MEMORANDUM

SUBJECT: IPRODIONE: Reassessed Upper Bound Carcinogenic Dietary Exposure and Risk Estimates Resulting From the Deletion of Cowpeas and Peanut Hay.

FROM: Brian Steinwand *BS*
Dietary Risk Evaluation Section
Science Analysis Branch/HED (7509C)

THROUGH: Elizabeth Doyle, Section Head *E.A. Doyle*
Dietary Risk Evaluation Section
SAB/Health Effects Division *WJH*

TO: J. Housenger/V. Prunier
Special Review Branch
Special Review and Reregistration Division (7508W)

Action Requested

Conduct a carcinogenic dietary risk analyses for iprodione using refined anticipated residue information that resulted from the deletion of cowpeas and peanut hay.

Discussion

Using anticipated residue information based on PDP data, a carcinogenic and acute risk analysis was previously performed. (See memo, B. Steinwand, 2/26/96) resulting in an upper bound cancer risk of 1.5×10^{-5} . A commodity contribution analysis was performed which showed milk products being responsible for 3.4×10^{-6} of the total risk.

The anticipated residues used in this analysis for milk were based on excluding peanut hay and cowpeas from the diet of dairy cattle. Consistent with this, the Registrant amended its label to prohibit feeding peanut hay and remove cowpeas from iprodione labels as risk reduction measures.

CBRS had advised that if peanut hay were excluded from animal diets, anticipated residues for milk would drop from 0.008 ppm to 0.0003 ppm for the national milkshed (See memo, J. Abbotts, 2/15/96). Thus, for the purpose of this analysis, the anticipated residue value used for milk products was 0.0003 ppm (down from 0.0073 ppm used in the previous analysis). Also, the commodity cowpeas was deleted from the risk analysis.

Toxicological Endpoint:

The HED Cancer Peer Review Committee met in 1994 and determined that iprodione should be classified as a group B2 carcinogen (probable human carcinogen) (E. Rinde and L. Taylor memo, 7/27/94). Calculations of Q_1^* s for both mice and rats are found in a B. Fisher memo, 7/19/94. The Q_1^* from the rat study used in this risk analysis was based upon interstitial cell benign tumor rates and was calculated to be $0.0439 \text{ (mg/kg/day)}^{-1}$. The $3/4$ interspecies scaling factor was used to determine human equivalence of the unit risk derived from the animal study.

Residue Information

The raw agricultural commodities which are being considered in the carcinogenic and acute dietary analyses are the published tolerances in 40 CFR § 180.399 and 185.3750. A new tolerance on celery was included in the carcinogenic and acute analyses.

For upper bound carcinogenic risk CBRS provided specific anticipated residues for this analysis (See memo, J. Abbotts, 2/16/96). It should be noted that some anticipated residues were higher than previous estimates found in the J. Abbotts memo of 5/1/95. In a previous analysis (See memo, J. Wintersteen, 6/29/95) anticipated residues based on monitoring data were adjusted for percent crop treated data. BEAD has updated this data (Memo, 12/95, A. Halvorson) and this analysis reflects the revised values used in this analysis.

A summary of the residue information used in the carcinogenic analysis is attached as Table 1. A summary of the commodity contribution for the upper bound carcinogenic analysis is attached as Table 2.

Results

Upper Bound Carcinogenic Exposure

The upper bound carcinogenic risk from food uses of iprodione for the general U.S. population was calculated using the following equation:

2

Upper Bound Cancer Risk = Dietary Exposure (ARC) x Q₁*

Based on a Q₁* of 0.0439 (mg/kg/day)⁻¹, the upper bound cancer risk was calculated to be 1.18 x 10⁻⁵ contributed through all the published and new uses for iprodione. The overall upper bound risk appears to be above the range the Agency generally considers negligible for excess life time cancer risk. A summary of the commodity contribution by raw agricultural commodity (RAC) for the overall U.S. population subgroup is attached as Table 2.

The following table lists some of the commodities which are driving the carcinogenic risk for iprodione.

Commodity	Upper Bound Cancer Risk
Wine and Sherry	3.06 x 10 ⁻⁶
Peaches	4.9 x 10 ⁻⁶

Acute Exposure:

The previous analysis (See memo, B. Steinwand, 2/26/96) showed a high end MOE value of 100, which is above the acceptable level and demonstrates no acute dietary concern. As the elimination of cowpeas and the subsequent reduction in anticipated residues for milk products would further reduce this risk, no additional analysis was performed.

Risk Assessment

The chronic and acute risk from iprodione seem to be minimal with the most concern for the carcinogenic estimate. Using a non-threshold model of carcinogenicity, the upper bound carcinogenic risk estimate exceeds the level the Agency generally considers negligible. As such, DRES has concern over the upper bound estimate of carcinogenic risk from iprodione.

cc: DRES; CDBS (J. Abbotts), Caswell 470A, RCAB
