OFFICE OF
PREVENTION, PESTICIDES AND
TOXIC SUBSTANCES

MEMORANDUM

SUBJECT: Dietary Exposure Analysis for Cypermethrin in Support of the Reregistration Eligibility Decision.

FROM: Brian Steinwand BJ
Dietary Risk Evaluation Section
Science Analysis Branch/HED (7509C)

Through: Elizabeth Doyle, Section Head Elizabeth A. Doyle
Dietary Risk Evaluation Section
SAB/Health Effects Division

TO: Mike Metzger, Chief
Risk Characterization Analysis Branch
Health Effects Division (7509C)

Action Requested

Provide a dietary exposure analysis to estimate the chronic and acute dietary exposure and risk from cypermethrin for uses which are being supported through reregistration.

Discussion

Toxicological Endpoint:

The Reference Dose (RfD) used in the analysis is 0.01 mg/kg bwt/day, based on a NOEL of 1.0 mg/kg bwt/day from a one year feeding study in dogs with an uncertainty factor of 100 that demonstrated gastrointestinal disturbances as endpoints (See TES Document, 9/16/96). Cypermethrin is classified as a Group C - possible human carcinogen. No Q_1^* is required to support registrations (See TES Document, 9/16/96).

The endpoint for acute dietary risk assessment is the NOEL of 1.0 mg/kg bwt/day from a chronic study in dogs based on gastrointestinal disturbances at 5 mg/kg observed in the first week of the study.

Residue Information

Tolerances for cypermethrin are published in 40 CFR §180.418. Tolerances for cypermethrin residues are currently expressed in terms of methidathion per se. The available data support the established tolerances in/on the brassica crop group, cabbage, the fat, meat and meat bypd of cattle, goats, hogs, horses, and sheep, cottonseed, milk, dry bulb onions and pecans; the established tolerances for residues in/on head lettuce should be decreased from 10 ppm to 4 ppm (See RED chapter). Tolerance level residues and 100 percent crop treated assumptions were made for all commodities. No anticipated residue (AR) information was used in this analysis. No food/feed additive tolerances have been established. (See memo, C. Olinger, 9/12/96).

Results

Chronic Exposure:

A summary of the residue information considered in this analysis is attached as Table 1. A DRES chronic exposure analysis was performed using tolerance level residues and 100 percent crop treated information to estimate the Theoretical Maximum Residue Contribution (TMRC) for the general population and 22 subgroups. Summaries of the TMRCs and their representations as percentages of the Reference Dose (RfD) are included as Table 2 and 3.

Existing tolerances (and pending tolerances on green onions, sweet corn, alfalfa sprouts, an increase in the existing tolerance on milk and meat products, poultry and eggs) result in a TMRC which represents 54.4% of the RfD for the U.S. general population. The highest subgroup, Non-Hispanic Others occupies 90.5% of the RfD.

The analysis for cypermethrin is a worst case estimate of dietary exposure with all residues at tolerance level and 100 percent of the commodities assumed to be treated with cypermethrin. Even including the pending tolerances and the higher tolerance for head lettuce, it appears that chronic dietary risk from the uses recommended through reregistration, is not of concern.

Acute Exposure:

Two acute analyses were performed. Table 4 shows the results of the analysis using all presently registered commodities. Table 5 demonstrates results which would occur following the recommendations of CBRS.

The Margin of Exposure (MOE) is a measure of how close the high end exposure comes to the NOEL (the highest dose at which no effects were observed in the laboratory test), and is calculated as the ratio of the NOEL to the exposure (NOEL/exposure = MOE). Generally, acute dietary margins of exposure greater than 100 tend to cause no dietary concern when results are compared to animal-derived data. The MOE values demonstrate that there is cause for concern regarding the acute dietary exposure from methidathion both for existing and proposed uses:

Presently registered commodities result in the following MOEs: U.S. POP = 20; Infants (< 1 year) = 55; Children (1-6 years) = 10; Females (13+ years) = 20; and Males (13+ years) = 25.

Following the recommendations of CBRS (which includes the reduction of the head lettuce tolerance from 10 ppm to 4 ppm) results in the following MOEs: U.S. POP = 25; Infants (< 1 year) = 55; Children (1-6 years) = 10; Females (13+ years) = 25; and Males (13+ years) = 25.

All subgroups exceed the Agency's level of concern regarding acute exposure for both existing published tolerances and with the proposed decrease in the head lettuce tolerance.
