DATA EVALUATION RECORD

- 1. CHEMICAL: (1) Terbufos (Shaughnessy No. 105001)
 - (2) Cycocel (Shaughnessy No. 018101)
- 2. Formulation: (1) AC 92,100 #1947-144 (purity 86.3%)
 - (2) Cycocel Technical No. 21-0317 (purity 98%)
- 3. Citation: Sleight, B. 1972. The acute toxicity of Cycocel and experimental insecticide AC 92,100 to bluegill (Lepomis macrochirus) and rainbow trout (Salmo gairdneri);

 (MRID #00037483)
- 4. Reviewed By: James D. Felkel, Wildlife Biologist Ecological Effects Branch Hazard Evaluation Division (TS-769)
- 5. Date Reviewed: November 28, 1982
- <u>Test Type:</u> Freshwater fish acute LC₅₀
 - A. Test Species: Bluegill (Lepomis macrochirus)
 Rainbow trout (Salmo gairdneri)
- 7. Reported Results: The terbufos 96-hour LC50 is 0.004 (0.003-0.005) mg/l for the bluegill and 0.010 (0.008-0.013) mg/l for the rainbow trout. No mortality or adverse effects were seen with either test species at Cycocel concentrations up to 1000 mg/l.
- 8. Reviwer's Conclusions:

These test are scientifically sound and indicate that terbufos is very highly toxic to both the bluegill [LC50 = 3.8(2.8-4.9)ppb] and rainbow trout [LC50 = 9.4(7.7-11.4)ppb]. With an LC50 > 1000 ppm for both test species, Cycocel[™] is practically non-toxic to the bluegill and rainbow trout. These studies meet the intent of proposed guidelines (7/10/78).

METHODS

Bluegills were obtained from a commercial hatchery in Nebraska and had a mean weight of 1.2 g and a mean lenght of 43 mm. The Rainbow trout were acquired from a commercial hatchery in Massachusetts and had a mean weight and length of 1.5 g and 55 mm respectively. The test fish were observed in the laboratory hatchery facilities for at least 30 days prior to testing. During that period, mortality in the test population was less than 2% and the fish were judged to be in excellent physical condition. Bioassays were conducted in 5-gallon glass vessels held in constant temperature water baths (18°C for bluegill and 13°C for rainbow trout) (+ 0.5). The test diluent consisted of 15 liters of deionized water of at least 1 million chms resistivity which was reconstituted by adding 3 mg potassium chloride, 30 mg calcium sulfate, 30 mg magnesium sulfate, and 48 mg sodium bicarbonate per liter. The pH of the diluent was 7.1, methyl orange alkalinity was 35 ppm. Bioassays were conducted under static conditions, without aeration, and with a single introduction of toxicant. Fish were approximately the same weight and length (+ 20%). Fish were conditioned to the test water for at least 24 hours prior to testing and were not fed for 2 days before the test commenced. The test solutions of Cycocel® were prepared by adding appropriate amounts of chemical dissolved in water to 15 liters of diluent. AC92,100 was dissolved in acetone before introduction to the test diluent. Ten fish were tested at each concentration, the mass/volume ration never exceeded 1.0 gram of fish per liter of water. Concentrations of the chemical formulations were prepared in series and used to evaluate the susceptibility of the fish to the compounds. Dissolved oxygen levels ranged form a high of 9.0 mg/l at the beginning, to a low of 5.0 mg/l after 96 hours.

RESULTS

The TL50 values for 24 and 96 hours are presented in Table 1. The data for p,p' - DDT are the results of our own standard <u>static</u> reference used to provide an indication of the susceptibility of the population to a known toxicant. These results indicate that the test population in question represents what might be considered an "average population". Table 2 presents the concentrations tested and corresponding observed percent mortalities after 24 and 96 hours exposure. The behavior of the test animals that succumbed to the compound was similar to a syndrome characteristic of chemicaly poisoned fish. Moribund fish first were observed to become dark, swim about erractically, lose equilibrium and drop to the bottom of the test vessel where they eventually expired.

REVIEWER'S EVALUATION

Methods reported are generally consistent with proposed guidelines (7/10/78). EPA computer analysis (attached) indicates an approximate LC50 of 3.8(2.8-4.9) ppb for terbufos with the bluegill, using the binomial test. The moving average and probit methods of analysis could not be used since there was only one concentration at which the percent mortality was

B

between 0 and 100. An approximate LC50 for terbufos with the rainbow trout is 9.4(7.7-11.4) ppb, using the probit method (attached). These results indicate that terbufos is very highly toxic to both the bluegill and rainbow trout. The complete lack of mortality in both test species to concentrations of Cycocel^m up to 1000 ppm indicates that this material is practically non-toxic to the bluegill and rainbow trout.

CONCLUSIONS

1. Category: Core

2. Rationale: These tests meet the intent of proposed guidelines (7/10/78).

3. Repairability: N/A
