HED's Response

The subject study was evaluated by G. Ghali (memorandum dated March 10, 1988). The study is of Core-Minimum quality but was considered to be supplemental or additional information since another acute inhalation study (classified as Core-Minimum) exists in our files.

The subject study is acceptable as Core-Minimum. An action will be taken to revise the records to reflect this fact and clarify this issue.

REQUEST FOR REEVALUATION OF STUDY #86389

As part of the review of a number of studies on the human safety data of BAYLETON (under cover memo dated 5/16/88 from Rossi to Thornton), acute inhalation study #86389 on BAYLETON 50% WP was evaluated. The core-classification applied to this study was supplementary. Mobay does not agree with this classification and requests a reevaluation of the study.

We have evaluated study #86389 against EPA guidelines (NTIS Pub. PB86-113438) and in our opinion, the study is in accordance with accepted protocols. The data evaluation record (DER) submitted by EPA shows the classification of the study as supplementary, but no specific justification is provided to support the classification. Because our analysis indicates that study #86389 is adequate, and, further, because the DER submitted by EPA lists no specific comments, defects or limitations regarding the study, we request that it be reevaluated and the defects, if any, be specified.
