MEMORANDUM

SUBJECT: Dietary Exposure Analysis for Methidathion in Support of the Reregistration Eligibility Decision.

FROM: Brian Steinwand *BS*
Dietary Risk Evaluation Section
Science Analysis Branch/HED (7509C)

Through: Elizabeth Doyle, Section Head *E.A. Doyle*
Dietary Risk Evaluation Section
SAB/Health Effects Division

TO: Mike Metzger, Chief *WJB*
Risk Characterization Analysis Branch
Health Effects Division (7509C)

Action Requested

Provide a dietary exposure analysis to estimate the chronic, carcinogenic, and acute dietary exposure and risk from methidathion for uses which are being supported through reregistration.

Discussion

Toxicological Endpoint:

The Reference Dose (RfD) used in the analysis is 0.0015 mg/kg bwt/day, based on a NOEL of 0.15 mg/kg bwt/day from a long term toxicity study in dogs with an uncertainty factor of 100 that demonstrated elevated hepatic enzymes, gross hepatic lesions, chronic hepatitis, and red blood cell cholinesterase inhibition as endpoints (See RfD Peer Review Report, 11/10/93).

Methidathion is classified as a Group C - possible human carcinogen by the HED Carcinogenicity Peer Review Committee with evidence of carcinogenicity in mice (liver) and negative in the rat. Additional evidence from short-term tests or structure activity relationships were not supportive of a higher classification. Thus, the evidence as a whole was not considered strong enough to warrant a quantitative estimation of human risk.

The endpoint for acute dietary risk assessment is the NOEL of 0.2 mg/kg bwt/day based on decreases in plasma, RBC, and brain ChE seen at the two week measurement.

Residue Information

Tolerances for methidathion are published in 40 CFR §180.298 (a), (b), and (c). Tolerances for methidathion residues are currently expressed in terms of methidathion per se in plant commodities [§180.298(a and c)] and in terms of the combined residues of methidathion, its oxygen analog, and its sulfoxide metabolites in animals [§180.298(b)]. The available data support the established tolerances in/on pome fruits, artichokes, cottonseed, mandarins, mangoes, olives, peaches, pecans, safflower seed, sorghum, stone fruit, sunflower seed, carambola, kiwifruit, longan, sugar apple, and walnuts; the established tolerances for residues in/on citrus fruits should be increased from 2 ppm to 4 ppm; tolerances on potatoes should be revoked as there are no registered uses on this crop (See RED chapter). Some anticipated residues and percent crop treated assumptions were used in the dietary risk analyses.

Acute Anticipated Residues were estimated using tolerance level residues and survey data from the USDA Pesticide Data Program (PDP) and were supplied by CBRS (See memo, W. Smith, 12/3/96) for the following commodities: orange pulp 0.33 ppm; orange juice 0.26 ppm; orange peel 0.114 ppm; grapefruit pulp 0.33 ppm; grapefruit juice 0.26 ppm; grapefruit peel 0.114 ppm; lemon pulp 0.33 ppm; lemon juice 0.001 ppm; lemon peel 0.114 ppm; lime pulp 0.33 ppm; lime juice 0.001 ppm; lime peel 0.114 ppm; apple juice 0.015 ppm; cottonseed oil 0.05 ppm; safflower oil 0.01 ppm; and sunflower oil 0.01 ppm.

2

Results

Chronic Exposure:

A summary of the residue information included in this analysis is attached as Table 1. A DRES chronic exposure analysis was performed using tolerance level residues and 100 percent crop treated information to estimate the Theoretical Maximum Residue Contribution (TMRC) for the general population and 22 subgroups. Percent crop treated data and anticipated residue data were used to calculate the Anticipated Residue Concentration (ARC) for those same population subgroups for certain commodities. Summaries of the TMRCs, ARCs and their representations as percentages of the Reference Dose (RfD) are included as Table 2 and 3. A summary of the residue information and the associated ARCs using the recommended tolerance increases and or decreases and RAC revocations are attached as Table 5, and 6.

Existing tolerances (and a pending tolerance on corn) result in a TMRC which represents 43.8% of the RfD for the U.S. general population. The highest subgroup, Non-Nursing Infants (<1 year old) occupies 160% of the RfD and Children (1-6 years old) occupies 111% of the RfD. (Note: deleting the pending use on corn does not result in acceptable risk levels in these two subgroups). The commodity which contributes most to this risk figure is milk at 130% (See Table 4). Incorporating the recommendations of CBRS (increasing the citrus tolerance from 2-4 ppm, deletion of potatoes, meat, milk, eggs, and poultry and without the pending use on corn) would result in a TMRC of 9.1% of the RfD for the U.S. general population, 11.9% for Non-Nursing Infants (<1 year old), and 22.5% for Children (1-6 years old) (See Table 6).

The analysis for methidathion is not a worst case estimate of dietary exposure with all residues at tolerance level and 100 percent of the commodities assumed to be treated with methidathion. Some refinements such as percent crop treated data and anticipated residues have been incorporated. Based on the risk estimates calculated in this analysis, it appears that chronic dietary risk from the uses recommended through reregistration, is not of concern. It should be noted however that the data refinements used are old (Percent crop treated 9/87

and Anticipated Residues 5/88) and should be updated.
Acute Exposure:

Two acute analyses were performed. Table 7 shows the results of the analysis using all presently registered commodities. Table 8 demonstrates results which would occur following the recommendations of CBRS.

The Margin of Exposure (MOE) is a measure of how close the high end exposure comes to the NOEL (the highest dose at which no effects were observed in the laboratory test), and is calculated as the ratio of the NOEL to the exposure (NOEL/exposure = MOE). Generally, acute dietary margins of exposure greater than 100 tend to cause no dietary concern when results are compared to animal-derived data. The MOE values demonstrate that there is cause for concern regarding the acute dietary exposure from methidathion both for existing and proposed uses:

Presently registered commodities result in the following MOEs: U.S. POP = 14.3; Infants (< 1 year) = 6.6; Children (1-6 years) = 6.6; Females (13+ years) = 20; and Males (13+ years) = 25.

Following the recommendations of CBRS results in the following MOEs: U.S. POP = ~~16.6~~^{16.6 DS}; Infants (< 1 year) = 6.6; Children (1-6 years) = 6.6; Females (13+ years) = 25; and Males (13+ years) = 33.3.

All subgroups exceed the Agency's level of concern regarding acute exposure.

TABLE 3

TOLERANCE ASSESSMENT SUMMARY FOR Methidathion
USING ANTICIPATED RESIDUES
CASWELL #378B

DATE: 07/02/96

ANALYSIS FOR POPULATION SUB-GROUP: U.S. POPULATION - 48 STATES

EXISTING ANTICIPATED RESIDUES (PUBLISHED ONLY)
RESULT IN AN ARC OF: 0.000641 MG/KG/DAY
THE EXISTING ARC IS EQUIVALENT TO: 42.748 % OF THE ADI.

NO NEW ANTICIPATED RESIDUES ARE IN THE FILE.

OTHER PENDING ANTICIPATED RESIDUES EXCLUDING THE
CURRENT NEW PETITION HAVE AN ARC OF: 0.000017 MG/KG/DAY
THIS ARC WILL OCCUPY 1.113 % OF THE ADI.

IF ALL PENDING ANTICIPATED RESIDUES (INCLUDING THE
CURRENT NEW PETITION) ARE GRANTED
THE RESULTANT ARC WILL BE: 0.000658 MG/KG/DAY
THE TOTAL ARC WILL OCCUPY 43.861 % OF THE ADI.

ANALYSIS FOR POPULATION SUB-GROUP: NON-NURSING INFANTS (< 1 YEAR OLD)

EXISTING ANTICIPATED RESIDUES (PUBLISHED ONLY)
RESULT IN AN ARC OF: 0.002355 MG/KG/DAY
THE EXISTING ARC IS EQUIVALENT TO: 157.000 % OF THE ADI.

NO NEW ANTICIPATED RESIDUES ARE IN THE FILE.

OTHER PENDING ANTICIPATED RESIDUES EXCLUDING THE
CURRENT NEW PETITION HAVE AN ARC OF: 0.000049 MG/KG/DAY
THIS ARC WILL OCCUPY 3.257 % OF THE ADI.

IF ALL PENDING ANTICIPATED RESIDUES (INCLUDING THE
CURRENT NEW PETITION) ARE GRANTED
THE RESULTANT ARC WILL BE: 0.002404 MG/KG/DAY
THE TOTAL ARC WILL OCCUPY 160.257 % OF THE ADI.
