Fish Early Life-Stage --

Fathead Minnow

TYPE OF PRODUCT(S) : I,D,H,F,N,R,S Fungicide

DATA ACCESSION NO(S). \_\_\_\_\_

PRODUCT MANAGER (NO.) Cynthia Giles-Parker

PRODUCT NAME(S) Fenbuconazole, RH7592, Fenethanil, Indar, RH-57,592

COMPANY NAME Rohm and Haas

SUBMISSION PURPOSE Meet EEB Study requirements

SHAUGHNESSY NO. 129011 CHEMICAL & FORMULATION(S) % A.I.

Fenbuconazole 98.3

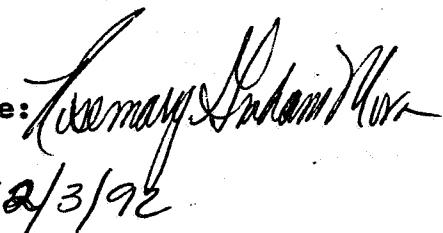

Inert 1.7

## DATA EVALUATION RECORD

1. **CHEMICAL:** RH-7592/INDAR. Shaughnessey No. 129011.
2. **TEST MATERIAL:** RH-7592 Technical; Lot No. BBP-3-1786R; 96.7% active ingredient; a white powder.
3. **STUDY TYPE:** 72-4. Freshwater Fish Early Life-Stage Toxicity Test. Species Tested: Fathead Minnow (*Pimephales promelas*).
4. **CITATION:** Rhodes, J.E., K. Friesen, and W.A. McAllister. 1991. Early Life-Stage Toxicity of RH-7592 Technical to the Fathead Minnow (*Pimephales promelas*) Under Flow-Through Conditions. ABC Report No. 38142. Rohm and Haas Report No. 89RC-0083. Study conducted by Analytical Bio-Chemistry Laboratories, Inc., Columbia, MO. Submitted by Rohm and Haas, Spring House, PA. EPA MRID No. 418750-08.

5. **REVIEWED BY:**

7. **CONCLUSIONS:** This study is ~~not~~ scientifically sound <sup>but</sup> and does not fulfill the guideline requirements for an early life-stage test using freshwater fish. The %RSD of weight for two control replicates and all solvent control replicates was >40%. The NO NOEC was determined by this study since growth was affected at all test levels. Based on mean measured concentrations, the LOEC for *Pimephales promelas* exposed to RH-7592 Technical was 0.28 mg a.i./l.

8. **RECOMMENDATIONS:** N/A.

9. **BACKGROUND:**

10. DISCUSSION OF INDIVIDUAL TESTS: N/A.

11. MATERIALS AND METHODS:

A. Test Animals: Newly fertilized eggs (<24 hours post-fertilization) of the fathead minnow (*Pimephales promelas*) were obtained from the spawning culture at the testing facility.

B. Test System: The test system was a 2-l proportional diluter which intermittently delivered test solutions to replicate test chambers. Duplicate glass aquaria were divided into two replicate chambers, each measuring 18 x 20 cm with a water depth of 25 cm, yielding a 9-liter chamber volume. All chamber drains were covered with stainless steel screen. The diluter delivered an average of 81.65 l of solution per day to each replicate chamber resulting in 9.07 volume replacements per day. The test solutions were allowed to flow through the test system for a 48-hour equilibration period before test initiation.

Embryo incubation cups were clear glass jars (9 cm diameter) with Nitex screen bottoms. One cup was suspended in each test chamber. A rocker arm apparatus was used to gently oscillate the incubation cups in the test chambers.

Sixteen hours of light at an intensity of 79.4 ±9.2 footcandles at the water surface were provided each day. Test temperature was maintained at 23.0-24.6°C by a water bath.

The dilution water was a mixture of untreated and treated (reverse osmosis) well water. The water had a mean pH of 7.8, a specific conductivity of 114-181 S/cm, and a hardness and alkalinity of 42-68 and 50-76 mg/l as CaCO<sub>3</sub>, respectively.

Stock solutions (39,400 mg a.i./l) were prepared by dissolving the appropriate amount of whole test material in acetone.

C. Dosage: Thirty-five-day embryo-larval, flow-through test. Nominal test concentrations selected based on results of preliminary testing were 0.19, 0.38, 0.75, 1.5, and 3.0 mg/l. A dilution water control and solvent control were also included. The solvent control contained an acetone concentration of 0.075

ml/l which corresponds to the highest acetone concentration used in exposure levels 1-5.

D. Design: Four replicates of each treatment and control were included in the test. Duplicate test aquaria per concentration were arranged in one row on one tier using a random number table to assign specific test concentrations, providing a nested experimental design.

Embryos were impartially selected and distributed to the incubation cups in groups of 5 until each cup contained 30 eggs, with the exception of 35 eggs mistakenly added to one replicate. Hatching was 95% complete on test day 5. Fry remained in the incubation cups until test day 11 (day 6 post-hatch) before being released into their respective chambers. Biomass loading was 0.025 g/l/day at test termination.

Starting on test day 4, larvae were fed live brine shrimp nauplii and rotifers daily. Beginning on study day 15, the rotifer supplement was discontinued and beginning on study day 21, a commercial dry food was added to the diet. Frequency of feeding along with quantity and food size was adjusted during the study on the basis of mortality and average fish size. Feeding was discontinued 24 hours prior to test termination. The aquaria were cleaned as needed.

Behavior, appearance, and survival of eggs, embryo, and larvae were observed and recorded daily. Dead individuals were removed at each observation. At test termination (test day 35), the larvae were counted and standard length and blotted wet weight of each individual were measured.

Dissolved oxygen concentration (DO), pH, conductivity, hardness, alkalinity, and temperature were measured on days 0, 1, 7, 14, 21, 28, and 35. Temperature and DO were measured in replicates A and B or C and D on days 0 and 35 and in one replicate chamber of each treatment and control on days 1, 7, 14, 21, and 28. Total hardness and alkalinity, pH, and specific conductance were measured in one replicate of the control, lowest and highest test concentrations containing live fish. Temperature was also measured continuously in a centrally located chamber throughout the test period.

Water samples were collected from each test concentration for the determination of RH-7592 Technical using high performance liquid chromatography

(HPLC). These samples were collected on test days 0, 1, 7, 14, 21, 28, and 35.

- E. **Statistics:** Statistical analyses were based on a  $p \leq 0.05$  level of significance. A t-test demonstrated no significant difference between the dilution water control data and solvent control data. Therefore, the pooled control data were used to assess the response of the treatment groups. Shapiro-Wilk normality test statistics were computed within each test concentration to assess departures from normality. When the data suggested departures from normality, the data were examined for indications of central tendency. If the variability between replicates within aquaria was not significant or there was no strong evidence of biological significance, then the aquaria within concentrations and replicate within aquaria error sources were combined.

Egg hatchability and survival data were analyzed using frequency analysis comparing the pooled control responses to each exposure level. Analysis of variance (ANOVA) procedure for nested design experiments, coupled with Dunnett's one-tailed multiple comparison procedure, was used to analyze the growth data.

12. **REPORTED RESULTS:** Mean measured concentrations were 0.28, 0.43, 0.85, 1.7, and 3.4 mg a.i./l (Table 3, attached). These values ranged from 113 to 147% of nominal concentrations.

Sublethal effects (spinal curvature, fish on bottom of chamber, loss of equilibrium, erratic swimming behavior, surfacing) were observed primarily in test concentrations  $\geq 0.85$  mg a.i./l. Hatching success was not significantly affected at any test concentration when compared to the pooled control data (Table 8, attached). Time to hatch was delayed at 3.4 mg a.i./l. Survival at the two highest test concentrations was significantly reduced when compared to the pooled control data (Table 8, attached). Due to significant effects on larval survival at the two highest test concentrations, data for these test concentrations were excluded from further statistical analysis. Standard length and wet weight were significantly reduced at all remaining test concentrations when compared to the pooled control data (Table 9, attached).

During the study, pH was 7.6-8.0, specific conductance was 114-181  $\mu\text{S}/\text{cm}$ , and total hardness and alkalinity were 42-68

and 50-76 mg/l as CaCO<sub>3</sub>, respectively. The DO ranged from 7.2 to 8.8 mg/l. The temperature range was 22.5-24.6°C.

13. **STUDY AUTHOR'S CONCLUSIONS/QUALITY ASSURANCE MEASURES:**

Based on egg hatchability, fry survival and growth data from this 35-day fathead minnow (*Pimephales promelas*) early life stage study, the Maximum Acceptable Toxicant Concentration (MATC) limits were estimated to be less than 0.28 mg a.i./l. A repeat study using nominal concentrations 0.006, 0.013, 0.025, 0.05, 0.10, 0.20, and 0.40 mg a.i./l is currently underway.

A GLP compliance statement was included in the report indicating that the study was conducted in accordance with EPA Good Laboratory Practice Regulations (40 CFR, Part 160). A quality assurance statement was also included.

14. **REVIEWER'S DISCUSSION AND INTERPRETATION OF STUDY RESULTS:**

A. **Test Procedure:** The test procedure is generally in accordance with the SEP guidelines, except for the following deviations:

For two replicates in the control and for all replicates of the solvent control, the %RSD for weight was greater than 40%. According to the SEP, a test is unacceptable in the %RSD in any control chamber is greater than 40%.

No NOEC was determined by this study, since growth was affected at all test levels.

During the test, the temperature range was 22.5-24.6°C; the SEP recommends 25 ±2°C.

The report did not indicate the use of 15- to 30-minute dawn/dusk simulation periods as recommended.

The number of male and female fish used to produce the test embryos was not reported; the SEP recommends at least 3 males and 3 females.

Embryos were "impartially" selected and distributed; the SEP requires random selection.

B. **Statistical Analysis:** Individual length and weight data were analyzed using a 2-way ANOVA coupled with Bonferroni's test for treatment comparisons (printouts, attached). The reviewer did not include growth data from the 1.7 mg a.i./l test level in the analysis,

since only one fish from three replicates survived until test termination. The results were the same as those reported by the authors. Length and weight treatment means obtained by the reviewer were slightly different from the authors.

Survival and hatchability data were analyzed using Toxstat® (Version 3.3). The survival (excluding 3.4 mg a.i./l which had 0% survival) and hatchability data met the assumptions of homogeneity of variance and normality when tested using Bartlett's or Hartley tests and Chi-square tests, respectively. Therefore, the survival data were analyzed using William's test and the hatchability data were analyzed using a one-way ANOVA coupled with Dunnett's comparison test (printouts, attached). The reviewer's results were the same as those presented by the authors.

Growth data were individually measured; however, the authors statistically analyzed these data using a one-way ANOVA and the replicate means. When replicate mean values are used, the variation that exists within each replicate is ignored. Individual measurements of growth should have been analyzed using the two-way ANOVA design.

C. Discussion/Results: This study is scientifically sound but does not meet the requirements for an early life-stage toxicity test using freshwater fish. The %RSD of weight for two control replicates and all solvent control replicates was >40%. A treatment effect on growth (length and weight) was noted at all exposure levels, therefore, no MATC or NOEC could be determined. The LOEC was 0.28 mg a.i./l mean measured concentration.

D. Adequacy of the Study:

- (1) Classification: Supplemental
- (2) Rationale: The %RSD for weight was >40% in two control replicates and all solvent control replicates. Failure to determine a NOEC.
- (3) Repairability: No.

15. COMPLETION OF ONE-LINER: Yes, December 3, 1992.

RIN 3477-95

Hartley test for homogeneity of variance

---

Calculated H statistic (max Var/min Var) = 37.50  
Closest, conservative, Table H statistic = 184.0 (alpha = 0.01)

Used for Table H ==> R (# groups) = 6, df (# reps-1) = 3  
Actual values ==> R (# groups) = 6, df (# avg reps-1) = 3.00

---

Data PASS homogeneity test. Continue analysis.

NOTE: This test requires equal replicate sizes. If they are unequal but do not differ greatly, the Hartley test may still be used as an approximate test (average df are used).

**DATABASE ENTRY FORM  
FOR ACUTE OR CHRONIC TOXICITY STUDIES**

1. Chemical RH-7592 /INDAR Shaughnessy 129011
2. Common Name Of Organism Tested Fathead Minnow
3. Scientific Name Pimephales promelas
4. Age Of Organisms <24 hours
5. Guideline No. 72-4
6. Type Of Dosing Method (Circle One) Or Study
  1. Oral
  2. Dietary
  3. Reproduction
  4. Static
  5. Static Renewal
  6. Flowthrough
  7. Acute Contact
  8. Other
7. % AI Of Test Substance 96.7%
8. Study Duration (Hrs Or Days) 35 days
9. Dose Type (Circle One) A. LD50 B. LC50 C. EC50 D. MATC
10. Toxicity Level A. mg/kg B. ppm C. mg/l D. µg/l E. ng/l F. µg/bee G. Other
11. 95% C.L.S NA LC<sub>50</sub> = NA
12. Curve Slope NA
13. NOEL 0.28 mg a.i./l LOEL = ND
14. Study Date (YEAR) 1991
15. Study Review Date (YEAR) 1992
16. Category (Circle One) CORE SUPPLEMENTAL INVALID
17. MRID or Accession Number 418750-08
18. Laboratory Analytical Bio-Chemistry Laboratories, INC.
19. Reviewer Rosemary Graham Mora
20. For Reproductive Studies (avian or aquatic) Indicate Which Parameter Affected At What Toxicity Level.
