation product. ¹⁴CO₂ was the final degradation product with more than 90% of the applied radioactivity at 8 days posttreatment (MRID# 00073214).

7. Methomyl and its degradate S-methyl-N-hydroxythioacetimidate were very mobile on sandy loam, silty clay loam, and silt loam soil TLC plates, with K₅ values ranging from 0.64 to 0.93. In batch equilibrium studies, methomyl was very mobile in two sandy loams, a silt loam, and a silt soil with K₅ values from 0.5 to 2.8 (MRID#'s 00044306 and 00161884).

8. Validated results show methomyl does not leach more than 15 inches over 5 months. In a muck soil no residues of methomyl were detected (MRID#'s 00009324 and 00009326). Supplementary studies show that in California at an application rate of 9 lb ai/A, methomyl dissipated with a registrant calculated half-life of 54 days (MRID#'s 41623901 and 41623902). In Mississippi, at an application rate of 4 lb ai/A, methomyl dissipated with a half life of 4-6 days. Methomyl remained primarily in the upper 0-15 cm of soil (MRID# 42288001).

9. Waived based upon results of satisfactory short term studies.

10. Beets and cabbage planted 30 and 120 days posttreatment had total radioactivity ranging from 0.04 to 0.15 ppm. Sunflower seeds ranged from 1.5 to 2.0 ppm. The application rate was four times the maximum single use rate (MRID# 00019947).

11. The octanol/water partition coefficient (Kₕ) for methomyl ranges from 1.29 to 1.33. This value is significantly less than 1000. Chemicals with this low Kₕ are not expected to bioconcentrate. EFGWB concurs with a waiver of the Bioaccumulation in Fish data requirement for methomyl.

12. Required because the detection of methomyl in ground water has been confirmed, but data are insufficient to assess the extent and degree of groundwater contamination (EFGWB 90-0410).

-1.1-
CONCLUSIONS:

Field Dissipation - Terrestrial

1. This study provides supplemental information about the soil field dissipation of methomyl.

2. Methomyl (Lannate L, 1.8 lb ai/gal) dissipated with a half-life of 4-6 days following one application at 4 lb ai/a to loam soil in Mississippi. Samples were not analyzed for methomyl degradates. Methomyl was generally found only in the upper 15 cm of the soil.

METHODOLOGY:

Methomyl (S-methyl N-[(methylcarbamoyl)oxy]thioacetimidide; Lannate L, 1.8 lb ai/gal, du Pont) was applied using a CO₂ sprayer at 4 lb ai/a to three replicate plots (50 x 12.68 ft) of loam soil (43% sand, 45% silt, 12% clay, 1-1.2% organic matter, pH 6.2-6.4, CEC 10.9-14.7 meq/100 g) on May 13, 1991; the plots had been planted to cabbage and were located in Greenville, Mississippi. The cabbage was 53 days old and 6-8 inches in diameter at time of methomyl application. An untreated plot (30 X 38 feet) located 8 feet from the treated plots served as a control. For sampling purposes, the plots were divided into ten subplots. Soil samples were collected 11 days prior to application, immediately post-application (6 hours posttreatment), and 1, 3, 7, 15, 30, 45, 60, 74, and 91 days posttreatment. Soil cores were collected to a depth of 90 cm with a "zero-contamination" soil probe (1.25-inch diameter). Ten soil cores were collected prior to application, two from each odd-numbered subplot, for residue analysis and soil characterization. After treatment, a total of five soil cores were collected from each plot; at each sampling interval, single soil cores were collected from either the odd-numbered or even-numbered subplots. Soil cores were divided into 0- to 45- and 45- to 90-cm segments and stored at -20°C until shipment to the analytical laboratory. The soil cores were stored up to 4.5 months before analysis. Prior to analysis, the soil cores were further divided into 0- to 15-, 15- to 30-, 30- to 45-, 45- to 60-, and 60- to 90-cm segments and composited by plot, sampling interval, and soil depth. The samples were then homogenized (method not reported).

Deionized water was added to the soil samples, and the samples were extracted three times by shaking with ethyl acetate. The organic layers were decanted, filtered, combined, and concentrated to dryness using a combination of rotary evaporation, evaporation over a steam bath, and a nitrogen stream. The residues were re-dissolved in water:acetonitrile:glacial acetic acid (85:14:1). Aliquots of the extracts were analyzed by HPLC on a Zorbax RX column eluted with a mobile phase of water:acetonitrile (85:15) with UV (233 nm) detection. Analytical-grade methomyl was used as a reference standard. Recoveries from soil samples fortified with methomyl at 0.02-1.00 ppm were 78-95%. The quantitation limit was 0.020 ppm.
DATA SUMMARY:

Methomyl (S-methyl N-[(methylcarbamoyl)oxy]thioacetimidate) dissipated with a half-life of 4-6 days from loam soil that was planted to cabbage and located in Mississippi following one application of methomyl (Iannate L, 1.8 lb ai/gal) at 4 lb ai/A in May 1991 (Figures 1-3). In the upper 15 cm of the soil, methomyl was 0.91-1.1 ppm immediately posttreatment, 0.57-0.94 ppm at 1-3 days, 0.076-0.61 ppm at 7-15 days, <0.037 at 30 days, and <0.023 ppm at all later sampling intervals (Table II). Methomyl was not detected in the deeper soil samples, except was 0.040-0.059 ppm in the 15- to 30-cm soil depth immediately posttreatment.

The mean monthly minimum and maximum temperatures over the study period were 68-94 F. Total rainfall was 9.6 inches and total irrigation was 2.1 inches.

COMMENTS:

1. The soil samples were only analyzed for methomyl. The degradate S-methyl-N-hydroxythioacetimidate was identified an aerobic soil metabolism study (MRID 00008568, Dynamac Report dated 9/29/87). The study author cited internal du Pont documents that indicated methomyl was the only compound detected in field studies. These documents should have been provided for review so the adequacy of the method could be evaluated.

2. The meteorological data were incomplete. Only the high and low monthly average temperatures were reported, and the rainfall and irrigation was presented as monthly totals. These data should be reported on a daily basis so that the temperature and rainfall may be correlated with the sampling intervals and methomyl dissipation. Additionally, the soil temperatures were not reported. These data should be collected at the study site since large variations may occur between meteorological stations in close proximity.

3. Methomyl was detected only in the upper 15 cm of the soil, with the exception of 0.040-0.059 ppm found in the 15- to 30-cm soil depth immediately posttreatment (6 hours posttreatment). The study author considered these values to be the result of contamination.

4. In 1988, the study site was a peach orchard, and was treated with monosodium methanearsonate (MSMA) at 2 lb ai/A, glyphosate (Roundup) at 2% v/v, and lime at 2 tons/A. In 1989, the plot was fallow. In 1990, the plot was planted to peanuts, corn, soybeans and sorghum; the plot was treated with metribuzin (Lexone) at 0.6 lb/A, fluometuron ("Cotovan") at 1 lb ai/A, pendimethalin (Prowl) at 2 pt/A, alachlor (Lasso) at 4 qt/A, atrazine (Aatrex) at 2.4 pt/A, potash fertilizer at 60 lb/A, phosphate at 30 lb/A, N-FERT at 60 lb/A, dicrotophos at 0.25 lb ai/A, oxamyl at 0.5 lb ai/A, esfenvalerate (Asana XL) at 8 oz/A, methyl parathion at 2 pt/A, Fert (6-18-6) at 1 qt/A and propargite (Comite) at 2 pt/A.
5. During the study period, the only pesticide applied to the study plots was chlorthal dimethyl (Dacthal W75) at 10 lb/A.

6. The study author cited a storage stability study performed with methomyl in sandy loam soil from California. Methomyl was reported to be stable for up to 19 months at -20 ± 5 C; however, no data were provided. The study author also mentioned an ongoing study using the test soil, but gave no additional information.

Forestry Dissipation (164-3)

[ ]

[ ]
Long-Term Soil Dissipation (164-5)

Accumulation in Rotational Crops, Confined (165-1)
[V] AT APPL RATE 4X MAX USE, BEETS AND CABBAGE PLANT-
[ ] ED 30- AND 120 DAYS LATER, CONTAINED .04-.15 PPM

Accumulation in Rotational Crops, Field (165-2)

Accumulation in Irrigated Crops (165-3)

Bioaccumulation in Fish (165-4)
[V] 96-HR LC50 FOR WARMWATER FISH = 1.05-1.88 PPM; FOR COLDWATER
[ ] FISH = 1.6 PPM.

Bioaccumulation in Non-Target Organisms (165-5)
[V] 48-HR LC50 FOR DAPHNIA = 31.7 PPB.

Ground Water Monitoring, Prospective (166-1)
[ ] Protocol reviewed for study in Cook County, GA (12/92).
[ ] Protocol partially acceptable.

Ground Water Monitoring, Small Scale Retrospective (166-2)

Ground Water Monitoring, Large Scale Retrospective (166-3)

Ground Water Monitoring, Miscellaneous Data (158.75)
[S] NEW YORK: 1-20 PPB; NEW JERSEY: TR - 1 PPB; FLORIDA: 1-20 PPB;
[ ] GEORGIA: 3-5 PPB; MISSOURI: 8.1 PPB
Field Runoff (167-1)

Surface Water Monitoring (167-2)

Spray Drift, Droplet Spectrum (201-1)

Spray Drift, Field Evaluation (202-1)

Degradation Products

Acetonitrile
CO2
(methomyl per se is the only residue of concern in plants)
S-methyl-N-hydroxythioacetimidate
methomyl oxime
Comments

-In plants, methomyl is absorbed by roots and translocated to leaves.
-Slightly toxic to avian wildlife.
-Degradation in soil is primarily a microbial process. Repeated applications within 19 day period may result in prolonged period of reduced nitrification.
-Can be a hazard to honeybees and other beneficial insects.
-Health advisory level is 175 ppb.
-Adsorption is directly related to org. content of soil; adsorption to org. matter is similar to that of terbacil.  
  \[K_{oc} = 72 \ (U)\]
