**A1. Testimony of Robert Prucha (referenced in Chapter 2). Excerpt from Hearing Transcript, Vol. 8, 9, and 40, *Petitions of the Keweenaw Bay Indian Community, et al. on Permits Issued to Kennecott Eagle Minerals Company* (Michigan Department of Environmental Quality, May 7, May 8, and July 16, 2008). (electronic only)**

STATE OF MICHIGAN

STATE OFFICE OF ADMINISTRATIVE HEARINGS AND RULES

In the matter of: File Nos.: GW1810162 and  
MP 01 2007

The Petitions of the Keweenaw  
Bay Indian Community, Huron Part: 31, Groundwater  
Mountain Club, National Discharge  
Wildlife Federation, and 632, Nonferrous  
Yellow Dog Watershed Metallic  
Environmental Preserve, Inc., Mineral Mining  
on permits issued to Kennecott  
Eagle Minerals Company. Agency: Department of  
Environmental  
Quality

Case Type: Water Bureau  
and Office of  
Geological  
Survey

HEARING - VOLUME NO. VIII

BEFORE RICHARD A. PATTERSON, ADMINISTRATIVE LAW JUDGE  
Constitution Hall, 525 West Allegan, Lansing, Michigan  
Wednesday, May 7, 2008, 8:30 a.m.

APPEARANCES:

For the Petitioner MR. ERIC J. EGGAN (P32368)  
Keweenaw Bay Indian Honigman Miller Schwartz and Cohn LLP  
Community: 222 North Washington Square, Suite 400  
Lansing, Michigan 48933-1800  
(517) 377-0726

1 the elders.

2 MS. HALLEY: Thank you. No further questions.

3 JUDGE PATTERSON: Thank you, sir.

4 MS. HALLEY: Thank you.

5 MR. HAYNES: Your Honor, before we call our next  
6 witness, I'm afraid we have to take that dreaded technology  
7 break.

8 JUDGE PATTERSON: Okay. All right. How long do  
9 you need?

10 MR. HAYNES: Five to ten minutes.

11 (Off the record)

12 MR. HAYNES: Petitioners call Robert Prucha to the  
13 stand.

14 REPORTER: Would you raise your right hand? Do  
15 you solemnly swear or affirm the testimony you're about to  
16 give will be the whole truth?

17 DR. PRUCHA: I do.

18 ROBERT H. PRUCHA, PH.D.

19 having been called by the Petitioner and sworn:

20 DIRECT EXAMINATION

21 BY MR. HAYNES:

22 Q Would you say your name for the record and spell your last  
23 name, please?

24 A Robert H. Prucha. It's P-r-u-c-h-a.

25 JUDGE PATTERSON: I'm sorry. Can you do that  
Page 1539

1           again?

2                           THE WITNESS: It's P-r-u-c-h-a.

3                           JUDGE PATTERSON: Okay. Thank you.

4                           THE WITNESS: Uh-huh (affirmative).

5    Q           Dr. Prucha, could you tell us briefly what your educational  
6           background is?

7    A           I have a background in geology, hydrogeology and  
8           engineering -- water resources engineering.

9    Q           And did you obtain a bachelor's degree?

10   A           I did.

11   Q           In what subject?

12   A           Geology.

13   Q           And where did you get your bachelor's degree from?

14   A           At UC Berkeley.

15   Q           For those of us out here in the Midwest --

16   A           In California.

17   Q           Thank you. And, Dr. Prucha, did you receive a master's  
18           degree from an educational institution?

19   A           I did.

20   Q           From where and in what?

21   A           University of California at Berkeley, and that was in the  
22           mining hydrology --

23   Q           And what was your --

24   A           I'm sorry -- engineering hydrology.

25   Q           And what was your master's thesis or the subject of the

1 master's thesis?  
2 A Geothermal reservoir engineering.  
3 Q And did you obtain a Ph.D.?  
4 A I did.  
5 Q From where and when?  
6 A University of Colorado at Boulder in 2002 in civil  
7 engineering water resources.  
8 Q And what was your Ph.D. thesis?  
9 A It was on looking at integrated hydrologic models and  
10 developing conceptual and numerical frameworks for  
11 large-basin systems and in semiarid areas.  
12 Q Dr. Prucha, where do you live?  
13 A In the Boulder, Colorado, area.  
14 Q Do you have any professional registrations?  
15 A I do. I'm a professional engineer in the State of Colorado  
16 and in California.  
17 Q Could you give us briefly your work experience post master's  
18 degree?  
19 A I worked at several companies, some large -- a large  
20 engineering firm, a smaller engineering firm for a number of  
21 years.  
22 Q And generally what have your duties been in your work?  
23 A Mainly to develop hydrologic models, water-flow systems.  
24 Q And what is your present employment?  
25 A I co-own a small business called Integrated Hydro Systems,

1 and we are involved in developing to a large extent models  
2 or reviewing models that have been developed for surface  
3 water systems, groundwater systems, the integrated coupling  
4 of those systems.

5 Q Have you published any papers dealing with hydrologic  
6 modeling?

7 A I have; integrated modeling to a large extent where you  
8 couple groundwater systems and surface water systems.

9 Q And are those papers listed in your resume?

10 A They are.

11 MR. HAYNES: For the record, Dr. Prucha's resume  
12 is Petitioner's Exhibit 120, and it has been admitted by  
13 stipulation.

14 Q Dr. Prucha, in your experience and education, have you  
15 become familiar with geologic terms?

16 A Yes.

17 Q And for instance, geologic terms such as "dikes"?

18 A Yes.

19 Q "Faults"?

20 A Yes.

21 Q A geologic term such as "unconsolidated material"?

22 A Yes.

23 Q By the way, is that a relatively recent phrase that's used  
24 to describe another -- is there another way to describe  
25 unconsolidated material? What did it used to be called?

Page 1542

**NetworkReporting**

1-800-632-2720

1 A It's what I normally refer to as unconsolidated material or  
2 deposits that are not consolidated. They're not in hard  
3 rock.

4 Q So unconsolidated material would be not bedrock?

5 A That's right.

6 Q In your field of hydrology and water resources engineering,  
7 are there other geologic terms that would be used that are  
8 relevant to your testimony today?

9 A You may hear terms like "quaternary deposits" or "alluvial  
10 deposits."

11 Q And what do you mean by "quaternary deposits"?

12 A Those are really Ice Age -- post Ice Age deposits, and I  
13 think they can be synonymous with the unconsolidated  
14 deposits or materials.

15 Q And what about alluvial deposits?

16 A Alluvial deposits are deposits that were deposited in a  
17 moving water system.

18 Q So how would you distinguish from a geologic standpoint  
19 quaternary deposits from alluvial deposits?

20 A "Quaternary deposits" just refers to an age or a date, and  
21 they're pretty much the same material.

22 Q I see. Now, do you have experience reviewing hydrogeology  
23 reports of other consultants?

24 A I do.

25 Q Do you have experience writing such reports?

1 A Yes.

2 Q And has that been true throughout your career?

3 A Yes.

4 Q Do you have experience reviewing characterizations of  
5 bedrock aquifers?

6 A Yes.

7 Q And has that been true throughout your professional career?

8 A I would say not exclusively. I probably spent more time  
9 looking at unconsolidated deposits. But in almost every  
10 system I've looked at, bedrock becomes an important factor  
11 in looking at the whole hydrology of the system.

12 Q I see. And do you have experience preparing reports dealing  
13 with characterizing groundwater flow?

14 A Yes.

15 Q And would those reports characterizing groundwater flow deal  
16 with groundwater flow in the unconsolidated materials as  
17 well as bedrock?

18 A Yes.

19 Q Do you have experience designing conceptual groundwater flow  
20 models?

21 A Yes.

22 Q And for Judge Patterson's benefit and perhaps for ours too,  
23 can you give a brief description of what you mean by  
24 "conceptual groundwater flow model"?

25 A It's a term that's used to describe where you think water

Page 1544

1 comes into a system; the basic structure of the system; the  
2 aquifers where water flows through; the aquatards where  
3 water doesn't flow through so easily; where water exits the  
4 system. So it's really a pretty comprehensive description  
5 of where you think the water's going throughout the system  
6 and what the stresses are or influences -- factors that  
7 influence its movement through the system.

8 Q And, Dr. Prucha, these models are predictive systems, are  
9 they not?

10 A That's right.

11 Q Do you have experience calibrating groundwater flow models?

12 A Yes.

13 Q And what do you mean by "calibrating groundwater flow  
14 models"?

15 A It's the process where you develop a conceptual  
16 understanding of the system, and you construct a  
17 mathematical model of the flow going through the system.  
18 And the process of calibration is your efforts to try and  
19 reproduce what you see in the field, either flows or  
20 groundwater levels, within a specified degree of tolerance.

21 Q When you say "a specified degree of tolerance," what do you  
22 mean by that?

23 A Well, that's where you say -- when you develop a model and  
24 you try and reproduce a water level at a given point within  
25 the system or flow, the model's only a representation of the

1 true system. There are simplifications. But effectively,  
2 that means that you will have some difference between what  
3 you simulate and what you observe. And the calibration  
4 attempts to reduce or minimize that difference between your  
5 observed and estimated or simulated level at that point.

6 Q Dr. Prucha, in your experience, do you have experience  
7 validating groundwater flow models?

8 A I do.

9 Q And what do you mean by "validating groundwater flow  
10 models"?

11 A We typically use it in a context of having developed a  
12 calibrated flow model. And typically you use it in the  
13 context of -- when you calibrate a model, you have another  
14 set of system observations, a distinct set, and you try to  
15 reproduce that set so it's -- the first model that you  
16 calibrate is one set of conditions. The second would be  
17 another set of conditions. Maybe the rainfall changes. And  
18 you go through the same process of calibration, where you  
19 compare the simulated or estimated model-derived value with  
20 what you observe. And again, if you can show that your  
21 model correctly -- you know or reproduces the system flow  
22 within this tolerance in both conditions, it provides  
23 considerably more credibility in the model that you've  
24 developed; that it reproduces the system.

25 Q I see. In your work, Dr. Prucha, do you have experience

1 using models to predict groundwater flows?

2 A Yes.

3 Q Is that the purpose of such models or a purpose?

4 A It's a purpose, yes.

5 Q And in your work, Dr. Prucha, do you have experience  
6 performing uncertainty analyses?

7 A Yes.

8 Q And what, for our benefit, is an uncertainty analysis?

9 A After you develop this series of models that you believe  
10 represents the system within this tolerance that you've  
11 specified, because the model is a -- it's a simplification  
12 of the actual system, you acknowledge that there will be  
13 some error in that calibration. And the uncertainty  
14 analysis is an attempt to add effectively a plus or minus at  
15 the end of a predicted value. So I estimate the flow out at  
16 this river of "X" amount, and you would add a plus or minus  
17 saying, "I believe that it's uncertain within a certain  
18 range." So there are a series of steps that you usually go  
19 through in conducting an uncertainty analysis, and it's  
20 really a required step these days to qualify your response.  
21 Because in modeling it's possible to develop a model that's  
22 not very-well calibrated, and you can generate a significant  
23 amount of uncertainty that could be greater than your  
24 objective.

25 Q For purposes of your testimony today, Dr. Prucha, did you

1 review various groundwater models prepared by Kennecott and  
2 its consultants?

3 A I did.

4 Q Dr. Prucha, we've had put on the screen a figure from  
5 Kennecott Exhibit 7.

6 MR. HAYNES: This is the -- for the record, the  
7 environmental impact assessment Appendix B-3.

8 JUDGE PATTERSON: B?

9 MR. HAYNES: B; "B" as in "boy," 3, Figure 8.1.

10 Q Dr. Prucha, have you reviewed this figure?

11 A Yes.

12 Q And is this figure related to the hydrology of the -- excuse  
13 me -- the groundwater modeling that was performed for the  
14 proposed Eagle Mine?

15 A Yes.

16 Q Dr. Prucha, can you tell us what the various -- what your  
17 understanding is of the various figures that are shown on  
18 this Figure 8.1?

19 A Okay. My understanding is that this is a map that describes  
20 the locations of where they conducted a bedrock well test,  
21 where they pumped the groundwater from the bedrock. And in  
22 this upper left corner here shows a line going down here  
23 with a black zone, and it says, "This is well 084." It's a  
24 pumping test interval. They pumped the water from this  
25 (indicating) zone in the lower bedrock, and they observed

1 the response in surrounding wells that are labeled at  
2 various locations here.

3 Q And just for the record, what are the labels of the other  
4 wells?

5 A To the left or west of the pump zone is well 84. And by the  
6 way, this is a well that has an -- it was drilled at an  
7 angle. So it started at the ground surface here and went to  
8 the east. To the west of that pump zone is well 074, and it  
9 actually starts at the surface to the south and goes up to  
10 the north. They have a shallow well, 023, to the far  
11 left -- upper left corner; have another well here, 107,  
12 that's between 84 and, say, 23, and another well, 077, that  
13 starts to the north and drops down into the lower bedrock to  
14 the south. And they have a well to the far right called  
15 YDO2-20. The text below each just indicates the amount of  
16 the drawdown at the -- during the test reported when they  
17 pumped this particular well.

18 Q When they pumped well 84?

19 A Right, when they pumped well 84.

20 Q And just for the record, for instance, what was the  
21 drawdown, based upon this figure, for well 074?

22 A I believe that says "83 feet" or "meters" -- "83 meters."

23 Q Okay. Can you explain for us what you mean by "drawdown"?

24 A When you pump a well -- and by the way, this particular well  
25 was pumped from a particular zone that was packed off over a

1 small zone where there was a fracture noted that produced  
2 flow through it. But drawdown effectively is, when you pump  
3 this well, the water surrounding it with time starts to drop  
4 from its original elevation, and that propagates out from  
5 the pump zone with time. So at the location where the pump  
6 was actually sitting in this well, the drawdown is the  
7 greatest. The water level drops the most. And for this  
8 well it was nearly 200 meters that they dropped that; couple  
9 of football field lengths. It's a pretty significant drop.

10 And out at wells at a distance here, they  
11 dropped -- this dropped 83 meters. So it's saying, in  
12 effect, that the pumping at this lower -- from this lower  
13 zone here (indicating) is influencing the water level at  
14 this well 074.

15 Q Is the purpose of the pump test, then, to try to determine  
16 how the water behaves underground when there is water drawn  
17 out from underground?

18 A Yes.

19 Q Dr. Prucha, I've now put up on the screen from Petitioner's  
20 Exhibit 63, this is slide 14. Dr. Prucha, is this a figure  
21 that you prepared?

22 A I did.

23 Q And what was your purpose in preparing this figure?

24 A My intent was to take the figure that had been provided in  
25 the report and simply try to locate it over the orebody and

1 with reference to the Salmon Trout River to tunneling in the  
2 area and to noted faults.

3 Q All right. For this figure we see a blue line that starts  
4 on the bottom sort of center and then trends up and to the  
5 left, and I see a label that says "Salmon Trout River." Is  
6 that your representation for your analysis here of where the  
7 Salmon Trout River is?

8 A That's right. This comes from the DEQ website for -- this  
9 is just another geographical information shape file, so it's  
10 a file that had this map, and I simply brought it into this  
11 program.

12 Q So you transposed an electronic map onto this figure?

13 A That's right.

14 Q Okay. And then the -- there seems to be an -- I guess it's  
15 orange-colored or magenta-colored figure to the north of the  
16 Salmon Trout River. What does that represent?

17 A This (indicating) line?

18 Q Right; yes.

19 A The red boundary is the approximate location of the  
20 orebody --

21 Q And where did you get --

22 A -- as I took off --

23 Q I'm sorry. Where did you get the orebody figure from?

24 A I traced that from a map that I'd gotten from a report and  
25 brought that in. That wasn't provided.

1 Q And then we have a purple line that seems to go in various  
2 directions. What's that represent?

3 A This is an approximate line that represents the tunnel. And  
4 again I got that off of a map. The intent wasn't to draw it  
5 super accurately but to get the approximate location and  
6 reference it to the pump test wells.

7 Q I see. And horizontally going through about the center of  
8 the figure, we see a light blue sort of dashed line. What  
9 does that represent?

10 A This is a line that represents a dike that a geologist in  
11 the late 70's identified.

12 Q And by "a dike" -- what do you mean by "a dike"?

13 A It's an obtrusive body of material that's different than the  
14 surrounding country rock that is extending up vertically  
15 relative to that country rock and --

16 Q And you've identified, it appears, on this figure that dike  
17 as the Klasner Dike?

18 A That's right, --

19 Q Is that your --

20 A -- as he defined it.

21 Q I'm sorry?

22 A As he defined it.

23 Q All right. Now, we also have a sort of a yellow line that's  
24 on the right-hand side of the figure that trends sort of  
25 northwest to southeast. What is that?

1 A This is actually the left side of a zone that the same  
2 author, Klasner, in the late 70's defined as a fault zone.  
3 And again, this was taken from his report by georeferencing  
4 his material and lining it up with information that we had  
5 at the local site here.

6 Q And we also see a red arrow in the upper right portion of  
7 the figure that you seem to have labeled "Klasner Fault  
8 Zone." What is that?

9 A Right. This orange line represents the westernmost boundary  
10 of the fault zone. And so if you proceeded maybe 500 meters  
11 to the east, it would represent the other side of this zone  
12 that he had mapped as a fault zone.

13 Q Now, you may have already testified to this, but what was  
14 your purpose in preparing this slide?

15 A The primary purpose was -- when I read through these reports  
16 initially, I had a lot of trouble trying to determine where  
17 these wells were located with respect to the orebody. One  
18 of my primary interests was to determine whether they had  
19 characterized hydraulic -- through hydraulic testing the  
20 entire area where they plan to mine, tunnel; whether they  
21 had crossed mapped faults through the area.

22 Q Now, in your experience, Dr. Prucha, is it important for  
23 modelers to take account of things like dikes and faults?

24 A Absolutely. They can be controlling features for the  
25 hydrology, especially in bedrock systems.

1 Q When you say "controlling features," what do you mean?

2 A Controlling the groundwater flow through those systems in  
3 the bedrock. The bedrock has been -- the matrix material,  
4 not the material that's faulted, appears to be relatively  
5 low permeability or has a low ability to transmit water  
6 through it.

7 Q Let me see if I can -- if I understand what you mean. Are  
8 you saying that bedrock normally doesn't allow water to flow  
9 through it very fast?

10 A Not very readily, not compared to the unconsolidated  
11 deposits that would --

12 Q Above the bedrock?

13 A Which are maybe sands. It much more readily allows water to  
14 flow through it; a greater volume.

15 Q And so, then, are you contrasting the dikes and faults with  
16 the bedrock, then, in terms of the flow capacity?

17 A That's right. They're associated with the bedrock. And  
18 when you think of the bedrock system -- when I read through  
19 the report, I think the conclusion is that there's not much  
20 flow through the bedrock system. And yet these large faults  
21 are -- can be significant conductors of water through the  
22 system -- through the bedrock system, and they can translate  
23 water from the bedrock system into the over- -- the  
24 unconsolidated material.

25 Q And explain that process for us; that is, how these faults

1 and dikes would transmit water more readily than the  
2 bedrock. Why is that?

3 A Because they're effectively open --

4 MR. LEWIS: Just a minute; just a minute. Just an  
5 objection as to form, your Honor. The witness has testified  
6 that they can be, and this question is now posed as if they  
7 are. So I have an objection to the form and the foundation.

8 MR. HAYNES: Well, I'll rephrase it.

9 JUDGE PATTERSON: All right.

10 Q Dr. Prucha, how would you describe the process by which  
11 faults and dikes can transmit water more readily than  
12 bedrock?

13 A There are continuous features that -- in the case of Klasner  
14 mappings, these are on the order of kilometers -- several  
15 kilometers or miles, and they're open. They have a certain  
16 width, and the -- they allow water to flow through readily  
17 along those lineaments.

18 Q Describe a lineament for us.

19 A It's a straight -- I mean, generally these features tend to  
20 be more linear than not linear.

21 Q Than curved or at right angles?

22 A That's right; that's right.

23 Q Dr. Prucha, I've had put up on the screen again from  
24 Kennecott Exhibit 7 the environmental impact assessment  
25 Appendix B-4, Figure 9.5. And is this a figure, Dr. Prucha,  
Page 1555

**NetworkReporting**

— 1-800-632-2720 —

1 that you've reviewed?

2 A Yes.

3 Q And what was your purpose in looking at this figure?

4 A This is a predicted drawdown at the end of mining for what's  
5 been referred to in the report as an upper bound case, where  
6 they --

7 Q And explain for us what you understand an upper bound case  
8 to mean as a -- from a modeling standpoint.

9 A Well, in modeling you try to define the range that could  
10 possibly result from your interpretation of --  
11 conceptualization of the system flow. When I reviewed a lot  
12 of the available information, it suggests that there are  
13 faults that run through the area that are extensive. And I  
14 was looking to see in this result here (indicating) whether  
15 the model that had been developed produces a drawdown --  
16 simulated drawdown in the bedrock that is reasonable.

17 Q And, Dr. Prucha, when you reviewed this exhibit, did you try  
18 to calculate the area that is shown by this figure in terms  
19 of the drawdown post mining?

20 A The area impacted?

21 Q Yes.

22 A I did not actually calculate the area for this particular  
23 drawdown.

24 Q Do you have an estimate?

25 A It's at least a mile in diameter.

Page 1556

**NetworkReporting**

1-800-632-2720

1 Q So from the center of the figure out to the outermost  
2 concentric circle here, we have a mile in diameter?

3 A A mile in diameter, right, at least.

4 Q Now, is that modeling dimension something that you would  
5 expect to see from the models that you saw in the reports  
6 that you reviewed?

7 A I was surprised that it wasn't more -- that it was so  
8 concentric or circular. It didn't seem to indicate just by  
9 design that the faults had a pronounced effect going north,  
10 south and east, west like they imposed on this particular  
11 model.

12 Q And for modeling an area that has a mile in diameter, would  
13 you expect to see six wells used or more than six wells or  
14 less than six wells?

15 MR. LEWIS: Objection; foundation.

16 MR. HAYNES: Your Honor, I think I've laid a  
17 foundation that the witness can testify about how models are  
18 constructed.

19 JUDGE PATTERSON: I agree. I'll overrule the  
20 objection.

21 A I would expect over this area that you would have not only  
22 more wells but not all located in one location.

23 Q And what do you mean by that?

24 A Well, relative to the size of the drawdown area here  
25 (indicating), all of the wells in the bedrock are located in

1 the very smallest central drawdown area that you can't even  
2 really see at this scale. It's almost a dot at this scale.  
3 So in effect, they haven't characterized the bedrock system  
4 over this entire area; just this small area largely within  
5 the orebody.

6 Q Just so the record is clear, Dr. Prucha, you're saying that,  
7 for purposes of this predicted drawdown figure, Figure  
8 8.5 -- excuse me -- 9.5, the wells are located within the  
9 center circle, and there are no wells located, for purposes  
10 of this drawdown prediction, in any of the other concentric  
11 circles noted on this figure?

12 A Not that I noted in the reports.

13 Q Dr. Prucha, I've put up on the screen from Kennecott Exhibit  
14 7 the environmental impact assessment Appendix B, as in  
15 "boy," 1, Figure 4. And is this a figure that you have  
16 reviewed?

17 A Yes.

18 Q And what does this figure show you in terms of the geology  
19 of the area around the proposed mine?

20 A Well, first of all, the proposed mine is located in this  
21 area, and it --

22 Q You're pointing with a laser to the center?

23 A In the central part of the figure. And the Salmon Trout  
24 extends just below that and off to the west going to the  
25 north. And what I saw from this figure was a number of

1 faults -- fault lines that go from southeast to northwest,  
2 pretty much paralleling each other. And in some cases  
3 they're offsetting dikes that are effectively for the most  
4 part running east/west. Another thing that struck me about  
5 this figure was the length of these.

6 Q Of these what?

7 A Of these dikes and the faults; that the lengths of these  
8 are -- and here's the scale here. This is 1 kilometer, this  
9 scale down in the lower left. And these -- there are one,  
10 two, three, four dikes shown on here that are running  
11 east/west, and these are several kilometers -- several miles  
12 long. And I believe that other information I've looked at  
13 it's actually these extend on for even longer than that.

14 Q And why is that significant for purposes of groundwater  
15 modeling? Let me rephrase the question. Is that  
16 significant for purposes of groundwater modeling?

17 A It is.

18 Q And in what way?

19 A Well, I believe that these dikes can be low-permeability  
20 material compared to the surrounding country rock. In terms  
21 of the implications for modeling and so forth, these weren't  
22 considered in the model, and they would certainly have an  
23 impact on any estimate or prediction put forth by those  
24 models from the drawdown in this particular area.

25 Q Dr. Prucha, if you had been asked to prepare a groundwater

1 model for this mining application, would you have put these  
2 dikes and faults into the groundwater model?

3 A Absolutely.

4 Q Would that have been best practices?

5 A Yes.

6 Q I'm sorry, Dr. Prucha. The faults and dikes, are those  
7 areas of low permeability or high permeability?

8 A Well, the dikes are generally considered to be areas of low  
9 permeability except for the information that I've reviewed  
10 from Marcia Bjornerud and Stan Vitton that indicates that  
11 there are brecciated zones around either side, the contact  
12 of these with the surrounding country rock.

13 Q And excuse me. What do you mean by "brecciated zones"? And  
14 could you spell that for the record so the court reporter --

15 A B-r-e-c-c-i-a-t-e-d.

16 Q And what are brecciated zones?

17 A My understanding is that they're the zone between the  
18 intrusive that was hot. And it cooled and created fractures  
19 in the country rock that was colder, and it created the  
20 fractured rock that's permeable, and that permeability  
21 allows water to freely move through that zone. So you can  
22 imagine that these might be impermeable to flow in a  
23 north-south direction. The dikes that are located east/west  
24 may be impermeable or prevent significant flow going from  
25 north to south." But along them on these brecciated zones at

1 a large scale like this, you can imagine them preferentially  
2 routing water along them. Then add that into conjunction  
3 with the noted faults through the area -- and I note that  
4 some of these actually align with rivers, which I think is  
5 another important point that was sort of overlooked.

6 Q And how is it important to note that faults are generally  
7 aligned with rivers?

8 A Well, in a lot of systems I've looked at, this is generally  
9 the case, where over time the rivers tend to align  
10 themselves with these large structural features, because  
11 water moves through these faults preferentially, and they  
12 establish a connection with the surface water because they  
13 tend to drain water out through the rivers.

14 MR. HAYNES: I apologize, your Honor. We have to  
15 wait for the electrons to move right.

16 Q Now, Dr. Prucha, for purposes of your testimony, did you  
17 prepare the figure that we have up on the board, which is  
18 slide 13 of Petitioner's Exhibit 63?

19 A Yes.

20 Q And what were your source materials in preparing this slide?

21 A Again, the information that is shown on the map. I have a  
22 topography shown with the various colors underlying the  
23 whole box here (indicating).

24 Q And what do the colors represent generally?

25 A Elevations generally are higher in red zones and lower in

Page 1561

**NetworkReporting**

1-800-632-2720

1 darker colors off to the north.

2 Q And what else have you shown on this figure?

3 A I've also shown the Salmon Trout River. It's roughly in the  
4 center of the diagram and goes up towards the north.

5 Q And does the diagram show the orebody?

6 A It does; a little red zone here (indicating) just above the  
7 Salmon Trout River, and then it shows Eagle Rock off to the  
8 right of that in the center area.

9 Q And what do the green lines represent -- the green  
10 horizontal lines?

11 A The green lines are the dikes that we saw in the former  
12 exhibit.

13 Q And what about the -- I think those are red sort of  
14 northwest-southeast-trending lines.

15 A These are the faults, the darker, almost brownish color  
16 heading off to the northwest.

17 Q And we also have a series of lighter blue lines that look  
18 like they tend mostly east and west. What are those?

19 A These were dikes as mapped by Klasner in 1979.

20 Q I see. And on this figure we have at the top -- it appears  
21 to be a reference to "Rossell and Coombs 2005." What is  
22 that?

23 A They were the authors of the geology report that I reviewed.

24 Q And what was your purpose in preparing this slide?

25 A Well, I'd also note that Klasner also mapped the orange

1 lines here as well, and these were faults in the area. And  
2 one of my primary interests was to see how two different  
3 groups were mapping the faults and dikes in the area.

4 Q Did you find the mapping between the two authors consistent  
5 generally or inconsistent generally?

6 A More consistent than inconsistent, but I did find  
7 differences.

8 Q Now, Dr. Prucha, have you reviewed Marcia Bjornerud's report  
9 that was submitted as part of the comments for the  
10 application in October of 2007?

11 MR. HAYNES: And for the record, that is  
12 Petitioner's Exhibit 3, Appendix A already admitted.

13 A Yes.

14 Q Dr. Prucha? "Yes"?

15 A Yes.

16 Q And what portion of that report, if any, was significant to  
17 you for your analysis here?

18 A Probably the most significant part was the brecciated zone  
19 along the dikes and the fact that these could be very  
20 significant water conductors or routes that groundwater can  
21 preferentially flow through.

22 Q Now, Dr. Prucha, we've had put on the screen from Kennecott  
23 Exhibit 11 the environmental impact assessment -- excuse  
24 me -- Appendix B, as in "boy," 8, Figure 21. And what was  
25 your -- you've looked at this exhibit, did you not?

Page 1563

**NetworkReporting**

1-800-632-2720

1 A Yes.

2 Q And what was your purpose in looking at this Figure 21,  
3 which is the conceptual hydrologic -- excuse me --  
4 hydrogeologic cross-section B to B prime?

5 A The point of this was to see whether the authors of the  
6 report had considered whether the intrusive that was mapped  
7 at the orebody was actually located underneath the Salmon  
8 Trout River and --

9 Q And what does this figure show you in that regard?

10 A This shows me that they are considering that at this -- in  
11 this particular conceptual diagram, that the actual dike  
12 that's shown with sort of the left part of the diagram  
13 that's sort of a vertical structure -- and it's elevated  
14 with respect to the surrounding country rock -- has intruded  
15 and sits below and is in contact with the Salmon Trout River  
16 and likely the wetland area.

17 Q Dr. Prucha, you've been talking about country rock. I don't  
18 see on this figure the phrase "country rock." Is there a  
19 designation of rock or soil types on this figure that would  
20 translate to country rock?

21 A It would be what they're referring to as the bedrock  
22 metasedimentary rock. And it's -- the writing doesn't show  
23 it well on this plot, but it underlies the unconsolidated  
24 material, and it appears on the left and the right of this  
25 (indicating) near-vertical dike or what they would refer to

1 as igneous intrusive.

2 Q Does the phrase "metasedimentary" have a particular meaning  
3 in geology, just for the record?

4 A It's of sedimentary origin, and it has been consolidated  
5 into a rock as opposed to unconsolidated.

6 Q I see. And is there a significance about this figure for  
7 modeling purposes?

8 A A big significance.

9 Q And what is that?

10 A Well, in terms of producing a model, you'd want to be able  
11 to show that the bedrock system is intruding to the ground  
12 surface. And although this (indicating) figure doesn't come  
13 out in the area that's black here, it actually shows  
14 stratification of different layers in the unconsolidated  
15 material. But probably the most important thing about this  
16 drawing is the fact that, if -- I mean, there are brecciated  
17 zones in the contact of this intrusive. This would offer a  
18 direct conduit between lower bedrock areas where they're  
19 going to be dewatering the mine and surface water, in  
20 addition to the shallow aquifer system shown in black on  
21 this picture.

22 Q Now, I notice on this figure that there are some appear to  
23 be designations along the top -- along the surface. What  
24 are those designations?

25 A Well, in the original diagram, they refer to "boreholes"

Page 1565

**NetworkReporting**

1-800-632-2720

1 or -- that are, you know, actually wells that have been  
2 drilled through the dark area here, which is really the  
3 unconsolidated material. So there are wells at each one of  
4 these points.

5 MR. HAYNES: Your Honor, I apologize for the  
6 opaqueness of the exhibit, but I think that Mr. Eggan will  
7 be able to clear this up later with a color version. So I  
8 apologize.

9 MR. EGGAN: We can do that if you wish, if it  
10 would help to have the color version.

11 MR. HAYNES: It would help, yes.

12 MR. EGGAN: Okay. Do you want it now?

13 MR. HAYNES: Yes.

14 MR. EGGAN: MDEQ 010814. Okay. It's a different  
15 one. Let me give you a different one. I think it's MDEQ  
16 0110820.

17 THE WITNESS: That's it.

18 MR. EGGAN: That's it in color.

19 Q All right. Dr. Prucha, Mr. Eggan has graciously put up on  
20 the screen the same Figure 21 in color. And with that help,  
21 can you explain for us what the different colors are in the  
22 legend for the different kinds of rock?

23 A Sure. The brown and the blue really are what are defined as  
24 sands. And the only difference there is that the blue is  
25 where groundwater has saturated the pores and exists there

1 above that. It's referred to as a vadose zone, so it's  
2 still sand, but there's not groundwater actually in that  
3 zone.

4 Q And just for the record, "vadose" is spelled how?

5 A V-a-d-o-s-e.

6 Q Thank you.

7 A The purple zone is referred to here as a fine sand silt and  
8 clay, and the red is considered a lean clay.

9 Q And what is a lean clay?

10 A Effectively a clay that has low permeability with respect to  
11 sand. So hydrologically it's going to provide less flow  
12 through it than sand.

13 Q I see. And the metasedimentary bedrock is in what color?

14 A Is gray, and it's shown below all of the unconsolidated  
15 soils in different colors.

16 Q All right. And then back to my question previously about  
17 the designations that appear to be on the surface here.  
18 What are those?

19 A These are simply well names, and associated with each well  
20 is a borehole that was drilled to install the well, and they  
21 record the geology as they go down.

22 Q And the representation here on this figure as you understand  
23 it shows the boreholes relating to the depth of the  
24 boreholes; is that a fair statement?

25 A I'm not sure --

1 Q Well, let me rephrase it. That was rather awkward. For  
2 these well designations does the figure show the depth of  
3 the well approximately?

4 A Relative to the ground surface shown here at the top it  
5 does, yes.

6 Q Dr. Prucha, for groundwater modeling is it important for  
7 purposes of groundwater modeling to test the groundwater  
8 flow system?

9 A To perform hydraulic tests on the system, it's imperative to  
10 develop that understanding before jumping into modeling.

11 Q And how do you test the groundwater flow system?

12 A Well, typically you will go out, and one of the most  
13 important bits of information is to measure the groundwater  
14 surface. So this line right here (indicating) that defines  
15 the blue-brown contact is a critical surface. That really  
16 is probably the most important bit of information about the  
17 groundwater system that you need to understand. And when  
18 you go to test the system -- and by testing, the whole  
19 purpose of that is to define the hydraulic properties of  
20 each of the wells, the material that's screened across each  
21 of the wells.

22 Q And just for Judge Patterson's benefit, what do you mean by  
23 "screening across the wells"? What does that mean?

24 A Well, each one of these wells it will have at the bottom --  
25 as though you stuck a straw into the ground, it has a zone

1 where it's perforated and allows water from the surrounding  
2 aquifer to come into the well. And the rate at which it  
3 comes in gives you a lot of information about the hydraulic  
4 properties of that aquifer material.

5 Q And does the testing of the groundwater flow system depend  
6 on the number of wells used?

7 A Yes.

8 Q And does it depend on the spacing, the geographic spacing of  
9 those wells?

10 A Yes.

11 Q And does the spacing and number of wells relate to the  
12 appropriate coverage for the groundwater model?

13 A Yes. It's important to have the correct spacing.

14 Q That is, the coverage of the area that's modeled?

15 A Did they include the correct spacing for the modeled area?

16 Q Well, that was going to be my next question. Was for this  
17 model, Dr. Prucha, in your view, the appropriate spacing  
18 used for the wells?

19 A I don't believe so, no; no.

20 Q Why not?

21 A They're located in -- if I were asked to go down and perform  
22 the test of the shallow aquifer system here, I would locate  
23 them primarily in the areas where I anticipate the greatest  
24 mine dewatering impacts to occur. And I don't see that that  
25 was done here:

1 Q Dr. Prucha, we've gone back to slide 13. In relation to the  
2 question of the appropriate spacing of groundwater wells and  
3 considering the geologic structures that you've already  
4 testified to, for purposes of testing a groundwater model  
5 for the area around the proposed mine, where would you have  
6 expected wells to have been placed?

7 A All along the area from East Eagle over the tunnel entrance  
8 on the north side of the orebody through the orebody over  
9 that entire area plus any area that you would expect to be  
10 impacted around that. And given that this is largely  
11 underneath the Salmon Trout River, I would have expected  
12 wells on both sides and located -- you know, a number of  
13 wells in that area.

14 Q And in view of the geologic properties shown on this slide  
15 13, Dr. Prucha, what would you expect in terms, not only in  
16 number but also the placement of the wells?

17 A Well, with reference to this plot here, I would have  
18 expected wells to be placed along noted -- near noted dikes,  
19 the brecciated zones above those, to see if there is contact  
20 and how much flow would occur there. I would expect them to  
21 have been placed near mapped faults -- fault zone areas.

22 Q And in your review of the groundwater models prepared by  
23 Kennecott and its consultants did you observe any such well  
24 located along those geologic structures?

25 A These are the features that I would expect to be major water

1 know what "plan to dewater" means. I've got no recollection  
2 of anybody talking about a plan to dewater. It may simply  
3 be that if I could get a little more explanation of what  
4 we're talking about, it would be fine.

5 MR. HAYNES: I'll do that, your Honor.

6 JUDGE PATTERSON: Okay.

7 Q Dr. Prucha, you mentioned the phrase "plan to dewater."  
8 What do you understand by that?

9 A The scheme to actually dewater the tunnels so that they can  
10 actually carry on the mining.

11 Q So did the documents you reviewed talk in any sense about  
12 dewatering the tunnels as the tunnel is built?

13 A Well, not specifically about every tunnel, but they do have  
14 a dewatering plan.

15 Q I see. And so back to my question, Dr. Prucha, what would  
16 you expect these six wells to be able to show in terms of --  
17 in terms of the area that's going to be dewatered for this  
18 mine?

19 A Well, I think at most you can say something about only the  
20 area that they extend. And they don't extend up into the  
21 access tunnel to the north all the way over to East Eagle  
22 Rock.

23 Q And would you have expected that modeling to -- or that  
24 characterization to occur for this proposal?

25 A Absolutely.

Page 1572

**NetworkReporting**

1-800-632-2720

1 Q That would have been best -- or would that have been best  
2 practices?

3 A Yes.

4 Q And based upon the six wells that you have observed in the  
5 modeling proposed by Kennecott, would you expect those six  
6 wells to be able to be the basis for a model for the one  
7 mile in diameter area that you described before?

8 A No.

9 Q Why not?

10 A It's too small of an area. And also the design of this test  
11 presumes that they have, in fact, intercepted a larger water  
12 conductive zone like the brecciated zone or, say, the fault  
13 zone over here (indicating) that Klasner had defined in  
14 orange.

15 Q When you say "the design of the test," what do you mean?

16 A The placement of the wells, the depth that they're pumping  
17 from, the fractures that they pump from and as it relates to  
18 the location of those, and they don't seem to acknowledge  
19 that these large-scale mapped water conductive features  
20 exist or potentially impact their test.

21 Q Now, Dr. Prucha, we've had put on the screen, from Kennecott  
22 Exhibit 7 the Environmental Impact Assessment Appendix B-4,  
23 page 16. Dr. Prucha, this is section 7.1 and 7.3 of  
24 Appendix B-4. And what is the significance of the  
25 discussion in this section for the purposes of groundwater

1 modeling?

2 A Well, as far as I can tell, the pump test on well 084 was  
3 pumped from a zone about 257 to 260 meters down. And this  
4 is the basis for that. And I wasn't very clear why that  
5 zone was chosen as the only zone to really pump test and  
6 then calibrate an entire bedrock model to.

7 Q I see. So is it your understanding that only one zone of  
8 this well that extends for almost 300 meters was tested  
9 here?

10 A In this particular case, yes, for this pump test that we  
11 referred to on that former diagram.

12 Q And were there other pump tests performed as part of the  
13 modeling besides this one?

14 A Not to my knowledge, that went into actually calibrating  
15 their bedrock model.

16 Q And in your view, based upon your experience, is the well  
17 084 representative of the orebody?

18 A I would say of the orebody, it's through the orebody, so I  
19 would question whether it's fully representative of the  
20 entire orebody. It's one well.

21 Q Would you have expected for best practices to have seen more  
22 wells through the orebody and more pump tests through those  
23 wells?

24 A I would have expected to see more outside in the tunnel  
25 area, any area they plan to dewater.

1 Q And did you see those?

2 A No.

3 Q Now, Dr. Prucha, we've had put up on the screen, Kennecott  
4 Exhibit 7, Environmental Impact Assessment, Appendix B-1,  
5 Figure 18, which is labeled "Surface Monitoring Locations."  
6 Have you reviewed this figure?

7 A Yes.

8 Q And what, for purposes of your testimony, is the  
9 significance, if any, of this figure?

10 A Well, where they are collecting surface water flow  
11 measurements, for example, on the Salmon Trout River here  
12 located sort of in the left center part of the screen, it  
13 heads off. And each one of these (indicating) triangles is  
14 a surface water gage.

15 Q And is the placement of the surface water gages, from your  
16 view, Dr. Prucha, appropriate for the model that was  
17 performed here?

18 A Well, there were several models produced, but for the models  
19 that actually included the river flow, it is important  
20 because they used this information to help calibrate it to  
21 observed flow.

22 Q Dr. Prucha, I've had put on the screen the first page from  
23 Petitioner's Exhibit 61, which is entitled "Technical Report  
24 Number 3 of the Michigan Department of Conservation  
25 Geological Survey Division," entitled "Groundwater  
Page 1575

**NetworkReporting**

**1-800-632-2720**

1 Investigations of the Marquette Iron Mining District,  
2 Michigan," dated 1954. Have you reviewed this?

3 A Yes.

4 Q And what was your purpose in reviewing this document?

5 A I was interested in seeing whether nearby mines have had  
6 similar water inflows or dissimilar inflows predicted,  
7 whether they have associated surface water impacts.

8 Q And would a prudent modeler take into account the experience  
9 of nearby mines for purposes of modeling the groundwater  
10 flow in a proposed mine in the location of the proposed  
11 Eagle Mine?

12 A Yes. If it's a similar environment, yes.

13 Q Now, Dr. Prucha, we've put up on the screen page 20 from  
14 proposed Petitioner's Exhibit 61 and the text of this, which  
15 is pretty faint right now. But what's significant to you  
16 about the text of this report for purposes of modeling the  
17 groundwater flow at the proposed Eagle Mine?

18 A What I found here that it is a similar environment to the  
19 Yellow Dog Plains in that it has similar material, outwash  
20 sands, till material and this -- the thicknesses are 100,  
21 200 feet thick. It overlies a bedrock. The bedrock is  
22 fractured, has dikes running through it. And so from that  
23 perspective, I think on this particular page, that was the  
24 point.

25 Q I see.

Page 1576

**NetworkReporting**

1-800-632-2720

1 MR. HAYNES: Move the admission of Petitioner's  
2 Exhibit 61.

3 MR. LEWIS: No, objection, your Honor.

4 JUDGE PATTERSON: All right. No objection, it  
5 will be entered.

6 MR. REICHEL: No objection.

7 JUDGE PATTERSON: I'm sorry.

8 MR. LEWIS: Mr. Reichel's back today.

9 (Petitioner's Exhibit 632-61 received)

10 Q Now, why would a prudent modeler take into account the  
11 experience of nearby mines?

12 A My perspective it's to assess the range of inflows that are  
13 possible in an environment similar to the Yellow Dog Plains,  
14 the long history of mining where they're mining in the  
15 bedrock system. And I wanted to compare what had been  
16 predicted by models in the Yellow Dog Plains to what is  
17 reported in this report.

18 Q So would the range of inflows be related to what sometimes  
19 is known as "the worst case scenario"?

20 A Yes.

21 Q And is that also sometimes known as the upper bound?

22 A In this report, yes -- or these reports that I've reviewed  
23 from Kennecott.

24 Q And does that relate to your previous characterization of  
25 modeling in terms of the range of uncertainty?

Page 1577

**NetworkReporting**

1-800-632-2720

1 A Yes.

2 Q That is, we have a lower bound and an upper bound for the  
3 range of uncertainty for any model?

4 A Yes.

5 Q And did you observe in your review of the Kennecott reports  
6 any analysis or discussion of the experience at nearby mines  
7 in terms of the inflow into those mines?

8 A In terms of the flow rates?

9 Q Yes.

10 A Yes.

11 Q And what did you find in those reports?

12 A I found several mines have reported inflows of up to several  
13 thousand gpm, so significantly higher than what I was seeing  
14 reported from the modeling and estimates done by Kennecott.

15 MR. LEWIS: I'll just place an objection, your  
16 Honor, to the last question and answer. Number one, the way  
17 I heard the question it was, had he read such information in  
18 Kennecott reports? So I took it that the question -- or the  
19 answer would be in that reference. However, it sounds like  
20 there's some testimony being offered about some mine inflows  
21 at other mines other than this mine. And to the extent  
22 that's the testimony, I would just remind the court of my  
23 continuing objection, I think, at this point about such use  
24 of evidence from other mines without sufficient foundation  
25 of similarity and would move to strike the last answer on

Page 1578

**NetworkReporting**

1-800-632-2720

1 in the conduct of his or her work?

2 A Yes.

3 Q And what was your purpose in reviewing this report?

4 A To assess mine inflows that were measured at mines in this  
5 area and to assess surface water impacts.

6 Q And how is the experience of nearby mines, if at all,  
7 relevant to assessing surface water impacts at this proposed  
8 mine?

9 A Well, it demonstrates that mines in the area can impact  
10 nearby surface water. And I point out that both this  
11 exhibit and the previous one, none of the mines that I  
12 looked at were sitting right underneath a river like the  
13 Salmon Trout River.

14 Q And why is that significant?

15 A Well, because I would expect more impact from the proposed  
16 mine at Eagle compared to the mines that I've seen here.

17 MR. HAYNES: Move to admit Petitioner's Exhibit  
18 60.

19 MR. LEWIS: No objection.

20 MR. REICHEL: I have no objection to the fact that  
21 this is a report. I do have a concern that the subject of  
22 this document which is the Iron River District, is not a  
23 foundation sufficiently established that the geologic  
24 conditions observed in the Iron River District as defined in  
25 this publication are transferrable to or equivalent to those  
Page 1580

**NetworkReporting**

1-800-632-2720

1 at the Eagle Mine site.

2 MR. HAYNES: I'll clear that up, your Honor.

3 Q Dr. Prucha, for purposes of modeling -- modeling surface  
4 water impacts from a proposed groundwater dewatering, is it  
5 important to understand the impacts at other kinds of mines  
6 in the general vicinity?

7 A Yes, because I think fundamentally, even though there are  
8 differences in the exact configuration and type of bedrock  
9 material, components are pretty similar. You have  
10 unconsolidated material, overlying bedrock. The bedrock's  
11 fractured. They're pulling water from the bedrock, and  
12 surface streams are interacting with the unconsolidated  
13 material and the bedrock in both of these areas.

14 Q And so for purposes of modeling the effect of dewatering  
15 underground for a mine and its effect on surface waters, you  
16 would expect that a modeler would review experience at mines  
17 nearby?

18 A Yes.

19 MR. HAYNES: Okay. Again move the admission of  
20 Petitioner's Exhibit 60.

21 MR. REICHEL: Again I would note that it's still  
22 established that, quote, "this is a mine nearby." I think  
23 if -- when and if we get into this, if you look at the body  
24 of the document, the area is located some considerable  
25 distance away in the western Upper Peninsula.

Page 1581

**NetworkReporting**

1-800-632-2720

1 Q Dr. Prucha, would that make a difference for you, that the  
2 mines discussed in Petitioner's proposed Exhibit 60 in the  
3 Iron River District are located some distance away?

4 A Not really, no.

5 MR. HAYNES: Your Honor, I think we've laid a  
6 sufficient foundation for purposes of modeling to admit this  
7 exhibit.

8 JUDGE PATTERSON: What was the number of the  
9 exhibit again?

10 MR. HAYNES: 60.

11 JUDGE PATTERSON: I'll admit it over objection.  
12 (Petitioner's Exhibit 632-60 received)

13 JUDGE PATTERSON: Would this be a good time to  
14 break for lunch?

15 MR. HAYNES: Sure.

16 (Off the record)

17 Q Dr. Prucha, good afternoon. I would like to return for a  
18 moment to Petitioner's Exhibit 61. And I'm looking at --  
19 it's identified for the record as HMC006188 which appears to  
20 be page 3? Okay. Page 3. And, Dr. Prucha, on the  
21 left-hand column of this exhibit is there some texture that  
22 is of particular significance to you in terms of using  
23 nearby mines for comparison for modeling purposes?

24 A Yes.

25 Q And could you point that out so that we can enlarge it,  
Page 1582

**NetworkReporting**

**1-800-632-2720**

1 please?

2 A This paragraph here (indicating) in the upper left.

3 Q And, if you could, read the portion that you find  
4 significant and tell us why.

5 A This part here (indicating) that says, "Induced recharge  
6 from the Carp River at the Morris Mine exceeds 400 gpm."

7 Q And what is the Morris Mine, if you understand it, and where  
8 is it located?

9 A It's a mine in the Marquette Mining District. It's about 15  
10 miles or so from the Eagle Mine.

11 Q And what does the phrase "induced recharge" mean to you in  
12 the context of your testimony today?

13 A Effectively here it means that because of dewatering it, the  
14 Morris Mine, the study here has measured 400 gpm lost in the  
15 Carp River that runs by it. But I point out here that this  
16 mine is about 1,000 feet away from the river.

17 Q You mean the Morris Mine is about 1,000 feet away from the  
18 Carp River?

19 A That's right, as opposed to the proposed Eagle Mine being  
20 pretty much underneath the Salmon Trout River, and the  
21 drawdown cone or extent of that drawdown from the Morris  
22 Mine later in this report also indicates that it extends  
23 about 10,000 feet downstream of the Carp River so about two  
24 miles in terms of the zone that it's impacting along that  
25 river, so --

1 Q And why would that be important from a modeler's  
2 perspective?

3 A Because, a) it establishes that there is a connection  
4 between the pumping in the Morris Mine and the nearby river,  
5 a drop in the flow of the river.

6 Q Now, Dr. Prucha, I've had put on the screen on the first  
7 page of what has been marked Petitioner's proposed Exhibit  
8 64 what appears to be a paper entitled, "Underground  
9 Hard-Rock Mining Subsidence and Hydrologic Environmental  
10 Impacts." Do you see that?

11 A Yes.

12 Q Have you reviewed this paper for your testimony today?

13 A I did.

14 Q And what is the significance, if any, of this paper for  
15 purposes of modeling proposed groundwater inflows into  
16 proposed mines?

17 A Well, a couple of things: One would be that this is sort of  
18 at a national level. So the first two papers that we went  
19 over are within, say, 15 miles. And the next one was maybe  
20 at 50 miles distance. This one is nationwide, and it  
21 specifically points out as one of the study sites the Athens  
22 Mine which is in this Marquette Iron Mining District area.

23 Q And how is that significant for you from a modeling  
24 standpoint?

25 A Well, I wanted to see what the impacts were in terms of the

1 amount of mine inflow at the mine -- at the Athens Mine.  
2 And also it points out that the subsidence issue is  
3 something that doesn't just occur in Marquette Iron Mining  
4 District or in the Iron River District.

5 Q All right. And we've pulled up now what's been marked  
6 HMC006327 from this report which is page 10 of the report.  
7 And is this where the discussion of the Athens Mine occurs?

8 A I'm not sure.

9 Q And what would be the significance from a modeling  
10 standpoint of the fact that the Athens Mine is now mentioned  
11 in a nationwide report dealing with subsidence?

12 A Oh, it's considered --

13 MR. LEWIS: I just want to note my objection for  
14 the record, your Honor.

15 JUDGE PATTERSON: Okay.

16 A I think it's significant because it's pointed out of one of  
17 many national mines that's had this problem associated with  
18 it.

19 Q And the problem is a subsidence issue; is that correct?

20 A Right, and they acknowledge here that it's not just a mine  
21 inflow problem, but it also is -- and they acknowledge that  
22 subsidence affects both groundwater and surface water, the  
23 mines that they go over in this report.

24 MR. HAYNES: Move admission of Petitioner's  
25 Exhibit 64.

1 MR. LEWIS: The objection I've stated from time to  
2 time, your Honor, as to the lack of necessary foundation  
3 under our Michigan Supreme Court law on the subject, lack of  
4 any necessary foundation of similarity to the only mine  
5 that's at issue in this case and therefore lack of  
6 relevance.

7 MR. REICHEL: I'll join in that objection.

8 JUDGE PATTERSON: I think I previously ruled  
9 that -- consistent with previous rulings, I will admit  
10 Exhibit -- I'm sorry. I missed the number again --

11 MR. HAYNES: 64.

12 JUDGE PATTERSON: -- 64.

13 (Petitioner's Exhibit 632-64 received)

14 Q Mr. Parker, we're back to slide 14. And I'd like you to, if  
15 you can, talk about where the bedrock wells were monitored  
16 in direction from the pump to L084.

17 A Well, I think what struck me about this pump task that was  
18 performed is that the monitoring wells are largely oriented  
19 east to west in relation to this pumped well instead of  
20 trying to monitor possible fractures, faults that might  
21 extend, say, for example along the north-west trending  
22 mapped faults through the area. So in other words, I would  
23 have put wells up in this (indicating) area to the north and  
24 south and an area around the area that they're going to need  
25 to dewater, for one, but not just sort of along an east-west

Page 1586

**NetworkReporting**

1-800-632-2720

1 trend.

2 Q And would that have been best -- would that be best  
3 practices for modeling for this kind of a situation?

4 A Yes.

5 Q Now, Dr. Prucha, I've had put on the screen what is  
6 Kennecott proposed Exhibit 214, 2-1-4, which -- have you  
7 reviewed this proposed exhibit?

8 A I did.

9 Q And what do you understand this exhibit to show?

10 A The presence of faults or fracture lines that are oriented  
11 both north -- you know, roughly trending along this  
12 (indicating) line north to south and also faults through the  
13 area that appear to be oriented almost at 90 degrees to  
14 that, that trend up.

15 Q And just so the record is clear, we have -- we're showing  
16 the first page of this exhibit, and there seem to be two  
17 figures. Can you identify the various features that we've  
18 talked about this far, the orebody and so on, on these  
19 figures?

20 A My understanding is these are just horizontal slices through  
21 at different mine elevations and that the orebody I believe  
22 is shown here in red. And the faults --

23 Q The green vertical lines represent what, Dr. Prucha?

24 A My understanding would be that those are boreholes.

25 Q Oh, I see. And again I apologize if I've asked you this

Page 1587

**NetworkReporting**

**1-800-632-2720**

1 question, that this exhibit shows faults or dikes; is that  
2 right?

3 A Faults.

4 Q And would you have expected those faults to have been  
5 included in any model that predicts -- tries to predict  
6 groundwater inflow into the mine?

7 A I would think that you'd need to include those. They're  
8 water conductive, and I don't see any reason why they  
9 weren't considered as not water conductive.

10 Q And did you see the -- did you see that these faults were  
11 included in the mine -- in the model that you reviewed?

12 A I didn't see it in the model or their analysis. And I think  
13 another significant point about this is that if you keep  
14 going down an elevation, I see similar fault features at  
15 various elevations. So it's not just something that occurs  
16 in the lower bedrock unit as they've defined it.

17 Q And then the next page of this exhibit we see a couple of  
18 figures. What do those show to you?

19 A Well, this figure on the top shows the drillhole trace map  
20 with above holes on level 275 of the mine. The lower one  
21 was sort of more interest because superimposed upon the  
22 fracture traces or faults are the pump test wells that they  
23 had performed in the bedrock.

24 Q Why is that significant?

25 A Well, for one, this was the first time I'd seen any

Page 1588

**NetworkReporting**

1-800-632-2720

1 reference to the faults there oriented here east-west. And  
2 these do appear to be significant because I see them in  
3 multiple layers going through the different mine levels.  
4 And to me, if I were developing a pump test to assess the  
5 flow through the faults which are going to control the  
6 amount of water flowing through the entire bedrock, which  
7 again is going to dictate how much mine inflow occurs, you  
8 want to design a test to acknowledge the existence of these,  
9 have wells that cross those and demonstrate clearly that  
10 they're connected or not connected.

11 Ultimately when I look at the pump test results,  
12 it looked like when they pumped the lower bedrock in 084,  
13 that I saw more of a east-west drawdown response. It seems  
14 to support the notion that there may be connected fractures,  
15 faults through this zone to the orebody. I don't see any  
16 information that suggests that these couldn't continue on  
17 and be further connected to the regional water conductive  
18 faults. That would be a critical element in the bedrock  
19 model that was used to predict mine inflows. So omitting  
20 that and assuming that you only had a very short connected  
21 fault is kind of presumptive in the sense that they  
22 calibrated the model and say, "This is really the only  
23 feature in here."

24 Q And do models normally, in your experience, assume that kind  
25 of a condition when you have multiple faults and multiple

1 dikes in a bedrock system?

2 A No.

3 Q All right. Dr. Prucha, we've put on the screen Kennecott  
4 proposed Exhibit 7, the Environmental Impact Assessment  
5 Appendix D-2, Figure 2-1. And what does this figure  
6 represent?

7 A Well, it shows a profile, a plan view of the boreholes in  
8 the top relative to each other. And there are horizontal  
9 lines showing the projection of where those wells extend to.  
10 The bottom plot simply shows the vertical projection of  
11 those boreholes in cross-section, and you can see the one  
12 well that's at an angle. This is their well 84.

13 Q And well 84 is the well that was pumped; correct?

14 A That's right. And the significance of this is that if you  
15 have identified near vertical faults through the area -- it  
16 could be water conductive -- the chances of hitting one of  
17 those near vertical water conductive faults is not that high  
18 with a vertical -- near vertical well.

19 Q And as a modeler, what would you have done in order to model  
20 the effect, if any, of the geologic structures that we've  
21 talked about?

22 A Well, before modeling I would have tried to assess how --  
23 you know, I would have located boreholes and wells in areas  
24 where I suspected faults, large water conductive faults or  
25 the dike that might be permeable. And if you did put

Page 1590

**NetworkReporting**

1-800-632-2720

1           verticals boreholes, that those would have to be pretty much  
2           right on those or going at an angle intercepting those and  
3           then testing those zones. But you can see from this picture  
4           that the majority of these are vertical and very localized  
5           compared to the entire orebody of the entire mined area  
6           which they'll be dewatering.

7    Q       Now, Dr. Prucha, I've had put on the screen Kennecott  
8           proposed Exhibit 7, the Environmental Impact Assessment  
9           Appendix B-2, Figure 3-1, and what does this figure  
10          represent to you?

11   A       Well, this is in color originally, and this had different  
12          geologic units on the left in this column and a legend  
13          describing what the geologic material is over here  
14          (indicating) on the right -- upper right corner. And then  
15          you see a series of columns of lines and dots and at the top  
16          different information like a caliper or resistivity,  
17          conductivity, flow rate, test information that they collect  
18          as they test the borehole through its vertical extent. And  
19          the point that struck me here was that when you look at  
20          these logs and the conductivity or the reverse of that, the  
21          resistivity information, which the conductivity can be  
22          translated into a TDS or, you know, effectively tells you  
23          how much salt you might have in the fluid at a depth.

24   Q       Excuse me. Let me interrupt you for a second. What does  
25          TDS mean?

1 A Total dissolved solids. It's also an indication of -- it's  
2 been indicated that the water at depth has a higher TDS than  
3 the shallow pressure water, the surface water, and that this  
4 boundary between the two defines an upper bedrock zone and a  
5 lower bedrock zone.

6 Q You're saying that's what was interpreted here?

7 A Not from this information, but from this log, this  
8 information doesn't appear to have been used to help refine  
9 that definition of where the bedrock might be, upper or  
10 lower.

11 Q And where would you -- how would you have used that  
12 information if you were to design a model for this system?

13 A Well, you take all of these logs and align them vertically  
14 so that they're at the same elevation. The comparison of  
15 the curves that you see on this conductivity plot -- and  
16 when it jumps out here, you get a higher value or higher  
17 value of TDS. And this (indicating) is depth below ground  
18 surface up here. Going down, that will tell you where you  
19 get jumps in the formation of TDS.

20 Q And is that information relevant for purposes of modeling?

21 A Yes, because an important factor in the bedrock modeling  
22 that was conducted is this definition of where an upper  
23 bedrock zone and a lower bedrock zone occur and that contact  
24 between the two. The upper bedrock zone is assigned a much  
25 higher hydraulic conductivity. Water flows through it much

1 easier than the lower. And this -- if that zone had been  
2 put down lower, which some of these logs indicate, I believe  
3 that you would end up producing a higher mine inflow rate  
4 just on that basis alone.

5 Q All right. We're looking at Figure 3-2.

6 A This is well 54. And the conductivity log shows a very  
7 constant value for -- I can't make out what the depth is,  
8 but it's maybe 125 meters below ground. The depth that was  
9 selected without consideration of its uncertainty, was 90  
10 meters, --

11 Q The depth for what?

12 A -- total vertical depth. For the break between the upper  
13 bedrock and the lower bedrock.

14 Q And can you tell from these figures or from the other  
15 materials you've read why that depth was selected?

16 A Well, from what I can see, it was based on a measurement in  
17 well 85 where they measured the TDS and said it looked like  
18 it had this value. And then they interpolated back up to  
19 near the ground surface, and they estimated 90 meters total  
20 vertical depth as the break.

21 Q All right. I think now we're at figure 3-6, and this looks  
22 like well 84, Dr. Prucha?

23 A That's right.

24 Q And explain for us what you just testified to.

25 A Well, the conductivity in this well shows a very low value

1 to below 200 meters. The previous well 83, the previous  
2 plot for well 83 showed a similar depth. There's another  
3 well -- and by the way, 83 and 84 were sort of closer to the  
4 western part of the orebody. And as you go to the east you  
5 see higher and higher elevations for the conductivity. So  
6 it seems like spatially there's a trend. But this suggests  
7 to me that 90 meters, you know, they're claiming as an upper  
8 bedrock up here (indicating), and really it could very well  
9 be down 200-plus meters. And then this pulse actually goes  
10 back to a low value, suggesting maybe there's fresher water  
11 at depth below this. This also -- this depth down here  
12 (indicating) of close to about 260 meters also seems to  
13 suggest that this peak is where you have the -- this is  
14 where they read the high TDS which happens to correlate  
15 reasonably well with this conductivity jump here.

16 Q And the peak in the TDS would suggest what?

17 A Well, that you've hit a fracture zone right here  
18 (indicating) that may not -- that may have a higher TDS in  
19 it.

20 Q And what's the significance of that for modeling purposes?

21 A Well, again, the most important point is the definition of  
22 this upper and lower bedrock zone. The upper bedrock was  
23 modeled as being more permeable than the lower bedrock. And  
24 the depth that gets assigned to this upper and lower bedrock  
25 is important because in the lower bedrock, they assign

1 faults and put those in there, and in the upper bedrock they  
2 don't. The upper bedrock, if you increase the permeability  
3 and drop that depth and they're still mining in this upper  
4 bedrock, it will produce more water as a mine inflow rate if  
5 the depth is deeper.

6 Q Dr. Prucha, we've put up on the screen from Kennecott  
7 proposed Exhibit 7, the Environmental Impact Assessment  
8 Appendix B, as boy, 2, page 12. And there's some discussion  
9 in here of field work. What is significant here for you?

10 A I believe this is where they indicate that the -- the fact  
11 that you find high TDS at depth is indicating that it's not  
12 well connected -- the zone is not well connected to the  
13 surface water or shallow aquifer zone.

14 Q And what's the significance of that for purposes of  
15 modeling?

16 A Again the upper and lower bedrock contact is an important  
17 factor to have considered in the modeling. There was no  
18 effort made in the modeling to consider the uncertainty of  
19 that depth and its implication on the estimated mine inflows  
20 or the dewatering extent, magnitude.

21 Q Dr. Prucha, for purposes of modeling and for modeling  
22 bedrock flow systems, is it important to consider  
23 groundwater flow direction?

24 A Yes.

25 Q And is it important to consider groundwater flow velocity?

- 1 A Yes.
- 2 Q And is it important to consider hydraulic gradients?
- 3 A Yes.
- 4 Q What is a hydraulic gradient?
- 5 A It is the change in the groundwater potential from a high  
6 point to a low point over a certain distance. So a higher  
7 gradient has a steeper slope. It's like walking on the  
8 ground surface. And a flat gradient is walking on very flat  
9 ground like in this room. A steep gradient is walking in  
10 the mountains, and you would go from high points to low  
11 points. It's what drives the water from high areas to low  
12 areas in an aqua group.
- 13 Q And for purposes of modeling bedrock flow systems for -- in  
14 a groundwater system, is it important to consider three  
15 dimensional flow paths?
- 16 A Yes.
- 17 Q And why is that?
- 18 A Well, because water doesn't just flow horizontally. It  
19 flows in a three-dimensional path. It can flow from the  
20 lower bedrock to the upper bedrock or vice versa in addition  
21 to moving laterally. So it's important to define the  
22 three-dimensional flow path that water takes.
- 23 Q Dr. Prucha, I have put up on the screen from Kennecott  
24 Exhibit 7, the Environmental Assessment, Appendix B-3, page  
25 41 which appears to have a table dealing with tunnels within

1 a weathered zone. Do you see that?

2 A Yes.

3 Q And what's the significance of this table for purposes of  
4 modeling?

5 A Well, these were inflow estimates for idealized tunnel  
6 within the weathered zone. Oh, I think it's the paragraph  
7 here under 8-2.

8 Q All right. And read the portion of the paragraph that's  
9 significant for you.

10 A "The conceptual model for the bedrock groundwater  
11 system below 90 meters true vertical depth is comprised  
12 of two components on weathered bedrock that is  
13 controlled primarily by matrix properties for the bulk  
14 of the rock mass and water conductive fractures with  
15 moderate hydraulic high activity with relatively sparse  
16 distribution."

17 Q And what does that mean for those of us who are not  
18 hydrologists?

19 A Well, effectively they're saying below this upper bedrock  
20 zone in the bedrock that they've defined, they're saying  
21 that they see that faults exist in there but apparently  
22 don't extend up into the upper bedrock.

23 Q And from the reports that you've reviewed and the slides  
24 that you've put up previously and that you've testified to  
25 previously, does that conclusion make sense?

Page 1597

**NetworkReporting**

**1-800-632-2720**

1 A It doesn't.

2 Q Why not?

3 A Well, to have a permeable fault stop right at a boundary  
4 that you've defined very loosely doesn't make sense. But  
5 the fact is that if you have faults that are extensive and  
6 the fact that we saw this Exhibit 214 suggests that these  
7 faults do extend up through the upper bedrock. And the real  
8 importance of this is that when you go to predict mine  
9 inflow, by limiting faults to only the lower bedrock, you  
10 prevented a pathway for the water going into the mine  
11 dewatering system from impacting units above it. And I feel  
12 that's not very realistic to assume that the faults end  
13 right there at this presumed boundary. There doesn't seem  
14 to be any evidence that I see to the contrary.

15 MR. REICHEL: Excuse me. Counsel, I apologize for  
16 the interruption. Could you please state for the record  
17 what page --

18 MR. HAYNES: Yes.

19 MR. REICHEL: -- and which appendix of the  
20 Environmental Impact Assessment we have up there?

21 MR. HAYNES: It's Appendix B-3, --

22 MR. REICHEL: B-3.

23 MR. HAYNES: -- page 41.

24 MR. REICHEL: I'm sorry. I don't mean to be  
25 argumentative, but I have a hard copy of that document and  
Page 1598

**NetworkReporting**

**1-800-632-2720**

1 it doesn't seem to correspond. There may be something --

2 MR. HAYNES: Your Honor, let's take a short break  
3 and try to clear this up.

4 JUDGE PATTERSON: Okay.

5 MR. HAYNES: I want to make sure we're all on the  
6 same page here literally.

7 (Off the record)

8 JUDGE PATTERSON: We all set?

9 MR. HAYNES: Yes. Your Honor, I stand corrected.  
10 The reference there is Appendix B-2, not B-3.

11 JUDGE PATTERSON: Okay.

12 MR. HAYNES: Thank you, Mr. Reichel.

13 Q Now, Dr. Prucha, following that correction, I've put up on  
14 the screen from Kennecott Exhibit 2, the mining permit  
15 application Appendix C-1, page 12, which has a discussion  
16 about Eagle deposit geology. Do you see that?

17 A Yes.

18 Q And what of that discussion is relevant for purposes of your  
19 testimony today?

20 A I think what I noticed on this was actually the paragraph  
21 above that where it talks about joint patterns that often  
22 align with stream patterns suggesting that they have  
23 concerted control over the drainage development. I know  
24 when I read through reports like Exhibit 60 and 61,  
25 Marquette iron range, they pretty much stated the same

Page 1599

**NetworkReporting**

1-800-632-2720

1 thing; that they saw that faults joint patterns tend to  
2 align with the streams in the area. It suggests to me that  
3 there's strong correlation with faulting which would occur  
4 in the bedrock and the streams flowing over.

5 Q And did you see evidence in the models that you reviewed of  
6 those factors being taken into account?

7 A No.

8 Q On the screen is from Kennecott Exhibit 7, the Environmental  
9 Impact Assessment, Appendix B-1, figure 23. What does this  
10 figure purport to show, Dr. Prucha?

11 A It says that it's plotting the A Zone groundwater elevation  
12 contours.

13 Q And what does that mean?

14 A This is the groundwater surface from what is referred to as  
15 the A Zone in the reports, the upper most permeable outwash  
16 sand aquifer.

17 Q And for purposes of the model, do you consider the number of  
18 wells here to be appropriate?

19 A No.

20 Q Why not?

21 A Well, the main mine impacts -- the mine dewatering impacts  
22 would occur around the tunnel and mining area and orebody.  
23 And when you zoom into this area, that's where I would have  
24 concentrated the number of wells to gain a full  
25 three-dimensional understanding of the flow through all of

1 the unconsolidated material, not just the A Zone. There's  
2 another significant aquifer zone in the unconsolidated  
3 materials in the Yellow Dogs Plain D Zone which underlies --  
4 is below the A Zone, but it's separated over a good part of  
5 the plains by a lower permeability sequence as B and C Zone.  
6 But the key point here is again the distribution and number  
7 of wells around the key area of interest, which is the area  
8 that will be dewatered.

9 Q And how many wells are there just for the record?

10 A In the area around the mine?

11 Q Yes.

12 A I see three alluvial -- it's hard to tell right here. But  
13 the problem is that the system in this area for the  
14 unconsolidated material is very complex. And usually you  
15 design the distribution and locations of the wells to  
16 correspond with the complexity of an area.

17 Q And do you see that happen -- did that happen here in the  
18 model that you reviewed?

19 A No. There are complexities of units that are disappearing,  
20 that are pinching out in this area. You have actually  
21 bedrock that's exposed at the ground surface. There are  
22 maps that I've reviewed that seem to indicate a really large  
23 area is just void or absent with the unconsolidated  
24 material, and that seems to be --

25 Q Let me back up. When you say the "unconsolidated materials  
Page 1601

**NetworkReporting**

1-800-632-2720

1 is absent," what does that mean in terms of the relationship  
2 of bedrock to the surface?

3 A There's no more unconsolidated material overlying the  
4 bedrock. The bedrock, if you're walking around out there,  
5 you would walk over the bedrock at the surface.

6 Q I see. On the screen now is figure 24 from the same  
7 Appendix, Appendix B-1. And what does this figure show, Dr.  
8 Prucha?

9 A This shows the D Zone "Groundwater Elevation Contours," the  
10 title up in the upper right. This is the groundwater  
11 elevation map. And really you can't see on the  
12 black-and-white plot, but they have contour lines that show  
13 the actual surface of the water -- this aquifer system. And  
14 I guess some of the problems associated with a number of  
15 wells on this plot are, again, around the mine key area  
16 where you expect the most mine dewatering impacts to occur.  
17 They're saying that the de-aquifer is actually missing in  
18 these areas that are cross-hatched. And yet when you show  
19 an outline like this with no question marks, it is extending  
20 across the Salmon Trout River, and I see no wells or  
21 boreholes to show that this area -- over most of that area  
22 is actually controlled by points where you can actually  
23 drill a borehole out here -- I don't -- this is a complete  
24 guess right here. The D Zone could be there, and I think --

25 Q You're saying that the cross-hatched area is a guess?

Page 1602

**NetworkReporting**

1-800-632-2720

1 A Yes. Well, with -- outside of the areas where they are  
2 showing actual boreholes. They have four points in this  
3 area. And this is important because in terms of their  
4 modeling to estimate the impacts of mine dewatering from the  
5 bedrock system, you dewater that zone below this  
6 unconsolidated unit where permeable aquifers disappear or  
7 occur are really important in terms of how that drawdown  
8 from the lower bedrock will impact the drawdown in the  
9 unconsolidated units or aquifers, the A and the D Zone.

10 Q Dr. Prucha, on the screen now is from Kennecott Exhibit 7,  
11 Environmental Assessment, Appendix B-1, figure 13. What  
12 does this show?

13 A In the report there are colored contours line. You can't  
14 really see them here. But the point is that they have a  
15 number of boreholes they've put throughout the orebody area  
16 and the treatment area, processing area. And they've  
17 estimated the thickness of the unconsolidated material or  
18 the quaternary deposit. And where you don't see points  
19 which represent boreholes, they have a lot of contours, no  
20 question marks. This is a complete guess in these areas.  
21 And yet this guess was never considered in terms of how it  
22 impacts the estimates of mine inflow, how the mine inflow  
23 dewatering would impact the overlying unconsolidated  
24 material.

25 Q Are you saying, Dr. Prucha, that the contour lines that

Page 1603

**NetworkReporting**

1-800-632-2720

1 extend out from the various well locations cannot be  
2 interpolated?

3 A It's fine to interpolate an area. And by "interpolation," I  
4 mean that between wells you know what the thickness is.  
5 Maybe it's 60 feet at one point and 50 feet at another.  
6 Between the two points, you logically assume they're  
7 somewhere in-between; 55 feet. But in areas outside of  
8 where you have good borehole controls, you are forced to do  
9 what they call extrapolate, which means you're using data  
10 points locally here to try and guess what is going on out  
11 here to the south where you don't have control points.

12 Q And is extrapolation an appropriate method to use in  
13 modeling groundwater flow systems?

14 A It can be used, but there has to go along with it an  
15 understanding that you're introducing a lot of uncertainty  
16 into the conceptual understanding of where water is flowing.  
17 How thick is the aquifer? Is it 10 feet? 100 feet? In  
18 areas where you don't have the boreholes, you can't say  
19 anything about that, or you can but you need to say it's  
20 plus or minus a certain amount of distance and that --

21 Q And do you see such qualification in any the documents that  
22 you reviewed?

23 A I did not.

24 Q What we have on the screen now is figure 12 from Appendix  
25 B-5 of the Environmental Impact Assessment; Kennecott

1 Exhibit 8. What does this figure show, Dr. Prucha?

2 A This is a similar plot. The title is "Quaternary Deposit  
3 Isopack." It's just the thickness of the unconsolidated  
4 material. And this does show the contours pretty well in  
5 here, and you see that they're defined by these dark lines.  
6 And the pattern from this scale, I see contours almost two  
7 bull's-eyes right around the orebody and then East Eagle  
8 Rock which are elevated with respect to -- the bedrock  
9 surface in those locations is elevated with respect to the  
10 surrounding countryside with I think we showed a  
11 cross-section before that demonstrated that.

12 Q And how is that significant for purposes of modeling?

13 A Well, this has a strong control in terms of the thickness of  
14 the unconsolidated materials overlying the bedrock where the  
15 groundwater flows through those. Where it's thin, you don't  
16 have as much water possibly flowing in the unconsolidated or  
17 it gets -- the directions and flow rates get dictated by the  
18 bedrock surface.

19 Q And did you see these contours taken into account in the  
20 modeling?

21 A They did, but it's the uncertainty in the area where they  
22 didn't have boreholes that I think they didn't consider.

23 Q Now, Dr. Prucha, we've put on the screen Kennecott Exhibit  
24 7, Environmental Impact Assessment, Appendix B-1, figure 15.  
25 And what does this show?

1 A Well, this plot shows the D Zone groundwater elevation  
2 contours, and they don't show up that well on the black and  
3 white. But they're -- the point I was going to make about  
4 this is that the contouring of both the A and the D  
5 groundwater elevations in my opinion are very poor around  
6 major features such as the Salmon Trout River.

7 Q Dr. Prucha, let me interrupt you for a moment. I misspoke.  
8 This is Appendix B-1, figure 24, but go ahead.

9 A Okay. I think this is a really important part of the  
10 characterization process where you collected water levels  
11 and you've posted them and you're estimating where the flow  
12 directions are going to go. And because of the lack of data  
13 in a lot of areas like, for instance, no wells south and  
14 west of the Salmon Trout River, you really can't say too  
15 much about what's happening in this aqua zone in that entire  
16 area. It's a very large area, and yet this is an area that  
17 would be impacted by the mine dewatering. Not accounting  
18 for the flow directions around the Salmon Trout River, this  
19 would have been a primary interest for me if I was going out  
20 there and trying to assess how the river interacted with the  
21 unconsolidated aquifers, how the bedrock interacts with the  
22 Salmon Trout River, and yet there's very little in terms of  
23 the number of wells and boreholes to tell you much in this  
24 area that would be impacted by mine dewatering even with  
25 their own modeling scenarios.

Page 1606

**NetworkReporting**

**1-800-632-2720**

1 MR. HAYNES: Your Honor -- sorry -- we're going to  
2 have another exhibit switch here. This will take a moment.

3 JUDGE PATTERSON: Okay.

4 Q While we're switching for the color version, Dr. Prucha and  
5 I apologize. What we put up is Appendix B-1 to the  
6 Environmental Impact Assessment, figure 15, Kennecott  
7 Exhibit 7. What's significant about this figure, Dr.  
8 Prucha?

9 A Well, the significance is in the area that's black here,  
10 but --

11 Q Once again.

12 A -- I think I can still speak to that though. I think what's  
13 important is this intrusive associated with the orebody.  
14 It's visible even in the local area there at the surface.  
15 The letters above the surface, QAO-008, is a well here and  
16 to the left of that intrusive, QAL-004. This is the only  
17 information they have in terms of the geology of these  
18 aquifer units near the proposed mine facility and yet --

19 Q Would you expect more for modeling purposes?

20 A Yes; absolutely. And given the likelihood that you have  
21 Brecciated zones that are acting as permeable conduits,  
22 these aren't shown. They're not considered. Any faults  
23 through the area aren't considered on this conceptual  
24 hydrogeologic cross-section. I think another important  
25 thing is in other cross-sections I've seen it seems to be

Page 1607

**NetworkReporting**

1-800-632-2720

1 sort of confused where the actual country rock or  
2 surrounding metasedimentary rock surface contact with the  
3 unconsolidated material here shown in the black versus white  
4 color, actually shows it smoothly going up to the intrusive  
5 indicating that the intrusive was -- elevated the whole area  
6 as it was intruded up the bedrock surface. And here it's  
7 shown going directly in, and then you show unconsolidated  
8 materials. And with the color, you'll see them going  
9 directly into the side of the intrusive. And I don't  
10 understand geologically how that can occur. But  
11 fundamentally this is the conceptual model that so many  
12 books and standards indicate is absolutely necessary for  
13 producing a good sound defensible model. And I see this as  
14 a confusing diagram. It doesn't really iron out the details  
15 before jumping into a model.

16 Q All right. Well, thanks to Mr. Eggan, again, we've put up  
17 what appears to be the same figure and this is, for the  
18 record, MDEQ 011171, and if you could then illustrate your  
19 testimony, Dr. Prucha, with the colored stratigraphy shown  
20 on this figure?

21 A Just pointing out the red lean clay here on the left and  
22 right side of the intrusive. And again, my point about  
23 layers coming horizontally straight into the intrusive and  
24 the bedrock surface going straight in as opposed to being  
25 carried up. No intrusive brecciated zone associated with

Page 1608

**NetworkReporting**

1-800-632-2720

1 the dike. That's important because a lot of water from deep  
2 down where the mining's going to occur, the tunneling could  
3 easily interact with this -- not only the surface but the  
4 stream we showed at the former cross-section that -- where  
5 the intrusive was right under the stream. This one has it  
6 over off to the side. But here are other things. This  
7 green area here (indicating) is a clay glacial till.

8 Q What is a clayey glacial till?

9 A It is derived from glacial movement; it's really a mixture  
10 of fine grained material. It's generally considered to be a  
11 low permeability material, probably similar in hydraulic  
12 properties to the red clay, the red lean clays down here.  
13 But what's important about this is that it occurs in an area  
14 where there are no boreholes, so I'm not sure what  
15 information is used to define that that exists here. At the  
16 borehole locations this information comes from the logs that  
17 are collected in the field and used to define the aquifers.  
18 The A Zone is this upper blue and the B Zone is this lower  
19 zone.

20 MR. REICHEL: Excuse me, Counsel.

21 MR. HAYNES: Yes?

22 MR. REICHEL: Sorry to interrupt the flow of your  
23 exam, but just so the record is clear the slide that you  
24 have before this was Figure 15 from Appendix B-1. I was  
25 able to verify that.

Page 1609

**NetworkReporting**

1-800-632-2720

1 MR. HAYNES: Yes.

2 MR. REICHEL: This one, although similar, appears  
3 to be from a different document. The previous one had a  
4 cross-section B to B Prime; this is --

5 MR. HAYNES: C to C Prime.

6 MR. REICHEL: I just want the record to be clear  
7 as to what document is being displayed; that's all.

8 MR. HAYNES: I appreciate that. So noted. All  
9 right. Let's go to the next page.

10 Q Dr. Prucha, I've had put up from the Environmental Impact  
11 Assessment Appendix B-8, Figure 23, which is Kennecott  
12 Exhibit 11. What's the significance of this figure for  
13 purposes of delineation of the stratigraphy?

14 A Well, the bedrock surface in this case you can clearly see  
15 being elevated and it's clearly associated with the  
16 intrusive on both sides. This controls the development of  
17 the unconsolidated deposits, but there's very little  
18 information around the actual intrusive. And this seems  
19 important, because this is where a lot of the mining will go  
20 on and the dewatering. And you can see that they have  
21 projected a well or borehole here, QAL025 which is from some  
22 distance, but there's not much control here. But I think  
23 the most important point about this is in contrast to the  
24 last cross-section conceptual hydrogeologic cross-section we  
25 looked at. The last one had the bedrock going straight into

Page 1610

**NetworkReporting**

1-800-632-2720

1 the dike; this one has it elevated. So I'm left wondering  
2 which is it and what information do you use to define this.  
3 To me, if I model this system, this is really critical  
4 information in terms of translating the dewatering in the  
5 mine -- the effects of the dewatering in the lower bedrock  
6 up to the surface.

7 Q And did you see any indication in the models that you  
8 reviewed of this -- these differences noted in the model?

9 A I did not.

10 Q All right. And just for the record, following up on Mr.  
11 Reichel's suggestion; this Figure 23 shows a cross-section D  
12 to D Prime, for the record?

13 A Right.

14 Q Okay. Dr. Prucha, we've had put on the screen from  
15 Kennecott Exhibit 8 the Environmental Impact Assessment,  
16 Appendix B-5, Table 2. What is the significance of this  
17 table for purposes of your testimony today? Well, let me  
18 lay some foundation, Dr. Prucha. Is it important for  
19 purposes of modeling to consider the hydraulic conductivity  
20 on consolidated materials?

21 A Yes.

22 Q And how does one normally go about doing that?

23 A There are a variety of tests that you apply in the field to  
24 collect hydraulic conductivity or the hydraulic properties  
25 of an aquifer system; there's some that you can do in a lab.

1 And there are different levels of quality in terms of the  
2 uncertainty associated with the tests. The highest level --  
3 and it's even acknowledged in the reports I reviewed -- are  
4 pump tests where you pump one well and you observe the  
5 drawdown response from that pumped well and surrounding  
6 wells. And that's the best kind of test to perform because  
7 it tests a much larger area of the aquifer.

8 Q And what other kinds of tests can be performed to determine  
9 hydraulic conductivity?

10 A There are a variety of other sorts of tests, like -- I  
11 noticed in their report they have done a number of slug  
12 tests. This is where you introduce a small volume of water  
13 into the well or you -- and watch the response from that  
14 well; you don't monitor the response of surrounding wells.  
15 So effectively that test only is giving you information  
16 about that local well, around that local area. And my  
17 experience is -- and there are pretty well documented  
18 literature that you end up with a bias towards the low end  
19 of hydraulic properties or hydraulic conductivity even up in  
20 the order of magnitude plus where slug tests give you lower  
21 than -- lower hydraulic properties than what you would get  
22 from actually conducting a multiple-well pump test. Other  
23 tests are doing -- collecting the soil from the actual  
24 borehole and sending it to a lab and estimating the grain  
25 sizes and you can estimate, but only roughly, what the

Page 1612

**NetworkReporting**

1-800-632-2720

1 hydraulic properties would be. In other words, if you get a  
2 value for a sand and you estimate it through this method the  
3 uncertainty could be orders of magnitude, which is -- an  
4 order of magnitude is about a factor of ten, so it could be  
5 ten to maybe a thousand times in error.

6 Q And what kind of tests did you see performed in the reports  
7 that you read dealing with a hydraulic conductivity?

8 A The majority by far were slug tests, seep tests, lab tests  
9 which produce values but the uncertainty is the greatest in  
10 those. And I saw one pump test in the unconsolidated  
11 material for multiple wells and that was really to test the  
12 interaction between the A aquifer zone and the D aquifer  
13 zone.

14 Q And would you have expected -- would you have expected to  
15 have seen in a model of this complexity that you've been  
16 describing more than one pump test?

17 A Absolutely. For the complexity that I see based on my  
18 review of the geologic logs, their plots, I would have  
19 expected more pump tests to test a broader area in the  
20 unconsolidated material; not only that, but between the  
21 unconsolidated and the bedrock. And I had a -- well, --

22 Q And in terms of the tests that you observed, did you note  
23 the length of the screens of the various tests that were  
24 performed?

25 A I did.

1 Q And what was -- what's your observation about those screens?

2 A Well, it seemed like a lot of the wells were screened  
3 much -- over a much shorter interval -- for example, five  
4 feet -- when the actual aquifer zone, like the A or the D  
5 zone, were on the order of 20, 30 feet thick and to me that  
6 just simply -- by doing that it introduces more uncertainty  
7 because the analysis is more complex and you induce flows  
8 that aren't as simple for the analytic method, the method  
9 that you would use to assess the hydraulic properties for.

10 Q Now, we've had put on the screen, Dr. Prucha, from Kennecott  
11 Exhibit 8, the Environmental Impact Assessment, Appendix B-  
12 5, Figure 9. And although it's in black and white and,  
13 therefore, not quite as readable as before, what's the  
14 significance of this figure for purposes of your modeling --  
15 or for purposes of modeling?

16 A Well, I think the point to this plot here was that the mine,  
17 I believe, is at -- the orebody is up here (indicating) and  
18 the location of the one multiple-well test where they  
19 pumped -- where they were looking at the interaction of the  
20 pump test between A and the D zone to establish what level  
21 of communication hydraulically they have -- they performed a  
22 test well south of the actual orebody and it's confusing to  
23 me why you would go and establish the hydraulic  
24 communication in an area so far away from the area that  
25 would be most impacted by mine dewatering. And another

Page 1614

**NetworkReporting**

1-800-632-2720

1 thing is that when you look at the trend of the thickness of  
2 the lower permeability units between the A and the D aquifer  
3 zone in the unconsolidated material it actually thins  
4 towards the mine and it's actually absent near that over  
5 some distance or area that hasn't been well defined. But  
6 the point is, if I were doing the test I would have put it  
7 up by the orebody to test the influents there because that's  
8 the area I'd want to know -- it has the greatest potential  
9 for having dewatering from the lower bedrock impacting the  
10 overlying unconsolidated material, and I wouldn't have put  
11 it in an area that had a thicker zone between this A and D  
12 aquifer of lower permeability units.

13 Q Now, Dr. Prucha, we're back to Kennecott Exhibit 7, the  
14 Environmental Impact Assessment, Appendix B-1, Figure 23.  
15 And the -- I apologize, but the figure doesn't show contours  
16 very well, but on this figure are contours represented?

17 A I don't think I saw contours represented well on any of the  
18 maps that I reviewed based on the wells and -- posted and  
19 the obvious hydraulically significant features, such as the  
20 Salmon Trout River.

21 Q And when you say "hydraulically significant," are those  
22 features significant for modeling and are -- let me back up.  
23 Would it be important to -- for modeling purposes to have  
24 contours inputs -- contour inputs into the models?

25 A Well, for this kind of information you don't -- you enter in

1 as an input the groundwater elevation as an initial  
2 condition, but really the importance of this data is in --  
3 sort of two-fold. One is that you contour it up first,  
4 which means you take this information and you estimate where  
5 the groundwater flows based on contouring and the  
6 contouring, if you have enough wells in the right location,  
7 gives you a very good indication of how much interaction --  
8 for example, you have between the Salmon Trout River and,  
9 say, the A Zone of the unconsolidated deposits, let alone  
10 the D aquifer zone, I don't even know from the available  
11 data whether the intervening B and C Zone, the low  
12 permeability unit between the A and D Zone is missing along  
13 a significant portion of the Salmon Trout River. I don't  
14 think it's been characterized well.

15 But this is the point where groundwater  
16 information you have to establish an understanding before  
17 you jump in the modeling of where you think the water is  
18 going and base it off of good sound data. A key area should  
19 have been an area right around the mine dewatering area. So  
20 initial modeling could say, "Here's the mine impact area."  
21 It looks like it's at least a mile in diameter over the  
22 extent of the Salmon Trout River. Why don't we have more  
23 wells in this complex unconsolidated system right there to  
24 establish clearly just based on data, not even modeling what  
25 the interaction is between the A and the D Zone and the

1           unconsolidated and the bedrock zone?

2    Q       I notice on this figure, Figure 23, that there are some  
3           arrows -- some sort of curved arrows pointing -- you know,  
4           northerly direction. What do those arrows represent, to  
5           your understanding?

6    A       These are estimated flow directions of the groundwater in  
7           this A Zone groundwater elevation.

8    Q       And from the materials that you've reviewed do those  
9           estimated flow directions appear to be accurate?

10   A       No.

11   Q       Why not?

12   A       Again, a variety of reasons. Just even up in the northern  
13           area I think there's confusion about whether the A and D  
14           Zone even -- which zone occurs, whether the B and C Zone  
15           pinch out; whether they know whether water is actually  
16           flowing towards some of the seep locations. There's a  
17           variety of things when you zoom in and look at the contours.  
18           It looks around the Salmon Trout, the whole upper stream  
19           area, in a large number of these contours it looks like the  
20           contours are written right over the Salmon Trout River as  
21           though it has no influence on the groundwater. So then  
22           later I look at some of the modeling and it looks like the  
23           contours are very sharply pronounced right around the river  
24           indicating that some of the models reviewed it looks like  
25           they are simulating kind of something what you would expect

1 where that's acting as a discharge point for the local  
2 groundwater.

3 Q And would you find such contouring to be consistent or  
4 inconsistent with the topography in the area?

5 A I would find it inconsistent.

6 Q And is that important from a modeling perspective?

7 A Yes.

8 Q Now, Dr. Prucha, we've put up from Kennecott Exhibit 7, the  
9 Environmental Impact Assessment, Appendix B-1, Figure 30,  
10 which is denominated the contours of the wetland study area.  
11 Do you see that?

12 A Yes.

13 Q What is significant about this figure for purposes of  
14 groundwater modeling?

15 A Well, again, this is another attempt to contour and  
16 demonstrate that the flow directions of groundwater run to  
17 this natural condition or factor it, and I have problems  
18 again with where they've placed wells and what wells or data  
19 they're using to help constrain the contours. And you don't  
20 see those here, but there's a pretty big gap in the data  
21 everywhere on the other side of the Salmon Trout River.

22 Q Now, you're pointing your laser pointer to the west and  
23 south of the Salmon Trout?

24 A That's right. Immediately across from the orebody and  
25 upstream to the west. In addition, the contours don't seem

1 to take into account what is commonly done to help constrain  
2 groundwater contours in the area as the stage elevation or  
3 average stage of the river flow through the system. And  
4 that seems like a key to help constraining whether  
5 groundwater is going into the river or going out at any  
6 point. Although I believe most of this stretch is a gaining  
7 reach on the stream; meaning, the groundwater is flowing  
8 into the stream.

9 Q So can you tell, Dr. Prucha, from your analysis of the  
10 documents whether the -- whether groundwater flow direction  
11 can be verified in these documents?

12 A No.

13 Q And is that -- would that be important for modeling?

14 A Yes.

15 Q And why is that?

16 A Well, I think at this level if you can't understand the  
17 contours you're introducing a lot of uncertainty in any  
18 modeling exercise and say that the modeling is just destined  
19 to not produce very reliable results because you don't  
20 understand the basic system, and that is the fundamental  
21 step in hydrologic studies that are conducted as the  
22 standard.

23 Q Dr. Prucha, for purposes of modeling a groundwater flow  
24 system, is it important to establish the hydraulic  
25 communication between the bedrock and the unconsolidated

1 material?

2 A Yes.

3 Q And why is that?

4 A Well, you're going to be pumping water out of the bedrock  
5 and that will create a drawdown in the bedrock and that  
6 drawdown will induce an increased amount of flow from the  
7 overlying unconsolidated material; the greater the drawdown  
8 on the bedrock the greater the drawdown on the overburden.  
9 So I think that's critical to understand where that occurs,  
10 the extent over which it occurs and the magnitude of that.

11 Q And for some of the documents that -- or for the documents  
12 that you reviewed, Dr. Prucha, did you note any documents  
13 that showed that there was an absence of unconsolidated  
14 material over bedrock in portions of the study site?

15 A Yes, in critical areas right around the orebody. And there  
16 were several maps that I looked at that seemed to have just  
17 one control point, but one map showed it extending for quite  
18 a distance under the Salmon Trout River.

19 Q And did the groundwater flow models that you reviewed  
20 consider these -- this feature?

21 A No, and it's important because if there are faults through  
22 the area and brecciated zones that are conductive, the fact  
23 that you have bedrock right at the surface -- and in one  
24 cross-section we saw before that had intrusives right  
25 underneath the Salmon Trout River -- this is a direct

Page 1620

**NetworkReporting**

1-800-632-2720

1 connection with the mine dewatering and --

2 Q Go ahead. I'm sorry.

3 A -- flow rates significantly higher than estimated.

4 Q Now, for purposes of modeling is it important to  
5 characterize the surface water flow system?

6 A Yes.

7 Q And why is that?

8 A Well, because that is where the drawdown from the mine  
9 dewatering will eventually propagate, and without  
10 characterizing the current system and its interaction with  
11 the underlying unconsolidated aquifers and bedrock, it's --  
12 you wouldn't be able to assess the relative impact when you  
13 went in to predictive modeling. So you need to understand  
14 that interaction now.

15 Q Now, Dr. Prucha, I'm putting back up for purposes of this  
16 portion of your testimony Kennecott Exhibit 7, Environmental  
17 Impact Assessment, Appendix B-1, Figure 30, which deals with  
18 the wetland study area. And in terms of the spatial  
19 distribution of the wells in the wetland area, what does  
20 this figure tell you?

21 A Again, I don't think it's adequate to characterize the  
22 stream-aquifer connection, so this is a pretty standard  
23 terminology in hydrology these days and it just means that  
24 if you have a stream that's connected hydraulically with the  
25 underlying aquifer you need to characterize how much flow

Page 1621

**NetworkReporting**

**1-800-632-2720**

1 goes in and out of the river and interacts with the  
2 groundwater. And they have some wetland wells that they  
3 show on the north side of the Salmon Trout River here but  
4 they're shallow. And I think if you were doing a study to  
5 assess this interaction over the length that would be  
6 impacted by mine dewatering, you would put wells shallow and  
7 deep; nested well pairs right below the river and assess the  
8 interaction.

9 Q What is a nested well pair?

10 A A nested well pair would be wells that are screened at  
11 different depths. Wetland wells they have here are nested,  
12 but they only go down nine feet, nine and a half feet, and  
13 the A aquifer zone is deeper than that. And I think to  
14 fully establish this connection you'd just not want to do it  
15 at two or three locations here but along a length that would  
16 over -- where the mine dewatering would be impacting it.

17 Q Dr. Prucha, on the screen is from Kennecott Exhibit 11, the  
18 Environmental Impact Assessment, Appendix B-6, Figure 6,  
19 which is "Denominated Wetland Hydrological Classification."  
20 And what's significant about this figure for you, Dr.  
21 Prucha?

22 A Well, they had three different zones of the wetlands defined  
23 on this map; one that was precipitation driven that was  
24 largely over where the mine is but apparently only there and  
25 not anywhere down to the south, and then they had a

1 groundwater-driven zone that was running adjacent to the  
2 stream but not directly underneath it, and then a third  
3 wetland zone that they called a "stream-driven wetland."  
4 And I guess I was surprised to not see a detailed conceptual  
5 picture, a cross-section through the orebody, through both  
6 sides of the stream that clearly showed the dynamics and the  
7 soil horizons, what's really controlling these zones and  
8 showing arrows of where -- where does water really come in  
9 and sustain these. Is it groundwater? Where does the  
10 groundwater-driven system versus precip really end? Is  
11 this -- are these boundaries seasonal? Do they vary  
12 spatially? This is one plot in time perhaps.

13 Q And, Dr. Prucha, we've had in earlier testimony and exhibits  
14 in this case some pictures of beaver dams along the Salmon  
15 Trout River. Would beaver dams be significant for purposes  
16 of groundwater modeling?

17 A Yes.

18 Q Why is that?

19 A Well, because they artificially dam the water up behind them  
20 and increase the elevation of the stage of the water and  
21 this could certainly mask potential fault discharge along  
22 different lengths of the stream.

23 Q In your review of the documents -- the modeling documents,  
24 did you see any discussion of the beaver dams?

25 A I did.

1 Q And was it sufficient for purposes of modeling in your view?

2 A It's really just a statement saying that it looked like they  
3 were significant, but nothing seemed to be considered; it  
4 wasn't considered in the modeling and didn't seem to be  
5 considered in their conceptualization of the flow around the  
6 critical orebody dewatering area.

7 Q Dr. Prucha, on the screen now is slide 31 from Petitioner's  
8 Exhibit 63. Is this a slide that you prepared?

9 A Yes.

10 Q And what does it represent?

11 A Well, it represents a plot that showed post-closure  
12 groundwater monitoring locations and I put flow arrows in  
13 green where I think it would probably occur and I put the  
14 orange boxes where I would put appropriate monitoring  
15 locations downstream of the temporary rock storage area  
16 closer to the actual stream.

17 Q And does this slide also indicate the placement of -- or the  
18 proposed placement of monitoring wells for -- by Kennecott's  
19 proposal?

20 A Yes.

21 Q And where would those be?

22 A They're shown with the circles with a cross through them.

23 Q And why did you place the orange boxes as opposed to --  
24 where you did as opposed to where the monitoring wells are  
25 proposed by Kennecott?

1 A To me those would be more likely to intersect any water  
2 flowing through that had impaired water quality than where  
3 their proposed locations are.

4 Q Can you tell, Dr. Prucha, based upon your experience whether  
5 the proposed monitoring well locations proposed by Kennecott  
6 would be able to determine the potential for measurable  
7 impact on surface water?

8 A Would you rephrase that?

9 Q Sure. Can you tell from the proposed locations here  
10 proposed by Kennecott for monitoring wells whether those  
11 monitoring wells would be able to measure impact on surface  
12 waters from the groundwater inflow to the mine?

13 A From their monitoring wells?

14 Q Yes.

15 A No.

16 Q And from their monitoring wells would you be able to  
17 determine in your view the measurable impact on groundwater  
18 from the groundwater inflow to the mine?

19 A Yes. The ones that I located were within their groundwater-  
20 driven wetland, whereas the precipitation -- it seems like  
21 the ones where they proposed were more in the wetland-driven  
22 precipitation area, which conceptually doesn't seem like  
23 it's being driven by the groundwater in that area. So if  
24 there are groundwater impacts from lower mining propagating  
25 up you might be more likely to see them as groundwater-

Page 1625

**NetworkReporting**

**1-800-632-2720**

1 driven wetland area.

2 MR. HAYNES: Your Honor, I'm going to move into a  
3 slightly different area. Perhaps we could take a break.

4 JUDGE PATTERSON: Okay.

5 (Off the record)

6 Q Now, Dr. Prucha, we put up on the screen Kennecott Exhibit  
7 11, the Environmental Impact Assessment, Appendix B-6, Table  
8 2 which talks about water elevation measurements. Do you  
9 see this?

10 A Yes.

11 Q And the discrete water elevation measurements. What, Dr.  
12 Prucha, about this table is significant for purposes of  
13 modeling?

14 A There might have been the second page on this table. Is  
15 there a second page on that? That's it.

16 Q All right. We'll try this one. What is significant about  
17 this page? This is Table 2, second page.

18 A Well, this is where they've shown in the report a number the  
19 wetland wells that they put in, piezometers, and they're at  
20 different depths; one four and a half and nine and a half  
21 feet below ground surface. And there are a number of F's  
22 over on the right-hand column refer to "water thawed prior  
23 to measurement" and I've never seen this before, but it  
24 makes me question the validity of those actual water  
25 elevations, the fact that they had to thaw the sample out.

Page 1626

**NetworkReporting**

1-800-632-2720

1 The change in density; the fact that the material around  
2 that immediately thawed zone would still be probably frozen.  
3 I'm just not sure how to interpret that, but it seems like  
4 it dramatically influences their estimation of the vertical  
5 gradients that would occur over pretty -- a pretty small  
6 vertical elevation. So --

7 Q And I note that the columns on this table show that  
8 measurements were taken in November and December. Is that  
9 significant for purposes of modeling?

10 A Well, probably it would have been nice to show what happens  
11 during the summer months to know -- I mean, this really is  
12 kind of a wintertime effort. The gradients -- if you're  
13 trying to produce a model it would be nice to understand  
14 whether the wells in these different wetland zones are  
15 behaving dramatically different than the one plot that says  
16 here are the three different zones.

17 Q When you say "it would be nice to know," would you consider  
18 it best practices to take seasonal measurements in wetlands?

19 A Yes.

20 Q Dr. Prucha, on the screen now is Kennecott Exhibit 7, the  
21 Environmental Impact Assessment, Appendix B-1, Figure 32,  
22 and what -- this says, "Wetland Hydrologic Classification."  
23 I think we've had this one before, but what does this show  
24 for purposes of modeling for any relationship between the  
25 stream and the wetland?

Page 1627

**NetworkReporting**

1-800-632-2720

1 A I think I made the point on the last exhibit when you  
2 brought it up.

3 Q It is important from a modeling perspective to show  
4 groundwater discharges into streams?

5 A Yes.

6 Q And what is -- how is that important?

7 A In trying to determine the impact of the mine inflow  
8 modeling -- or, you know, the impact from the mine  
9 dewatering that was done in the bedrock model you need to  
10 consider the groundwater discharge and estimate it through  
11 measurements before connecting the modeling so that you have  
12 something to compare against.

13 Q Dr. Prucha, is it important for purposes of modeling to have  
14 an appropriate conceptualization of the flow in the system?

15 A Yes.

16 Q And why is that important?

17 A If you don't conceptualize the system well in the model that  
18 you produce based on that conceptualization will be only as  
19 good as the conceptual model. So if that's flawed, then  
20 your numerical model will start off flawed.

21 Q Dr. Prucha, I've had put on the screen from Kennecott  
22 Exhibit 7, the Environmental Impact Assessment, Appendix B-  
23 1, Figure 6 which is the "Generalized Geologic Cross-  
24 section." For purposes of a conceptualization of the flow  
25 in the system, how is this exhibit important, if at all?

1 A Well, they produced a model that covers this area over the  
2 Yellow Dog Plains that's noted on the upper left, and this  
3 is a south to north cross-section. And I think the color  
4 version of this would show the intrusive dike coming up in  
5 here (indicating) in this -- through the sediments. But I'm  
6 not sure how realistic this is to show just one conceptual  
7 picture slice like this when you have a groundwater that's  
8 flat here and then it suddenly drops off and mysteriously  
9 disappears. I'm not quite sure I understand the mechanism  
10 by how this all occurs. Does it have all of the important  
11 features? I think one important feature they do show here  
12 is that at the edge of the Yellow Dog Plains that the  
13 topography does actually increase somewhat and I don't think  
14 I saw any adequate explanation for why that might occur.

15 Q Now, Dr. Prucha, we've had put on the screen Kennecott  
16 Exhibit 8, Environmental Impact Assessment, Appendix B-5,  
17 Figure 34 which is another "Conceptual Hydrogeologic Cross-  
18 section." What's the significance of this figure, if any,  
19 for purposes of modeling?

20 A Well, I think here's another example of a conceptual  
21 hydrogeologic cross-section for the system and I don't see  
22 the intrusive dike here or the four others that look like  
23 they traversed across this zone from the one exhibit that we  
24 showed that was produced by their geologist. And they show  
25 groundwater seeping out the site over here. I'm not sure

1 Appendix B-1 and Figure 34 from Appendix B-5, consistent  
2 with those guidelines for conceptualization?

3 A I would say no.

4 Q Why not?

5 A Well, again, when you produce a model you should produce a  
6 model that is as defined as well as you can and if you do  
7 identify alternative models or hypotheses that's sort of  
8 your obligation to show why those alternatives aren't valid  
9 and that the one you decide to use in predictions is more  
10 valid than others. But there's a process that you go  
11 through to eliminate those and I don't think that was  
12 followed here or considered.

13 Q For purposes of modeling the inflow to this proposed mine,  
14 how important is it to conceptualize the groundwater flow  
15 system?

16 A I think it's critical.

17 Q And for purposes of the model how does the flow system then  
18 feed into the model?

19 A Could you rephrase that?

20 Q Sure. The flow system that is described by Exhibit -- or  
21 Figure 6 and Figure 34, these two exhibits; how is that flow  
22 system then translated into the model for purposes of  
23 deriving some sort of a prediction of the inflow into the  
24 mine?

25 A Well, this conceptualization is used to guide the definition

1 of the structure of the numerical model that you develop,  
2 how you see the interaction between the different aquifer  
3 zones within. For example, the unconsolidated material; how  
4 you see the interaction between the unconsolidated material  
5 and the underlying bedrock and, for that matter, what code  
6 you use -- what computer or mathematical code you use to  
7 actually simulate the flow in the system. And it also is  
8 important in terms of how you define things like boundary  
9 conditions or conditions that control how the water gets  
10 into the system and then how it gets out of the system.

11 Q Dr. Prucha, I've had put up on the screen the first page of  
12 Petitioner's Exhibit 62, which is a "Groundwater Modeling  
13 Guidance" from the Michigan Department of Environmental  
14 Quality, draft 1.0 from, I believe, 1990- --

15 A 2002.

16 Q 2002. I'm sorry. Have you reviewed this document, Dr.  
17 Prucha?

18 A Yes.

19 Q Have you in your career and your experience reviewed other  
20 various modeling guidance documents from other states?

21 A Yes.

22 Q In your view are such modeling guidance documents helpful  
23 for purposes of preparing models?

24 A Yes.

25 Q In your view are the guidelines that are in proposed

1           Petitioner's Exhibit 62 appropriate for modeling at the  
2           Eagle Mine site?

3    A       Yes.

4    Q       Do the guidelines discuss worst-case modeling?

5    A       Yes.

6    Q       Is that appropriate?

7    A       Yes.

8    Q       Is worst-case modeling what some might feel to be equivalent  
9           to conservative modeling?

10   A       Yes.

11   Q       Are the two phrases synonymous or equivalent?

12   A       Yes, but I think sometimes you can get the word  
13           "conservative" confused; you need to define is it  
14           conservative one way or another. And by "worst case," the  
15           way I interpret that is what is the worst case in terms of  
16           how mine dewatering will impact, say, for example, the  
17           aquifer, the A Zone aquifer, the shallow aquifer? The worst  
18           case would be what's -- what do you think the largest  
19           drawdown would be? What's the magnitude of that? What's  
20           the worst-case dimension that would be impacted or area that  
21           would be impacted?

22   Q       And is worst-case modeling standard engineering practice?

23   A       Yes.

24   Q       Would such worst-case or conservative modeling use site-  
25           specific data?

1 A I'm sorry?

2 Q Would such worst-case modeling use site-specific data?

3 A Yes.

4 Q And for a proposed underground mine what kind of  
5 worst-case -- excuse me -- what kind of site-specific data  
6 would you expect such worst-case modeling to use?

7 MR. LEWIS: Objection; foundation, your Honor.

8 MR. HAYNES: Your Honor, I'm not quite sure how to  
9 respond to that objection. I think I've laid a foundation  
10 for this witness to discuss modeling -- worst-case modeling,  
11 underground mines, so I'm not quite sure how what I have to  
12 do further.

13 MR. LEWIS: My objection goes to the lack of any  
14 information about any experience that Dr. Prucha has had  
15 with modeling the amount of water that might be expected to  
16 flow into an underground mine, and the question was  
17 specifically phrased in those terms.

18 JUDGE PATTERSON: I'm trying to recall if he  
19 testified to any experience in that.

20 MR. HAYNES: Well, all right.

21 Q Let's be more general, Dr. Prucha. You have experienced  
22 modeling groundwater inflows into underground structures;  
23 correct?

24 A Yes.

25 Q All right. And that would include underground mines?

1 A Well, open pit mines, not necessarily underground mines  
2 exactly like this, but --

3 Q Okay. But for purposes of groundwater modeling does the  
4 structure make a difference if it's a mine, an open-pit  
5 mine, an underground mine or some other underground  
6 structure for purposes of groundwater modeling of inflows?

7 A No.

8 Q Okay. So what kind of site-specific data would you expect  
9 for modeling water flow to a proposed underground mine?

10 A Would you repeat that?

11 Q Sure. What kind of site-specific data would you expect in a  
12 model for purposes of modeling underground flow into an  
13 underground mine?

14 A I would expect adequate numbers and locations of wells  
15 throughout the bedrock and the unconsolidated material, a  
16 zone that would be impacted by the mine dewatering.

17 Q And would site-specific data assist in limiting the range of  
18 uncertainty in any models?

19 A Yes.

20 Q Would site-specific data assist in limiting the range of  
21 uncertainty for baseline conditions of a model?

22 A Yes.

23 Q Do the guidelines, Proposed Exhibit 62, call for an  
24 understanding of the importance of transport processes at a  
25 site?

1 A Yes.

2 Q What are transport processes?

3 A Well, the movement of water and in this case contaminants in  
4 the water.

5 Q Are transport processes related to site characterization?

6 A Yes.

7 Q And how so?

8 A Well, if you don't characterize how that transport of a  
9 particular component in the water is moving, then it would  
10 be difficult to model it accurately.

11 Q If you were to model the groundwater inflow into a proposed  
12 underground mine in Michigan, would you consider the  
13 groundwater modeling guidance prepared by the DEQ as part of  
14 your task?

15 A Yes.

16 MR. HAYNES: Move the admission of Exhibit 62.

17 MR. LEWIS: No objection.

18 MR. REICHEL: No objection.

19 JUDGE PATTERSON: No objection. It'll be entered.

20 (Petitioner's Exhibit 632-62 received)

21 Q Dr. Prucha, in your view, has there been proper site  
22 characterization of the flow into this system?

23 A No.

24 Q And why not or how not?

25 A Lack of data in the right spots; lack of proper hydraulic  
Page 1636

**NetworkReporting**

**1-800-632-2720**

1 testing; lack of interpretation of -- poor understanding --  
2 characterizations -- very poor characterization of an  
3 interpretation of groundwater flow directions in the various  
4 units.

5 Q Dr. Prucha, when we started with you today, you spoke of the  
6 term "calibration of models." What does calibration  
7 involve?

8 A It involves trying to reproduce the system -- the observed  
9 system behavior. That would include groundwater levels in  
10 wells that vary over time; the discharge of flow at rivers;  
11 discharge from the groundwater system as evapotranspiration

12 Q Can calibration include calibrating steady-state conditions?

13 A It can.

14 Q And can calibration of a model include calibrating transient  
15 conditions?

16 A Yes.

17 Q And would you explain those two, please?

18 A Well, a steady-state calibration is what was done for the  
19 models that I've reviewed here, and my opinion, it's the  
20 basic level of modeling. And you can develop those kinds of  
21 models, but it's pretty well-known in the industry that --  
22 the practice that steady-state models often are associated  
23 with large uncertainties and are associated with a problem  
24 we call non-unique. In other words, the models that get  
25 developed, you don't really have enough constraint on the

Page 1637

**NetworkReporting**

1-800-632-2720

1 model to define hydraulic properties accurately within the  
2 model to reproduce the system. And this is why the next  
3 step of calibration is to go into transient calibration,  
4 where you're trying to match the fluctuation, say, of  
5 groundwater levels in time or discharge to a river.

6 And then the next step after that is -- and it's  
7 stated in these -- this modeling guidance here by the DEQ --  
8 is to go and verify that your calibration is correct. And  
9 you can't do a verification on a steady-state model because,  
10 by definition, the steady-state model only simulates a  
11 constant groundwater elevation. Nothing is -- groundwater  
12 moves through the system, but it's at a constant rate. And  
13 it -- this non-unique problem, a good analogy to that is  
14 that you have a bathtub and you're filling it with water at  
15 some rate of inflow, and you have a pipe that you don't know  
16 the size at the base of the bathtub coming out.

17 And you can pour in a huge amount of water, and  
18 your objective is to simply match the water level in the  
19 bathtub. But if you make the pipe at the exit larger or  
20 smaller, you can maintain this. It doesn't -- you're not  
21 calibrating the system. There are -- recharge can be  
22 adjusted very high, and the pipe diameter can be adjusted  
23 very high, and you can still get the same water level in the  
24 bathtub. It's the same concept in the groundwater flow  
25 model.

1 Q I see. In this case, based upon your review of the  
2 documents, was transient modeling done?

3 A It was not.

4 Q If you were to model this system, Dr. Prucha, would you have  
5 performed transient modeling?

6 A Well, they performed a transient model simulation, but they  
7 did not do a transient calibration of the model for the  
8 unconsolidated material. In the bedrock model that they  
9 used for FEFLOW or developed with FEFLOW --

10 Q Wait. Let me stop you.

11 A Yeah.

12 Q "FEFLOW," a new term. What is it?

13 A It's a computer code that's used to simulate flow through a  
14 groundwater system.

15 Q And is FEFLOW a model that is normally used by groundwater  
16 modelers?

17 A It is.

18 Q I'm sorry. I interrupted you. Go on.

19 A In the FEFLOW model, they actually -- that they prepared,  
20 they calibrate -- they say in their report that they  
21 calibrate to the pump tests that they performed on this well  
22 084 that we talked about earlier.

23 Q Now, Dr. Prucha, for purposes of predicting outputs from a  
24 model, should outputs be produced as a single outcome or as  
25 a range of outcomes?

1 A As a range of outcomes.

2 Q And why is that?

3 A Well, because your models by design are uncertain. And the  
4 examples I give there are the contour maps we looked at  
5 earlier of, say, for example, the thickness of the  
6 unconsolidated material outside of the areas where they  
7 actually have borehole data to constrain that estimate.

8 Q Dr. Prucha, is there something called code selection in  
9 model design?

10 A Yes.

11 Q And what is that?

12 A Well, that's the process of selecting an appropriate  
13 mathematical code. And I distinguish code from model in  
14 that a code is actually the computer code or software that  
15 was produced to develop a model. The model is of the actual  
16 site. You develop a model of the actual physical site. But  
17 there is a process where you go through selecting an  
18 appropriate code that can simulate, for example, fracture  
19 flow. Not all codes can simulate the flow of fractures --  
20 flow-through fractures in a system. This is in fact why we  
21 have read report -- the reports here on modeling that  
22 indicated they used FEFLOW to model discrete fractures,  
23 where they used the more common code, MODFLOW, that was  
24 developed by the USGS to simulate the unconsolidated  
25 material. But they actually end up simulating the bedrock

1 later in later versions of the model.

2 Q And is it appropriate, in your view, to mix the two kinds of  
3 models, FEFLOW and MODFLOW?

4 A No.

5 Q Why not?

6 A Well, for the reasons that they pointed out in their  
7 document. FEFLOW has the capability of simulating discrete  
8 water-conducting fractures, and MODFLOW really doesn't have  
9 that capability. And so they -- that's -- that was one of  
10 their main justifications for using FEFLOW, to simulate the  
11 flow in the bedrock system, which was then used to estimate  
12 the amount of mine inflow.

13 Q Dr. Prucha, are you familiar with the American Society for  
14 Testing and Materials, --

15 A I am.

16 Q -- so-called ASTM?

17 A Uh-huh (affirmative).

18 Q "Yes"?

19 A Yes.

20 Q What is ASTM? What does it do generally?

21 A It's a standard. It's actually a series of quite a large  
22 number of different standards that have been put forth by a  
23 group of professionals in the industry. And the guidelines  
24 aren't absolute, but they are used in the industry to help  
25 guide the development of models that are more defensible and

1 credible.

2 Q And, Dr. Prucha, are there ASTM standards for selecting  
3 appropriate codes for modeling?

4 A Yes.

5 Q And have you observed any adherence to those standards in  
6 the models that you reviewed for your testimony today for  
7 selecting codes?

8 A They have statements as to why they chose their codes, but  
9 it was certainly not rigorous, in my --

10 Q And is such rigor required for modeling?

11 A In this system I believe that it should have been.

12 Q You testified just previously about the two models that --  
13 the FEFLOW and MODFLOW models are the methods; correct?

14 A Yes.

15 Q In your review of the documents, is there a reason that you  
16 can determine why two models were used here instead of one?

17 A I'm still unclear as to why they used two models.

18 Q And in your view, Dr. Prucha, from modeling this system,  
19 would it have been preferable to use a single model?

20 A Yes.

21 Q Why?

22 A Well, the problem with using two different models, one for  
23 the overburden or this unconsolidated material and the  
24 bedrock, is that separating those two out leads to problems  
25 translating the drawdown that you see and that develops in

1 the bedrock to the overlying unconsolidated material. And  
2 you're forced to choose boundary conditions that aren't  
3 really appropriate and don't really simulate what's really  
4 going on in terms of the interaction between the  
5 unconsolidated material and the bedrock.

6 Q When you're forced to choose those conditions, is that  
7 appropriate for modeling?

8 A I think there are better alternatives.

9 Q And what would those be?

10 A Using one single code like FEFLOW to model both the bedrock  
11 and unconsolidated material.

12 Q Now, Dr. Prucha, we're going to back to Figure 8.1 of  
13 Appendix B-3. You spoke early on in your testimony about  
14 model calibration. Do you recall that?

15 A Yes.

16 Q And was the bedrock model in this -- in the model that you  
17 reviewed your calibrated?

18 A It was calibrated to the pump test performed at well 84  
19 here.

20 Q I'm sorry. Let me back up for a second. What do you mean  
21 by "calibration of a model"?

22 A Depends on the type of model you're trying to calibrate.  
23 The model that's used here covers 87 square kilometers,  
24 which is a large area. And you needed a model that size,  
25 because the prediction of mine inflow is unknown at the

1 beginning of the simulations, but it's clear, even from the  
2 initial simulations they do, that the area is 1 to 2 miles  
3 in size in terms of the drawdown zone. The model that  
4 they're claiming to calibrate is calibrated. It's  
5 calibrated to a pump test. And it's arguable that you could  
6 calibrate to a pump test where wells are spaced  
7 couple-hundred meters apart and extrapolate what you find  
8 there over 87-square kilometers, and that doesn't consider  
9 the 4 mapped miles-long dikes that they had that brecciated  
10 zones around them; doesn't consider the faults that they'd  
11 mapped, the large miles-long  
12 west-northwest-southeast-trending faults that seemed to  
13 align with water drainage features.

14 Q Dr. Prucha, just for the record, the 87 square kilometers,  
15 for those of us who think in terms of miles, what's that  
16 area in terms of square miles?

17 A It's about 33 square miles roughly.

18 Q You spoke of the faults -- the east-west dikes and the  
19 north-south faults, Dr. Prucha. How is the orientation of  
20 those faults important, if at all, for purposes of  
21 calibrating a model?

22 A Well, the orientation that you put into your model -- impose  
23 on your model ought to be consistent with what you're  
24 mapping. And what was imposed in the models that I reviewed  
25 were a set of north, south, east, west regularly spaced

1 fault. But primary issue I had with that is that they were  
2 only included in the lower bedrock, and they did not extend  
3 to the upper bedrock, which, just by design doesn't allow  
4 any transfer of -- or much transfer of the drawdown impact  
5 that you see in the lower mine and dewatering into the  
6 overlying unconsolidated material.

7 Q In your view from a modeler's standpoint, is it realistic to  
8 exclude faults in that way?

9 A No.

10 Q And is there such a thing in modeling called bias?

11 A Yes.

12 Q And how would you define bias in modeling?

13 A Where -- when you model you can choose to adjust parameters  
14 up or down to look at worst-case or not-such-a-worst-case  
15 scenario, and bias would be selecting things that maybe are  
16 biased towards your opinion or what you want the outcome to  
17 be.

18 Q And would characterizing the faults here as ending in the  
19 lower bedrock reflect any sort of a bias?

20 A I believe so, yes.

21 Q In what way?

22 A Well, again, if they had considered what I believe is more  
23 realistic, the faults to extend all the way into the  
24 overburden, this would have allowed direct connection  
25 between the dewatering that's occurring in the orebody and

1 tunnel area to translate up into the overlying  
2 unconsolidated material and would have impacted a larger  
3 area and larger impacts on the Salmon Trout River.

4 Q Dr. Prucha, in your review of the documents, did you note  
5 whether or not a FEFLOW model was used for 2004 model?

6 A Yes.

7 Q And in your view, was that FEFLOW model appropriate to use?

8 A Well, this model was the -- what was referred to as a  
9 preliminary model -- preliminary numerical model, and that  
10 is the model where faults or fracture zones were simulated  
11 in the model but only in the lower bedrock zone. And  
12 effectively, this is like putting a small permeable slit in  
13 a block of concrete and, if the slit is entirely contained  
14 in the bedrock or the concrete block and it's not allowed to  
15 connect to other permeable water bodies, there's not really  
16 any effect of that fracture or fault.

17 Q In this 2005 FEFLOW model, what was the groundwater used in  
18 that model? Was it constant, or was it variable?

19 A In the 2005 model?

20 Q Yes.

21 A The groundwater elevation was constant.

22 Q Is that appropriate?

23 A No.

24 Q Why?

25 A It doesn't reflect reality.

1 Q That is, groundwater is -- groundwater levels are variable;  
2 correct?

3 A That's right. And in this case they didn't produce a map of  
4 the water level in the bedrock, but you would assume that it  
5 was probably close to what is in the overlying  
6 unconsolidated material, and that certainly -- the number of  
7 maps that we've seen here for the A and D zone show the  
8 gradients approximately.

9 Q And what is the effect on this -- or what would be the  
10 effect on this 2005 FEFLOW model of using variable  
11 groundwater levels rather than steady-state groundwater  
12 levels?

13 A More realistic inflows.

14 Q So in your view, is this -- are the results from the 2005  
15 FEFLOW model realistic?

16 A No.

17 Q What did those results predict for purposes of inflow into  
18 the mine?

19 A For -- that model was referred to as the upper bound, and  
20 that was 215 gallons per minute. Actually, their initial  
21 one, I think, was 180 gallons after three years; sorry.

22 Q And so, Dr. Prucha, in your view, the upper bound limit for  
23 the 2005 FEFLOW model is not realistic at 215 gallons per  
24 minute?

25 A No.

Page 1647

**NetworkReporting**

1-800-632-2720

1 Q Based upon the data that you've reviewed, do you have a view  
2 as to what would be a realistic upper bound?

3 A I believe it's much high.

4 MR. LEWIS: Objection; objection; foundation, your  
5 Honor. There's no foundation for this witness having done  
6 anything which I assume would be necessary to present some  
7 alternative calculation. I've heard nothing about the steps  
8 taken by this witness. I've heard nothing about all these  
9 modeling details, calibration of his model, none of that. I  
10 don't believe there's any foundation for an opinion by this  
11 witness as to some alternative modeling results.

12 MR. HAYNES: I'll rephrase.

13 Q Dr. Prucha, have you had a chance to go through the data  
14 presented by Kennecott in its 2004 FEFLOW model to determine  
15 if those data are sufficient for determining an upper bound?

16 A Yes.

17 Q And what would those steps be?

18 A I've looked at the four FEFLOW model exhibits which were  
19 FEFLOW model input files, and this preliminary numerical  
20 model was used to simulate several scenarios.

21 Q And did you in fact simulate several scenarios?

22 A Yes.

23 Q And did you then calibrate that model?

24 A No.

25 Q Were you able to -- do you think that -- based upon the data  
Page 1648

**NetworkReporting**

**1-800-632-2720**

1 that you had available, that you would be able to calibrate  
2 the model?

3 A No.

4 Q In your simulation -- Dr. Prucha, was your simulation  
5 similar to that carried out by Kennecott?

6 A I used their model and their data as introduced in their --  
7 you know, in the file that I started with.

8 Q And based upon their data, were you able to arrive at a  
9 figure for an upper bound inflow into the mine?

10 MR. LEWIS: Same objection, your Honor; same  
11 basis. The witness has just testified in effect that he has  
12 no basis to offer an alternative opinion. He would have no  
13 basis to offer anything that's been calibrated and -- nor  
14 anything that would apparently be realistic since that's the  
15 way he's characterized all the modeling has gone before.

16 MR. HAYNES: I think I've laid enough of a  
17 foundation, your Honor, for the witness to testify.

18 JUDGE PATTERSON: I thought he testified he  
19 couldn't make a calculation from the data that he reviewed.

20 MR. HAYNES: Well, he said he didn't calibrate,  
21 but he did testify that he used Kennecott's data in his  
22 model, and that's what we're basing this on.

23 MR. LEWIS: Well, there's nothing about what he  
24 did with that data; how he computed the data; what  
25 calculations he did. And he's already testified it's not

1 calibrated. He's already testified that calibration is a  
2 necessary function to derive any kind of result with any  
3 relevance to the Court, I believe, your Honor.

4 JUDGE PATTERSON: I'll allow him to go ahead and  
5 answer it if he can.

6 Q Dr. Prucha?

7 A That range, based on simulations I conducted, ranged from  
8 about 280 to over 3,000 g.p.m.

9 Q And the 280 to 3,000 g.p.m. is your range of uncertainty for  
10 this model based upon Kennecott's data?

11 A Effectively, yes.

12 Q Now, Dr. Prucha, in your review of the models prepared by  
13 Kennecott, did you also review a 2006 FEFLOW model?

14 A Yes.

15 Q And what is your understanding of the purpose of preparing  
16 the second model by Kennecott?

17 A The second model apparently was calibrated to this pump test  
18 at 084.

19 Q And is that the only change between the 2005 and 2006 model?

20 A They made a change to the boundary condition at the surface  
21 contact between the bedrock and the unconsolidated material.

22 Q And what was that change?

23 A A boundary condition, which changed it from a constant head  
24 boundary condition, where they'd specified a constant head  
25 to what they call a general head boundary condition, where

Page 1650

**NetworkReporting**

1-800-632-2720

1 they're specifying a head or a water level and a conductance  
2 term or a term that's used to define the flow between -- the  
3 resistance effectively between the unconsolidated material  
4 and the bedrock.

5 Q And how would that change affect the model results between  
6 the 2005 and 2006 FEFLOW models?

7 A The 2005 FEFLOW model -- and I'm not sure if I'm correct on  
8 this -- estimated 180 g.p.m. after three years. The 2006  
9 FEFLOW model estimated an upper bound mine inflow of 215  
10 g.p.m. or gallons per minute. And actually, you know, I'm  
11 going to make one more clarification. The model that I --  
12 the other model that was produced that I reviewed was a  
13 model that they adjusted the fault lengths in the north-  
14 south direction and got rid of faults in the east-west  
15 direction. And I think I may have to correct that that was  
16 what was calibrated to this model, where they based their  
17 reevaluation of this pump test data and used that as the  
18 basis for calibrating -- stating that the model was  
19 calibrated.

20 Q And in your view, was that appropriate?

21 A No. Because for this kind of model, it's not calibrated to  
22 the actual flow in the bedrock system. So for example, they  
23 developed another model that they claim is calibrated to the  
24 unconsolidated material, and they try to reproduce the  
25 observed groundwater flow directions and water levels. But

Page 1651

**NetworkReporting**

**1-800-632-2720**

1 in the bedrock they don't try to do that at all, because  
2 they didn't have any other bedrock wells other than these in  
3 this test.

4 Q Now, Dr. Prucha, did you review as part of your assignment  
5 here a 2005 baseline model for the unconsolidated quaternary  
6 deposit?

7 A Yes.

8 Q And how was the unconsolidated material model calibrated?

9 A That was calibrated at a steady-state level, and they used  
10 groundwater levels and base flow estimated from the stream  
11 gauges that are along the various stretches of streams.

12 Q And was the steady-state calibration one that was  
13 appropriate, as far as you know, for purposes of preparing  
14 such a model?

15 A I would say that it's calibrated at a very high level.

16 Q All right. Dr. Prucha, I put up on the screen Kennecott  
17 Exhibit 8, the environmental impact assessment, Appendix B-  
18 5, Page 6, which has text dealing with boundary conditions.  
19 What portion of this text was significant for you?

20 A I'm not sure that's the exhibit. Yeah, that's --

21 Q All right. We'll pass that exhibit. Dr. Prucha, you may  
22 have testified about this before, but what are boundary  
23 conditions in a model?

24 A Things like rivers, evapotranspiration where water is being  
25 pulled out by plants or soil evaporation, wells recharge,

1 which is derived mainly in this case through precipitation  
2 or rainfall, snowfall.

3 Q And for the model that was produced for the bedrock flow --  
4 excuse me -- the mine inflow in this case, what boundary  
5 conditions -- what would boundary conditions be for such a  
6 model?

7 A For the bedrock model, did you say?

8 Q Yes.

9 A Well, you would have boundaries laterally. What was used in  
10 the model were no-flow boundaries but --

11 Q Excuse me. Low-flow boundaries?

12 A No-flow boundaries, --

13 Q No-flow. Okay.

14 A -- where water is assumed not to flow in laterally. It all  
15 comes in from above.

16 Q And for purposes -- I'm going to -- I'm sorry. I got a  
17 little ahead of myself. I'm going to move back to the  
18 quaternary deposit model. What was used as a boundary  
19 condition for the quaternary model deposit -- the quaternary  
20 deposit model?

21 A They had recharge in at the upper boundary. They had -- the  
22 rivers like the Salmon Trout and the Yellow Dog were  
23 exchanging flows with the shallow groundwater.

24 Q And how is bedrock system characterized in this quaternary  
25 deposit model in terms of boundary conditions?

1 A In the 2006 quaternary deposit model? Is that the one  
2 you're referring to?

3 Q Yes.

4 A Yeah. That was -- took the estimated flows from the FEFLOW  
5 model, which is a separate model that simplified the  
6 boundary condition, which represents the contact between the  
7 unconsolidated material and the bedrock, and they took that  
8 estimated flux or flow at every -- at a few points in their  
9 model domain around the mine area and the tunnel area, and  
10 they imposed that as a flux on their unconsolidated model at  
11 those locations. And they calibrated -- they ran a  
12 transient model, where they used every year a new flux from  
13 that bedrock model that was calculated. And that seemed  
14 strange to me. I think the problem with that unconsolidated  
15 model was that it wasn't re-calibrated after a number of  
16 modifications were made, based on my review of the report.

17 Q Dr. Prucha, is recharge an important parameter for modeling  
18 groundwater systems?

19 A Yes.

20 Q And why is that?

21 A Well, typically, in models like this, there's a significant  
22 control on the groundwater and your ability to calibrate a  
23 model and on the -- it's one of the more sensitive  
24 parameters in the model.

25 Q Do ASTM standards apply to recharge in models?

Page 1654

**NetworkReporting**

**1-800-632-2720**

1 A I don't know the specific ASTM standard for recharge, but I  
2 think it is acknowledged that parameters like recharge and  
3 hydraulic conductivity can be adjusted in steady-state  
4 models, and you can end up with non-unique solutions. In  
5 other words, you can adjust either of those parameters and  
6 end up calibrating the model to observe levels and  
7 discharge, and you really don't get a unique set of  
8 parameters, which you're after to go predict. The idea --  
9 objective is to determine hydraulic conductivity parameters  
10 throughout the model so that you can calculate accurate  
11 velocities. But if it's uncertain in terms of what those  
12 values are, then this is this problem you get with  
13 steady-state calibrated models.

14 Q I put up on the screen Kennecott Exhibit 8, Appendix B-5,  
15 Figure 3, which is the bedrock geology of the Eagle Project  
16 area. Does this exhibit illustrate how recharge was handled  
17 in the Kennecott models?

18 A No.

19 Q Dr. Prucha, how, in your estimation, was recharge handled in  
20 the Kennecott model?

21 A I don't think there was sufficient basis for defining the  
22 number of zones and the values of recharge that were imposed  
23 on the model. And this again is a very important parameter  
24 in a model such as the unconsolidated deposit model.

25 Q Dr. Prucha, what is sensitivity analysis in modeling?

1 A It's a process where you adjust parameters or adjust model  
2 input and assess the sensitivity of the output. And there  
3 are really two types of sensitivity analyses that can be  
4 performed. One is kind of associated with the calibration  
5 process. And there's another process that I think is more  
6 important that I think was not done here, and it's the  
7 sensitivity that you would do -- a sensitivity analysis that  
8 you would do on predictive simulations.

9 Q And would you explain that for us, please?

10 A It's more important to do a sensitivity analysis on  
11 predictive simulation so that you can assess the uncertainty  
12 of your predictions based on range of uncertainty in your  
13 input parameters. This is described in an ASTM standard  
14 pretty well.

15 Q And how did Kennecott's models handle the sensitivity  
16 analysis?

17 A My understanding is that they're more oriented at the  
18 calibration process, and I'm not sure that they really used  
19 that information beyond performing that and identifying  
20 that things that -- you typically find when you simulate  
21 flows in, say, an unconsolidated aquifer, you'll typically  
22 find that parameters like recharge and hydraulic  
23 conductivity are the most important parameters governing  
24 your solution or your estimates of where the water table is  
25 and where it's discharging and how much.

Page 1656

**NetworkReporting**

1-800-632-2720

1 Q And did you find those -- that kind of discussion in the  
2 Kennecott models?

3 A No.

4 Q If you were modeling this groundwater flow regime, Dr.  
5 Prucha, would you have used such parameters in your  
6 sensitivity analysis?

7 A I would have conducted a sensitivity analysis of -- you  
8 know, associated with the predictive simulations that were  
9 done, and I think I would have referred to the ASTM  
10 standards on that. When you do sensitivity simulations, the  
11 ASTM standards have very clear guidelines in terms of  
12 identifying different types of sensitivities and how to  
13 document that.

14 MR. HAYNES: Your Honor, perhaps we could take a  
15 short break here. I want to make sure that the next set of  
16 exhibits are consistent with where we're going.

17 JUDGE PATTERSON: Okay.

18 MR. HAYNES: Thank you.

19 (Off the record)

20 JUDGE PATTERSON: Mr. Haynes, are we set?

21 MR. HAYNES: Yes, in just a few minutes.

22 Q Dr. Prucha, you testified about the 2006 model that you  
23 reviewed, that Kennecott FEFLOW model; is that right?

24 A The bedrock model, yes.

25 Q The bedrock model. Did the 2006 FEFLOW model include upper

1 bedrock layers in the model?

2 A Yes.

3 Q Did the code used for this model, as far as you can  
4 determine, allowed designation of discrete geological  
5 features in the model?

6 A Yes.

7 Q Did the 2006 model re-calibrate for current conditions from  
8 the 2005 model?

9 A Well, they didn't calibrate any of the bedrock models to  
10 actual site conditions. They only claimed to calibrate the  
11 2006 bedrock model, which they used FEFLOW -- the FEFLOW  
12 code for to this 084 well pump test in the bedrock.

13 Q And, Dr. Prucha, did the modelers for Kennecott, as far as  
14 you can tell, attempt to merge the unconsolidated and the  
15 bedrock models?

16 A No.

17 Q Now, did the Kennecott modelers attempt to predict drawdowns  
18 from mining in the groundwater flow regime --

19 A Can you --

20 Q -- in the bedrock model?

21 A Did they try and estimate the drawdown in the bedrock?

22 Q Yes.

23 A Yes, with the FEFLOW model.

24 Q And what was the drawdown that was predicted in the FEFLOW  
25 model?

1 A Well, it was equivalent to where they had their drains in  
2 the mine at the different levels. I don't remember off the  
3 top of my head what level that was but --

4 Q And in your view, does the bedrock model accurately predict  
5 drawdown?

6 A No.

7 Q Why not?

8 A It's very much based on the assumptions of the faults, their  
9 fault lengths, the vertical extent of the faults and how  
10 they connect with the upper bedrock and the overburden. I  
11 believe the assumptions that they had were very limited in  
12 terms of faulting. They did not consider the permeable  
13 dikes that -- you know, the brecciated zones around the  
14 dikes. They didn't consider the major water-conductive  
15 features that were mapped in the area.

16 Q Now, Dr. Prucha, did you attempt to model the mine inflow  
17 for this proposed Eagle Mine?

18 A I did.

19 Q And would you describe for Judge Patterson what you did for  
20 your model?

21 A Yes. As opposed to trying to develop a new model from  
22 scratch, I wanted to see what a more realistic range of the  
23 mine inflows would be, so I started with a model I believed  
24 was the more realistic model, which they claimed to be their  
25 upper bound model. That was the -- this 2005 version of the

1 model with faults imposed on it that were 1 to 2 kilometers.  
2 Those were short in terms of their extent laterally, but I  
3 believe they actually didn't extend those faults vertically  
4 through the upper bedrock, which really limits the amount of  
5 mine inflow to those faults. So I -- that's just a  
6 conceptual problem right upfront with that model. My new  
7 simulations were intended to extend more realistic  
8 assumptions in these -- in this FEFLOW model.

9 Q And what did you do?

10 A So I ran several simulations. One was starting with just  
11 extending the upper boundary condition at the contact of the  
12 upper bedrock and the unconsolidated material. They did not  
13 simulate any flow in the unconsolidated material, which I  
14 think was limiting. It was very presumptive to model that  
15 that way. I put an actual thickness of the unconsolidated  
16 material in there, which allows the model to calculate the  
17 amount of flow more realistically to -- from the  
18 unconsolidated material into the bedrock. And that was one  
19 scenario, where I think I came up with a better boundary  
20 condition. That was -- that boundary condition alone  
21 increased their upper bound estimate, which I thought was  
22 more realistic of the two they'd done before, from about 215  
23 gallons per minute to maybe about 280 gallons per minute.

24 The next several scenarios were devoted towards  
25 assessing the effect of vertically continuing their faults

Page 1660

**NetworkReporting**

**1-800-632-2720**

1 that they'd specified in the lower bedrock through the upper  
2 bedrock so that they stopped at the overburden or the  
3 unconsolidated material.

4 Q And, Dr. Prucha, why did you put those conditions into your  
5 model?

6 A Because it doesn't make sense to me to stop discrete  
7 water-conductive features that are more permeable in the  
8 lower bedrock right at this upper bedrock and lower bedrock  
9 contact.

10 Q All right. And what else did you do for your model?

11 A Well, in addition to putting in those -- this extension  
12 vertically on the fault, I extended them laterally. And  
13 probably the most significant adjustment, which is well  
14 within reasonable bounds of adjusting parameters, was I  
15 increased the permeability of the actual fault zone by a  
16 factor of 10, and that one particular simulation led to over  
17 3,000 g.p.m. mine inflow. So that's where I came up with  
18 this range of 280 to 3,000. If you increase the fracture --  
19 fault permeability, it would be even greater inflows.

20 Q And would increasing the fault permeability be an ordinary  
21 task for such a model?

22 A Yes. The uncertainty associated with major water-conductive  
23 features in the area could easily have hydraulic properties  
24 that are within what I simulated.

25 MR. HAYNES: Sorry, Judge. We're having one of  
Page 1661

**NetworkReporting**

**1-800-632-2720**

1 those electronic moments again.

2 Q Now, Dr. Prucha, we've put up on the screen Proposed  
3 Kennecott Exhibit 399, which is a technical memorandum  
4 relating to additional mine inflow predictions and  
5 sensitivity analysis. Do you see that?

6 A Yes.

7 Q Have you had a chance to review this document?

8 A Yes.

9 Q And what is it that you understand this document to try to  
10 do?

11 A Well, it's a new model that was developed very recently. It  
12 has a number of changes to it compared to the previous  
13 Fletcher Driscoll and Golder models for the unconsolidated  
14 material.

15 Q And what changes are those?

16 A Well, they changed the number of model layers to represent  
17 the unconsolidated aquifer system.

18 Q Is that appropriate?

19 A I think it's appropriate to use a new set of model layers.  
20 But this model is similar to the previous ones and the  
21 problems that I saw with the previous ones, which were it  
22 didn't consider simulating the whole area of the bedrock  
23 that's been de-watered all in one model. So you're not  
24 forced to try and guess what the impact of mine dewatering  
25 is as it crosses into the unconsolidated material. So this

Page 1662

**NetworkReporting**

1-800-632-2720

1 model only simulates the unconsolidated material.

2 Q And what is the effect on the model outputs of such a  
3 simulation?

4 A I'm sorry. Could you rephrase that?

5 Q What is the effect on the model outputs of such a limited  
6 simulation?

7 A Well, when I reviewed this report, my sense is that the  
8 model output is somewhat uncertain like the previous models,  
9 because it's based on the same characterization and  
10 conceptual model that was presented before. And I don't see  
11 that this is any real improvement over the former models for  
12 the unconsolidated material.

13 MR. HAYNES: Your Honor, I'm going to go to  
14 Kennecott Exhibit 591. But again because of a technical  
15 glitch, we don't have the whole exhibit in our system. And  
16 I've asked Mr. Lewis if he would be -- if he could be  
17 assisted to put it up on the screen, and he's assented. So  
18 we're going to make a small technical change here.

19 JUDGE PATTERSON: Okay.

20 (Off the record)

21 Q Now, Dr. Prucha, we've had put on the screen -- and I  
22 appreciate Mr. Lewis' indulgence here -- Kennecott Exhibit  
23 591, which is labeled "Technical Memorandum" dated April 1,  
24 2008, and it's a draft. The subject is "Quaternary  
25 Groundwater Model." Do you see that?

Page 1663

**NetworkReporting**

**1-800-632-2720**

1 A Yes.

2 Q Have you had a chance to review this proposed exhibit?

3 A Yes.

4 Q And what is your understanding of what this -- what is  
5 contained in this document?

6 A Well, this is the -- an updated, very recent model for the  
7 unconsolidated flow system.

8 Q And have you had a chance to review it?

9 A Yes.

10 Q And does this quaternary groundwater model improve or not  
11 improve the previous models that you've testified about?

12 A In terms of the drawdown estimates?

13 Q Yes, in terms of drawdown.

14 A I would say it's equally as uncertain as the previous models  
15 developed.

16 Q And again, by "drawdown" -- just for Judge Patterson's  
17 purpose -- edification, what do you mean by "drawdown"?

18 A In the unconsolidated material above the actual mine  
19 dewatering that's occurring, it's going to be drawing water  
20 from that unconsolidated material. So the water level in  
21 the aquifers above the bedrock will start to -- the aquifer  
22 levels will actually start to decline, and the drawdown is  
23 simply the difference between what they start at and where  
24 they end at.

25 MR. HAYNES: Now, if we could, go to figure 25 of  
Page 1664

**NetworkReporting**

— 1-800-632-2720 —

1 this exhibit, which is about three pages from the end.

2 Thank you.

3 Q Dr. Prucha, Figure 25 of Kennecott Exhibit 591 is labeled  
4 "Simulated Head Change in Layer 2 Calibration Scenario 2."  
5 Can you explain that designation for us?

6 A This is a plot just showing the change in the groundwater  
7 levels and the de-aquifer. The red indicates a drop in the  
8 water level, and the greenish color there is an increase in  
9 the groundwater level.

10 Q Now, I noticed that, for purposes of explaining this -- the  
11 contour lines on this figure, the red contour lines are in  
12 positive integers, and the green contour lines are in  
13 negative integers.

14 A Right.

15 Q So the positive integers mean a drop from existing?

16 A Right.

17 Q And the green and the negative integers means a rise in  
18 existing; correct?

19 A Right.

20 Q So for the red contour lines, does this Figure 25 show the  
21 orebody?

22 A It does.

23 Q And would you point that out with your pointer, please?

24 A It's in this area right here (indicating).

25 Q All right. And it seems to be in the center of all of the

Page 1665

**NetworkReporting**

1-800-632-2720

1 red circles; correct?

2 A Yes.

3 Q And the red contour lines start at 0 -- I'm sorry -- start  
4 at 0.5, and then they increase in value to what around the  
5 orebody?

6 A 8.

7 Q And what does the "8" then signify?

8 A The drop in the water levels in that aquifer.

9 Q And this would be around the orebody?

10 A That's right.

11 Q So the new model prepared April 1st by GeoTrans suggests  
12 that there would be a drawdown from the mine operations of 8  
13 feet in the water levels around the orebody?

14 A That's right. And this is for the case where they only  
15 simulate 60 gallons per minute.

16 Q And so under the simulation that you derived from your  
17 models of between 280 and 3,000 gallons per minute, would  
18 you expect the drawdown to be more or less from what this  
19 model shows?

20 A Substantially more.

21 Q Now, Dr. Prucha, if you can sum up your concerns with the  
22 modeling that was performed for Kennecott for this case,  
23 what would those concerns be in summary?

24 A I believe that models developed are inadequate to predict  
25 mine inflows because they weren't -- the underlying

1 conceptualization and characterization was inadequate. I  
2 believe that they substantially underestimated the amount of  
3 mine inflow, and I believe that they substantially  
4 underestimated the impacts to the unconsolidated aquifer  
5 zones and the stream flow in the Salmon Trout River.

6 MR. HAYNES: Dr. Prucha, thank you. I have no  
7 further questions at this time.

8 MR. EGGAN: Your Honor, I think the ball passes to  
9 me at this point. I would inquire of the Court's  
10 perspective on this. I could begin. I probably have two  
11 and a half hours with Dr. Prucha. It's about almost --  
12 well, it's five after 4:00.

13 JUDGE PATTERSON: Right.

14 MR. EGGAN: What I would propose to do is go back  
15 and prune out some of the information that has already been  
16 elicited from Dr. Prucha that I probably would have asked  
17 about. Do you mind if we end now and pick up with him  
18 tomorrow at 8:30?

19 JUDGE PATTERSON: No, on that assurance, certainly  
20 not at all.

**Network**Reporting

1-800-632-2720

1                   Lansing, Michigan  
2                   Thursday, May 8, 2008 - 8:32 a.m.  
3                   MR. EGGAN: Good morning, Judge. How are you this  
4 morning?  
5                   JUDGE PATTERSON: Good. I'm fine.  
6                   MR. EGGAN: We are ready to go when you are.  
7                   JUDGE PATTERSON: I'm ready.  
8                   MR. EGGAN: All right. I think Mr. Haynes has a  
9 housekeeping matter he wants to --  
10                  MR. HAYNES: Yes, your Honor. A housekeeping  
11 matter in terms of exhibits, I would like to move the  
12 admission of the slides that Dr. Prucha identified yesterday  
13 from Plaintiff's Exhibit 63. And those slides are slide 13,  
14 slide 14, and slide 11.  
15                  JUDGE PATTERSON: I think you said "Plaintiff's  
16 exhibit." You mean Petitioner's?  
17                  MR. HAYNES: Yes, Petitioner's Exhibit 63.  
18                  JUDGE PATTERSON: Okay. I assumed that, but --  
19                  MR. HAYNES: Yeah. Sorry. I misspoke.  
20                  MR. LEWIS: I just don't recall what they are,  
21 your Honor.  
22                  JUDGE PATTERSON: I don't either, frankly. I was  
23 hoping you would.  
24                  MR. EGGAN: Oh, just trust us on that.  
25                  MR. HAYNES: I apologize, your Honor.

1 MR. LEWIS: I suggest maybe at the break or lunch  
2 Mr. Haynes can show me and Mr. Reichel what they are and  
3 take of it after that if that's agreeable.

4 JUDGE PATTERSON: Is that all right?

5 MR. HAYNES: That's fine.

6 JUDGE PATTERSON: Okay.

7 MR. HAYNES: Thank you, your Honor.

8 JUDGE PATTERSON: Okay.

9 MR. EGGAN: Are you comfortable, Mr. Prucha?

10 THE WITNESS: Yes.

11 ROBERT H. PRUCHA, PH.D.

12 having been recalled by the Petitioners:

13 DIRECT EXAMINATION

14 BY MR. EGGAN:

15 Q Doctor, at this point you've been talking about your  
16 hydrologic assessment of mine dewatering and the impacts as  
17 they relate to the mine permit. I'd like to turn our  
18 attention now to those very same issues as they relate to  
19 the Part 31, groundwater discharge permit process.

20 A Okay.

21 Q So with that as our overall theme, let's go ahead. Tell the  
22 hearing officer, if you will, some of the information you  
23 have reviewed so that you are able to talk about the  
24 groundwater discharge permit. Did you review the permit  
25 application?

1 A I did, yes.

2 Q What else did you look at?

3 A I looked at the permit, the groundwater permit, MDEQ

4 groundwater permit. I looked at modeling done by --

5 Q Well, that would have been my -- that would have been really

6 the focus.

7 A Right.

8 Q We talked about you having looked at the groundwater

9 discharge permit application that was submitted by the

10 company.

11 A Right.

12 Q Did that include all of the appendices that were attached to

13 that?

14 A That included all -- yes.

15 Q And I think there was some modeling done in that process.

16 A That's right; yes.

17 Q It was a hydrologic investigation, if you will, --

18 A Yes.

19 Q -- done by the company. You looked through all that?

20 A Yes.

21 Q Now, there's been some new modeling, some new work done.

22 Have you looked at the new work that has been done by the

23 company in preparation for this hearing?

24 A Yes.

25 Q Did you take a look at the Department of Environmental

1 Quality's file materials related to groundwater and  
2 hydrologic issues?

3 A Yes.

4 Q And what about the reports that were submitted by the  
5 company's hydrogeologists and hydrologists related to the  
6 groundwater discharge issue?

7 A Yes.

8 Q Now, I want to -- without belaboring it, I'd like to review  
9 a couple of issues that you talked about yesterday with Mr.  
10 Haynes pertaining to the mine permit and the hydrologic  
11 investigation. You talked about professional standards and  
12 guidelines and key steps that really need to be followed as  
13 one is doing a hydrologic investigation. Do the same  
14 standards, if you will, apply to the investigation that  
15 we're going to talk about now with respect to the  
16 groundwater discharge permit?

17 A Yes.

18 Q So I guess my -- what I'm getting at is, rather than cover  
19 the whole area of ASTM standards and that kind of thing,  
20 those same rules apply here as we're considering this  
21 permit?

22 A Yes.

23 Q Now, you talked yesterday about some steps, and essentially  
24 they are steps to investigating groundwater flow. And I  
25 want to talk about groundwater flow as we begin this

Page 1675

**NetworkReporting**

— 1-800-632-2720 —

1 morning. And you talked about these steps. Can we talk  
2 about those key steps again? What are those steps, the key  
3 steps in doing a hydrologic investigation as you would do?  
4 A It starts with collecting the right data, characterizing the  
5 system, using that data and then developing a good, sound  
6 conceptual model or alternative hypotheses, and developing  
7 models that are based on that conceptualization.

8 Q Now, Dr. Prucha, I have in my very poor handwriting, written  
9 these steps here on this dry-erase board. Okay? And I just  
10 want to make sure that we cover these three steps that you  
11 have talked about and you talked about yesterday for a  
12 hydrologic investigation. You talked about the collection  
13 of accurate data. Why is that so important in a hydrologic  
14 investigation?

15 A Well, you need to establish what information exists in a  
16 subsurface and the correct location. You need to have data  
17 there to make any estimates of what's going on in terms of  
18 groundwater flow.

19 Q So when we talk about the collection data, what we're really  
20 doing is, we're trying to find out what we can about the  
21 site so that we can begin to decide what the groundwater  
22 flow is going to look like and where the water is going to  
23 go?

24 A Yes.

25 Q Now, talk about this characterization step because I think

1 that's an important part of the steps.

2 A Typically when I look at data from the site I look to see  
3 how that data has been interpreted, whether the correct  
4 hydraulic tests have been performed, the interpretation of  
5 that is consistent with the data collected. I think that's  
6 an important step in terms of developing a sound  
7 conceptualization.

8 Q Okay. So, again, this is an investigation of the site of  
9 the area so that you have a good handle on what the site  
10 really looks like hydrologically?

11 A Right.

12 Q Okay. Now, what is this process of conceptualizing the  
13 flow? What does that really mean?

14 A That means taking the interpretations that you've made  
15 through your characterization of, for example, the  
16 groundwater flow conditions, the geologic conditions and  
17 putting that into a consistent diagram that shows clearly  
18 where the water flows from, how it enters the system, how it  
19 flows through the system and then where it discharges.

20 Q Are these three -- these three steps, are they  
21 conditioned -- are they precedent to doing modeling?

22 A Yes.

23 Q Okay. Do these three -- and I don't want to put words in  
24 your mouth. I don't want to be leading you. Okay? But do  
25 these three steps -- are they critical before you really can

- 1 begin modeling?
- 2 A Yes.
- 3 Q It's got the building blocks, if you will?
- 4 A Yes.
- 5 Q Okay. Let's talk about modeling now. Let's assume we've
- 6 collected accurate data, which is critical. We have
- 7 characterized the groundwater flow and we've gotten a sense
- 8 of the characterization and then we've conceptualized the
- 9 flow, and now we're ready to begin modeling. How do you
- 10 construct the model?
- 11 A From the conceptual model that you've developed in step 3,
- 12 there, you construct a model where you identify the aquifers
- 13 that the groundwater is going to flow in. You've defined
- 14 external boundary conditions which control the flow in and
- 15 out of the system, and that's the basic step.
- 16 Q Is that the first step?
- 17 A Yes.
- 18 Q Okay. What's the second step, this calibration issue?
- 19 A The second step is your efforts to reproduce with that model
- 20 the actual site observations that you've collected from the
- 21 field, for example, groundwater elevations or flows that
- 22 have been measured.
- 23 Q Okay. And is that the calibration phase?
- 24 A That's right.
- 25 Q Okay. Give us an analogy for calibration. Why is this step

1 important?

2 A Well, this is where there are two types of calibration and  
3 it's important to distinguish between the two. One is  
4 called a steady-state calibration where it is sort of an  
5 initial step to calibration, but it's not as credible as a  
6 transient-state calibration which you would do. And the  
7 difference is basically that in a transient calibration you  
8 are trying to reproduce the time bearing conditions in the  
9 model.

10 Q Now, there's a third step: Verify the current system  
11 behavior. How do you do that?

12 A Well, if you do it --

13 Q And I should say, why is that important and how do you do  
14 that?

15 A Well, if you have developed a transient-state model and  
16 calibrated it, this next step is considered demonstrating --  
17 it's a demonstration of -- that shows that the calibrated  
18 model in step 2 there -- it adds more credibility to that.  
19 It verifies that under one set of conditions that you've  
20 calibrated to, that the model reproduces a second set. And  
21 that's a very good demonstration that your underlying  
22 conceptual model for the system is closer to reality than an  
23 alternative one that you may have had.

24 Q So this verification of current system behavior, this is  
25 just another check that you have to make sure that you're on

1 the right track with modeling?

2 A That's right.

3 Q Okay. Now what about -- what about step number 4 which is  
4 to run predictive simulations? What is that?

5 A Well, this is a step that is really the objective of the  
6 modeling, and it's to predict what will happen when you  
7 change the conditions of the hydrologic system. So, for  
8 example, if you start pumping a well and you want to know  
9 what the impacts of that pumping are on the system, this is  
10 where you would run a predictive simulation. It's trying to  
11 assess what happens when you change the flow conditions of  
12 the calibrated model.

13 Q Now, let me ask you something. We've talked about modeling.  
14 We've talked about these three steps. If you don't do steps  
15 1, 2 and 3, what does this modeling look like? If you don't  
16 do steps 1, 2 and 3 and get it right, what does the modeling  
17 end up looking like?

18 A Well, in effect, there's no point to doing that modeling  
19 because you'll be simulating a condition that's not  
20 realistic. So the modeling won't be right.

21 Q In effect, what you're talking about is, garbage in; garbage  
22 out?

23 A That's right.

24 Q Now, let's talk for a moment to make sure where we were  
25 going. Why are these steps important in the context of this

1 particular groundwater discharge permit? Why were these  
2 steps important?

3 A Because predictive models have been developed to estimate  
4 the effects of the discharge on the groundwater system. And  
5 it's a complex system. Simple tools don't work to assess  
6 that. And so this whole series of points or steps applies  
7 as it did in the mine permit.

8 Q Well -- and thank you for that answer, but let me ask it in  
9 maybe a slightly different way. Why does the Department of  
10 Environmental Quality need modeling to decide this  
11 particular permit?

12 A To assess what the predictive model -- you know, a  
13 prediction is -- to assess the prediction that's put forth,  
14 the model is the way that you would demonstrate or show that  
15 your estimate is correct.

16 Q Okay. Can you tell from the information that you have  
17 looked at whether the Department of Environmental Quality  
18 did its own modeling?

19 A I can't tell.

20 Q If they didn't do their own modeling, what did they rely on  
21 based on what you looked at?

22 A The reports as submitted by Kennecott.

23 Q The company's modeling?

24 A That's correct.

25 Q Now, did you do any of your own modeling in this situation,  
Page 1681

**NetworkReporting**

**1-800-632-2720**

1 in this case?

2 A I did for the bedrock flow model file that was provided.

3 Q Okay. Talk to our hearing officer about the modeling that  
4 you did so that we have an understanding. Did you go out to  
5 the site and collect your own -- you know, sink your own  
6 wells? How did you handle this?

7 A I used the model input as provided and developed by the  
8 mine, Kennecott. And I simply made adjustments to that  
9 model that I believe are more realistic. So I used their  
10 input and model and as we received it.

11 Q You used -- essentially used the company's data --

12 A That's right.

13 Q -- and the information that they had gathered --

14 A Right.

15 Q -- to create your own -- your own model?

16 A Yes.

17 Q Okay. Did you apply this conservative approach that you and  
18 Mr. Haynes talked about yesterday? Did you use a -- what  
19 scenario did you use so that Judge Patterson knows a little  
20 bit more about the modeling you did?

21 MR. LEWIS: I don't mean to interrupt the direct,  
22 but it sounds like the same subject matter we covered at  
23 some depth with Mr. Haynes yesterday.

24 MR. EGGAN: We did discuss this with Mr. Haynes  
25 and "asked and answered" is going to be a welcome objection.

Page 1682

**NetworkReporting**

— 1-800-632-2720 —

1 I have no problem with it. But that was late in the day  
2 yesterday.

3 Q I just want to make sure that Judge Patterson has a sense  
4 for the work that you did in deciding some of the issues  
5 we're going to talk about now with respect to inflow. So,  
6 again, what we're looking for, is you applied their --  
7 essentially used their data, the data they had created to do  
8 your own model?

9 A Yes. I mean, that was effectively these top three steps.  
10 It was, you know, the data they collected, characterized and  
11 conceptualized, the model that they developed based on that.  
12 And I simply extended that to include what I think are more  
13 realistic conditions at the site.

14 Q Okay. Now, when you say "more realistic conditions," why  
15 are your conditions more realistic than theirs, I guess is  
16 maybe the essence of the question.

17 A Because I didn't see information on the faulting as I --  
18 implemented in their model the way I saw that it would  
19 likely be implemented in a model if I were to develop the  
20 modelings.

21 Q Okay. You talked about faulting, and I think you had  
22 mentioned yesterday these dikes, perched aquifers and that  
23 sort of -- that is the issue we're talking about?

24 A Yes.

25 Q And those are the more realistic calculations that you built

1 into the model that you did?

2 A Yes.

3 Q Now, so that Judge Patterson is aware of where we're going  
4 here, I'm going to ask to have the wastewater treatment plan  
5 scheme put on the screen, and then you and I can talk about  
6 that for a minute. Okay?

7 MR. EGGAN: Can I have Bates number 101716? Your  
8 Honor, I've provided a book that should be on your table.  
9 And the document that we're looking for is under Tab 1.

10 JUDGE PATTERSON: Tab 1?

11 MR. EGGAN: Tab 1. Your Honor, are you at Tab 1?

12 JUDGE PATTERSON: I am.

13 MR. EGGAN: And, Mr. Reichel, are you at Tab 1  
14 also? And, Mr. Lewis, Tab 1?

15 MR. LEWIS: Yes.

16 MR. EGGAN: All right. I think we can do this one  
17 the old-fashioned way, Judge.

18 JUDGE PATTERSON: Okay.

19 MR. EGGAN: Okay?

20 Q Now, Dr. Prucha, maybe I'll come up and come close to you.  
21 Now, this is Figure 7.1 from the Kennecott Eagle Minerals  
22 application. And it is -- "Monitoring Well Data" is what  
23 it's titled. But what it is, is --

24 MR. EGGAN: Your Honor, I just want to make sure  
25 you're in the right place. I'm looking at --

Page 1684

**NetworkReporting**

**1-800-632-2720**

1 JUDGE PATTERSON: Yeah, I'm lost. I've got Tab 1,  
2 but I have no idea where you are within that.

3 MR. EGGAN: There it is, right there (indicating).

4 Q Okay. Let's look at this together, Dr. Prucha.

5 MR. EGGAN: And, again, for those who have the  
6 tabbed book, this is Tab 1.

7 Q Now, as you can see, Dr. Prucha, the main elements of the  
8 wastewater treatment system that they have created are the  
9 contact water basins here (indicating). See them here --

10 A Yes.

11 Q -- down on the lower left-hand side. Then here (indicating)  
12 in the middle is the wastewater treatment plant.

13 A Yes.

14 Q And then from the wastewater treatment plant, the next basic  
15 element is the treated water infiltration system.

16 A Yes.

17 Q Okay? So those are the basic elements of the wastewater  
18 treatment system that has been generated or created by  
19 Kennecott; am I right?

20 A Yes.

21 Q Now, as I understand it, the wastewater treatment system  
22 that the company is presented is based on -- in part on the  
23 inflow that's going to be coming into the system. Can you  
24 explain that?

25 A Well, the inflow from the mine dewatering will be routed to

Page 1685

**NetworkReporting**

1-800-632-2720

1 this system, and there were two estimates for that.

2 Q Okay. Well, we're going to talk about what their estimates  
3 are in terms of inflow in a minute.

4 A Okay.

5 Q I just want to make sure I've got an understanding. The  
6 inflow that we have been talking about, the inflow from  
7 mining operations, the wastewater, is going to be going up,  
8 and it's going to go into these contact water basins where  
9 it's going to remain; am I right?

10 A Yes.

11 Q And then what's going to happen?

12 A Then it will go to the wastewater treatment plant, and that  
13 will be routed to the TWIS, the treated water --

14 Q We call it the TWIS; the treated water infiltration system?

15 A Right.

16 Q Okay. Now, what is the impact on -- of flow, of inflow on  
17 this system?

18 A It controls the design, I mean, the sizing of each of these  
19 units or components.

20 Q Okay. So that the system was based, at least by the  
21 company, on certain assumptions and sized its treatment  
22 facilities based on those assumptions?

23 A Yes.

24 Q And one of those assumptions was inflow?

25 A Yes.

1 Q Okay. What happens if those assumptions are not correct?

2 MR. LEWIS: Objection; foundation, your Honor. I  
3 think this question presumes this witness has some knowledge  
4 of the wastewater treatment system itself, how it will work  
5 and so forth, and there's no foundation for that. He's a  
6 groundwater modeling person, as I understand it.

7 MR. EGGAN: He is a groundwater modeling person,  
8 your Honor, but I think he does have some basic knowledge of  
9 this system and how it's supposed to work.

10 Q Are you competent to answer that question, what happens if  
11 there's -- if the assumptions are incorrect?

12 A Well, the sizing of these would --

13 MR. LEWIS: Well, just a minute. Same objection.  
14 The witness' view on his competence has no relevance here,  
15 your Honor. Again I don't think there's any foundation for  
16 him to offer any opinions which presume knowledge as to the  
17 design, construction, operation of the wastewater treatment  
18 plant. And I think he's being asked to do so.

19 Q Do you have an understanding the company has made estimates  
20 about the capacity of this system?

21 A Yes.

22 Q And we're going to be talking about that capacity in a few  
23 minutes, but do you have an opinion as to what will happen  
24 to the system generally if those assumptions are incorrect?

25 MR. LEWIS: Same objection, your Honor.

1 MR. EGGAN: Your Honor, I think this witness can  
2 answer. It's a basic question. If there's too much water,  
3 the system isn't going to be able to handle it. I think  
4 that's the essence of what he's going to say and we'll move  
5 on.

6 MR. LEWIS: There's no foundation for this witness  
7 knowing what the design capacity of this system is, your  
8 Honor.

9 MR. EGGAN: Well, I think I'll be showing that in  
10 about a minute.

11 MR. LEWIS: Well, we'll see, but it hasn't  
12 happened yet, Mr. Egan. So I'm afraid I have an objection  
13 to foundation.

14 MR. EGGAN: Okay.

15 JUDGE PATTERSON: Yeah, I don't think there's been  
16 a proper foundation yet.

17 Q Do you have an understanding of the design capacity that the  
18 company has decided upon for the system?

19 A What they used as the basis for the design?

20 Q Yes.

21 A Yes.

22 Q Okay. And where does that information come from?

23 A Discharge application permit -- or permit application.

24 Q Okay. Let's take a look at that right now. Let's talk for  
25 a minute about the company's estimates of inflow, and then

1 we'll go back to my question.

2 MR. REICHEL: Excuse me, Counsel. Since this is  
3 being projected up, could you identify for the record what  
4 you're asking to look at?

5 MR. EGGAN: Yes; yes. This is page 14 of the  
6 application. It is from MDEQ Exhibit 141.

7 MR. REICHEL: Thank you.

8 MR. EGGAN: And it is Tab 2 among the materials I  
9 gave you this morning.

10 MR. REICHEL: Thank you.

11 MR. EGGAN: Okay?

12 Q Now, looking at this page, we're going to go through a  
13 number of figures that the company has estimated, and we'll  
14 get to the figure that Mr. Lewis was concerned about in a  
15 moment. Does the company provide an estimated inflow rate  
16 into the system?

17 A Yes.

18 Q And what is that estimate based on this exhibit?

19 A They have two: 75 gallons per minute and an upper bound  
20 inflow rate of 215 gallons per --

21 Q Okay. We're going to get to that in a minute. What is  
22 the -- you said the estimated inflow rate into the system is  
23 75 gallons per minute?

24 A Yes.

25 Q Okay. Now, you talked, then, about an upper bound of

Page 1689

**NetworkReporting**

1-800-632-2720

1 inflow. Where is that -- where is that on this document?

2 A It's in the first bullet, second sentence.

3 Q Okay. And let's read that together. The upper bound  
4 estimated inflow rate is approximately 215 gallons per  
5 minute.

6 A Yes.

7 Q And this is what the company is estimating --

8 A Yes.

9 Q -- in the documents that they provided to the Michigan  
10 Department of Environmental Quality.

11 A Yes.

12 Q Now, what is the inflow rate in gallons per minute that the  
13 company itself used to size the wastewater treatment plant?

14 A That's in the second bullet. It's 250 gallons per minute.

15 Q And let's read that together. "With the design basis mine  
16 inflow rate of 250 gallons per minute, the water balance for  
17 the site shows that on an average discharge rate" -- so what  
18 we're talking about here is the design basis inflow is 250  
19 gallons a minute?

20 A Yes.

21 Q Okay. What about this (indicating) line? And this is the  
22 first bullet in this document. "The design basis in  
23 developing the water balance for the project and sizing the  
24 wastewater treatment plant assumed an inflow rate to the  
25 mine of 250 gallons per minute"?

Page 1690

**NetworkReporting**

**1-800-632-2720**

1 A Yes.

2 Q So to answer Mr. Lewis' question, we do know what the  
3 projected design inflow rate was, and that's 250 gallons per  
4 minute?

5 A Yes.

6 Q What is the permit maximum under this document?

7 A That was listed as 504 gallons per day, which is 350 gallons  
8 per minute.

9 Q Okay. I'm looking at this (indicating) figure here with the  
10 third bullet. It says, "The wastewater treatment plant will  
11 be sized to accommodate up to 350 gallons per minute in  
12 treatment capacity to accommodate peak stormwater runoff  
13 events." What does that mean?

14 A Well, in the local area water will run off of the surface  
15 and be captured by the treatment system, and that was sized  
16 up to accommodate that.

17 Q Sir, I have shown you -- I am now projecting on the screen  
18 MDEQ Exhibit 141.

19 MR. EGGAN: It's Tab 3 for those of you who have  
20 the tabbed document. Okay?

21 Q And what I'm going to ask you to look at on this document,  
22 Mr. Prucha, is this reference -- do you know where this  
23 comes from, by the way -- where this document comes from?

24 A I believe this is the management plan.

25 Q Yes. This is page 47 of the company's application for a  
Page 1691

**NetworkReporting**

— 1-800-632-2720 —

1 groundwater discharge permit.

2 MR. EGGAN: And, again, it's MDEQ Exhibit 141, Tab  
3 3, for those of you who have the tabbed document.

4 Q And what I'd like to look at is paragraph 7.2.2 on this  
5 page. Okay? Does that tell us anything -- does this tell  
6 us anything about the designed flow rate for the treated  
7 water infiltration system?

8 A Yes. It says that it's going to be designed for a flow rate  
9 of at least 400 gallons per minute.

10 Q Okay. Thank you.

11 MR. EGGAN: Your Honor, at this time I would like  
12 to offer the documents that are identified in Tabs 1, 2 and  
13 3, and those documents are MDEQ Exhibit 141, Figure 7.1,  
14 MDEQ Exhibit 141, which is page 14 of the application, and  
15 MDEQ Exhibit 141 page 47 of the application.

16 MR. LEWIS: No objection.

17 MR. REICHEL: No objection, your Honor. I think  
18 actually the MDEQ Exhibit 141 should be admitted in its  
19 entirety.

20 MR. EGGAN: I'm happy to admit MDEQ Exhibit 141 in  
21 its entirety, your Honor.

22 JUDGE PATTERSON: Okay. Mr. Lewis, you don't have  
23 a problem with that, I assume?

24 MR. LEWIS: No.

25 JUDGE PATTERSON: Okay.  
Page 1692

1 (Respondent's Exhibit 141 received)

2 Q Okay. We've talked about these various rates, and we're  
3 going to get back to the rates that were predicted in a  
4 minute and your perspective on what a more reasonable rate  
5 will be. But if the inflow rates are higher than the  
6 designed capacity of the facility, what will be the impact?

7 A It may have to be redesigned.

8 Q Okay. Let's go back, then, to the first document. I want  
9 to particularly focus your attention on the TWIS at this  
10 point -- okay? -- and talk to you about the configuration of  
11 the TWIS based on your observations and the inflow rates  
12 that are going to happen. You and I talked about a concern  
13 over the configuration itself, how it's -- the direction it  
14 is configured on this diagram. Can you talk to Judge  
15 Patterson about that and explain what your perspective is on  
16 that?

17 A The orientation of the TWIS or treated water infiltration  
18 system is oriented with the long axis heading off to the  
19 north --

20 Q Mr. Prucha, why don't you get out and get up and walk over  
21 to the document and show us with your pointer?

22 A The TWIS is oriented its long axis in this (indicating)  
23 direction to the northwest. And the presumed flow is to the  
24 northeast. I believe that orientation is probably taking  
25 advantage of that assumption in its design.

Page 1693

**NetworkReporting**

**1-800-632-2720**

1 Q Okay. And if your analysis is correct, is there going to  
2 need to be any change in the TWIS in the orientation?

3 A I believe that should be considered, yes.

4 Q All right. Well, tell the court what that consideration  
5 would be and what the result might be.

6 Q If the flow direction from the TWIS is not primarily to the  
7 northeast, you may end up getting more mounding or mounding  
8 effects that are building up over each other. This is an  
9 efficient -- if the groundwater is flowing to the northeast,  
10 this is an efficient orientation, but if, in effect, it's  
11 more oriented towards the east or southeast, then this may  
12 not be as an efficient way of introducing the water into the  
13 groundwater system. The mounding would be affected.

14 Q Okay. Now let's get back to the inflow issue and the  
15 company's predictions as to inflow. And I have created a  
16 non-electronic old-school way of sort of presenting this  
17 issue to Judge Patterson. Let's talk about this. Okay.  
18 Let's go through this again, Dr. Prucha, to talk about the  
19 information that has been provided by the company and which  
20 has been approved by the MDEQ. And these are inflows,  
21 aren't they?

22 A Yes.

23 Q Okay. And we can see from looking at this exhibit, Exhibit  
24 141, that the estimated inflow rate that the company has  
25 used and which has been permitted by MDEQ is 75 gallons per

Page 1694

**NetworkReporting**

1-800-632-2720

1 minute. Based on your analysis and the work that you did,  
2 what conclusion do you reach about what the estimated inflow  
3 rate will be?

4 MR. REICHEL: Objection for the record, your  
5 Honor. Counsel's misstatement mischaracterized in a couple  
6 of respects. The status of this, I believe he asserted that  
7 the DEQ has approved, quote, "the information presented."  
8 He also misstated -- there's no foundation that the DEQ in  
9 the permit has specifically approved the estimated inflow  
10 rate. I don't think either of those -- there's any  
11 foundation for either of those contentions. I think what  
12 the DEQ approved is reflected in the permit, --

13 MR. EGGAN: Okay.

14 MR. REICHEL: -- not every word in the  
15 application.

16 MR. EGGAN: If the MDEQ wishes to reject these  
17 numbers, it should say now, and maybe we can stop the  
18 proceedings.

19 MR. REICHEL: That's not the point, Counsel. I'm  
20 simply stating that what the DEQ approved is reflected in  
21 the text of the permit. I don't think it is accurate or  
22 there is a foundation to say that the DEQ approved every  
23 word, every figure in the application.

24 MR. EGGAN: Well, I'll have an opportunity to  
25 examine MDEQ witnesses on whether they agree with these

Page 1695

**NetworkReporting**

1-800-632-2720

1 figures or don't agree with these figures, and maybe we  
2 should just leave it at that. Let me rephrase.

3 MR. REICHEL: Thank you.

4 JUDGE PATTERSON: All right.

5 Q From the company's application we know what their basic  
6 estimates were --

7 A Yes.

8 Q -- in gallons per minute of inflow, don't we?

9 A Yes.

10 Q Okay. And looking at this exhibit we can see that, "The  
11 company's expected inflow rate" -- and I'm reading this.  
12 "The company's expected inflow rate of water into the mine  
13 is going to be approximately 700" -- excuse me -- "75  
14 gallons per minute."

15 A Yes.

16 Q What do they say about the upper bound inflow?

17 A 215 gallons per minute.

18 Q Okay. And what do they say about the rate used to size the  
19 wastewater treatment plant?

20 A 250 gallons per minute.

21 Q All right. And then we call it "the permitted rate." What  
22 is the permitted rate?

23 MR. LEWIS: Objection to form, your Honor, and in  
24 conjunction with the prior objection in conjunction with  
25 what Mr. Reichel said. I don't know that there's a

Page 1696

**NetworkReporting**

1-800-632-2720

1 permitted rate. I agree Mr. Eggan has established with some  
2 documentation that on this documentation there appears to be  
3 a design capacity of 350 gallons per minute, but I don't  
4 think it's proper to equate that with a so-called permitted  
5 rate.

6 Q Then let's change this. We'll call it the "treatment  
7 capacity." Okay? And maybe we should call it the "maximum  
8 treatment capacity" because what we're talking about here --  
9 and you correct me if I'm wrong -- the wastewater treatment  
10 plant will be sized to accommodate 350 gallons per minute in  
11 treatment capacity to accommodate peak stormwater runoff  
12 events.

13 MR. LEWIS: Objection. Leading, your Honor.

14 Q Can we call that the maximum treatment capacity, Dr. Prucha?

15 A I'm sorry. I was dealing with that. Can you repeat the  
16 question, please?

17 Q Sure. Can we call -- this figure of 350 gallons per minute  
18 for the wastewater treatment plant, can we call that the  
19 maximum treatment capacity?

20 A For the wastewater treatment plant, yes.

21 Q Yes. And we looked at the other document and we established  
22 the rate that was used to size the TWIS?

23 A Yes.

24 Q Now, if you wouldn't mind, Dr. Prucha, what is the estimated  
25 inflow rate that you conclude here on this document? Would

1           you mind writing that in?

2    A       Well, as I said yesterday, I based -- I used the FEFLOW  
3           model for the bedrock and generated a new range, and the  
4           estimated low end, I guess would be maybe 280 gpm.

5    Q       Okay. What about the upper bound inflow?

6    A       This would equate to that 3,000 gpm.

7    Q       All right. How did you get to 3,000 gallons per minute when  
8           the company only got 215 gallons per minute?

9    A       Again I used their model and made adjustments that I thought  
10          reflect the system features, hydraulic features, more  
11          realistically. So this represents sort of upper range of  
12          that.

13   Q       When we talk about upper bound inflow, what are we really  
14          talking about? What is upper bound inflow, I guess is the  
15          question.

16   A       Well, this is important because this was used to -- as the  
17          basic design parameter for the subsequent components for  
18          this wastewater treatment plant.

19   Q       All right. What rate would you utilize -- if you were doing  
20          the analysis here, what rate would you use to size the  
21          wastewater treatment plant?

22   A       Well, I would just -- following their number here, I would  
23          add the difference between their upper bound and the 250.  
24          So I would add 35 gpm to this.

25   Q       Okay. So what would your figure be?

Page 1698

**NetworkReporting**

1-800-632-2720

1 (Witness writes on board)

2 Q So your upper bound inflow into the wastewater treatment  
3 system would be 3,035 gallons per minute?

4 A Yes.

5 Q Okay. What about the maximum treatment capacity?

6 A I would simply just take the difference between the 350 and  
7 the 250 gallons per minute, so adding another 100 gallons  
8 per minute --

9 (Witness writes on board)

10 Q 3,135 gallons per minute?

11 A That's right.

12 Q And what rate would you use to size the treated water  
13 infiltration system based on your calculations of inflow?

14 A Again I would just take the difference between the size used  
15 for the TWIS and the treatment capacity. So adding another  
16 50 gpm, it's 3,185 gpm.

17 Q So you come up with the maximum for sizing the TWIS of 3,185  
18 gallons per minute?

19 A Yes.

20 JUDGE PATTERSON: Counsel, can you ask Dr. Prucha  
21 to -- what's the definition of an upper bound inflow?

22 Q Yeah, tell us what this upper bound inflow is. What are we  
23 talking about here when we talk about upper bound inflow?

24 Is that the maximum?

25 A From the dewatering at the mine, it represents a range

Page 1699

**NetworkReporting**

1-800-632-2720

1           that -- you know, if you go much higher it starts getting  
2           into an unrealistic amount that could come in there just  
3           based on a water balance of the area. But this was  
4           developed through a simulation that --

5    Q       You know, Dr. Prucha, I think the question is a lot more  
6           simple. What is upper bound inflow? What does that term  
7           mean?

8    A       It's a maximum amount of inflow.

9                       MR. EGGAN: Your Honor, does that answer that your  
10           question?

11                     JUDGE PATTERSON: I think so.

12                     MR. EGGAN: It's the maximum amount of inflow into  
13           the system based on Kennecott's calculations and now based  
14           on ours.

15                     JUDGE PATTERSON: Okay.

16                     MR. EGGAN: Okay?

17                     JUDGE PATTERSON: Yeah, I think -- thank you.

18                     MR. EGGAN: Okay.

19    Q       There's a substantial difference between your predictions  
20           and the company's predictions. Why are your predictions  
21           more realistic?

22    A       I think they include more realistic -- they were -- they  
23           included more realistic features of the system in the model  
24           of the bedrock system locally; for example, how the faults  
25           were implemented in the model, how the boundary conditions

1           were implemented in the model. And I'm referring to the  
2           model as the FEFLOW bedrock model that was developed.

3   Q       Okay. Go ahead. Continue.

4   A       And it also -- this particular 3,000 gpm is based off of a  
5           range for the water conductive features like the faults in  
6           the area within a reasonable hydraulic conductivity for that  
7           in a feature.

8   Q       And I don't want to repeat all your testimony from  
9           yesterday, but it sounds to me as if you were considering  
10          faults and dikes that were just plain not considered by the  
11          company?

12  A       I did not even include the dikes, the potential for those to  
13          be water conductive features within the system. This was  
14          really just the faulting as it was implemented in their  
15          model.

16  Q       Did you also consider the information that you gathered  
17          related to other mining in the area of the Kennecott Mine  
18          Project?

19  A       Yes.

20  Q       Tell the hearing officer about that.

21                       MR. LEWIS: Same objection for the record, your  
22                       Honor.

23                       MR. EGGAN: The objection from yesterday?

24                       MR. LEWIS: And several days running.

25                       MR. EGGAN: Understood. Understood.

1 A When I looked at the nearby mines in the Marquette Iron  
2 Mining District, that has a -- it's similar in terms of the  
3 components of the hydrologic system. I see flows from the  
4 mines reported in -- and I'm not sure what the exhibit  
5 number was. I think it was Exhibit 61, Eric?

6 Q Okay.

7 A I think it was 61?

8 Q It was Exhibit 61. I'm not going to take the time to show  
9 it --

10 A That's fine.

11 Q -- because we showed it ad nauseam yesterday, but --

12 A But there were several mines in that area that indicate  
13 fairly high flow rates. The Mather A -- B Mine had 4,000  
14 gpm over several days when they intercepted a water  
15 conductive feature. The Maas Negaunee Mine area was 3,000  
16 gpm as reported in this report. The Morris Mine had flow  
17 rates of 1650 to 2,000 gpm, of course the Athens Mine up to  
18 600 gpm. So in my opinion, these demonstrate that it is  
19 possible to get this flow rate. And I would also point out  
20 that one difference between this mining area is that the  
21 river flows effectively right over it. And none of the  
22 mines I just mentioned have the river flowing over that. I  
23 think the closest river to any of these is at the Morris  
24 Mine which is about 1,000 feet away.

25 Q What difference does it make that this particular mine has a

Page 1702

**NetworkReporting**

**1-800-632-2720**

1 river flowing directly over it? What impact will that have  
2 on inflow?

3 A If there's a direct communication between the bedrock water  
4 conductive features underneath this river which has been  
5 hypothesized in this report that faults are typically  
6 aligned with drainages or rivers as well as has been stated  
7 here in the Yellow Dog Plains, then that water in the Salmon  
8 Trout River can act as a direct source of water. And it  
9 doesn't just come from groundwater storage. It would be  
10 also supplied by direct communication of the river.

11 Q You talked about -- you talked about these other mines in  
12 the area. Are the geologic conditions -- I should say the  
13 hydrogeologic conditions similar to the mine that we are  
14 considering, the Kennecott Mine Project?

15 A I believe that the essential features are very similar. The  
16 thickness of the unconsolidated material overlying the  
17 bedrock is about the same range as we see here. The bedrock  
18 has dikes and faults that run through it and noted faulting.  
19 There's a clear indication in this report that water is  
20 really supplied to these mines through a fracture -- a  
21 fracture network.

22 Q And that is the essence of what you're talking about here,  
23 this fracture network?

24 A That's right.

25 MR. EGGAN: Your Honor, what I want to do -- I'm  
Page 1703

**NetworkReporting**

1-800-632-2720

1 about to move into a different area, but I want to respond  
2 to Mr. Reichel's objection to my reference that the numbers  
3 that Dr. Prucha is utilizing -- the upper bound inflows and  
4 the numbers that were provided by the company, Mr. Reichel  
5 has suggested that they were not incorporated into the  
6 permit. I would like to offer -- your Honor, this is  
7 Department of Environmental Quality Exhibit 117 and page 1  
8 from that document. I just want to, in response Mr.  
9 Reichel's objection that the MDEQ has not -- I don't know --  
10 utilized or adopted these numbers, I would just like to have  
11 the court take notice of the language here:

12 "The terms and conditions that are set forth in  
13 the Application for a Mining permit (the Permit  
14 Application) submitted by Kennecott Eagle Minerals  
15 Company to the Eagle Project including all supplemental  
16 documents are incorporated in and become a part of this  
17 mining permit."

18 So, again, the suggestion that the MDEQ has not adopted  
19 these numbers is correct.

20 MR. LEWIS: Your Honor, just to the extent Counsel  
21 is apparently making argument and not posing any questions,  
22 I guess I'll object to that and secondly note that although  
23 the permit does, in fact, incorporate the mine permit  
24 application materials and other materials, the inference  
25 that all the various numbers set forth in the mine permit

Page 1704

**NetworkReporting**

1-800-632-2720

1 application materials are -- in effect become permit  
2 conditions and limitations, there's no foundation for that,  
3 and that's not the way this works.

4 MR. REICHEL: I would -- again, I don't think this  
5 is the appropriate time for argument. I made what I  
6 continue to believe was a legitimate objection. I would  
7 also note for the record that ostensibly what this witness  
8 is being asked by Mr. Egan about is the groundwater, the  
9 Part 31 application. And what he was asking this witness  
10 about was a question directed to the contents of the Part 31  
11 application. This is the Part 632 application. But rather  
12 than burden the record with further argument of counsel,  
13 which I think this is really a legal thing, I do continue to  
14 maintain that there was a basis for my objection. But I  
15 think the issue is moot.

16 MR. EGGAN: Well, if it's mooted, then we can go  
17 on.

18 JUDGE PATTERSON: All right.

19 Q All right. I think we can agree, Dr. Prucha, that your  
20 numbers are different than the company's number with respect  
21 to inflow.

22 A Yes.

23 Q And what I want to ask you is a little bit about where we  
24 think the company went wrong. Okay? Why do you think the  
25 company's numbers are incorrect?

Page 1705

**NetworkReporting**

1-800-632-2720

1 A I don't think they considered a realistic upper range of  
2 inflows to the mine.

3 Q In what respect?

4 A In terms of the magnitude.

5 Q Well, let's look at -- let's look at your steps in terms  
6 of -- in terms of determining inflow. Where did the company  
7 go wrong in terms of collection of data?

8 A I think that they did not collect data in the appropriate  
9 locations or --

10 MR. LEWIS: Your Honor, as I said earlier, and  
11 maybe Mr. Egan can -- a lot of this seems to me that we're  
12 going through the same ground we spent a lot of time  
13 yesterday going through. I believe, if the intent is to ask  
14 these three questions, that we covered that yesterday. And  
15 is there some way we can avoid doing some of that?

16 MR. EGGAN: Well, I'm certainly all for avoiding  
17 repetition, your Honor. My concern is that that was related  
18 to the 632 permit and there were certainly groundwater  
19 issues there. I'm asking for a basic summary from Dr.  
20 Prucha as to where the company went wrong in terms of its  
21 predicted inflow that is the basis for design for this  
22 system.

23 MR. LEWIS: And it's exactly that that was covered  
24 in detail yesterday, the basis for the inflow. That's the  
25 point, as I understand it, of yesterday's testimony.

Page 1706

**NetworkReporting**

**1-800-632-2720**

1 MR. EGGAN: Your Honor, I --

2 JUDGE PATTERSON: That was my understanding too.

3 I --

4 MR. EGGAN: Well, I do think that, for the Part  
5 632 Permit, I am entitled to have this witness testify as to  
6 what he thinks -- I'm sorry -- for the Part 31 Permit --

7 JUDGE PATTERSON: Right.

8 MR. EGGAN: -- I think this witness is allowed to  
9 testify as to where he thinks the company went wrong in  
10 terms of inflow. And I did -- I do think he testified about  
11 this yesterday. I intend to just do this as a brief recap.

12 JUDGE PATTERSON: All right.

13 Q Basically, Dr. Prucha, without repeating everything we did  
14 yesterday, where did the company go wrong?

15 A Basically in the steps that you've listed on the board in  
16 terms of collecting the correct data, characterizing the  
17 system, conceptualizing the flow and developing adequate  
18 models.

19 Q Was the company's investigation of inflow consistent with  
20 ASTM standards?

21 A No.

22 Q You indicated you had an opportunity and you talked to --  
23 yesterday to Mr. Haynes about the Department of  
24 Environmental Quality's guidelines for groundwater modeling.

25 Was the company's investigation of the inflow consistent

- 1 with the MDEQ's guidelines for groundwater modeling?
- 2 A No.
- 3 Q Was the company's methodology in determining the amount of  
4 inflow consistent with what a reasonably prudent hydrologist  
5 doing this kind of analysis would have done?
- 6 A No.
- 7 Q Why not?
- 8 A I don't think they considered realistic upper bound inflows  
9 to the system.
- 10 Q Did the company submit a plan that accurately predicted the  
11 amount of inflow that is to be treated?
- 12 A Can you rephrase that?
- 13 Q Yes. The company submitted a plan --
- 14 A Yes.
- 15 Q -- for inflow -- for analyzing inflow. Is -- that plan  
16 describing this inflow, is it accurate?
- 17 A No.
- 18 Q Why not?
- 19 A Again, I think they underestimated or understated the upper  
20 bound inflows.
- 21 Q Do you have an opinion, based upon a reasonable degree of  
22 scientific certainty, as to the significance of their error?
- 23 A Yes.
- 24 Q How wrong were they?
- 25 A Well, I think this diagram we put up here indicates that

1 it'd be off by a factor of 10 for the upper bound.

2 Q Which would be what we might call an order of magnitude?

3 A An order of magnitude.

4 Q Given the errors that the company committed, were -- the  
5 inflow volume assumptions that they presented to the  
6 Michigan Department of Environmental Quality, were those  
7 assumptions valid in terms of their sizing of the wastewater  
8 treatment system?

9 A No.

10 Q Why not?

11 A Too low.

12 MR. EGGAN: Your Honor, this might be an  
13 appropriate time for a break, if you wish.

14 JUDGE PATTERSON: Yeah, that's fine.

15 (Off the record)

16 MR. EGGAN: Your Honor, as a housekeeping matter,  
17 this small chart we did on inflows that Dr. Prucha and I  
18 created while he was on the stand --

19 MR. BRACKEN: We're all set.

20 MR. EGGAN: Your Honor, as a housekeeping matter,  
21 this small chart we did on inflows where Dr. Prucha offered  
22 his estimates of inflow rates, et cetera, we would offer  
23 that as Defendant's Exhibit Number 44 -- I'm sorry --  
24 Petitioner's Exhibit Number 44.

25 MR. REICHEL: I assume that would be the Part 31  
Page 1709

**NetworkReporting**

1-800-632-2720

1 exhibit?

2 MR. EGGAN: Yes.

3 MR. LEWIS: No objection.

4 MR. REICHEL: No objection.

5 JUDGE PATTERSON: Okay. No objections. It'll be  
6 entered.

7 (Petitioner's Exhibit 31-44 received)

8 (Counsel marks on document)

9 MR. EGGAN: What I've done, your Honor, is written  
10 "Petitioner's Part 31 Exhibit Number 44." As an additional  
11 housekeeping matter, Judge, I think that I want to make sure  
12 that the record is clear that, while we have identified Part  
13 31 exhibits and Part 632 exhibits, I would invite any of the  
14 parties to utilize all of the exhibits for the -- these are  
15 being presented in a consolidated proceeding.

16 JUDGE PATTERSON: Correct.

17 MR. EGGAN: So if Mr. Haynes is utilizing exhibits  
18 during his examination and they're admitted during the Part  
19 632 case, those would still be available to me to use in the  
20 briefing and documents and other materials filed with the  
21 court.

22 JUDGE PATTERSON: I just understood it was a  
23 matter --

24 MR. EGGAN: Does everybody understand that to be  
25 the case?

1 MR. LEWIS: I have no problem with that.

2 MR. REICHEL: That was my understanding, Counsel.

3 And just to be clear, I simply suggested that this latest  
4 exhibit; that is, 44; be designated by reference to Part 31.

5 MR. EGGAN: Yeah.

6 MR. REICHEL: Because as you well know,  
7 Petitioners have two separately numbered listed exhibits.

8 MR. EGGAN: We do, and I've been thinking about  
9 this through the proceeding, and I just wanted to make it  
10 clear that we can all use each other's exhibits and for  
11 whatever purpose that we need to use them for.

12 JUDGE PATTERSON: I just thought it was a matter  
13 of identifying them --

14 MR. EGGAN: Me too.

15 JUDGE PATTERSON: -- as opposed to any substantive  
16 determination.

17 Q Dr. Prucha, let's move on now to a different area. And,  
18 Doctor, what we are going to be talking about is the  
19 vicinity of the treated water infiltration system --  
20 okay? --

21 A Yes.

22 Q -- and the company's analysis of flow direction and flow  
23 speeds essentially in the fate and transport of the water  
24 that is going to be reinjected into the system by the  
25 treated water infiltration system. Okay?

Page 1711

**NetworkReporting**

**1-800-632-2720**

1 A Yes.

2 Q So that's what we're going to be talking about now. Have  
3 you reached any conclusions about the validity of the  
4 company's investigation of the fate and transport of water  
5 as it leaves the treated water infiltration system?

6 A Yes.

7 Q What are your conclusions?

8 A I believe that the estimates of flow direction are  
9 incorrect.

10 Q Well, let's talk about that. What difference does it make  
11 in terms of which direction the water goes and how much of  
12 it there is? What difference does that really make?

13 A In terms of the amount of water that gets applied at the  
14 TWIS, if the volumes are -- if the flow rates are  
15 significantly higher than it was designed for or even if it  
16 was designed at this level, the potential for mounding to  
17 reach the surface is large, and I think that the direction  
18 of flow may have been miscalculated.

19 Q Well, we're going to talk about that.

20 A Yeah.

21 Q I'm interested in going through the steps that the company  
22 took in assessing the hydrology from the TWIS discharge to  
23 the venting area. Okay?

24 A Okay.

25 Q But we need to define some terms. Where is the area of the

1 TWIS discharge, and where is the area that is the venting  
2 area? And we're not going to get very specific here, but I  
3 want you to get up and show the court essentially what we're  
4 talking about here.

5 A On this diagram?

6 Q Yes.

7 A Well, as I understand it, the water will be applied in this  
8 area here (indicating) of the treated water infiltration  
9 system through a series of pipes. That water will  
10 infiltrate the ground and at some point will start flowing  
11 laterally in some --

12 Q Or in some direction?

13 A In some direction.

14 Q Okay. Now, there's -- there are areas -- and we're going to  
15 identify some of those areas in a few minutes. But there  
16 are areas called venting areas. What are those?

17 A Well, that refers to the area where groundwater will  
18 discharge to the surface water or to the ground surface.

19 Q Okay. So this is the area where the groundwater essentially  
20 comes to the surface and goes somewhere?

21 A Yes.

22 Q Okay. Now, you talked a moment ago about a concept called  
23 mounding, and I want to give the judge some basis of  
24 understanding about what we're talking about when we talk  
25 about mounding. What is that?

1 A That's when groundwater will -- when it's -- in this  
2 particular case, when groundwater is -- when the discharge  
3 from the TWIS infiltrates down and it intercepts either a  
4 low-permeability zone or the groundwater that exists  
5 underneath the TWIS, it will begin to mound locally or  
6 elevate.

7 Q Would it help you to draw a little drawing of that on one of  
8 the pages that we have?

9 A Sure.

10 (Witness draws diagram)

11 A If this is the infiltration system, the TWIS, and water is  
12 applied in here at the ground surface and at depth -- this  
13 symbol means the groundwater table -- water will infiltrate  
14 down. And if water hits this groundwater surface, it will  
15 cause an increase in the elevation of that groundwater  
16 surface. It changes the gradients, and the gradients are  
17 basically defined as the slope of this water table.

18 Q Okay. So when we talk about mounding, what we're talking  
19 about is water that's being injected into the ground from  
20 the treated water infiltration system. And what happens to  
21 that water when it hits the water table?

22 A If it hits the water table, it will mound, and this mounding  
23 and this increased gradient will cause the groundwater to  
24 move away from that area of mounding. And if this occurs  
25 and it intercepts the groundwater at a gradient, this

Page 1714

**NetworkReporting**

**1-800-632-2720**

1 mounding may be projected off in the direction of that  
2 groundwater gradient more so than back towards the opposite  
3 end. But either way, it --

4 Q So when we talk about "downgradient," we're talking about  
5 water that is essentially flowing downhill?

6 A Effectively, yes.

7 Q All right. Now I'd like to go through the steps that the  
8 company took in assessing the hydrology from the TWIS  
9 discharge to this venting area that we're talking about --  
10 okay? --

11 A Okay.

12 Q -- and see what your opinions of each of the steps that the  
13 company utilized are. You outlined the steps that one  
14 should take in conducting this kind of investigation, both  
15 with Mr. Haynes and me, and here they are again: collection  
16 of data, the characterization of that data and then the  
17 creation of a conceptualization of that flow; the direction  
18 the water's going to go. Okay?

19 A Yes.

20 Q Let's talk about this in the context of this case -- these  
21 steps in the context of this case and the company's  
22 investigation. Did they collect hydrogeologic -- hydraulic  
23 data in the appropriate locations to assess the flow  
24 conditions?

25 MR. LEWIS: Objection; foundation.  
Page 1715

**NetworkReporting**

1-800-632-2720

1 MR. EGGAN: I'd like a little bit more  
2 understanding of what that objection is.

3 MR. LEWIS: I haven't heard any basis for his  
4 knowledge about where they collected this data or what he  
5 knows about it; no reference to any maps of all the various  
6 wells that have been put to do exactly that; no reference  
7 that he has reviewed any of those documents; no reference  
8 that he can testify based on the knowledge that would be  
9 necessary in this case.

10 MR. EGGAN: Okay. I think that's a fair  
11 objection, your Honor. Let's see if we can't get to that  
12 point. Can I have MDEQ 010712? And I need you to blow up  
13 the part that is right --

14 Q Will this cover it?

15 A I would blow up this zone right here (indicating).

16 Q Is that large enough, Dr. Prucha?

17 A Yes.

18 Q Now, again, this is in response to the objection. We need  
19 to establish for the judge that you have some basis by which  
20 to conclude something about whether or not the company  
21 collected data in the appropriate locations. Talk to us  
22 about that.

23 MR. REICHEL: Excuse me, Counsel. Please identify  
24 for the record what's on the screen.

25 MR. EGGAN: Thank you. This is Figure 2-2 of the  
Page 1716

**NetworkReporting**

**1-800-632-2720**

1 discharge permit application. It is MDEQ Exhibit 141.

2 MR. REICHEL: Thank you.

3 Q Okay. Dr. Prucha, again, tell us what this means in terms  
4 of the appropriate locations to assess the flow conditions  
5 from the TWIS to the venting areas.

6 A Okay. The pink dots represent wells with boreholes, and the  
7 location of the TWIS is located in the center of this  
8 figure. The outline of that TWIS isn't actually shown, but  
9 these eight sort of equally spaced locations here are  
10 included in that TWIS. I guess the important point I'd like  
11 to make that seems fundamental about locating data in an  
12 area where you would want to assess the -- what happens to  
13 the water once it leaves the TWIS, is the area from this  
14 TWIS up to the northeast, this whole area up here that's in  
15 the area of the presumed flow is completely void of data  
16 and --

17 Q Now, when you say "in the area of the presumed flow," whose  
18 presumed flow is that?

19 A The various models that have been produced; the groundwater  
20 contour maps that I've seen in the mine permit application;  
21 appendices EIA; various groundwater flow maps that --

22 Q Yeah. I'm asking who it is in this case that has decided  
23 that the flow is to the northeast.

24 A Well, the mine applicant -- the discharge permit applicant.

25 Q The company?

Page 1717

**NetworkReporting**

1-800-632-2720

1 A Kennecott Company.

2 Q Okay. Go ahead, then. What would you do?

3 A Well, if you're trying to assess the impacts of mounding in  
4 this area and where it's going to eventually vent or  
5 discharge to the ground surface, I would want to have data  
6 in an area where I'm presuming the flow goes based on  
7 groundwater plots that I've made for the area. The only  
8 well out towards the east and -- is this well 09; really  
9 virtually no data down to the south, southeast for a good  
10 distance. So it just seems to me that there's a lack of  
11 information outside of the local TWIS location, and this  
12 seems like a critical flaw to not have that information to  
13 allow you to --

14 Q So if you were trying to determine the effect of this  
15 mounding and the flow data, what would you have done?

16 A I would have placed wells in presumed pathways. So I would  
17 have put wells between the TWIS and where, say, for example  
18 it's believed the water discharges to, these streams here or  
19 out in this area. And that would have allowed me to assess  
20 what the geology's doing, confirm what I was hypothesizing  
21 here about the geology, the aquifers, their extent.

22 Q What does this tell you about their collection of data,  
23 which is one of your three steps?

24 A Just seems fundamentally flawed because, if you're asked to  
25 go assess where this flow is going, you can't even begin to

1 do anything beyond this point. You haven't even collected  
2 the basic data needed to characterize the flow direction and  
3 confirm that it is in fact towards the northeast.

4 Q Dr. Prucha I'm showing you Figure 23 from the application,  
5 which is Appendix B-1. Does this add anything more in terms  
6 of your conclusion with respect to their collection of data?

7 A Yes. Maybe we can zoom in here, the small area around here  
8 (indicating).

9 Q Again, Doctor, what we're talking about is the company's  
10 collection of data that they utilize to create their model.  
11 So talk about what this tells us with respect to their  
12 collection of data.

13 A Well, a critical bit of data, in addition to the geologic  
14 information that you would collect to confirm aquifers that  
15 the water would be flowing from the TWIS location, which is  
16 in this area right here (indicating), would be the  
17 groundwater elevation data. So just to confirm that your  
18 presumed groundwater flow direction is to the northeast, you  
19 need wells in this area here to confirm that. I believe  
20 that these wells placed a good distance out are not  
21 necessarily the ideal locations to define the groundwater  
22 flow conditions that you would expect to occur around local  
23 seep areas.

24 Q Does this map give us a better idea of where the so-called  
25 venting locations are?

Page 1719

**NetworkReporting**

— 1-800-632-2720 —

1 A From their contours, I don't believe that you could actually  
2 say that the venting locations are well-defined. I don't  
3 think that they accounted for the venting locations in the  
4 development of these contours. I think -- the site visit  
5 that we took out there, we went to one of the seeps at the  
6 very top, and we noticed groundwater flowing out of the  
7 seep, and yet it doesn't seem like that information -- at  
8 the head of the seep, and yet that information isn't used to  
9 help define the basic groundwater contours that are kind of  
10 the basic foundation of developing a conceptual model that's  
11 valid.

12 Q Okay. Where do you think they focused their collection  
13 efforts -- the data collection efforts?

14 A Well, they focused more in the TWIS area or the treated  
15 water infiltration system located in the upper corner right  
16 here (indicating) and towards the orebody -- Eagle Rock and  
17 the orebody.

18 MR. EGGAN: Your Honor, the first exhibit that I  
19 showed was Figure 2.2 of the discharge permit application.  
20 That's MDEQ Exhibit 141. That's already been admitted.  
21 This figure is Figure 23 from the application at B-1. It's  
22 from the EIA. I believe it's MDEQ Exhibit 32. I would  
23 offer that. These are found at Tab 7, by the way, in the  
24 materials I provided this morning.

25 MR. LEWIS: And they're identified by Bates stamp  
Page 1720

**NetworkReporting**

**1-800-632-2720**

1 number and MDEQ exhibit number; is that right?

2 MR. EGGAN: They are. That's correct.

3 MR. LEWIS: I have no objection, your Honor.

4 MR. REICHEL: I have no objection. Again,  
5 Counsel, are you -- is your proffer just to this particular  
6 thing, or are you --

7 MR. EGGAN: It's just of this particular thing at  
8 this point, yes; yes.

9 MR. REICHEL: As opposed to Exhibit 32, which is  
10 of course --

11 MR. EGGAN: Which is a multi-page document, yes.

12 MR. REICHEL: I have no objection.

13 JUDGE PATTERSON: No objection. It will be  
14 entered.

15 (Respondent's Exhibit 32, Figure 23 received)

16 Q Dr. Prucha, we were talking about the focus of their study.  
17 Can you talk a little bit about what you determined about  
18 the focus of their collection efforts?

19 A Well, I believe that the focus of their efforts was really  
20 at and beneath the TWIS.

21 Q Do you believe they focused on the correct areas, Doctor?

22 MR. LEWIS: Asked and answered.

23 MR. EGGAN: I don't think it has been.

24 Q Do you believe that they focused on the correct areas?

25 A No.

1 Q Ok. Does this exhibit --

2 MR. EGGAN: -- which is MDEQ Exhibit 143, Tab 8 at  
3 your documents, Counsel.

4 Q Does this exhibit assist you in reaching that conclusion?

5 A Yes.

6 MR. EGGAN: And this again is Figure 15 from  
7 the -- from MDEQ Exhibit 143.

8 Q Tell us why, Doctor.

9 A Well, in this diagram the TWIS outline is shown in green  
10 here, and these lines that they have labeled with letters A  
11 through F are various cross-sections that show the geology  
12 and groundwater levels. But the problem I see is that there  
13 is an inferred or a presumed direction of groundwater  
14 north -- to the northeast or up in this (indicating)  
15 direction, and they've put their cross-section starting at  
16 the TWIS going to the southwest in the opposite direction of  
17 the presumed flow. And it's unclear to me why you would do  
18 that. I -- if I drew cross-sections to assess the flow of  
19 the discharge from the TWIS, I would start here and go up in  
20 the presumed direction of flow. So this is --

21 Q So in other words, their cross-sections are in the wrong  
22 location?

23 A The cross-sections A, B and C are in the wrong location, in  
24 my opinion -- A, C and D -- no -- B, C and D; sorry. I  
25 can't see that from here.

1 MR. EGGAN: Your Honor, I would offer this Figure  
2 15 from the application as Petitioner's Exhibit 45 --  
3 Petitioner's Part 31, Exhibit 45.

4 MR. LEWIS: Is that a new exhibit, Mr. Eggan?

5 MR. EGGAN: It is not. It's part -- it's actually  
6 part of MDEQ Exhibit 143.

7 MR. LEWIS: We've been in the practice, I thought,  
8 of offering them as MDEQ exhibits.

9 MR. EGGAN: Okay. And I'm fine with that. I'm  
10 fine with that.

11 MR. LEWIS: Can we do that?

12 MR. EGGAN: If you want to do it, let's go with --  
13 we would offer MDEQ Exhibit 143, then, at this time.

14 MR. LEWIS: And it's the Figure 15, --

15 MR. EGGAN: Correct.

16 MR. LEWIS: -- Bates stamped MDEQ 10814?

17 MR. EGGAN: Correct.

18 MR. LEWIS: No objection.

19 MR. REICHEL: No objection.

20 JUDGE PATTERSON: All right. No objection. It'll  
21 be entered.

22 (Respondent's Exhibit 143, Figure 15 received)

23 Q Doctor, I'm going to show you Figure 15.

24 MR. EGGAN: And again, this is from Exhibit 1- --  
25 MDEQ Exhibit 143, your Honor. It's at Tab 8 in the

1 documents I presented this morning. This is Figure 21.

2 Q Dr. Prucha, does this offer any additional information as to  
3 their location of -- or their collection of data and the  
4 focus of their data collection efforts?

5 A Well, again it indicates to me that their interpretation of  
6 the geology and hydrogeology is in the wrong location. The  
7 infiltration gallery would be over where it says "HS  
8 investigation area" roughly. And this is a cross-section  
9 that starts at that point and goes to the southwest in the  
10 opposite direction of the presumed flow. You can see that  
11 flow direction is towards the northeast by the fact that  
12 this blue contact with the red -- the brown color is  
13 oriented towards the northeast.

14 Q So the groundwater flow is going to at least naturally be  
15 this (indicating) way under their depiction, yet these three  
16 monitoring wells would suggest that they're collecting data  
17 back in this direction, which is the opposite direction of  
18 the flow?

19 A That's right.

20 Q Okay. Did they collect data on the bedrock surface?

21 A They have, but -- yes, they have.

22 Q Okay. I want to show you an exhibit which is Figure 17 from  
23 Exhibit 143 -- MDEQ Exhibit 143. So that's Figure 17.

24 MR. EGGAN: MDEQ 010816. This is Tab 9, your  
25 Honor.

1 Q Dr. Prucha, what does this tell us about wells north of the  
2 Yellow Dog Plains?

3 A Well, if we could zoom into this area right here  
4 (indicating) roughly, the bedrock surface is very important  
5 in terms of -- as an input in terms of controlling the  
6 groundwater flow through the unconsolidated material through  
7 the system. And this is a map that was produced that shows  
8 the surface with the contours of the bedrock surface. And  
9 they have labeled various boreholes, wells here with the  
10 elevations. The TWIS is located right here. And if the  
11 presumed flow is off to the northeast or really in most  
12 directions from the TWIS, there are no bedrock wells to help  
13 control the estimate of that bedrock surface, which is very  
14 important in terms of controlling flow in the unconsolidated  
15 materials.

16 Q Well, it sounds like they collected data, then, from the  
17 bedrock area, but they just didn't put it in the right  
18 place?

19 A They didn't --

20 MR. LEWIS: Objection; leading, your Honor.

21 JUDGE PATTERSON: Can you rephrase it?

22 MR. EGGAN: Sure.

23 Q Did they collect it from the right place?

24 A They did not.

25 Q Okay.

Page 1725

**NetworkReporting**

— 1-800-632-2720 —

1 MR. EGGAN: Your Honor, I would offer this  
2 exhibit, which is Figure 17 from the -- from Appendix B to  
3 the discharge permit application. It's MDEQ Exhibit 143.  
4 It's Tab 9 in the back of this.

5 MR. LEWIS: To be of continuing assistance, I  
6 believe it's Bates number 10816.

7 MR. EGGAN: That's correct.

8 MR. LEWIS: Thank you.

9 MR. EGGAN: Yeah.

10 (Respondents Exhibit 143, Figure 17 received)

11 Q All right. While we're talking about data collection, I  
12 just want to go to one more exhibit on this subject, and  
13 that is this latest GeoTrans modeling that they did in  
14 April. Okay? Now, you testified yesterday that the company  
15 has had another attempt to model, another attempt to gather  
16 data?

17 A Yes.

18 Q And that's this GeoTrans model. When was that done?

19 A It looks like in 2008.

20 Q Do you know when?

21 A April, I think they stated.

22 Q April of 2008?

23 A That's the date of the report.

24 Q Okay. Does that correct anything? Does it provide

25 additional data that would be useful in determining this

Page 1726

**NetworkReporting**

1-800-632-2720

1 issue, flow direction?

2 A No.

3 Q Well, let's look at Exhibit -- excuse me -- Figure 8 to that  
4 GeoTrans exhibit.

5 MR. EGGAN: This is KEMC Exhibit 591. It's Bates  
6 number KEMC 186845. It's at Tab 10 in your books.

7 Q Is this the exhibit we're looking for, Dr. Prucha?

8 A Yes.

9 Q Tell the hearing officer what this is and whether or not  
10 this provides additional data that would be useful; corrects  
11 the errors that you've pointed out.

12 A Could we zoom into this area here (indicating)? Again, the  
13 implication in terms of predictions of where flow is going  
14 to go is very dependent on the accuracy and understanding of  
15 this bedrock surface. And I would point out that the TWIS  
16 location, as shown here with a rectangle and the little  
17 symbols here, crosses that are pink, I guess, are  
18 representing where they have controls on -- where they have  
19 information on the bedrock surface. So from the TWIS  
20 location, there are just no bedrock controls anywhere out  
21 here. And so this estimated surface for the bedrock is an  
22 entirely extrapolated or, to a large extent, guessed  
23 surface. And to me this gets into -- creates a lot of  
24 uncertainty about what that actually is. Is this off 100  
25 feet? Is it off 22? Is this the correct orientation of

Page 1727

**NetworkReporting**

— 1-800-632-2720 —

1           that bedrock surface? This could be oriented in the wrong  
2           direction, and this has a big influence, I believe, in  
3           controlling the direction of groundwater flow in the area  
4           from the TWIS.

5    Q       Do you think that they collected enough data to characterize  
6           the potential migration pathways?

7    A       No.

8    Q       Let me show you what is -- hang on.

9                       MR. EGGAN: I need to go back to this document. I  
10           need to admit this document. This is Figure 8 to the  
11           GeoTrans report that was done in April. It's KEMC Exhibit  
12           591. I would like to offer that into evidence, your Honor.

13                      MR. LEWIS: Do you want to offer the report?

14                      MR. EGGAN: No. I'd like to offer this figure.

15                      MR. LEWIS: No objection, your Honor.

16                      MR. REICHEL: No objection.

17                      JUDGE PATTERSON: All right. No objection. It'll  
18           be admitted.

19                               (Intervenor's Exhibit 591, Figure 8 received)

20    Q       All right. Again, we're looking at whether or not the  
21           company collected enough data to really adequately  
22           characterize the potential migration pathways.

23                      MR. EGGAN: Show me MDEQ 010823. Your Honor, this  
24           is from MDEQ Exhibit 143. It is Figure 24 from Appendix B  
25           of the groundwater discharge permit application, MDEQ

1 Exhibit 143, Tab 11 at your book.

2 Q What does this tell us about whether or not they  
3 identified -- they collected enough data to characterize the  
4 migration pathways?

5 A Well, this is sort of a critical point here in terms of the  
6 vertical nature of how water will enter the system from the  
7 TWIS or from the infiltration gallery at the ground surface  
8 here. And what I see is low-permeability units well above  
9 the water table that I believe the water can easily mound  
10 upon. And this particular cross-section is taken through  
11 lengthwise along the TWIS -- the TWIS' longer access. But I  
12 guess what concerns me is that beyond this location there  
13 are no data points to confirm that -- in fact this  
14 low-permeability unit. And they've colored this on other  
15 slides as a more regional unit that extends over a good  
16 portion of the Yellow Dog's Plain.

17 There's, in my opinion, almost a presumption that  
18 this unit actually disappears and that what they have been  
19 calling an A zone or this upper permeable outwash sand  
20 aquifer and the lower de-aquifer zone were two separate  
21 units but that at the TWIS they combine and become one.  
22 From these cross-sections at the TWIS, I don't necessarily  
23 see any indication that these would necessarily pinch out.  
24 They may thin here.

25 But I still -- with the lack of data off to the  
Page 1729

**NetworkReporting**

— 1-800-632-2720 —

1 northeast, east, south seems difficult to show that that  
2 actually occurs. And this, in my opinion, can be  
3 significant because, if water is infiltrating from the TWIS  
4 straight down, it may very likely mound up here and not  
5 really affect where the actual groundwater level is right  
6 now. Examples like this, in this particular figure where  
7 they have a lean clay in this borehole here and one right in  
8 the one next to it, this interpretation that they're  
9 disconnected yet connected between two others seems sort of  
10 like picking this in a biased fashion to indicate that there  
11 are pathways down. But in reality, why aren't these  
12 connected?

13 Q You said "picking." Do you mean -- is there another word  
14 you might use?

15 A Like cherry picking the answer to a -- the conclusion that  
16 water infiltrates readily down to this existing water table  
17 as opposed to hitting the low-permeability units in this  
18 vadose zone or the zone from the groundwater table up to the  
19 ground surface. And having done a lot of models where you  
20 actually try and simulate the flow in this vadose zone from  
21 the ground surface down to the groundwater table, these  
22 low-permeability units are critical and are much lower  
23 permeability than the surrounding ground which they're  
24 referring to here as unsaturated sand.

25 So if these are in fact continuous out to the  
Page 1730

**NetworkReporting**

— 1-800-632-2720 —

1 northeast or whatever direction the groundwater flows, then  
2 these become critical elements in finding the hydrogeology  
3 of the system and what happens to the water once it leaves  
4 the mound -- the TWIS. So in fact, the presumption that the  
5 groundwater below -- existing groundwater below this TWIS  
6 actually mounds, I would submit that groundwater can easily  
7 mound over these. And the wells that they have placed in  
8 here may not capture that.

9 Q May not capture what?

10 A That there may actually even be water in here now. I didn't  
11 see that on the logs. But this -- I know, when you inject a  
12 lot of water into an unsaturated zone like this, these  
13 become critical.

14 Q Are there other areas -- with respect to data collection,  
15 are there other areas where the company was deficient?

16 A I would say in hydraulic testing of the area.

17 Q Tell us about that.

18 A I would say that there are no multiple aquifer well tests in  
19 the area where they're attempting to pump from one well and  
20 monitor several nearby wells to -- that gives you probably  
21 the best information about how well connected a system is  
22 over -- provides an effective hydraulic property over a  
23 larger area. The types of hydraulic tests conducted were  
24 very localized, so you really can't get a sense of how  
25 important these low-permeability layers are throughout the

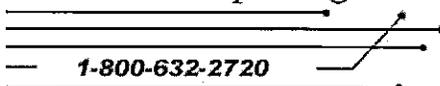

Page 1731

**NetworkReporting**

— 1-800-632-2720 —

- 1 system in this area.
- 2 Q Now, we know what the company did not do. What do you think  
3 a reasonably prudent or a quality hydrologist would have  
4 done to really collect data here?
- 5 A Do you mean at this cross-sectional --
- 6 Q No. In order to really collect data, on the flow conditions  
7 from the TWIS to the venting areas, --
- 8 A Yes.
- 9 Q -- what would a reasonably prudent investigator have done --
- 10 A Right.
- 11 Q -- a reasonably prudent hydrologist have done?
- 12 A I would have put more wells in between that TWIS location  
13 and venting locations in directions -- all directions that I  
14 think mounded water could flow towards.
- 15 Q Let's go to Part B of the groundwater investigation. That's  
16 the characterization of this data that they collected. Did  
17 the company -- well, let me ask you it this way -- the Part  
18 22 rules require a three-dimensional flow path?
- 19 A Yes.
- 20 Q Did they do that?
- 21 A No, I didn't see a three-dimensional flow path.
- 22 Q Did the company evaluate or develop an adequate geologic  
23 profile over the potential pathways of this water?
- 24 A No.
- 25 Q Why do you say that?

Page 1732

**NetworkReporting**

1 A Well, they have no wells from the TWIS to the venting  
2 location, so they couldn't.

3 Q Did the company's cross-section support that conclusion?

4 A Sorry. Can you rephrase that?

5 Q Yeah. Let me show you --

6 MR. EGGAN: Can you show us MDEQ 010814?

7 Q I guess what I'm getting at is, when we discussed this, you  
8 indicated that the company's cross-sections and borehole  
9 logs beneath the TWIS show something about this issue. Can  
10 you talk to us in that context using this exhibit?

11 A About what issue? I'm sorry.

12 Q Well, I think what we're talking about is the  
13 low-permeability units in zones B and C?

14 A Right. I think the point is that, without data out in areas  
15 that are presumed to be where groundwater would flow -- I'm  
16 not understanding this concept of these low-permeability  
17 units that appear above the water table are important. And  
18 they just don't have data in the areas that would allow them  
19 to assess that thickness of the -- of these low-permeability  
20 layers where water could perch on. And "perching" means  
21 that water would mound up above a low-permeability unit  
22 above the water table. That's what I mean by "perching."

23 Q Okay. Now, what is your thought on the geologic logs that  
24 were provided by the company?

25 A I noticed several inconsistencies in those logs that again

1 number 13, there are a number of documents, and we're going  
2 to use -- probably just use the first one in at that tab.

3 JUDGE PATTERSON: But what I have as the first  
4 page doesn't correspond to what's up there.

5 MR. EGGAN: At Tab 13?

6 JUDGE PATTERSON: Right.

7 MR. EGGAN: Okay.

8 JUDGE PATTERSON: That's my problem.

9 MR. EGGAN: All right. Go back to the page so I  
10 can see that.

11 JUDGE PATTERSON: The second page does. I have  
12 two page 2 of 5.

13 THE WITNESS: Should be on page --

14 JUDGE PATTERSON: The first one is not what's up  
15 there. It's the second page.

16 THE WITNESS: Page 2 of 5, I think.

17 MR. EGGAN: Okay. My mistake, then. Let's go to  
18 the --

19 JUDGE PATTERSON: I just want to make sure we're  
20 all on the same page, so to speak.

21 MR. EGGAN: No. I -- that's -- we need that,  
22 Judge, yeah. That should be it, your Honor.

23 JUDGE PATTERSON: That is it.

24 THE WITNESS: Right here (indicating), please.

25 Q Okay. Doctor, what is this telling us?

1 A Well, the geologic log and text says "silty sand," and yet  
2 this classification indicates sort of an inconsistency. You  
3 would only label a silty sand "SM." This is a soil  
4 classification system. And the "SP" refers to a more  
5 permeable sand. So I find it a little misleading to put  
6 "silty sand" in the text; no indication that it's anything  
7 but a silty sand, which is a reasonably low permeability.  
8 And this permeability for this sand -- for a standard silty  
9 sand several orders of magnitude lower, can be then just a  
10 standard sand that doesn't have the silt in it. So this  
11 sort of inconsistency I've seen in several logs.

12 Q So there are again instances that you have seen in their  
13 logs that have been, from your perspective, misleading?

14 A Right; yes.

15 Q And this again relates to their characterization of flow  
16 direction?

17 A That's right. The point is, this particular log, this  
18 occurrence right here (indicating) is well above the water  
19 table. And so this sort of suggests the existence of  
20 low-permeability units that would promote this shallow  
21 mounding -- mounding or perching, I guess, above -- on units  
22 above the water table.

23 Q What impact does this have on your thoughts of their  
24 study -- their hydrologic study of this site?

25 A Well, it makes me question whether they accounted for this.

Page 1736

**NetworkReporting**

1-800-632-2720

1 And I -- in terms of any kind of predicted groundwater flow  
2 direction. And I -- having reviewed their models, I don't  
3 see that they include this. The models they used don't  
4 simulate the flow in this vadose zone, and yet this seems  
5 like it'd be a very significant -- have a very significant  
6 impact in terms of how much mounding below the TWIS and what  
7 direction the flows could be and velocities that they could  
8 be.

9 Q There are other pages of the well construction report, the  
10 well logs. Did you see a pattern of this sort of reporting  
11 in the materials that you reviewed?

12 A Yes.

13 Q What impact would this have had on mounding?

14 A Again where you're implying that it's more permeable in the  
15 vadose zone, water would go straight down probably without  
16 impediment to the groundwater table. If, in fact, you have  
17 a low permeability unit as described here by silty sand well  
18 above the water table, I would expect groundwater to mound  
19 up above that layer.

20 Q So there may be shallow mounding?

21 A That's right, well above the water table that is shown on  
22 the cross-sections through the area for the current system.

23 Q What does this tell you -- this kind of work tell you about  
24 their characterization in this report?

25 A I'm thinking it's pretty biased and not -- it's inaccurate.

Page 1737

**NetworkReporting**

1-800-632-2720

1 Q Did they identify all of the aquifers in the pathway from  
2 the TWIS discharge to the venting area?

3 A No.

4 Q Did they consider -- did they make any estimate of the  
5 thickness of aquifers in that pathway?

6 A They didn't define the thickness or really, in my opinion,  
7 identify the -- clearly the aquifers that exist in -- in  
8 potential pathways from the TWIS.

9 Q What difference does that make?

10 A Well, it makes a lot of difference in terms of how they  
11 predict the three-dimensional flow paths, the velocities,  
12 the venting locations of groundwater, the extent of  
13 mounding.

14 Q Do you think they considered the effect of dikes on the  
15 possible flow from the TWIS to the venting locations?

16 A No.

17 Q Why do you say that?

18 A It doesn't appear to be included in their modeling.

19 Q At all? Not at all?

20 A That's right.

21 Q Why would that have been important? Why would the effect of  
22 dikes have been important?

23 A Well, along the intrusive that is at the orebody and East  
24 Eagle Rock, the bedrock from their own bedrock surface maps  
25 appears elevated with respect to the surrounding

1 metasedimentary rock. And my thought is that, if other  
2 dikes occur and they're parallel to this intrusive, that it  
3 may very well be that other dikes are elevated as well.  
4 That would, in turn, control probably the thickness of the  
5 unconsolidated materials. And dikes may prevent flow going  
6 from the TWIS to the north and may actually end up orienting  
7 it more towards the east. But this doesn't appear to have  
8 been considered as an alternative hypothesis.

9 Q Okay. Can you draw for us when you mean on this issue on --  
10 using one of the little flip-chart pages?

11 A I probably have an exhibit on this. I'm not sure. Maybe it  
12 comes up later.

13 Q Is this (indicating) what we're talking about, Doctor?

14 A That's right.

15 Q Okay. Good.

16 A Probably easier, but I can do both here. The point is that  
17 the yellow areas on this exhibit here, the left one is the  
18 orebody and the right one is the East Eagle Rock.

19 Q Doctor, I need to stop here, just to slow down a little bit.  
20 Okay. Where does this come from?

21 MR. REICHEL: Excuse me, Counsel. Could you  
22 identify for the record what --

23 MR. EGGAN: We're going there right now.

24 Q Where does this graphic that is on the screen come from?

25 A Right.

1 Q Is this from the KEMC Exhibit 596?

2 A The underlying color graphic is the magnetic survey results  
3 that, I think, Exhibit 5- --

4 Q 596 from the company's exhibits.

5 A 596. Right. All I did was bring this into a geographical  
6 information system. It's a mapping program. And I  
7 georeferenced this to existing site features. So it's  
8 basically bringing this in and just -- all I wanted to do  
9 was line it up with other information at the site. I was  
10 interested in looking at where the faults are and where  
11 mapped dikes have been placed. Yesterday when we presented  
12 some figures, those were shown. These pink lines that are  
13 laying at east-west are mapped dikes from the Kennecott  
14 reports that I reviewed. And the TWIS is located roughly  
15 around this location right here (indicating). I can  
16 probably point to it easier here, with these four dots. And  
17 the red dots in the background apparently are a number of  
18 boreholes that exist throughout the area, which I haven't  
19 seen in any of the reports. I didn't have the opportunity  
20 to review those.

21 Q Okay.

22 A But the TWIS is located here (indicating). And my thought  
23 is that, as you progress to the northeast, when we made a  
24 site visit and saw the first seep over here, we drove up  
25 over the hill and around, that there's a pretty noticeable

Page 1740

**NetworkReporting**

**1-800-632-2720**

1 increase in the topography. And it's shown on a number of  
2 the cross-sections and reports that I've reviewed as you go  
3 down towards the TWIS. So in other words, from the TWIS  
4 going north, you see an increase in the topography and  
5 before it goes down and steeply drops off into the drainage  
6 to the north. I think it's equally plausible that, given  
7 the number of dikes that run east-west through here, that an  
8 underlying could be -- could exist that's oriented in the  
9 same directions parallel to existing dikes. This may cause  
10 the topography to be elevated in that area.

11 And if that's true, the presumed northeast flow --  
12 and again remember no data exists in this area to prove or  
13 disprove that. But if a dike does exist there and it's  
14 elevated with respect to the surrounding metasedimentary  
15 rock, it's very possible that this could cause water to flow  
16 to the east-southeast effectively as a barrier. And that's  
17 important because this is a significant change to the  
18 underlying conceptual -- my opinion presumed conceptual  
19 model for the pathway that groundwater would be flowing from  
20 that TWIS.

21 Q Does the company's application materials, the materials you  
22 have reviewed, take that as a possibility?

23 A They don't. And this is where the ASTM standards on  
24 characterization and conceptualization clearly state pretty  
25 standard in this industry to consider multiple working

Page 1741

**NetworkReporting**

1-800-632-2720

1 hypotheses where you have a good level of uncertainty about  
2 information. And this is clearly an area where no data  
3 exists. I showed you the bedrock surface that was produced  
4 before, no borehole data in this whole area, and yet that  
5 surface is now estimated or guessed by modelers and used in  
6 the model. And that has a pronounced effect in terms of  
7 estimating where the groundwater goes from the TWIS, the  
8 velocity, the amount of mounding, et cetera. But this  
9 should have been considered, I think.

10 In addition, I see a point out to the east, this  
11 well QA0009 of the TWIS. And the thickness of the  
12 unconsolidated material rapidly increases to the  
13 east-southeast from the TWIS. This wasn't really  
14 considered. But that thickness increased and the bedrock  
15 sloping down sharply to the east-southeast as well in my  
16 mind also kind of further supports an argument that  
17 groundwater from this TWIS could very much be heading to the  
18 east-southeast.

19 Q Did you see additional data in the application materials  
20 that they provided that would suggest that the water is not  
21 flowing to the northeast as they suggest but in a different  
22 direction?

23 A I did not see any information -- I'm sorry. Could you  
24 rephrase that?

25 Q Yeah. Did you see any data that they provided -- okay --

1 that might suggest that the water is not, in fact, going to  
2 the northeast?

3 A No.

4 Q Okay. I want to show you Figure 2 to Appendix B1 to the  
5 EIA, which is MDEQ Exhibit 32. What does this exhibit tell  
6 you?

7 A Well, my understanding is that the development of the  
8 unconsolidated material, you know, in geologic time in its  
9 development, was draining -- flows were draining to the  
10 southeast into this Mulligan Plains area as a big deposit.  
11 But the fact that the development and the increasing  
12 thickness of sediments, outwash sands, et cetera, to the  
13 southeast suggests that water may preferentially flow that  
14 direction as well. It's just an added support for the  
15 previous conceptualization that I offered.

16 Q Okay. And your previous conceptualization showed what? You  
17 said --

18 A That the flow could be to the east-southeast rather than to  
19 the presumed northeast direction.

20 Q Okay. Do you think the company has sufficient data to  
21 really conclude that the water is going to go to the  
22 northeast?

23 A No.

24 Q In your opinion, Doctor -- in your expert opinion, did the  
25 company correctly estimate the groundwater flow directions

Page 1743

**NetworkReporting**

1-800-632-2720

1 from the TWIS?

2 A No.

3 Q Why do you say that?

4 A They had insufficient data. They didn't characterize the  
5 system well enough to determine -- you know, to support  
6 their presumed groundwater flow directions. I don't think  
7 they hydraulically tested an adequate area to confirm the  
8 details of the aquifers. I don't think they characterized  
9 or identified whether one aquifer or two aquifers actually  
10 exist beyond the TWIS in any direction really that's been  
11 inferred.

12 MR. EGGAN: Your Honor, I think this would be a  
13 good time for a break, if you please.

14 JUDGE PATTERSON: Fine with me.

15 MR. EGGAN: Okay.

16 (Off the record)

17 JUDGE PATTERSON: Mr. Egan, are you ready go to?

18 MR. EGGAN: I am, your Honor.

19 JUDGE PATTERSON: Okay.

20 Q Keeping with our theme now of whether they collected and  
21 correctly interpreted the data, collection and  
22 interpretation of data, let's talk for a minute about their  
23 contours. Okay?

24 A Okay.

25 Q And I want to show you an exhibit that I think is

1 particularly important in the context of these contours.

2 MR. EGGAN: Can I have MDEQ 002353? Your Honor,  
3 this is Figure 23 from the groundwater permit application,  
4 Appendix D1 -- I'm sorry. It's to the EIA. It's MDEQ -- a  
5 part of MDEQ Exhibit 32, Tab 7 for those of you that are  
6 keeping track.

7 Do you want the -- Mr. Lewis, would it help you to  
8 have the Bates number?

9 MR. LEWIS: Not until you want to offer something.

10 MR. EGGAN: Well, I'll offer it in a minute.

11 Q Doctor, does this tell you -- does this particular figure  
12 show you anything about the contours that were developed by  
13 the company in their application?

14 A Yes. I think this is a fundamental piece of information  
15 that you use to develop a sound conceptual understanding of  
16 flow through the system. When I looked at these contours  
17 and the flow directions as --

18 Q Just to make sure that everybody understands, what are we  
19 talking about when we talk about contours on a map like  
20 this?

21 A Right. The different blue lines represent constant  
22 elevations like in a ground surface topography. And --

23 Q Are these contours geographic contours or are they hydraulic  
24 contours? Are we talking about water or land here?

25 A The blue lines are water, groundwater elevation. And they

Page 1745

**NetworkReporting**

1-800-632-2720

1 are at constant elevations. And where they're more dense or  
2 closely spaced together, you have a steeper slope on the  
3 water surface. In any case, what is fundamental about this  
4 to understand is that where you have noted streams and then  
5 at the heads of the streams you have what has been referred  
6 to as seeps -- they are probably more likely springs because  
7 they flow year around, but either way what struck me  
8 initially about these was that the elevations of these  
9 contours as they cross over these notable topographic  
10 depressions is that they don't seem to consider the fact  
11 that groundwater is at the surface here.

12 And so when I checked independently in this  
13 geographical information system, the surface topography  
14 compared to these groundwater elevations, I see errors in  
15 these contour -- in these groundwater contours that indicate  
16 that groundwater is on the order of 10 to 30 feet above  
17 ground surface in these drainage areas. And to me, that has  
18 a big impact in terms of where you're trying to assess where  
19 groundwater is going to vent and probably also had some  
20 influence on placement of wells that they have out in these  
21 locations.

22 Q Well, Doctor, I think I've made it abundantly clear to  
23 everyone. I'm no expert in hydrology. But what we're  
24 saying is that we have contours here on their documents that  
25 they submitted to the MDEQ that is showing groundwater or

1 water 30 feet above ground level?

2 A Yes.

3 Q Does that seem odd to you?

4 A Well, that's just wrong. And in reality, they have the  
5 surface topography. And it's just standard practice to,  
6 when you prepare a plot like this to, at a minimum, subtract  
7 the ground surface and make sure that your groundwater  
8 contours here aren't above ground surface. This has a lot  
9 to do with the flow arrows that they show here. And I  
10 think, if they had considered that, they would have seen  
11 much tighter arrows flowing directly towards the blue  
12 drainage lines there than is shown.

13 Q Is there any evidence that the Michigan Department of  
14 Environmental Quality caught this error and corrected them  
15 on it?

16 A From what I reviewed, I didn't see any comments towards this  
17 issue. And this is important because it's information  
18 that's sort of fundamental to developing a sound conceptual  
19 model which forms the basis for subsequent models where  
20 you're going to predict where flow goes and discharges or  
21 vents.

22 Q Let me show you a couple more exhibits not related to  
23 contours but perhaps on more to this point. Okay. Doctor,  
24 what is this showing us? This is -- this is a Quaternary  
25 Deposit Characterization, TWIS infiltration characteristics.

Page 1747

**NetworkReporting**

— 1-800-632-2720 —

1 MR. EGGAN: Your Honor, this is Petitioner's  
2 Exhibit 29-S.

3 Q What does this show us, Doctor?

4 A Well, the focus was really on the two cross-sections that  
5 were placed on a long axis of the TWIS sand. In these  
6 cross-sections -- I don't know if it's possible to blow up  
7 one of them perhaps. The important point is that the blue  
8 line -- the blue area here and its contact with the ground  
9 is the groundwater table. And you can see that flowing from  
10 the northwestern part of the TWIS down to the southeast  
11 there's a pretty significant drop in the groundwater table.  
12 And that gradient is actually stronger than the gradient  
13 going to the northeast. To me -- when I saw this, I  
14 immediately thought, why don't the contours seem to be  
15 aligned more towards the east-southeast that are consistent  
16 with these contours -- I mean, this groundwater table as  
17 it's drawn here on this cross-section?

18 Q Okay.

19 MR. EGGAN: I'm going to go back to the exhibit on  
20 the contours and offer into evidence MDEQ Exhibit Number 32,  
21 which is Figure 23 from Appendix B1 to the EIA. It is Bates  
22 numbered MDEQ 002353.

23 MR. LEWIS: Tab, please?

24 MR. EGGAN: Tab 7.

25 MR. LEWIS: No objection.

Page 1748

**NetworkReporting**

1-800-632-2720

1 MR. REICHEL: No objection.

2 JUDGE PATTERSON: No objection, it will be  
3 entered.

4 (Respondent's Exhibit 32, Figure 23, Tab 7 received)

5 MR. EGGAN: All right. And also, your Honor, this  
6 document is Figure 25, which is one of the exhibits that we  
7 have. It's Petitioner's Exhibit Number 29. It is Figure 25  
8 from a document created by the North Jackson Company,  
9 Conceptual Hydrogeologic Cross-Section F-F5. And we would  
10 offer this into evidence.

11 MR. LEWIS: As for clarification, is this the  
12 original condition of that figure from the mine permit  
13 application or has Mr. Prucha added something?

14 Q Have you added something to this, Mr. Prucha?

15 A I added the photo and this title called "gradient."

16 Q The photo.

17 MR. LEWIS: And then in your Part 31 exhibit list,  
18 Mr. Egan, as you indicated earlier, this is under Exhibit  
19 Number 29-S, as I understand?

20 MR. EGGAN: This would be, yes, 29-S.

21 MR. LEWIS: And according to the list, there's  
22 actually two figures there. I'm not clear whether you're  
23 trying to offer the entire 29 -- 29-S or part of 29-S.

24 MR. EGGAN: The entire Exhibit 29-S.

25 MR. LEWIS: 29-S only, I mean.

Page 1749

**NetworkReporting**

1-800-632-2720

1 MR. EGGAN: For right now, 29-S.  
2 MR. LEWIS: The configure?  
3 MR. EGGAN: That's correct.  
4 MR. LEWIS: And would that be made -- is it  
5 labeled as such in your exhibits, 29-S?  
6 MR. EGGAN: Yes.  
7 MR. LEWIS: No objection.  
8 MR. REICHEL: No objection.  
9 JUDGE PATTERSON: No objection, it will be  
10 entered.  
11 (Petitioner's Exhibit 31-29-S received)  
12 Q Doctor, you have indicated with this gray line here the flow  
13 line.  
14 A Yes.  
15 Q So what does this suggest to you?  
16 A Well, on the plots that I've seen of groundwater flow  
17 direction, this seems inconsistent with the northeast trend.  
18 Q Okay. Who had -- let's go slow here so we understand. The  
19 northeast trend was something that was predicted by the  
20 company in one of their flow models?  
21 A No, based on their field data and incorporated into their  
22 models.  
23 Q Very good. And this would suggest what? That those -- that  
24 that northeasterly direction may not be correct?  
25 A That's right.

1 Q Okay. Let's look at -- Doctor, as you can see, I've shown  
2 you what has been marked as Petitioner's Exhibit 31-29-T --  
3 excuse me. I'll say that again -- Petitioners in the Part  
4 31 matter, that's our Exhibit 29-T. Okay. That's the  
5 document that I'm showing you now, which is the Quaternary  
6 Deposit Characterization TWIS infiltration area. It looks  
7 like it was part of a submission provided by Kennecott.  
8 It's Figure 27. Have you seen this document before?

9 A Yes.

10 Q And what does this show us?

11 A It shows in the red arrows, these were --

12 Q Can you get up and show us, Doctor, show us with your  
13 pointer?

14 A The groundwater contours that were developed based on the  
15 available data that they did have show -- are shown in light  
16 blue here. And the red arrows barring these two over the  
17 TWIS were included on the original figure and are showing  
18 estimated flow directions of the groundwater.

19 Q So the three long arrows on this exhibit are Kennecott's  
20 estimation of groundwater flow direction?

21 A That's right.

22 Q Okay. I simply placed the arrows over the TWIS area based  
23 on my assessing the previous cross-sections which were  
24 aligned with these arrows that showed a very strong gradient  
25 or drop in the groundwater elevation from the northwest down

1 to the southeast. And I would have expected contours in  
2 light blue and the flow areas that are shown on this diagram  
3 to be showing something that's consistent with those  
4 cross-sections. Instead I see something that's at least 90  
5 degrees different.

6 Q All right. So the shorter two arrows that we have on this  
7 document are based on your examination of the data including  
8 the two cross-sections we just talked about?

9 A That's right.

10 Q And what conclusion do you reach based on those  
11 cross-sections and the data you looked at?

12 A The groundwater flow directions on this plot are incorrect.

13 Q Okay. They're showing northeast. What are the two arrows  
14 that you have added -- what direction do they show?

15 A Southeast.

16 Q Now, we talked about the contours and the groundwater  
17 between 10 and 30 feet above the ground. We talked about  
18 the errors that they've made on their other mapping. What  
19 does this tell you about the company's knowledge of the flow  
20 direction?

21 A It seems like it is not really well understood or known at  
22 this point.

23 Q Does their analysis -- their analysis of the flow and the  
24 direction of the flow have any implication as to the  
25 placement of monitoring wells by the company?

Page 1752

**NetworkReporting**

1-800-632-2720

1 A Yes. I think that there's a presumption that groundwater  
2 flows to the northeast. They have no wells northeast of the  
3 TWIS. And their placement of wells down north of the Yellow  
4 Dog Plains downhill from that point seems like maybe they're  
5 not placed in the right locations or in adequate locations  
6 for assessing true flow direction.

7 Q Okay. Now, I want to talk about the company's modeling.  
8 We've gone through their data collection, their  
9 characterization of flow, their conceptualization of the  
10 flow. And I think we've identified some significant  
11 problems. But I'd like to discuss the company's modeling,  
12 the modeling that they did. What is the reason that the  
13 company modeled in the area of the TWIS?

14 A It was to predict where -- the mounding, the horizontal and  
15 vertical mounding beneath the TWIS and to determine  
16 three-dimensional flow paths of the discharge water, the  
17 velocities and the venting locations.

18 Q Okay. I want to show you something from the latest modeling  
19 that they did.

20 MR. EGGAN: Let's go to KEMC page number 186852.  
21 This is at Tab 31 for those of you that are looking.

22 Q Does this particular document tell you anything about flow  
23 direction?

24 A Yes. Is there a second page to this exhibit?

25 Q Yes, there is.

Page 1753

**NetworkReporting**

— 1-800-632-2720 —

1 A I think the second page is --

2 Q 186853. Is that the second page you're looking for, Doctor?

3 A That's right.

4 Q Okay. Tell us what this tells us about flow direction. And  
5 this is from Kennecott Exhibit KEMC 591, and it's Figure 16,  
6 Tab 19. Tell us what that -- what this particular exhibit  
7 shows us about their modeling.

8 A I believe that this latest modeling compared to previous  
9 modeling, there is a little bit more of an eastward trend in  
10 the flow direction from the TWIS. So my understanding of  
11 the modeling results is that they seem somewhat variable in  
12 the directions that they're estimating where the discharge  
13 goes to.

14 Q But it sounds like, at least with the latest modeling,  
15 they're coming around to your perspective, that it's going a  
16 different direction than northeast?

17 A It appears to be more of an eastward direction.

18 Q Now, you indicate --

19 MR. EGGAN: Well, let me offer this, your Honor --  
20 this exhibit. It's KEMC Exhibit 591. And I want to offer  
21 this particular Bates page 186853 into evidence.

22 MR. LEWIS: No objection.

23 MR. REICHEL: No objection.

24 JUDGE PATTERSON: No objection, it will be  
25 entered.

Page 1754

**NetworkReporting**

— 1-800-632-2720 —

1 (Intervenor's Exhibit 591, Figure 16, Tab 19 received)

2 Q Now, you've indicated the company has done a number of  
3 different groundwater models?

4 A Yes.

5 Q Have they been consistent with one another? Have the  
6 groundwater models done by the company been consistent with  
7 each other?

8 A No.

9 Q Can you tell the hearing officer about the inconsistencies?  
10 And maybe this is a time to show this history of modeling  
11 slide that we've developed.

12 MR. EGGAN: Can you bring up 101075? This is at  
13 Tab 32, Counsel.

14 Q Dr. Prucha, is this something that you created?

15 A Yes.

16 Q And what is it intended to show?

17 A Well, that there have been a number of models produced for  
18 both the unconsolidated material and the bedrock flow  
19 system.

20 Q Okay. Just to make sure that we're on the same page here,  
21 how many models have they actually done?

22 A Well, from what I can tell, there's four different models  
23 for the unconsolidated material done by three different  
24 consultants and then three different bedrock models.

25 Q Well, that's quite a number of models. From your

Page 1755

**NetworkReporting**

1-800-632-2720

1 perspective as a hydrologist, any sense for why they needed  
2 this number of models?

3 A It's unclear to me why, but it suggests that the results --  
4 the system may be complex and they wanted different  
5 perspectives.

6 Q Are they consistent with one another? Do they track one  
7 another as they go?

8 A No. But they do rely on the same flawed characterization  
9 and conceptualization, limited data, and there's just  
10 different ways of producing a model off the same  
11 conceptualization, different model layers, different  
12 boundary conditions. But really they're relying on the  
13 same, in my opinion, flawed set of data and  
14 characterization. And to me, that's the most important part  
15 of developing the model.

16 Q Tell the hearing officer about the inconsistencies that you  
17 have seen in the various models that they have done.

18 A Well, I'm going to just focus on the unconsolidated model,  
19 because it really is that that relates to the Part 31  
20 issues, if that's all right.

21 Q Okay. That's fine. Yeah.

22 A Although I do show some red arrows, and the importance of  
23 arrows going from the bedrock models into the unconsolidated  
24 flow models is that information in the unconsolidated model  
25 or the models depend on what was modeled at the bedrock.

1 And that's changed over time. And so it's been pretty  
2 difficult to actually see what's changed. But at the same  
3 time, this plot here was an attempt to try and clarify that.  
4 In 2005 -- let me just explain the chart, too, that the  
5 boxes in the center of the diagram label the years 2005,  
6 '06, '07 and '08. And the first model that I reviewed for  
7 the unconsolidated material appears to have been prepared in  
8 2005 by Fletcher Driscoll. It was a MODFLOW model of the  
9 unconsolidated flow system. And can I draw a diagram here  
10 to represent that real quick?

11 Q You may, absolutely.

12 (Witness draws diagram)

13 A So this 2005 model that was produced, from my understanding,  
14 included what I'll just simply refer to unconsolidated,  
15 abbreviated "unc," and then I guess I'll just write this  
16 out. My understanding is that the model simulates flow  
17 using the USGS code MODFLOW, which is different than the  
18 FEFLOW code used to model flow in the bedrock system, but  
19 that the -- this initial model simulated flow in the  
20 unconsolidated material and also included flow in the upper  
21 bedrock. It did not include the lower bedrock material.  
22 But this initial model appears to be developed to simulate  
23 the current conditions. And this is claimed to have been  
24 calibrated to site water levels and groundwater discharge.

25 In 2006, apparently two different models were  
Page 1757

**NetworkReporting**

**1-800-632-2720**

1 developed, one by Golder and then one by Fletcher Driscoll  
2 to look at the flow system. And the 2006 version of the  
3 Fletcher Driscoll model is similar to the 2005 but, in that  
4 case, they actually simulated the lower bedrock. So --

5 Q What significance does that have, the simulation in the  
6 lower bedrock?

7 A Well, for one, they're using a code MODFLOW again to now  
8 simulate the bedrock flow. And the problem I had with that  
9 is that they made -- had discussion when they selected  
10 FEFLOW to model the flow in discrete faults as to why  
11 MODFLOW was not as good of a code really doesn't handle  
12 discrete faults. That's why they selected the FEFLOW code.  
13 And now they're modeling the system that they had modeled  
14 with FEFLOW that had discrete faults in it. And they're in  
15 addition now doing a coupling that -- with the bedrock flow  
16 model that I -- is certainly not a standard approach and I  
17 believe has issues in terms of the mass balance or the flows  
18 that you get translated from the bedrock model from the  
19 dewatering to the actual unconsolidated material.

20 Either way they in 2006 made several modifications  
21 in addition to including the lower bedrock. They adjusted  
22 things like the recharge at the top of the model. They  
23 adjusted hydraulic conductivities inside the model. And in  
24 the lower bedrock, they also appear to have tried to  
25 translate the effect of the lower bedrock pumping on the

Page 1758

**NetworkReporting**

1-800-632-2720

1 model. The issue here, though, is that this, they claimed,  
2 was a calibrated model, the 2005 model. It was a  
3 steady-state model, which I believe has a number of issues  
4 in terms of demonstrating that it's really valid.

5 2006 they made all these changes. But then they  
6 apparently didn't recalibrate or I can't tell that they  
7 recalibrated from the report. And that seems to violate  
8 sort of the basic approach that's outlined in guidelines  
9 like the AS10 or DEQ groundwater modeling guidelines. You  
10 don't just make significant changes to a model and then jump  
11 right into predictions. This is like sending a car out with  
12 a brand new type of engine, different tires, a different  
13 types of transmission and you haven't test run it and you  
14 said, "Just go ahead and drive this. Trust me. It'll  
15 work." This seems like a fundamental issue to me in terms  
16 of the modeling.

17 The Golder 2006 model, my understanding, is just  
18 taking the unconsolidated flow zone. But that was done in a  
19 very simplistic way where it was assumed -- they made  
20 several very simplifying assumptions about the flow system.  
21 They didn't model the bedrock. They assumed it was, I  
22 believe, unpermeable. They had constant hydraulic  
23 properties for their unconsolidated materials. They had --  
24 anyway, to me, it was a rectangular square. They didn't  
25 consider important water sinks and sources or, you know,

Page 1759

**NetworkReporting**

— 1-800-632-2720 —

1 effectively where groundwater is discharging into rivers  
2 like the Salmon Trout. Yes, their models don't include  
3 that. So it's overly simplified. And I was not clear on  
4 exactly why that was done other than to get maybe a  
5 preliminary assessment of what mounding might be.

6 And finally we have the GeoTrans model. And  
7 that's different from either of the Fletcher Driscoll models  
8 where they only consider the unconsolidated unit.

9 Q Doctor, just so that I'm clear, the GeoTrans model which was  
10 done in 2008 is different than the Golder model in 2006?

11 A Yes.

12 Q Is it different than the Fletcher Driscoll model in 2006?

13 A Yes.

14 Q Is it different than the Fletcher Driscoll model in 2005?

15 A Yes.

16 Q Is it consistent with the other three?

17 A No.

18 Q Is the 2008 consistent with the other three?

19 A No.

20 Q Were the other three consistent with each other?

21 A No.

22 Q Okay. What is unusual about all of this?

23 A Well, to me, it's dramatically different underlying  
24 assumptions about what the aquifer units are, which ones  
25 should they include. Should they include the upper bedrock?

1           Should they include the -- which of the unconsolidated  
2           aquifers should they include? The Fletcher Driscoll  
3           certainly had more detail in it for the unconsolidated. The  
4           Golder and GeoTrans tend to have fewer layers. So the  
5           GeoTrans now just has two layers. And to me, there's been a  
6           change every year -- every attempt at a new model.

7    Q       Well, does this evidence that the company has a concept -- a  
8           good concept of the area -- the groundwater in this area?

9    A       My understanding is this probably reflects, to a large  
10           extent, the poor data that they have available, their poor  
11           characterization and this conceptualization that just  
12           doesn't seem to be well thought out. And they're really  
13           considering one conceptualization where they're presuming  
14           flow at least in the area of the TWIS to the northeast. And  
15           yet I think we show a number of diagrams here that suggest  
16           that there are probably significant alternatives that they  
17           could considered. But I sense that -- at least in my  
18           experience having reviewed a lot of models in the past is  
19           that it doesn't seem like they're tying this to a  
20           well-thought-out conceptualization and that this is maybe  
21           one reason why they have multiple models that have such  
22           dramatically boundary conditions, dramatically different  
23           structures, layers.

24   Q       Awhile ago when you were testifying, you talked about  
25           garbage in, garbage out. How does that concept relate to

1 what we've seen in the modeling that they've done?

2 A Well, I believe that, if you don't have a good  
3 conceptualization, a foundation for developing the model and  
4 you develop the model anyway, that anything that you put  
5 into the model and expect to get out as a prediction is only  
6 going to be as good as what you've put in. And in this  
7 case, I don't think they've put in or considered adequate  
8 characterization and conceptualization for this system.

9 Q Did they get it right? Did they get it right in 2005 when  
10 they did the model?

11 A No.

12 Q Did they get it right in the first -- in the Fletcher  
13 Driscoll modeling in 2006?

14 A No.

15 Q Did they get it right in the Golder modeling in 2006?

16 A No.

17 Q Have they gotten it right with the latest GeoTrans  
18 materials?

19 A No.

20 Q Is it important to get it right with respect to groundwater  
21 flow?

22 A Yes.

23 Q Why? Why is it important?

24 A Well, if you're going to try and predict with any sense of  
25 accuracy the degree of mounding, where the mounded water

1 flows to, at what rate, when it would get there and then the  
2 actual surface water venting locations, it's imperative that  
3 you have a good underlying conceptualization and a model  
4 that can demonstrate that.

5 Q Okay. I want to talk briefly about each of the models, and  
6 just ask you a few basic questions about them. Okay? The  
7 2005 groundwater model that was done by Fletcher Driscoll,  
8 is there an issue with uniqueness?

9 A Yes.

10 Q What is that issue?

11 A Well, again it's a steady-state calibrated model that  
12 includes the upper bedrock. And I would see the upper  
13 bedrock as having, you know, discrete faults that they're  
14 clearly considering in the lower bedrock that wasn't  
15 included here. Either way, this model as a steady-state  
16 model really is subject to large uncertainties, and, you  
17 know, due to this non-uniqueness where, for example, the  
18 recharge input is a very important parameter into this  
19 model. And I didn't see really any good basis for the  
20 numerous zones that they have recharge applied over this  
21 model.

22 Q What is this concept of uniqueness? Because I think that's  
23 an important concept that the Judge needs to understand.

24 A Right.

25 Q What is uniqueness, and why is it important?

1 A Well, I had an example yesterday like a bathtub. And if you  
2 are -- the only information you have about a system is the  
3 level in the bathtub and you don't know how much water  
4 you're pouring into a bathtub or the size of the drain pipe  
5 coming out the bottom, you could put a huge amount of water  
6 into the tub, a large flow rate, and adjust this drain and  
7 still match your water level in the tub using different sets  
8 of combinations of the recharge and discharge out that pipe.  
9 And what it doesn't -- this is the kind of model that's been  
10 prepared here. And I don't believe it's adequately unique.  
11 And I think if they had done transient modeling, done  
12 verification on that like the ASTM standards suggest and DEQ  
13 standards suggest or guidelines, that these issues would  
14 have been less. It would have been less non-unique.

15 Q Okay. I want to talk about the 2006 modeling done by  
16 Fletcher Driscoll. Did they recalibrate that model?

17 A They did not recalibrate that model from what I can tell  
18 reviewing.

19 Q Tell us why that's an important issue.

20 A Well, again you don't want to apply a model that hasn't been  
21 calibrated because you can't verify that it actually  
22 reproduces observed system behavior.

23 Q You talked about their application of MODFLOW modeling in  
24 that Fletcher Driscoll report in 2006 --

25 A Right.

1 Q -- and your perspective that FEFLOW was the better tool to  
2 use. Talk to the hearing officer about why that's  
3 important.

4 A I think it would have been better from the perspective that,  
5 when they did the bedrock model down here having --

6 Q Down where?

7 A Oh, I'm sorry. In the bedrock zone here where I have the  
8 Golder models, the FEFLOW models. If just one model had  
9 been produced, then the model would have done the  
10 calculating of flows and impact from the mine dewatering  
11 area in the lower bedrock as defined by the company. This  
12 interaction would have been calculated by the model, which  
13 is important because one of the biggest issues I have with  
14 the modeling that was done here is that they were separated  
15 out. And this flow between what was estimated coming out of  
16 the bedrock isn't translated into this upper overlying  
17 unconsolidated material very accurately. And I have serious  
18 questions about how that's done.

19 Q Can this model -- this 2006 Fletcher Driscoll model be used  
20 for predicted simulations?

21 A I don't believe so. One important point as it relates to  
22 Part 31 is that MODFLOW doesn't have the capability to  
23 simulate the mounding in the vadose zone. It's just simply  
24 not in the code. It's the wrong code to use when you can  
25 show that there are shallow low permeability units above the

1 water table and infiltration that comes down from the ground  
2 surface to this infiltration gallery reaches that well above  
3 the groundwater table. There's no way to actually simulate  
4 that mounding in MODFLOW effectively.

5 Q Did the 2006 Fletcher Driscoll model -- were they able to  
6 verify that it reproduces current system behavior?

7 A No. They didn't recalibrate in what I could see and they  
8 made several changes to the model input.

9 Q Was that model consistent with ASTM guidelines and the  
10 requirements?

11 A No.

12 Q Was it consistent with the MDEQ guidelines for groundwater  
13 modeling?

14 A Not that I could see.

15 Q Was the Fletcher Driscoll 2005 modeling consistent with MDEQ  
16 guidelines -- groundwater guidelines?

17 A Right. No, in the sense that they require, as do any  
18 guidelines, that you have a sound conceptualization before  
19 jumping in and developing any kind of model.

20 Q Would that be the same for the Golder 2006?

21 A Yes.

22 Q Are the groundwater modeling efforts that were made in 2006  
23 by the company, the Fletcher Driscoll and the Golder  
24 models -- are they in your view defensible?

25 A No; neither was calibrated. And again, they're relying on,  
Page 1766

**NetworkReporting**

**1-800-632-2720**

1 in my understanding, inadequate conceptualizations.

2 Q I just want to -- I just want to talk briefly about this  
3 2006 Fletcher Driscoll flow model. Can you show us  
4 graphically what they did?

5 A Yeah, I think I covered that right here in this particular  
6 diagram here where they included the lower bedrock and  
7 really they had -- the FEFLOW model had been simulating this  
8 but they included this in the Fletcher Driscoll 2006 model  
9 so that they could somehow translate the flow conditions  
10 that they got from the FEFLOW model into the upper bedrock  
11 and unconsolidated material. But my understanding is that  
12 they didn't translate the actual hydraulic properties of the  
13 medium; they ended up having to adjust those to try and  
14 match the flux coming out of these -- or the flow conditions  
15 coming out of these areas around the mine dewatering in the  
16 lower bedrock.

17 Q What are your -- what are your conclusions about Kennecott's  
18 predicted modeling of where this groundwater is going to get  
19 up -- is going to end up? And I'm talking about the 2005  
20 modeling, the 2006 modeling by Fletcher Driscoll, and then  
21 the 2006 modeling by Golder.

22 A I think that they have issues in terms of the -- where  
23 they're predicting groundwater flow. They have issues in  
24 terms of the amount of mounding, where it occurs. They  
25 don't consider realistic inflow rates.

Page 1767

**NetworkReporting**

1-800-632-2720

1 Q Do you think Kennecott -- do you think the company  
2 characterized the hydrology in the area of the flow  
3 direction and the hydraulic properties from the TWIS to the  
4 eventual seep areas?

5 A No.

6 Q Is there a concern about given the mounding that there's  
7 going to be a different flow path?

8 A Yes.

9 Q Can you explain that to Judge Patterson, please?

10 MR. LEWIS: Asked and answered, your Honor.

11 Q Talk about the radial flow path and the whether or not this  
12 -- some of this water could end up near the Yellow Dog  
13 River.

14 A I think that this is the TWIS location and considering much  
15 higher inflow rates -- and if this wasn't redesigned in  
16 terms of the size, that what I would expect is more mounding  
17 in a radial direction and flow directions from this TWIS in  
18 all directions rather than just a presumed assumption that  
19 it all flows to the northeast where they installed some  
20 wells up to the north, northeast.

21 Q Does radial flow, this flow that you're talking about with  
22 respect to this mounding, does that call into question the  
23 possibility that this -- some of this water could end up in  
24 the Yellow Dog?

25 A Well, the Salmon Trout River is really in this (indicating)

1 direction and the Yellow Dog is really to the southwest, to  
2 the southeast and -- yes, I think that some of that water  
3 could eventually drain into the Yellow Dog River. Depending  
4 on the infiltration rates, this is pretty close to a terrace  
5 elevation where the elevation drops off quickly and then a  
6 wetland is just to the south about 800, 900 meters.

7 Q I also want to talk to you about the GeoTrans modeling, the  
8 2008 modeling. And this is -- what? -- the fourth in a  
9 series of models that the company has tried to do. Isn't  
10 this model a steady state? If that's the case, isn't that a  
11 good thing?

12 A No. I mean, the steady state is not as credible, in my  
13 opinion, in a large way to having done a transient model.

14 Q Why would they have utilized a steady state modeling for  
15 this particular site when a transient state is better?

16 A Well, it's simpler.

17 Q What other criticisms do you have the latest modeling  
18 effort, the 2008 effort?

19 A I think the largest one is just that it's still based on  
20 what I see as flawed characterization, data collection,  
21 conceptualization.

22 Q Does this model show a three-D flow path?

23 A It doesn't show a three-dimensional flow path like the -- it  
24 doesn't even show a two-dimensional flow path like the --  
25 was done in the Fletcher Driscoll and Golder model reports.

Page 1769

**NetworkReporting**

1-800-632-2720

1 It showed --

2 Q And what difference does that make?

3 A Well, if I were assessing the report and I haven't done my  
4 own modeling, I'd have to rely on whatever is the conclusion  
5 of the flow direction. I can't even determine the flow  
6 direction because the simulated head or the groundwater  
7 level with the effects the mounding weren't even included as  
8 a figure. They showed the change in head, which shows the  
9 extent of the mounding aerially, but I can't determine just  
10 based on any of the plots included in the report what flow  
11 direction occurs, how much flow is oriented back to the  
12 southwest or the southeast. It seems like that would have  
13 been a primary objective to show that as far as the  
14 hydrogeologic reporting requirements of Part 31.

15 Q Did they use FEFLOW for this particular modeling effort?

16 A They used an updated inflow rate from FEFLOW model -- a  
17 FEFLOW model that had been updated in late December. And  
18 actually, reduced the amount of mine inflow to 60 GPM  
19 instead of 75. But the GeoTrans report acknowledges that  
20 the -- they do not do an upper bound inflow rate to assess  
21 the mounding affect that the -- you know, the flow direction  
22 from the TWIS. So I'm uncertain what the benefit of that  
23 is. I think it would have been more beneficial to show,  
24 like the Fletcher Driscoll models, Golder model that, you  
25 know, you were simulating an upper bound estimate of

Page 1770

**NetworkReporting**

**1-800-632-2720**

1 infiltration of the TWIS.

2 Q Let me show you Exhibit 591 from that GeoTrans groundwater  
3 modeling effort. It's KEMC 186849.

4 MR. EGGAN: This is -- your Honor, this is one of  
5 Kennecott's exhibits. It's this GeoTrans report and it is  
6 Figure 12 from that exhibit. It is KEMC, Bates number  
7 186849.

8 Q What does this show you and what, if anything, does this  
9 tell you about their modeling effort?

10 A Well, it's a different model boundary that is being  
11 considered now compared to previous models. But this  
12 particular plot is showing a hydraulic conductivity zone and  
13 I see data points here that -- I'm not sure in the report,  
14 but it -- maybe these are used to constrain or estimate  
15 these hydraulic conductivity zones. In this particular  
16 location they show -- and I'm not sure that the color shows  
17 up or something, but a zone around the orebody that extends  
18 and seems to be following the Salmon Trout River where it's  
19 claimed that it's a low permeability in this upper A-B zone.  
20 And there's a lot of data over on the right side, but no  
21 data along the Salmon Trout to suggest that it actually  
22 exists over here. And without having the model I wouldn't  
23 be able to explore the implications, but it seems to me that  
24 it would be sort of presumptive. And the extent of that  
25 zone; there are no wells south or boreholes south and west

Page 1771

**NetworkReporting**

— 1-800-632-2720 —

1 of the entire Salmon Trout creek; and yet, this is a  
2 critical area. The mine dewatering, you know, the impacts  
3 from the TWIS could easily be felt back on that area.

4 Q So does this reflect a quality effort on their part?

5 A No.

6 Q What does it reflect?

7 A Well, I think they're not considering necessarily the  
8 uncertainty that is associated with this conductivity zone.  
9 I can't tell whether there are hydraulic conductivities  
10 available for the lower aquifer. I believe most of these  
11 wells to the south off the Yellow Dog are in very shallow  
12 wells and wouldn't reflect the D aquifer. So over a large  
13 portion of the model they don't know what the hydraulic  
14 property is; it hasn't been tested.

15 Q So this goes back to our collection of data issue?

16 A Right. And at first glance you might think this isn't  
17 really important in terms of how it impacts this, but they  
18 half modeled the large because the impacts from the TWIS and  
19 the mine dewatering you don't want the boundary conditions  
20 to influence this area. So, you know, flow over here will  
21 impact this as opposed to trying to make an assumption that,  
22 you know, a closer model -- boundaries. They're modeling a  
23 large area. I mean, out to the east I don't see any data  
24 points out here except for one. So this is virtually  
25 unexplored territory.

Page 1772

**NetworkReporting**

— 1-800-632-2720 —

1 Q So if the water is flowing to the east, are they going to be  
2 able to tell?

3 A No. It's entirely dependent on the assumptions that they  
4 make. And the bedrock surface, the aquifer thickness; these  
5 can vary significantly from west to east or north to south.

6 MR. EGGAN: Again, this is from the KEMC exhibit  
7 591, your Honor, and it is from this latest GeoTrans  
8 modeling effort apparently done this spring.

9 Q What does this tell us about their --

10 MR. REICHEL: Excuse me, Counsel. What tab is  
11 that?

12 MR. EGGAN: That would be Tab 44.

13 MR. REICHEL: Thank you.

14 Q What does this tell us about their modeling effort?

15 A Well, again this is an important parameter in the model, the  
16 thickness of the second layer, the D and E Zone. And I  
17 don't see any of the constraints or the locations of  
18 boreholes used to define this pretty complicated thickness  
19 map.

20 Q What does that tell you?

21 A Well, that you're adding a considerable amount of  
22 uncertainty into the model. And this just wasn't considered  
23 in the simulation; it was one out of probably thousands of  
24 possible combinations of what the thickness could be. And  
25 my question is, when you put this in or another estimate,

1           which could be dramatically different than this but still  
2           honor the locations where you have borehole data, the  
3           results could be dramatically different.

4   Q       And this is the GeoTrans report that was submitted by KEMC  
5           as part of Exhibit 591?

6   A       Yes.

7   Q       And it looks like it's Figure 11?

8   A       Yes.

9   Q       Okay. Let me show you again from Exhibit 591 --

10                   MR. EGGAN: This will be Tab 46, Counsel. It's  
11           KEMC, Bates number 186846.

12   Q       And this is the GeoTrans recent -- most recent modeling  
13           effort, the latest in a series of four. This is Figure 9,  
14           "Thickness of Layer 1, A and B Zone." Can you tell us what  
15           this tells you about their modeling effort?

16   A       It's the same issue as the prior plot. Again, fairly  
17           complex estimate for the spatial distribution of this  
18           thickness for the A Zone, and I don't see the constraints or  
19           the boreholes placed here, which is standard to put on maps  
20           like this so that one gets a sense of how accurate -- or  
21           where you know actual information about this thickness.

22   Q       Did the GeoTrans report simulate the 400 gallon-per-minute  
23           infiltration rate used to design the TWIS?

24   A       Like the Fletcher Driscoll model? No.

25   Q       Well, tell us the significance of that.

1 A Well, they're not evaluating the -- their upper bound limit.  
2 It seems if the TWIS has been designed towards that, that  
3 this is something we'd want to evaluate.

4 Q Do you have any other comments or criticisms regarding the  
5 latest GeoTrans report?

6 A Again, I think it simply adopts the conceptualization, the  
7 data, the conceptualization that was used in prior modeling  
8 efforts; it's just a different model prepared with some  
9 different assumptions. So I think it's subject to a lot of  
10 uncertainty and --

11 Q Garbage in; garbage out?

12 A Yes.

13 Q Is the latest GeoTrans -- does this latest GeoTrans  
14 investigation and the modeling -- do they get it right this  
15 time?

16 A No.

17 Q Is this latest GeoTrans modeling consistent with the  
18 Michigan Department of Environmental Quality groundwater  
19 modeling guidelines?

20 MR. REICHEL: Objection; asked and answered at  
21 least three times by my count.

22 JUDGE PATTERSON: I think it has been.

23 Q Do they get it right?

24 A Could you rephrase the question?

25 Q Yeah, let me -- I'll ask -- re-ask the question.

Page 1775

**NetworkReporting**

— 1-800-632-2720 —

1 A Okay.

2 Q Is the latest GeoTrans model consistent with the MDEQ  
3 groundwater modeling guidelines?

4 A No.

5 Q Did they get it right this time?

6 A No.

7 Q I want to talk briefly about the groundwater well network --  
8 excuse me -- the groundwater monitoring well network. What  
9 is your understanding of the groundwater modeling -- excuse  
10 me -- the groundwater monitoring network? Do you have  
11 opinions with respect to the groundwater monitoring network?

12 A Yes.

13 Q And what are your opinions?

14 A Well, there are wells that are placed to monitor discharge  
15 from the TWIS as it enters the groundwater flow system and  
16 there are wells that are proposed to test the infiltration  
17 system associated with the TWIS is working.

18 Q Do they accomplish this?

19 A I believe they'll have problems with these locations in the  
20 way they presented it.

21 Q Let me show you what is part of MDEQ Exhibit 143; it is  
22 Appendix B to the groundwater discharge permit application,  
23 MDEQ 010823.

24 MR. EGGAN: This is Tab 11, Counsel.

25 Q What does this tell us about the groundwater monitoring  
Page 1776

**NetworkReporting**

**1-800-632-2720**

1 network and the adequacy of that network?

2 A Well, I don't think it considers -- it shows that these low  
3 permeability units weren't really considered in the  
4 placement and design of the proposed infiltration monitoring  
5 well and it will likely influence the placement of up-  
6 gradient versus down-gradient wells to monitor the discharge  
7 from the TWIS.

8 Q Are you saying that the monitoring wells are just not placed  
9 in the right place?

10 A Well, with respect to the gradient, yes.

11 Q Well, tell the judge what you mean by that.

12 A Well, the -- there's the current system gradient where the  
13 flows look like they're to the east, the southeast possibly  
14 and wells are placed around the perimeter or proposed wells  
15 are placed around the perimeter, the side and the north, and  
16 they're referenced as down gradient. Don't have a problem  
17 with those really; it's the wells that they -- and I think I  
18 have an exhibit to this that demonstrates that, but the  
19 wells up-gradient, if the mounding is significant and you  
20 get a flow reversal and the flow gradient is oriented  
21 towards the southwest, then the up gradient wells as defined  
22 in this upcoming exhibit would be in fact down gradient.

23 Q Okay.

24 MR. EGGAN: It's about 10 to 12:00, your Honor. I  
25 probably have another half hour. Would this be a good time

Page 1777

**NetworkReporting**

1-800-632-2720

1 to break?

2 JUDGE PATTERSON: Yeah, I think if you have that  
3 much.

4 MR. EGGAN: I do.

5 JUDGE PATTERSON: Okay. Back at 1:00 o'clock.

6 (Off the record)

7 Q Dr. Prucha, when we left off this morning you and I were  
8 talking a little bit about groundwater monitoring and the  
9 well network that has been established by the company to  
10 monitor. Have you reached a conclusion about whether the  
11 groundwater monitoring network established by the company is  
12 going to adequately monitor groundwater in the vicinity of  
13 this mine?

14 A Yes.

15 Q What is your conclusion?

16 A Well, can I draw a simple diagram?

17 Q Yes, please.

18 A I can just use this (indicating) diagram here that I drew  
19 showing the TWIS in the center. And if you are infiltrating  
20 a lot of water through this TWIS and the mound ends up  
21 developing and forcing groundwater to flow back to the  
22 southwest and your presumed upgradient wells are located  
23 within this mounding zone, they'll become downgradient  
24 wells. So I noticed in the permit application report that  
25 there were different water sampling criteria for those

Page 1778

**NetworkReporting**

1-800-632-2720

1 upgradient versus downgradient or sidegradient wells. And I  
2 think these were placed assuming that the mound would cause  
3 water to flow to the northeast but that these would remain  
4 somehow as background or upgradient wells.

5 Q So it sounds to me as if the groundwater monitoring system  
6 is set up with the assumption that the water is going to  
7 flow in one direction.

8 A That's right.

9 Q But the groundwater based on your calculations may actually  
10 be going in a different direction?

11 A Yes.

12 Q And do they have adequate wells in the locations where  
13 groundwater is going to flow to actually monitor that  
14 groundwater?

15 A In terms of the gradient, no.

16 Q Okay. In terms of what? In terms of the gradient. What  
17 about other issues?

18 A Well, I think in terms of the upgradient wells that we just  
19 described, I think these are going to be downgradient wells.

20 Q Okay. And for the judge's benefit, what is the import of  
21 that?

22 A Well, the importance is that their reporting limits are  
23 different for upgradient versus downgradient wells.

24 Q Okay. Switching gears to a subject that we might have  
25 discussed this morning, and that's the non-contact water

1 infiltration basin. Should there have been a consideration  
2 of modeling in the area of the non-contact water  
3 infiltration basins?

4 A Yes.

5 Q Why?

6 A I believe that water is focusing a lot of localized runoff  
7 to infiltration basins that allow the water to then  
8 infiltrate into the groundwater system, and on my review of  
9 the reports, I don't see that that was considered in the  
10 modeling. And I believe that this could significantly  
11 impact any mounded groundwater propagation away from this  
12 TWIS infiltration gallery.

13 Q In what way? How could it affect that?

14 A Well, it could mound up under each one of these infiltration  
15 basins and force water that is mounding away from the TWIS  
16 infiltration gallery to project into different directions.  
17 And I just don't think this was considered in the modeling  
18 or analysis.

19 Q Was this well thought out? Was this an issue that impacts  
20 your overall conclusion of the modeling that was done here?

21 A Again I think it lacked -- their model lacked in estimation  
22 of the mounding effects and discharge of the water and its  
23 travel to venting locations. I think this was an oversight  
24 and should have been included in the models and predictions.

25 Q Are you aware of this company's plan when the mine closes?

Page 1780

**NetworkReporting**

1-800-632-2720

1 A Yes.  
2 Q All right. What is your understanding of what will happen  
3 to the mine as the mine itself closes? What are they going  
4 to do in terms of the hole in the ground?  
5 A The dewatering will cease in the mine area, and my  
6 understanding is that water will also be injected through  
7 wells in the vicinity to increase the groundwater to recover  
8 in that area to natural conditions.

9 Q Okay. What you're saying is they're going to fill the mine  
10 up with water?

11 A Yes.

12 Q Do you have an opinion as to whether or not when this water  
13 is put into the well at the close -- or excuse me -- into  
14 the mine at the close of mining operations -- you've talked  
15 about faulting in this area. Do you have an opinion as to  
16 whether or not water will escape from the mine itself?

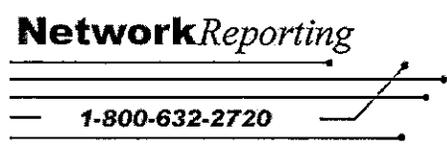

17 A Yes.

18 Q Is this -- I guess what I'm asking is, is this a Mason jar,  
19 or is it a colander?

20 MR. LEWIS: Objection; foundation, your Honor.

21 MR. EGGAN: Is the question whether this witness  
22 is qualified to testify about whether water will leave the  
23 mine through these faults?

24 MR. LEWIS: No, it goes to the foundation, not the  
25 qualification.

1 MR. EGGAN: Okay. I guess I'd like to know a  
2 little bit more about what the objection is then.

3 MR. LEWIS: I haven't heard that he's done any  
4 kind of analysis or what kind of data or other information  
5 would support any opinion he may offer on that subject.

6 Q What information do you have that might support an opinion  
7 on this issue?

8 A I think I've developed an understanding of the bedrock  
9 system as presented in the various reports, any  
10 unconsolidated material that overlies it, and developed an  
11 understanding of what happens to the water in the --  
12 groundwater in the bedrock system as you dewater, by running  
13 their models with modifications, so --

14 Q And I think I also heard you testify about the faulting that  
15 may occur in these systems and the impact that it's going to  
16 have on groundwater flow.

17 A The faulting and the potential for permeable zones along  
18 dikes.

19 MR. EGGAN: Your Honor, I think the witness is  
20 certainly able to answer this question.

21 JUDGE PATTERSON: I'll allow him to answer.

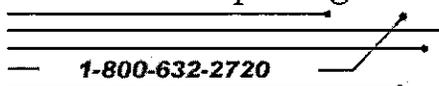

22 MR. EGGAN: All right. Very good.

23 Q Is this mine going to be a Mason jar at the end, or is it  
24 going to be something more permeable?

25 A Could I draw a small diagram?

- 1 Q Please do.
- 2 A Again, if the mining orebody area is here (indicating)  
3 tunneling off here, the Salmon Trout River is here, there  
4 were a number of faults that were drawn through the area  
5 that were trending northwest. There were certainly dikes  
6 that were propagating -- or trending through the orebody  
7 that likely line up with the river because they may be  
8 permeable and connected. When the system comes back to a  
9 natural state, unfortunately we don't have enough data in  
10 terms of the bedrock aquifer saying what direction  
11 groundwater actually flows 'cause that wasn't included in  
12 the analysis, which I think it probably should have been,  
13 but I think the dominant features that will control  
14 groundwater movement through the area once the mine's closed  
15 will be these water conductive features along the dikes, the  
16 faults. And I believe that it's very possible that water  
17 can leak out of this system into the river if you have the  
18 dikes that -- their own cross section showed were right  
19 under the river, faults through the area. This system --  
20 these lineaments are extensive. They're kilometers, miles  
21 long, so --
- 22 Q Well, you talked about those lineaments yesterday, those --
- 23 A That's right.
- 24 Q -- am I correct to call them fault lines and --
- 25 A Yes; uh-huh.

Page 1783

**NetworkReporting**

1 Q And you talked about those yesterday. They're miles long.

2 A That's right.

3 Q Okay. And do those -- do those lineaments have the  
4 potential for transmitting groundwater that is leaving the  
5 mine to other places?

6 A Yes.

7 Q Are there aquifers -- obviously we've talked about this, but  
8 are there aquifers in the vicinity of the mine itself?

9 A Yes.

10 Q Okay. Are the aquifers -- and I'm going to ask you to  
11 assume that water from the mine after closure will be  
12 flowing into those aquifers. Okay? I want you to consider  
13 those aquifers. Today before mining operations begin are  
14 those aquifers usable by, say, a family of four? Could  
15 you -- is there sufficient water quantity there to support a  
16 family that lived in the area?

17 A Yes.

18 Q What about aquatic life? Is it sufficient to support  
19 aquatic life in the vicinity?

20 A I can't tell.

21 Q You can't tell. Okay. We know that there are industrial  
22 uses that are already planned and that that aquifer is  
23 sufficient to support an industrial plant 'cause that's what  
24 this is, isn't it?

25 A Yes.

1 Q So do you have an opinion as to whether or not the aquifers  
2 that are in the vicinity of the mine into which this water  
3 post-closure will flow, are they useable?

4 MR. LEWIS: Objection; form of the question. This  
5 witness has not offered an opinion that water will flow  
6 anywhere. He's offered opinions -- hypothetical opinions is  
7 what I've heard, could flow.

8 Q If they flow, will they be flowing into a useable aquifer?

9 A In terms of the quantity, yes.

10 Q "Yes." Okay. Doctor, I want to conclude by covering your  
11 primary conclusions. Okay? And this is this list, 1  
12 through 4, of those conclusions. Tell the court what the  
13 first of your main conclusions are.

14 A Well, the first conclusion is that the maximum inflow to the  
15 wastewater treatment system will be dramatically higher than  
16 was predicted by the company and MDEQ.

17 Q Okay. And your second conclusion relates to the  
18 hydrogeologic study and the modeling done by Kennecott to  
19 support their perspective on groundwater flow and direction.

20 A Yes.

21 Q What is your conclusion on that?

22 A The company's hydrogeologic study and modeling are  
23 inadequate and inaccurate.

24 Q Okay. And your third conclusion as prepared here is --  
25 relates to the volume and the direction and the hydrologic

1 impact of the wastewater discharge. Can you tell the court  
2 what your conclusion is?

3 A The company's prediction of the volume, direction and  
4 hydrologic impact of the wastewater discharge are wrong.

5 Q And then the fourth with respect to post-closure issues,  
6 what is your conclusion regarding that?

7 A The leachate will escape from the mine after closure and  
8 contaminate surrounding groundwater and surface water.

9 Q Thank you. Did we miss any of your primary conclusions?

10 A No.

11 Q Very good.

12 MR. EGGAN: I have nothing further.

13 (Counsel reviews notes)

14 MR. EGGAN: Mr. Lewis, I do have -- I did have two  
15 more questions that I needed to ask. I had them on a  
16 separate pad so I didn't ask them. But, your Honor, if you  
17 can indulge me for a couple of more questions.

18 JUDGE PATTERSON: All right.

19 Q Just a question or two about drawdown. Okay? With your  
20 prediction of 3,000 gallons per minute, did you make a  
21 prediction of magnitude in the extent of drawdown that will  
22 occur in the bedrock aquifer?

23 A Yes. Under that scenario --

24 MR. LEWIS: Wait a minute. Objection; foundation.

25 Q Did you make -- did you make a prediction?

Page 1786

**NetworkReporting**

1-800-632-2720

1 A Yes.

2 Q And is that prediction based on your analysis and review and  
3 calculation?

4 A Yes.

5 Q How did you -- how did you make that prediction?

6 A I made a simulation that was based on the company model, the  
7 FEFLOW model, and I made some adjustments that I think were  
8 more realistic to reflect what I was seeing in the geology  
9 and hydrogeology of the system and estimated on the order of  
10 3,000 gpm as an upper limit. And I also calculated the  
11 aerial extent and magnitude of drawdown. And for that  
12 particular case, the --

13 Q Don't give your answer yet.

14 MR. EGGAN: Your Honor, I think we've established  
15 a foundation for his conclusion on this issue.

16 MR. LEWIS: All we've heard is a brief description  
17 of what he says he did. I think the court should have a  
18 fair understanding by now that the leap going from the mine  
19 water inflow number that Dr. Prucha talked about earlier  
20 today, he's -- going from that number to now a prediction as  
21 to what drawdown there may be in the aquifer above and  
22 surrounding the mine is not a simple transition. And I  
23 think there's been a lot of testimony and discussion by Dr.  
24 Prucha himself as to how complicated these analyses are. He  
25 spent some time talking about all the data that would be

Page 1787

**NetworkReporting**

— 1-800-632-2720 —

1 necessary to gather about the characterization that would  
2 have to be done and about the very intricacies of different  
3 kinds of models. And I assume all those things would go  
4 into transitioning from the one number to the other. And we  
5 have heard nothing about any analysis he's done in that  
6 regard.

7 MR. EGGAN: Well, I think he's indicated that he  
8 did do that analysis. He used the model -- or he used the  
9 numbers that Kennecott provided and used those numbers and,  
10 while he may have reached a different conclusion, the data  
11 was their data. So I think he -- I think he has established  
12 a foundation to --

13 JUDGE PATTERSON: I'll allow him to answer, for  
14 what it's worth.

15 Q All right. You've indicated you have reached a prediction  
16 of the magnitude and extent of drawdown in the bedrock  
17 aquifer?

18 A In the bedrock aquifer; that's right.

19 Q What is the prediction that you have reached?

20 A That the drawdown would be about a foot or more within a  
21 radius of about two miles from the mine based on the model  
22 that I used.

23 Q When you say "two miles from the mine," do you mean from --

24 A The orebody.

25 Q -- can we use the orebody?

Page 1788

**NetworkReporting**

**1-800-632-2720**

1 A Right.

2 Q What about the drawdown impacts in the unconsolidated  
3 aquifer system?

4 MR. LEWIS: Same objection, your Honor.

5 JUDGE PATTERSON: Okay.

6 MR. EGGAN: Same response, your Honor.

7 JUDGE PATTERSON: Same ruling.

8 Q Go ahead, Mr. Prucha.

9 A Okay. That is more complicated to answer that, and it very  
10 much depends on the unconsolidated material overlying the  
11 bedrock and the connection that it has with the bedrock and  
12 faults within the bedrock and dikes, et cetera. But I think  
13 at 3,000 gpm, a lot of that water is going to be coming from  
14 the overburden in the stream. This will certainly be  
15 dramatically more drawdown than what's been estimated with  
16 the current unconsolidated flow models we went over earlier,  
17 the Fletcher Driscoll model, the Golder or the latest  
18 GeoTrans model. I think the predicted drawdown impacts,  
19 aerial extent and the magnitude from those models is  
20 substantially underestimated, you know, in this 3,000 gpm  
21 scenario.

22 MR. EGGAN: Thank you. That's all I have, your  
23 Honor.

24 MR. LEWIS: Dr. Prucha, I'm Rod Lewis. I think we  
25 got introduced earlier. I represent Kennecott Eagle

1 Minerals Company.

2 CROSS-EXAMINATION

3 BY MR. LEWIS:

4 Q The subject came up earlier as to any mine -- or experience  
5 you may have had working -- doing anything related to the  
6 mining industry. I don't see any related to the mining  
7 industry listed in your CV. Is that true? There's nothing  
8 in your CV about that?

9 A That's right.

10 Q You indicated earlier, I think in response to an objection,  
11 that you had some kind of experience related to a surface  
12 mine. Is that what you indicated?

13 A Yes.

14 Q And as to underground mines such as this one, you have no  
15 experience; is that correct?

16 A That's right.

17 Q And you also indicated, I think, that you had -- and I don't  
18 want to mischaracterize it, but that you had had some kind  
19 of experience with some kind of facilities underground. And  
20 I wanted to ask you, do you have any experience in  
21 actually -- for any kind of cavity that may be created under  
22 the ground for any purpose, actually being brought in to do  
23 the background studies, do the data collection, do the  
24 characterization and then prepare a prediction as to what,  
25 if any, water might flow into that cavity?

Page 1790

**NetworkReporting**

1-800-632-2720

1 A Yes.

2 Q And not mine; it's some other application? What kind of  
3 application is that?

4 A It was Department of Energy project site in Colorado, a  
5 former nuclear manufacturing, parts manufacturing facility.

6 Q What was the underground facility?

7 A They had several buildings that were built several stories  
8 below ground and well below the water table.

9 Q Buildings to store something in?

10 A Nuclear parts manufacturing facilities.

11 Q So in that sense it would be akin to buildings generally for  
12 which the lower levels may penetrate the area of the earth  
13 in which there's water?

14 A They did penetrate the groundwater table, and it was -- they  
15 had pretty complicated footing drains and, you know, designs  
16 to remove water from entering the building.

17 Q As to the alternative numbers that you put on the board  
18 yesterday, I think it was, for the potential flow of water  
19 into the mine, I had a couple technical questions for you.  
20 First of all, could you describe what you used for boundary  
21 conditions for the top, sides and bottom of your model?

22 A Yup. I started with the basic Kennecott flow model for the  
23 bedrock flow system. I don't recall the name of the file,  
24 but it was submitted as, I guess, an exhibit. It already  
25 had the basic FEFLOW grid structure and downward conditions

Page 1791

**NetworkReporting**

1-800-632-2720

1 as defined and described in the 2005 bedrock flow model. So  
2 that condition had no-flow boundary conditions on the side.  
3 Those were unchanged in the modeling simulation that I did.  
4 The upper --

5 Q That's the 2005 model -- I'm sorry -- 2005 report?

6 A Right. The model that -- well, actually -- I'm sorry --  
7 that is -- I think it must be the 2006. The 2005 had a  
8 lower flow rate estimated. It's the model that was used to  
9 generate the flow estimate of 215 gallons per minute.

10 Q For the upper bound?

11 A For the upper bound as defined in their report. And I took  
12 that model and reviewed that along with several other model  
13 inputs, including the one that was used to calibrate the  
14 bedrock model to the 1084 well test. But the particular  
15 model that I had made adjustments to, I looked at the model  
16 input and wanted to -- I ran it first to verify that I --

17 Q Just a minute. My question right now is only about what  
18 boundary conditions did you assume in your modeling?

19 A It's a series of boundaries conditions that I changed.  
20 There were a series of scenarios --

21 Q Oh, you changed them?

22 A Yup.

23 Q I thought you indicated earlier today that you kept  
24 Golder's. But you did change them?

25 A You're referring to the boundary conditions, external side

- 1 boundary conditions and the top boundary condition?
- 2 Q Top, sides and bottom, you gave us new numbers. I want to
- 3 know what boundary conditions you used when you did that.
- 4 A Okay. Let me go back for a second. The side boundary
- 5 conditions didn't change for anything that I did.
- 6 Q Change from what?
- 7 A From what was already in the company mine.
- 8 Q The 2006 Golder?
- 9 A The 2006 upper bound mine inflow model.
- 10 Q All right. The upper boundary condition in there had been
- 11 changed to a general head boundary condition in that
- 12 particular model from the 2005 model. I changed that upper
- 13 bound condition to include a thickness of overburden. And I
- 14 believe I put in 100 feet for that, and I assigned at the
- 15 top of that a boundary condition of a constant water level.
- 16 Q So do you have 100 feet of overburden above the mine -- the
- 17 rock in your model?
- 18 A That's right. It was just a constant. It's a --
- 19 Q Is that based on any data?
- 20 A When you look across the Yellow Dog Plains -- and again --
- 21 Q No, I mean any data for overburden above the mine.
- 22 A Not immediately over the mine, no.
- 23 Q And did you also adjust the bottom boundary for your model?
- 24 A I didn't. I kept that the same.
- 25 Q So you're telling me, then, just to be clear, your boundary

1 conditions for your model for the mine for the sidewalls and  
2 the bottom are the same as Golder's in his 2006 reporting?

3 A Yes.

4 Q And the one you changed was the top, and you just described  
5 the change you made?

6 A That's right.

7 Q Now I want to turn to what I understood to be some key  
8 assumptions for your alternative numbers, Dr. Prucha. And  
9 the first one, as I understand it, is that you talked about  
10 various faults and dikes and lineaments and so forth, and we  
11 saw some of your slides that depict these various things.  
12 And number one assumption that you made -- and tell me if  
13 I'm wrong -- is that those things actually exist; right?

14 A Which slide are you referring to?

15 Q Any of them where you showed these lines, these faults and  
16 lineaments and so forth from Klasner's article.

17 A Well, I also --

18 Q You assumed those things exist; is that right?

19 A The potential for those exists and --

20 Q The potential. That's what you said: There is a potential;  
21 right? They may be there; right?

22 A I showed the Klasner faults as he mapped them and the  
23 company fault lines and dikes as they mapped them.

24 Q Also from geophysical data; right?

25 A That's my understanding. It's largely geophysical although

1 I believe Klasner did field verification as well.

2 Q Well, we'll look at that in a minute. But at any rate, so  
3 your first assumption is that those lines up there from  
4 Klasner actually exist. That's number one; right?

5 A I would say that they -- there's a likelihood that they do  
6 exist and it seems like there is consistent field  
7 information to support their existence.

8 Q All right. And then number two you have assumed for your  
9 alternative numbers that not only do those features exist  
10 but they have a high hydraulic conductivity; right?

11 A Yes.

12 Q And thirdly you have assumed not only that those features  
13 exist, not only that they have a high hydraulic  
14 conductivity, but that they are interconnected; right?

15 A Yes.

16 Q And it's true, is it not, Dr. Prucha, that if any one of  
17 those three assumptions are wrong, that you're going to have  
18 a much lower number?

19 A No.

20 Q Well let me ask you: It is true that these things have to  
21 actually exist to support your 3,000 number, isn't it?

22 A Yes.

23 Q And it is true that they have to be -- have high hydraulic  
24 conductivity in order to get that kind of number, is it not?

25 A Higher but -- higher conductivity than was initially assumed

Page 1795

**NetworkReporting**

1-800-632-2720

1 in the Kennecott model that I started with, but which I  
2 believe is well within the range of conductivities for  
3 large-scale faults.

4 Q Again, you're assuming a large-scale fault, and you're  
5 assuming a high degree of hydraulic conductivity; right?

6 A I would say that it's not exceptionally high. I mean, I did  
7 a simulation with a much higher range, but I would say that  
8 it's within the range of what I would expect for a fault.

9 Q A fault that was conductive?

10 A Sure, a water conductive feature.

11 Q And your third assumption is also necessary to your  
12 recalculated number, that being that these conductive  
13 features are interconnected?

14 A A simulation that I ran showed them as being interconnected  
15 with the basic design in the Kennecott FEFLOW model, but I  
16 don't believe that that's absolutely necessary as a  
17 requirement to generate a high inflow rate. For instance,  
18 you could have a series of north-south faults as opposed to  
19 having east-west and north-south and still generate  
20 substantial mine inflow on these levels.

21 Q If you make them -- if you make them long enough.

22 A Actually I found that by extending the faults, that doesn't  
23 have as big of an impact. It's really the more -- one of  
24 the biggest changes I found was just by extending the fault  
25 that was placed as an isolated little slit in the lower

1 bedrock, if you just extend that up through the upper  
2 bedrock, which seems very reasonable, and connect it to the  
3 overlying overburden which is much more permeable, that acts  
4 as a local drain. And for some reason, after a certain  
5 distance it doesn't become so important how long the faults  
6 are.

7 But one thing I did find was that the faults that  
8 were specified in this original modeling report didn't  
9 actually extend all the way through the lower bedrock as  
10 sort of implied in the report, which I didn't even extend  
11 the faults below where they had over the full extent of the  
12 mine. And faults can easily extend several kilometers below  
13 the ground surface. So I didn't include that. I didn't  
14 include permeable dikes in my analysis. I was just looking  
15 at the fault network. And it was interconnected in the  
16 model, but still that was only in the lower bedrock.

17 Q Well, you interconnected it in the model; right? You made  
18 it that way in the model.

19 A It was already that way in the basic model that I started  
20 from.

21 Q And then you increased the conductivity of those features  
22 for your modeling.

23 A But only by a factor of 10 which I think is --

24 Q Only by a factor of 10; only by one order of magnitude, as  
25 you described it earlier. That's what you did.

Page 1797

**NetworkReporting**

1-800-632-2720

1 A By a factor of 10 and by a factor of 100.

2 Q Okay. I want to look at Klasner's article a little bit with  
3 you, Dr. Prucha. And I believe this is Petitioner's Part  
4 632 Exhibit 59. Is that the Klasner article, Dr. Prucha?

5 A Yes.

6 Q This is page 3 of that article, Dr. Prucha, and I wanted to  
7 direct your attention to that first paragraph. It  
8 indicates, does it not, that:

9 "The present study was undertaken to determine if  
10 a relatively large differentiated igneous complex is  
11 beneath the Yellow Dog Plains, and if so, to determine  
12 its configuration and potential economic  
13 mineralization."

14 That's what it says; right?

15 A Yes.

16 Q And that is the purpose of the study; correct?

17 A As stated there, yes.

18 Q And you do know, I believe, without me reading parts of this  
19 for you, Dr. Prucha, that this study here was based entirely  
20 what's called geophysical studies?

21 A I don't remember the entire report verbatim, but they used  
22 magnetics and gravity surveys to help determine the location  
23 of faults and dikes through the area.

24 Q Which are aboveground techniques, are they not?

25 A That's right.

Page 1798

**NetworkReporting**

— 1-800-632-2720 —

1 Q And they're used to -- the word I see in here a lot is to  
2 infer whether certain structures may actually be under the  
3 surface; is that true?

4 A That's right.

5 Q And then the results that we see in here and that you talked  
6 about earlier are inferences based on such aboveground  
7 electromagnetic and other type of studies; isn't that  
8 correct?

9 A Could you repeat that?

10 Q The maps and so forth, these dikes and faults that you've  
11 talked about, those are an inference based on these  
12 electromagnetic studies; isn't that correct?

13 A And to some extent ground truthing, the fact that they have  
14 the outcrops of East Eagle Rock and the orebody.

15 Q But the point is, they're not based on drill core  
16 information, are they, sir?

17 A That's my understanding.

18 Q And, in fact, that's why they refer to them -- well, let's  
19 look here. Here's one of the maps I think you referenced  
20 and on which you based some of your slides. And these are  
21 some of the lines that you talked about. And we see  
22 there -- I've circled where they've drawn arrows and so  
23 forth. They say "inferred fault, inferred fault"; right?

24 A Yes.

25 Q That's the language; right? And then in the explanation

Page 1799

**NetworkReporting**

1-800-632-2720

1 under here they refer to "designating location of  
2 geophysical anomaly." Do you see that, sir?

3 A At the bottom?

4 Q Yes, sir.

5 A Yes.

6 Q And the reason they used the word "inferred" in  
7 characterizing these structures is because one cannot  
8 actually draw the conclusion that these exist only from  
9 geophysical data. Isn't that also true?

10 A I think this technology is something that gives you a good  
11 indication that something might be there and you follow up  
12 with other information to conclude that they're actually  
13 there.

14 Q And the best information would be drill core data, would it  
15 not?

16 A I would agree that you can confirm the existence of faults.

17 Q Do you have any idea how many drills or drill holes have  
18 been made around and in the vicinity of the crown pillar for  
19 this mine, Dr. Prucha?

20 A I've heard estimates, and I did look at, I think, an exhibit  
21 that had a lot of red dots. And I think one of the reasons  
22 I plotted Klasner's map here along with the company's  
23 geology map was to correlate those features with the red  
24 dots to see if, in fact, there had been an effort to  
25 actually go confirm the existence of these longer lineaments

Page 1800

**NetworkReporting**

— 1-800-632-2720 —

1 that seemed like two studies had confirmed exist.

2 Q Oh, is that your position, that all these lineaments and so  
3 forth in Klasner's article have been confirmed by Kennecott  
4 through its drilling? Are you telling me that?

5 A I'm sorry. Could you rephrase that?

6 Q Are you telling me that all these faults and lineaments we  
7 just looked at on Mr. Klasner's figure have been confirmed  
8 by Kennecott's drilling?

9 A No, I'm not saying that.

10 Q Okay. Now, let's look a minute at what the author of this  
11 paper says about the use of such studies in making the  
12 assumptions you have made, Dr. Prucha. On page 9 at the  
13 bottom there where I've got a line under it, it says, does  
14 it not:

15 "Complications of interpretation arise, however,  
16 from several factors. Most important are 1) the  
17 complexities of the magnetic field caused by the  
18 interaction of the induced field and the irregularly  
19 oriented natural remnant field; 2) the possible  
20 variations in density of the peridotite due to variable  
21 degrees of serpentinization; 3) imprecise knowledge of  
22 the densities of all rock types in the area; 4)  
23 variations in thickness of plasticine drift; and 5) the  
24 imprecise understanding of the composition of the  
25 varied conductive bodies that produce the measurable

Page 1801

**NetworkReporting**

**1-800-632-2720**

1 VLFEM response.

2 MR. HAYNES: Just for the record, what page are  
3 you reading from, Counsel?

4 MR. LEWIS: Page 10.

5 MR. HAYNES: Thank you.

6 Q That's what Klasner has to say about assuming things based  
7 on geophysical studies; correct, Dr. Prucha?

8 A As stated there, yes.

9 Q Now I want you to turn to your second assumption, and that  
10 is as to the conductivity of these structures. Again, in  
11 your testimony yesterday, what I heard and wrote down is  
12 that, when you described the potential water conductivity,  
13 you said -- used such terms as "could be." And I think you  
14 indicated that again earlier today. But Mr. Klasner in his  
15 article says absolutely nothing about the potential  
16 conductivity of these structures; is that not true, Dr.  
17 Prucha?

18 A I don't remember seeing that in his report.

19 Q But it is true, is it not, Dr. Prucha, that Golder in their  
20 reporting did have some data about the potential  
21 conductivity of some of those structures?

22 A I wouldn't say that they're of the magnitude of these  
23 water-conductive -- potential water-conductive features that  
24 were outlined by Klasner and the company geologists.

25 Q Well, certainly -- you're saying the test results are not of

1 the magnitude, or what's not of the magnitude?

2 A I wouldn't jump to the assumption that, in the wells that I  
3 looked at, that the pump tests performed on in the orebody  
4 had actually intercepted any of these larger lineaments as  
5 mapped by both the company geologists and the Klasner report  
6 that indicates --

7 Q No. I understand you wouldn't assume that. You don't have  
8 the information from which to conclude one way or the other,  
9 do you, sir?

10 A I can't conclude that they have not hit that, but I -- the  
11 reason I plotted the Klasner fault -- inferred fault map and  
12 the company geologist fault and dike map was to see if in  
13 fact the wells that have been pumped in the orebody have the  
14 potential of intercepting any of those or whether the faults  
15 would have crossed any portion of the area that would be  
16 dewatered.

17 Q In other words, you assumed, for purpose of your analysis,  
18 that, with all the drilling that Kennecott had done on this  
19 property, it had not intersected, described and  
20 characterized these features. You assumed that did not  
21 happen, merely because you did not have the data from which  
22 you could verify it one way or the other; isn't that right?

23 A It's true that I did not have the data that I saw on a  
24 recent plot or exhibit that had lots of red dots.

25 Q So as with your assumption as to the existence of the dikes

1 and faults referred to by Klasner, you also assumed, in the  
2 absence of any data to the contrary that you were aware of,  
3 that in fact all of these features had high hydraulic  
4 conductivity, Dr. Prucha; right?

5 A Can you rephrase that, please?

6 Q Let's look at Golder's -- one of Golder's tables here a  
7 moment.

8 MR. LEWIS: This is Intervenor Number 7, Counsel,  
9 Bates stamped 4442, very small numbers.

10 Q Now, I assume, Dr. Prucha, since you represented earlier  
11 that you had examined the various Golder reports and the  
12 various reports having to do with characterizing the  
13 hydraulic situation in the crown pillar, that you had looked  
14 previously at this table; is that correct?

15 A I don't recall it off the top of my head but -- I'm not  
16 sure. What report was this in?

17 Q It's in our Exhibit 7. It's one of the Golder reports, Dr.  
18 Prucha. But you don't recall, sitting here today, whether  
19 you've looked at it or not?

20 MR. HAYNES: Well, perhaps, if counsel could  
21 reference which appendix out of the EIA or the mine permit  
22 application this is, it'll help the witness recall.

23 Q It's in the environmental impact assessment, Appendix B-4,  
24 Dr. Prucha. Does that help?

25 A I read through that report, yes.

1 Q And you don't recall the table specifically?

2 A It's a lot of information. I don't recall it specifically  
3 off the top of my head but --

4 Q Well, there's a lot of information in a lot of reports,  
5 isn't there, sir? Right?

6 A Yes.

7 Q And some of it's more relevant than others; wouldn't you  
8 agree?

9 A (No verbal response)

10 Q And wouldn't a table showing the identification of various  
11 structures and testing them as to their hydraulic  
12 conductivity be relevant to the topics that you testified  
13 about?

14 A If you believe that these particular boreholes have  
15 intercepted the larger water-conductive features that are  
16 implied by the Klasner report and the company geologist's  
17 report.

18 Q And in the absence of hard evidence to the contrary, you're  
19 going to presume that Kennecott did not do its job and  
20 failed to intercept any of these structures which may or may  
21 not exist. Is that your opinion?

22 A In my opinion, that I don't believe that they attempted to  
23 characterize potentially larger-scale water-conductive  
24 features, which I think in a fractured system like this  
25 dominate the flows. I mean, I think, when I reviewed mining

Page 1805

**NetworkReporting**

1-800-632-2720

1 efforts in nearby Marquette iron mining district --

2 Q Let's talk about this mine a minute. Okay, Dr. Prucha? I'm  
3 asking you about the data from this mine.

4 A Uh-huh (affirmative).

5 MR. HAYNES: Your Honor, perhaps counsel could  
6 allow the witness to finish his answer without interruption.

7 MR. LEWIS: I think I'm giving him sufficient --

8 JUDGE PATTERSON: And I think his answer was  
9 transcending something unresponsive to the questions.

10 Q Now, even though you may not recall this table, Dr. Prucha,  
11 it does show on the left-hand margin, does it not, borehole  
12 identification information? You can tell that, can't you,  
13 Dr. Prucha?

14 A In the very left column?

15 Q Yes, sir.

16 A Yes.

17 Q And in the very next column it shows the depth of various  
18 locations within the drilling?

19 A Within the drilling within the --

20 Q Within the well that's indicated in the borehole number.  
21 Each borehole number has various depths indicated in the  
22 next column; isn't that correct?

23 A Depths, yes.

24 Q And we have the length in meters, and then the next column  
25 in fact has the heading on it "Structure," does it not?

- 1 A Yes.
- 2 Q And that's what you've been talking about also, structure;  
3 isn't that correct?
- 4 A Yes.
- 5 Q And it gives various characteristics of those structures  
6 such as broken, sheared, gouged and so forth; right?
- 7 A Yes.
- 8 Q And I think you'll recognize this middle column, sir, as  
9 some indications that have some relevance to the hydraulic  
10 characteristics of these structures, does it not?
- 11 A The "Temperature or Fluid Conductivity" column?
- 12 Q Yes, sir.
- 13 A It says "No" under each one?
- 14 Q That's right; indicates "No flow anomalies detected in the  
15 testing," does it not, Dr. Prucha?
- 16 A It's says "No" on this table.
- 17 Q That's all I'm asking you about, Dr. Prucha. And on the  
18 right-hand column we have some data under the heading,  
19 "Hydraulic Conductivity Meters Per Second," do we not?
- 20 A Yes.
- 21 Q And there this in fact for many of those parameters a number  
22 such as the first one in the right-hand column "2.00E-09."  
23 Do you see that?
- 24 A Yes.
- 25 Q And tell me if you don't know -- but I'm presuming you

1 know -- that that means that the conductance in that  
2 structure is 2 times 10 to the minus 9 meters per second.

3 A The hydraulic conductivity, --

4 Q Yes, sir.

5 A -- is that value? Yes.

6 Q And that's 2 -- that's the numeral 2 with a whole bunch of  
7 zeroes in front of it, is it not?

8 A 2 with zeroes in front of it?

9 Q 2 times 10 to the minus 9. Isn't that .000 and so forth -9?

10 A Right; yes; yeah.

11 Q Thank you, sir. Now, we've been through two of your  
12 assumptions so far. One is that these so-called faults and  
13 dikes and so forth really exist and your foundation for that  
14 based on Klasner's article. Second we've talked about your  
15 assumptions as to the conductivity of these features based  
16 on what you told us earlier. And the third one I wanted to  
17 ask you about was your assumption as to the  
18 interconnectedness of these inferred features from the  
19 Klasner article. And I think you talked earlier yesterday  
20 or today -- I forget which -- about some pump tests that  
21 Kennecott had done. Do you recall that?

22 A Yes.

23 MR. LEWIS: This is from Intervenor Exhibit 7  
24 also, Counsel, Bates stamped 4463.

25 Q And again tell me if I'm wrong but, since you talked about  
Page 1808

**NetworkReporting**

1-800-632-2720

1           this, I assume that you had seen and examined this figure  
2           before, Dr. Prucha?

3    A           I've seen that figure.

4    Q           And you're aware, are you not, that this is a pump test  
5           performed by Kennecott?

6    A           The pump test response shown in one of the mines.

7    Q           And you're aware, are you not, that this was pump test  
8           results from a feature that was identified as the most  
9           conductive feature in the rock?

10   A           Over the area that the boreholes that were located, yes.

11   Q           Okay. Now, again, since you studied this -- the text is a  
12           little hard to read, but you may remember it. The first  
13           line at the top -- well, first of all, we see on the  
14           left-hand margin it shows "Units Drawdown in Meters." Do  
15           you see that, sir?

16   A           Yes.

17   Q           And then across the top is "Elapsed Time in Hours"; correct?

18   A           Yes.

19   Q           So what this figure reflects is a drawdown of water in this  
20           highest conductive feature identified by Kennecott -- the  
21           drawdown of water in terms of depth over time; is that  
22           right?

23   A           The lower number -- the lower graph?

24   Q           Yes, sir.

25   A           Okay.

1 Q And let me ask you something just to make this clear. If we  
2 do this testing in a borehole, this so-called pump testing,  
3 and we get a lot of water out of the hole, to try to put  
4 this into simpler terms, that would indicate that there is  
5 not a connectivity between that feature we're pumping and  
6 other features which may hold substantial water; is that  
7 correct?

8 A I'm not sure I understand the question. Could we --

9 Q Let's look at it this way: We got two potential outcomes  
10 here when we pump test down here in one of these features --  
11 right? -- relatively speaking? We can get a lot of water  
12 coming out of it, or we can get a little water. Let's take  
13 those two scenarios. All right?

14 A Sure.

15 Q And I know it was counterintuitive to me for awhile, and I  
16 still have trouble with it. All right? But my  
17 understanding is, then, if in effect -- let's look at it  
18 this way: If we have a tube like this that's closed --  
19 right? -- and we put a well down there and we pack that off  
20 and we do that so-called pumper test and we pump water,  
21 we're going to quickly draw out the water, which is going to  
22 effect a rapid drawdown in that structure; isn't that  
23 correct?

24 A So this tube is a horizontal tube?

25 Q Let's make it one for now. All right? The point is, if

Page 1810

**NetworkReporting**

**1-800-632-2720**

1 we've got a feature down there which could hold water -- and  
2 let's assume it has water in it -- okay? -- for this  
3 purpose --

4 A The tube?

5 Q Yes.

6 A Okay.

7 Q -- and we pump the water out, we're going to see a rapid  
8 drawdown in the water level?

9 A I think that that rapid drawdown would depend on the volume  
10 or the size of that tube. If it was a large volume, then it  
11 would take a long time to draw down.

12 Q That's the other factor -- right? -- how tight it is. Let's  
13 take --

14 A Well, that's not about how tight it is. It's the volume of  
15 that tube. So the larger the -- and if you had a gasoline  
16 truck tank below the ground versus a small bowl, if you pump  
17 from the small bowl, the drawdown would be nearly  
18 instantaneous if you were pumping at a decent rate. But for  
19 the gasoline tank, that drawdown would take a lot of time,  
20 because that volume of tank underground is pretty large. So  
21 what I'm saying is it depends on the volume of that tank.

22 Q Well, I think we're on the same page. I understand that, I  
23 think. But let's assume that we've got one tank. Okay?  
24 And then the other scenario, let's assume we've got a whole  
25 bunch of interconnected tanks, kind of like your

1 interconnected faults and dikes. Okay? All right?

2 A (No verbal response)

3 Q And we put our well in there. We're going to have a greater  
4 drawdown, are we not, in the smaller unconnected bowl -- if  
5 you want to call it a water bowl, Dr. Prucha -- than we are  
6 in this greater interconnected water bowl. Isn't that the  
7 point you just made?

8 A If you're saying that the diagram on the left is a much  
9 bigger volume, then --

10 Q No. What I'm saying, sir, is what this test reflects. And  
11 again, tell me if you don't know how this is done and what  
12 this means, but I'm assuming you do. So all I'm asking you  
13 is, if we put our pump in here (indicating) and we pump the  
14 water, we're going to get a drawdown of the water level in  
15 there, are we not?

16 A You will get a drawdown of the water if it's an isolated  
17 chamber, yes, I agree.

18 Q All right. And if we have a relatively small chamber  
19 compared to a relatively large or greatly interconnected  
20 chamber, we will have a greater drawdown in the small  
21 chamber than we will in the large chamber; isn't that  
22 correct?

23 A Well, I would say that that's not necessarily correct.  
24 Because if -- once you drain out the larger-volume cavity,  
25 it may end up being about the same drawdown amount.

Page 1812

**NetworkReporting**

**1-800-632-2720**

1 Q I'm just talking we're putting the pumps in there. We're  
2 going to start pumping at the same rate -- okay? -- ten  
3 gallons a minute, let's say. Is it not true that in this  
4 small container we're going to have a more rapid drawdown of  
5 the water level than we are in this very large chamber over  
6 here?

7 A I agree with that.

8 Q All right. That's all I'm talking about. All right? Now,  
9 you see that top red line. Do you understand that to be the  
10 pump test results that were simulated and assumed for  
11 Golder's upper bound case model?

12 A Yes, that was the simulated drawdown in the upper bound  
13 model, FEFLOW model, as I understand it.

14 Q And do you recognize the bottom line, the bottom part of  
15 this figure, to show the actual drawdown in the pump test of  
16 the figure Golder had identified as the most highly  
17 conductive feature?

18 A Yes.

19 Q And it shows, does it not, that, in that feature they had  
20 identified and target for pump testing, because it was the  
21 most highly conductive, that, in actual fact, there was a  
22 very rapid drawdown of the water as a result of the pumping  
23 test?

24 A You're talking about the lower line?

25 Q Yes, sir.

1 A I don't know what to reference the rapid drawdown to, but  
2 the magnitude of the drawdown appears to be large.

3 Q And that does not support your theory that this largest  
4 conductive feature was connected to a -- was interconnected  
5 with a great deal of other high hydraulic conductive  
6 features, does it, Dr. Prucha?

7 A Well, my argument was that this presumed that it -- this  
8 well that was being pumped and the zone of this most  
9 permeable water-conductive feature that it intercepted was  
10 in fact related to the large water-conductive features that  
11 were -- I understood were possible from both the Klasner  
12 report and the company geologist's map that seemed to have a  
13 large degree of overlap. They seemed to correlate pretty  
14 well. The point is that it didn't seem like the pump test  
15 performed in well 084. Because it was so localized, I felt  
16 like it didn't necessarily intercept any of the larger fault  
17 features that I was seeing on these other maps or the  
18 dike -- an intrusive dike brecciated zones that could be  
19 very water conductive and extend for long distances.

20 Q So again, your opinions are based on, number one, assuming  
21 that the inferred structures in the Klasner report are real,  
22 for which you have no data to support from actual drilling  
23 and, number two, your assumption that Kennecott for some  
24 reason failed and neglected to actually search for, look for  
25 and find any such features and test them and, lastly, your

1           apparent willingness to ignore the fact that in the record  
 2           there is evidence that they did find these structures, that  
 3           they did put -- they did test them for conductivity and that  
 4           the results indicate well conductivity.

5                       MR. EGGAN: Your Honor, is this a question or a  
 6           speech?

7                       MR. LEWIS: It's a question.

8                       MR. EGGAN: Well, can we have it phrased in a  
 9           question that asks individual questions rather than a  
 10          paragraph of several questions?

11                      MR. HAYNES: And I'll also object because the  
 12          question mischaracterizes the testimony.

13                      MR. LEWIS: I can move on, your Honor.

14                      JUDGE PATTERSON: All right.

15    Q           So we've covered the three assumptions now, Dr. Prucha;  
 16           again, one, that the inferred structures shown in the  
 17           Klasner report really exist; two, that not only do they  
 18           exist, but they're highly conductive and, three, not only do  
 19           they exist and are highly conductive, but they're  
 20           interconnected. I wanted to turn next to a couple other  
 21           bases for your opinion that you've offered as to your number  
 22           for some mine inflow. You also testified, I believe, Dr.  
 23           Prucha, that you had done no calibration for your analysis;  
 24           is that correct?

25    A           It wasn't the intent to calibrate the flow model.

1 Q You had not done any calibration; is that correct?

2 A I did not perform any calibration on the company model.

3 Q And I believe you testified earlier that without calibration

4 the results of such analysis are meaningless; is that not

5 true?

6 A Without calibration I would not predict -- I would not put

7 forth an unqualified single value for an estimated amount of

8 flow or impact to a system.

9 Q So you've got these assumptions we just reviewed. You

10 admittedly did do, could do no calibration for your

11 analysis, and yet you offered your opinion yesterday during

12 your testimony; right?

13 A I did offer my testimony yesterday, but I --

14 Q Did your analysis follow these so-called ASTM standards, Dr.

15 Prucha?

16 A I don't think they necessarily apply in terms of calibrating

17 the model.

18 Q They don't apply to your analysis. Is that what you're

19 saying, Dr. Prucha?

20 A That's not what I'm saying.

21 Q They didn't follow what Mr. Haynes characterized the other

22 day and asked you about what he called best practices, would

23 they, Dr. Prucha?

24 A I don't think that they fall under that from the standpoint

25 that what I was doing wasn't to produce a model from the

1 start and try to reproduce the actual site conditions.

2 Q In fact, what you were asked to do was come up with an  
3 opinion for purposes of this litigation; is that not true,  
4 Dr. Prucha?

5 A I was asked to assess the hydrology of the system.

6 Q As Mr. Eggan said from time to time and you agreed with, you  
7 would agree as to your model, sir, garbage in, garbage out?

8 A I wouldn't say that in this case.

9 Q Now, Dr. Prucha, another thing you talked about -- and I  
10 think I made a note here in one part of my notes from  
11 yesterday -- is you said -- commented from time to time  
12 about the uncertainty of this type of modeling. And I wrote  
13 down here -- I mean, you said it several times, but you  
14 said, "Models by design are uncertain." Is that your view?

15 A Yes.

16 Q And given that there is inherently the degree of uncertainty  
17 in this kind of modeling, whether it's yours or Golder's or  
18 whose it is, wouldn't it be prudent, then, sir, in your  
19 opinion, to require someone in Kennecott's position, before  
20 we actually go down there and mine this ore and create this  
21 cavity, to gather the additional data -- to gather,  
22 additional data to more fully characterize the area above  
23 the mine, including these potential conductive features?  
24 You would agree with that, wouldn't you, Dr. Prucha?

25 A Could you restate that, please?

Page 1817

**NetworkReporting**

— 1-800-632-2720 —

1 Q Given the uncertainty in modeling that you've talked about,  
2 wouldn't it be prudent to require in such circumstances that  
3 additional data be gathered before we commence the mining of  
4 the ore?

5 A I would agree that more characterization would be a good  
6 thing.

7 Q In fact, that was one of your criticisms, was it not, that  
8 not enough characterization had yet been done?

9 A Yes.

10 Q And it would also be prudent, I assume you would agree, to  
11 not only require in this case that Kennecott gather  
12 additional data once underground, do additional  
13 characterization of the hydraulic properties in the rock; do  
14 additional 3-D modeling of such things; not only that but  
15 that there actually be performance requirements in the  
16 permit covering such things as the amount of water which may  
17 be flowing into the mine and covering ultimately the amount  
18 of drawdown in the aquifer which will be tolerated or not  
19 tolerated. Wouldn't you agree it's also prudent to do that  
20 under these circumstances?

21 MR. HAYNES: Objection. That's a seriously  
22 compound question, and it mischaracterizes the testimony.

23 MR. LEWIS: I think he can follow it, your Honor.

24 JUDGE PATTERSON: Could you understand the  
25 question?

1 THE WITNESS: No, I didn't.

2 JUDGE PATTERSON: All right.

3 Q Are you aware of the permit conditions in this case that  
4 pertain to Kennecott?

5 A Which permit?

6 Q Are you aware that there's a permit condition that requires  
7 Kennecott before they mine the ore underground to do  
8 additional drilling of the rock, to do additional  
9 characterization of the rock, including the hydraulic  
10 conductivity? Were you aware of that?

11 A In addition to what's already been done?

12 Q Yes, sir.

13 A That hasn't been done now?

14 Q Were you aware of that permit condition, sir?

15 A I'm not aware of a permit condition to that --

16 Q But you agree it would be a prudent thing to have Kennecott  
17 do that?

18 A Before --

19 MR. HAYNES: Your Honor -- just a moment. Before  
20 counsel asks questions about whether the witness knows if  
21 there's a permit condition, perhaps counsel could offer the  
22 witness the permit so that he can verify whether the  
23 condition exists or not.

24 MR. LEWIS: Your Honor, I've read that into the  
25 record in the prior proceedings. The court is fully aware

Page 1819

**NetworkReporting**

— 1-800-632-2720 —

1 of that condition. I'm just asking the witness if he's  
2 aware of it or not. I haven't mischaracterized the  
3 condition -- the permit condition. So I just want to know  
4 if he's aware of it, and I've asked him whether it wouldn't  
5 be a prudent thing to do exactly what's been done.

6 JUDGE PATTERSON: I think you can ask if he's  
7 aware of it.

8 MR. LEWIS: And I think he's already answered that  
9 question. That's all I have, Dr. Prucha.

10 MR. REICHEL: Good afternoon, Dr. Prucha. My name  
11 is Bob Reichel. I represent the Department of Environmental  
12 Quality.

13 THE WITNESS: Good afternoon.

14 MR. REICHEL: A relatively few questions for you,  
15 sir.

16 CROSS-EXAMINATION

17 BY MR. REICHEL:

18 Q I believe on your direct examination you -- by Mr. Egan,  
19 you testified about -- you made reference to Part 22 rules.  
20 Do you recall that?

21 A Not off the top of my head.

22 Q Okay. I'm sorry. Let me back up. You understand, I  
23 assume, sir, that one of the issues in this case is a permit  
24 issued by the DEQ under the State Water Pollution Control  
25 Statute, which happens to be called Part 31, and

Page 1820

**NetworkReporting**

1-800-632-2720

1 specifically a discharge -- a permit that authorizes under  
2 certain conditions discharges to the groundwater of the  
3 state. Do you understand?

4 A Yes.

5 Q Are you aware, sir, from your work on this project, review  
6 of the file materials, that the DEQ has promulgated formal  
7 administrative rules dealing specifically with groundwater  
8 discharges?

9 A Am I aware of that?

10 Q Yes.

11 A Yes.

12 Q And again, I'm not trying to trick you or anything.

13 A Uh-huh (affirmative).

14 Q I believe there was some testimony on direct examination  
15 where you made reference to -- I thought, to certain  
16 requirements with respect to groundwater discharge permit  
17 applications. Do you recall testifying about that?

18 A In Part 22?

19 Q Yes.

20 A Yes.

21 Q Okay. That's what I'm asking about. All right. To the  
22 extent that you've looked at those administrative  
23 requirements governing groundwater discharge permit  
24 applications, you're aware, are you not, sir, that those  
25 rules do not actually require a permit applicant to conduct

1 numeric groundwater modeling? You're aware of that, aren't  
2 you?

3 A I'm not sure of whether that is required or not based on my  
4 review of Part 22.

5 Q So you don't know?

6 A I don't know that that's required or not required as part of  
7 the analysis.

8 Q Are you aware, sir -- again, I -- have you had an  
9 opportunity to look at the groundwater discharge permit that  
10 was actually issued by the DEQ to Kennecott Eagle Minerals  
11 Company in December of last year?

12 A Yes.

13 Q You're aware, are you not, sir, that that imposes certain  
14 specific limitations both quantitatively and qualitatively  
15 on what may be discharged to the groundwater? Is that your  
16 understanding, sir?

17 A I'm not sure I understand the --

18 Q Okay. Let me break it down.

19 A Yeah.

20 Q Are you aware or are you not, sir, that the groundwater  
21 discharge permit that is one of the principal issues in this  
22 case imposes or limits the volume and the rate of  
23 groundwater that is authorized to be -- excuse me -- the  
24 volume of treated water that is authorized to be discharged  
25 into the groundwater through this TWIS system? Are you

Page 1822

**NetworkReporting**

— 1-800-632-2720 —

1 aware of that?

2 A I -- in terms of the actual -- I don't know whether you're  
3 referring to the actual discharge permit --

4 Q Yes, that's what I'm asking. I'm not trying --

5 A -- that specified 504,000 gallons per day?

6 Q That's exactly what I'm asking about. You are aware of  
7 that?

8 A Yes, I have seen that and am aware of that.

9 Q Okay. And again, I don't mean to trick you. But do you  
10 know or have you attempted to -- if I were to suggest to you  
11 that that specified rate of 504,000 gallons per day  
12 converted to an equivalent rate in gallons per minute would  
13 equate to 350 gallons per minute, would you have any basis  
14 for disagreeing with that?

15 A Assuming it was continuous all day long, yeah, that's what I  
16 calculated it to be; yeah.

17 Q So you're aware, then, that the permit as it now stands  
18 would not authorize Kennecott to discharge into the  
19 groundwater through this TWIS system in excess of that work;  
20 correct?

21 A That's right. I understand that.

22 Q One of the subjects you testified about earlier today had to  
23 do with the provisions in the permit that have to do with  
24 groundwater monitoring. Do you recall that?

25 A Yes.

- 1 Q And you expressed some concerns about the monitoring  
2 requirements in the permit; correct?
- 3 A The groundwater monitoring well network?
- 4 Q Yes, exactly.
- 5 A Yes; uh-huh.
- 6 Q And if I understood your testimony correctly, you were  
7 focused upon a concern that, under an alternative analysis  
8 of the potential flow direction of groundwater from this  
9 TWIS system that you've done -- you expressed a concern that  
10 particular wells designated in the permit as -- at issue  
11 today -- identified as, quote, "upgradient wells," might not  
12 in fact be upgradient. Am I understanding your --
- 13 A That was my understanding, yeah.
- 14 Q And that is part of your concern; correct?
- 15 A Yes; that they may become downgradient wells if too much  
16 mounding occurs or if the conditions beneath the TWIS had  
17 been better characterized and perhaps the low-permeability  
18 units had been considered, that mounding could in fact go  
19 back to the southwest into the area where these background  
20 wells -- upgradient wells were located.
- 21 Q Now, sir, as a part of your review on this project, you've  
22 actually looked at the permit conditions that involved  
23 monitoring requirements; is that correct?
- 24 A You're talking about Part 22?
- 25 Q Yeah. I'm talking about the groundwater discharge permit --

- 1 A Okay.
- 2 Q -- and the conditions in that permit that specify the  
3 monitoring that has to be done by Kennecott --
- 4 A Yes.
- 5 Q -- in order to lawfully discharge. Correct?
- 6 A Yes.
- 7 Q And are you aware, sir -- well, let me back up. If -- just  
8 assuming hypothetically that the situation you posited that  
9 there was mounding to an extent or in a way that caused an  
10 increase in water elevation in wells that have been presumed  
11 to be, quote, "upgradient wells" -- first of all, is it  
12 your -- isn't it true, sir, that under the permit there  
13 would be regular monitoring observations, both  
14 groundwater-level observations and in some cases water  
15 quality observations made in various monitor wells?  
16 Correct?
- 17 A I'm not sure I follow. You're asking whether I know that --
- 18 Q Let me rephrase the question. Are you aware, sir, that the  
19 permit has specific conditions that require the permittee at  
20 specified intervals to take measurements from various  
21 monitor wells? Correct?
- 22 A Water quality measurements or water levels?
- 23 Q Both.
- 24 A Both. That's my understanding, yes.
- 25 Q Correct. Okay.

- 1 A And if there's --
- 2 Q And so in order to comply with the permit, there would be at  
3 regular intervals measurements of water elevation in various  
4 specified wells; correct?
- 5 A Yes.
- 6 Q And isn't it true, sir, that those -- one of the purposes of  
7 those measurements would be to identify changes in  
8 groundwater elevation at the monitor locations that occur as  
9 a result of the discharge? Correct?
- 10 A Yes.
- 11 Q And in fact, isn't it true, sir, that, through the  
12 monitoring program that would be required to be implemented  
13 by the permittee here -- if in fact there were increases in  
14 elevation in these wells -- in any of the wells, that would  
15 be detected; correct?
- 16 A Not necessarily. I mean, if the low-permeability units  
17 above the water table act as a very effective perched --
- 18 Q Let me rephrase the question. I'm -- let me be specific  
19 about the -- this concern that you posited about upgradient  
20 monitoring wells not being upgradient. Okay?
- 21 A Yes.
- 22 Q If in fact mounding occurred in these upgradient wells, the  
23 regular measurements of water levels taken from those and  
24 other wells in the network would be recorded over time;  
25 correct?

1 A The water levels in those wells will be recorded in the  
2 wells, right; yeah.

3 Q And so that would require the permittee to monitor  
4 groundwater conditions in these wells over time; correct?

5 A Yes.

6 Q And those results are required to be reported under the  
7 permit to the Department of Environmental Quality, are they  
8 not?

9 A That's my understanding.

10 Q And again, from reviewing the permit, are you aware, sir,  
11 that the permit specifically authorized the DEQ to require  
12 changes or modifications of the monitoring and sampling  
13 program required under the permit as originally issued if  
14 circumstances warrant? Are you aware that that -- the  
15 permit authorizes those kinds of changes by the DEQ?

16 A I'm not sure that I am aware of the actual language, no.

17 Q Do you have any reason to disagree with that?

18 A Can you repeat the language so I understand that clearly?

19 Q Sure. Okay. Fair enough. Sir, I'm going to put up on this  
20 overhead projector, sir, what I'm going to represent to you  
21 is an excerpt from the --

22 MR. REICHEL: Thank you, Counsel. Just so the  
23 record is clear, this is an excerpt that appears from page  
24 10 of 32 of the groundwater discharge permit issued by the  
25 DEQ and directing your attention to the middle of this page

1 under "Sampling Locations A." There's some language  
2 highlighted there.

3 Q Do you see that under the heading "Sampling Locations"?

4 A Yes.

5 Q It says in the last sentence of that paragraph, "The  
6 Department may approve or require alternate sampling  
7 locations which are demonstrated to be representative"; is  
8 that correct?

9 A That's correct.

10 Q And similarly, with respect to the next page --

11 MR. REICHEL: And this appears at page 11 of 32.  
12 This is, I believe, Condition 4a, "Sampling Location."

13 Q Again it indicates, "The Department may approve or require  
14 alternate sampling locations which are demonstrated to be  
15 representative." Do you see that, sir?

16 A Yes.

17 Q And turning now to page 15 of 32, this is, I believe,  
18 Condition 10F, as in "Frank": "Pursuant to Rule 2223(1),  
19 the Department may modify the effluent or groundwater  
20 monitoring parameters of frequency requirements of this  
21 permit, or they may be modified upon request of the  
22 permittee." Again, you do -- these conditions appear in the  
23 permit; correct?

24 A Yes.

25 MR. REICHEL: May I have just a minute?  
Page 1828

**NetworkReporting**

— 1-800-632-2720 —

1 JUDGE PATTERSON: Sure.

2 MR. REICHEL: I have nothing further at this time.

3 MR. HAYNES: Your Honor, I have some redirect.

4 JUDGE PATTERSON: I assumed you would.

5 REDIRECT EXAMINATION

6 BY MR. HAYNES:

7 Q Dr. Prucha, Mr. Lewis asked you about your experience in the  
8 mining industry. Do you recall those questions?

9 A Yes.

10 Q And for purposes of modeling a subsurface groundwater regime  
11 as was done in this case both by the Kennecott consultants  
12 and by you, is it critical that you have had experience in  
13 the mining industry to do that kind of modeling?

14 A I would say no.

15 Q Why is that?

16 A Well, I think it's the hydraulics and hydrology of systems  
17 or sort of independent, really, of exactly how you're  
18 drawing down the water. In this case it's going to depend  
19 on the natural system outside of the actual dewatered area  
20 that supplies water to that actual mine.

21 Q So the modeling is, in essence, independent of the fact that  
22 there's going to be a mine here or some other subsurface  
23 structure; is that right?

24 A That's right.

25 Q Mr. Lewis asked you about the boundary conditions in the --  
Page 1829

1 both the Kennecott model and your model. Do you remember  
2 that testimony?

3 A In the model that I modified, yes.

4 Q Yes, the model you modified.

5 A Uh-huh (affirmative).

6 Q And you testified that you added overburden as a boundary  
7 condition of your model. Do you remember that?

8 A That's right.

9 Q And is adding overburden in the regime, as you understand it  
10 here, a reasonable thing to do from a modeling perspective?

11 A Yes.

12 Q And why is that?

13 A Well, because that occurs in the vicinity of the mine.  
14 There is overburden. Bedrock is just not at the surface,  
15 and, in my opinion, is a better boundary condition because  
16 the flow into the bedrock is now limited by the overburden  
17 hydraulic properties that -- and we chose the hydraulic  
18 properties used for the overburden from the GeoTrans  
19 model -- latest GeoTrans model for hydraulic properties.

20 Q And the GeoTrans model is Exhibit --

21 MR. LEWIS: -- 591 of --

22 MR. HAYNES: Thank you, Counsel.

23 Q -- 591 of Kennecott; correct?

24 A I think so.

25 Q That is --

1 A Right.

2 Q Those are their numbers; correct?

3 MR. LEWIS: Objection; form.

4 Q The numbers that you chose from the GeoTrans model are the  
5 numbers that Kennecott produced; correct?

6 A That's right; yeah.

7 Q Okay. Mr. Lewis asked you about the Klasner study, which is  
8 Petitioner's Exhibit 59.

9 MR. HAYNES: Sorry. We have to do that technology  
10 switch, your Honor.

11 JUDGE PATTERSON: Okay.

12 Q Mr. Lewis asked you about page 10 of the Klasner report,  
13 again, Petitioner's Exhibit 59, and he read to you the first  
14 of the two paragraphs shown on the screen here from page 10.  
15 Do you recall that?

16 A Yes.

17 Q And this paragraph deals with complications arising from  
18 several factors. Do you recall that?

19 A Related to the geophysical interpretation, yes.

20 Q Yes. And you read the Klasner report cover to cover, didn't  
21 you?

22 A Yes.

23 Q Did you also notice, after this paragraph that Mr. Lewis  
24 read, the next paragraph that says, "In spite of these  
25 difficulties, much useful information has been obtained on  
Page 1831

1 the geologic nature of the area, and geophysical models were  
2 prepared that seemed consistent with the observed geological  
3 and geophysical data"?

4 A Yes.

5 Q And what does it mean to you when it says that, "The models  
6 were prepared that seemed consistent with observed  
7 geological data"?

8 A Well, the outcrops, for example, where the intrusive was  
9 observed, they -- Klasner has mapped the dikes in that  
10 location.

11 Q And from a modeling perspective, did you consider it  
12 important to use all available information at your disposal  
13 concerning geologic features in the area?

14 A Yes.

15 Q And that included the features mapped by Klasner; correct?

16 A That's right.

17 Q Mr. Lewis asked you about whether you could confirm the  
18 existence of faults, and you -- your answer was that you  
19 referenced two studies. Which were those two studies?

20 A It was the Klasner report and the geologic report that the  
21 company did. I think it's Appendix C by --

22 Q Appendix C-1 to the mine permit application?

23 A -- Coombs and Rossell. I can't remember the names off the  
24 top of my head, but it was the one that was presented in  
25 their reports.

1 Q All right. Mr. Lewis asked you about Table 7.1 in Appendix  
2 B-4. And I'm sorry. I don't have that slide available.  
3 But that was the table that described the four boreholes,  
4 numbers 54, 73, 83 and 84. Do you remember that?

5 A Yes.

6 Q All right. And those are four out of the six boreholes that  
7 you studied for part of your exercise here; correct?

8 A Yes.

9 Q And Mr. Lewis asked you about the tables report on the  
10 various hydraulic conductivities of those boreholes. Do you  
11 recall that?

12 A That's right.

13 Q Now, is it your understanding that those four boreholes  
14 represent the sum total of all of the geologic structures in  
15 the area?

16 A Over the 87 square kilometers that they modeled, no.

17 Q And so would you as -- from a modeling perspective rely on  
18 the hydraulic conductivity represented in those four  
19 boreholes to construct a model of the groundwater flow  
20 regime in this area?

21 A They're just not effective parameters to characterize the  
22 systems, so, no.

23 Q Mr. Lewis asked you about calibrating your model. Do you  
24 recall that testimony?

25 A Yes.

1 Q And you testified that you would not put forth a single  
2 number based upon the model that you performed; correct?

3 A Yes.

4 Q All right. And the numbers that you gave us yesterday,  
5 which I recall from your model -- the output numbers, which  
6 were 280 to 3,000 gallons per minute of inflow into the  
7 mine -- do you recall that?

8 A Yes.

9 Q And you gave us a range in numbers. Is that range in  
10 numbers consistent with your view of the uncertainty with  
11 any type of model?

12 A Yes.

13 Q Mr. Lewis asked you about whether it would be prudent for  
14 Kennecott to gather additional data before mining occurs.  
15 Do you recall that testimony?

16 A Yes.

17 Q And in your view, it would be prudent, would it not, to  
18 gather additional data in order to appropriately model the  
19 groundwater regime in the mine area?

20 A Yes.

21 Q And could that work be done before mining begins?

22 A Yes.

23 Q And could it occur before Kennecott starts constructing the  
24 tunnel?

25 A Yes.

1 Q In fact, it could be done now?

2 A Yes.

3 Q It could have been done two years ago?

4 A Yes.

5 MR. HAYNES: I have nothing further. Thank you.

6 MR. EGGAN: Just two or three questions, your  
7 Honor.

8 JUDGE PATTERSON: Okay.

9 REDIRECT EXAMINATION

10 BY MR. EGGAN:

11 Q Dr. Prucha, following up on what brother counsel, Mr.  
12 Haynes, just asked about whether it would be prudent and  
13 whether or not this could be done before the permits were  
14 granted -- and the question was -- from Mr. Lewis was,  
15 wouldn't it be prudent to conduct these tests? But my  
16 question would be this: Given the potential impact and the  
17 size of this site, wouldn't it really be prudent to do this  
18 testing -- all the testing that Mr. Lewis referred to before  
19 the permit is even granted?

20 A Yes.

21 Q Are you aware of the public hearing requirements under Part  
22 632 and the involvement of the public in this process?

23 A Yes.

24 Q Would it be prudent to allow the public to vet some of these  
25 issues before this permit is granted, as the statute appears

1 to require?

2 A Yes.

3 Q Would it be prudent to do that?

4 A Yes.

5 Q Now, Mr. Reichel asked you some questions about the Part 22  
6 rules. Are you an expert in the Part 22 rules?

7 A No, I'm not.

8 Q Okay. Well, let me show you just a couple of rules here in  
9 Part 22. And what I'm referring to specifically is the rule  
10 requiring a hydrogeological report for this kind of  
11 discharge. It's rule 323.2222(1). And I'm going to refer  
12 you specifically to that rule at (4)(b)(ii). Okay? And  
13 what we're talking about here is a requirement that an  
14 applicant evaluate the vertical and horizontal extent of  
15 mounding resulting from the discharge. Okay?

16 A Yes.

17 Q So I want you to think about that requirement, and I also  
18 want you to think about the requirement in that same  
19 provision. And this is under (4) of that rule -- (4c), and  
20 again it's (ii): "An applicant is required to analyze the  
21 interconnections between the aquifers receiving a discharge  
22 and other aquifers in the vicinity of the discharge  
23 location."

24 A That's correct.

25 Q Do you think that you could really analyze those two issues

Page 1836

**NetworkReporting**

**1-800-632-2720**

1 without doing some sort of modeling regime?

2 A No.

3 Q Do you think that the company -- in the evidence that it has  
4 presented, the modeling that it has conducted, do you think  
5 that the company has done modeling that is consistent with  
6 what this rule would require?

7 A No.

8 MR. EGGAN: Thank you. I have nothing else, your  
9 Honor.

10 MR. LEWIS: Nothing further.

11 JUDGE PATTERSON: Thank you, Doctor. You may be  
12 excused.

13 THE WITNESS: Thank you.

14 MR. HAYNES: Your Honor, perhaps it would be  
15 appropriate for a break now before we call our next witness.  
16 Thank you.

17 (Off the record)

18 JUDGE PATTERSON: Ready?

19 MR. HAYNES: Yes. Petitioners call Ann Maest.

20 REPORTER: Do you solemnly swear or affirm the  
21 testimony you're about to give will be the truth?

22 DR. MAEST: I do.

23 ANN S. MAEST, PH.D.

24 having been called by the Petitioners and sworn:

25 DIRECT EXAMINATION  
Page 1837

STATE OF MICHIGAN

STATE OFFICE OF ADMINISTRATIVE HEARINGS AND RULES

<p>In the matter of:</p> <p>The Petitions of the Keweenaw Bay Indian Community, Huron Mountain Club, National Wildlife Federation, and Yellow Dog Watershed Environmental Preserve, Inc., on permits issued to Kennecott Eagle Minerals Company.</p> <p>_____ /</p>	<p>File Nos.: GW1810162 and MP 01 2007</p> <p>Part: 31, Groundwater Discharge 632, Nonferrous Metallic Mineral Mining</p> <p>Agency: Department of Environmental Quality</p> <p>Case Type: Water Bureau and Office of Geological Survey</p>
---	---

HEARING - VOLUME NO. XL (40)

BEFORE RICHARD A. PATTERSON, ADMINISTRATIVE LAW JUDGE

Constitution Hall, 525 West Allegan, Lansing, Michigan

Wednesday, July 16, 2008, 8:00 a.m.

APPEARANCES:

<p>For the Petitioner Keweenaw Bay Indian Community:</p>	<p>MR. ERIC J. EGGAN (P32368) Honigman Miller Schwartz and Cohn LLP 222 North Washington Square, Suite 400 Lansing, Michigan 48933-1800 (517) 377-0726</p>
--	--

1 ROBERT H. PRUCHA, PH.D.

2 having been called as a rebuttal witness by the

3 Petitioners and sworn:

4 DIRECT EXAMINATION

5 BY MR. HAYNES:

6 Q Dr. Prucha, good morning.

7 A Good morning.

8 Q You testified before so we can dispense with the  
9 preliminaries. Dr. Prucha, for your rebuttal testimony this  
10 morning have you prepared a series of slides that will  
11 assist your testimony?

12 A Yes.

13 MR. HAYNES: For the record these will be marked  
14 as Petitioner's Proposed Exhibit 191 for demonstrative  
15 purposes only.

16 Q Dr. Prucha, to prepare for your rebuttal testimony this  
17 morning did you review the testimony of certain witnesses in  
18 this matter?

19 A Yes.

20 Q And did you review the testimony of Mr. Beauchamp, Dr.  
21 Carter, Mr. Chatterson, Dr. Council, Mr. Eykholt, Mr.  
22 Janiczek, Mr. Logsdon, Mr. Thomas, Mr. Ware, Mr. Wiitala,  
23 Mr. Wozniewicz, and Mr. Zawadzki?

24 A Yes.

25 Q Now, and did you also review exhibits including the

Page 8283

**NetworkReporting**

**1-800-632-2720**

1 demonstrative exhibits that they prepared for their  
2 testimony?

3 A For most of them.

4 MR. HAYNES: Now, if we can go to the next slide,  
5 please.

6 Q Dr. Prucha, you reviewed the testimony of Mr. Thomas who  
7 testified on behalf of the DEQ, and on page 6803 of the  
8 transcript Mr. Thomas testified that he doesn't agree that  
9 mine inflows can high because country rock is low  
10 permeability. Did you review that testimony?

11 A Yes.

12 Q And do you have -- do you take issue with that testimony?

13 A Yes.

14 Q And in what way?

15 A Well, I think he doesn't assume -- I think he assumes that  
16 all the flows through that low permeability country rock  
17 matrix, I don't think he really acknowledges the potential  
18 for major water conduits, such as the faults and brecciated  
19 dikes and --

20 Q And would that be an acknowledgment that a prudent  
21 groundwater modeler should acknowledge?

22 A Yes. And I think that it in a way he's not really justified  
23 for making that statement, because they didn't really  
24 characterize the hydraulics of the Met or inferred locations  
25 of these.

Page 8284

**NetworkReporting**

**1-800-632-2720**

1 Q So did they map what you consider to be the major water  
2 conduits, such as faults?

3 A There are Met locations of these features and they did not  
4 hydraulically test them.

5 Q I see. Those would be faults and dike-breccia zones?

6 A Right.

7 MR. HAYNES: All right. The next slide, please.

8 Q Dr. Prucha, you reviewed the testimony of Mr. Ware who  
9 testified on behalf of Kennecott, who on page 3134 of the  
10 transcript testified that there had been no hydraulic  
11 testing in the Klasner fault zone. Now, just for the  
12 court's -- to bring the record current, tell us again what  
13 the -- what you consider the Klasner fault zone to be.

14 A Well, it's -- the way he mapped it it was a 500-meter-wide  
15 zone extending north-northwest between Eagle Rock and the  
16 orebody. And my understanding of the testimony by Mr. Ware  
17 was that they hadn't performed any hydraulic testing to  
18 confirm in sort of a conclusive fashion that these were --  
19 there were no water-conductive features in that zone, nor  
20 did they do any flow metering, geophysical logging like they  
21 had done for the test wells that they had associated with a  
22 well pump test at 084.

23 Q And, Dr. Prucha, what should Kennecott have done in your  
24 opinion --

25 A I believe they --

Page 8285

**NetworkReporting**

**1-800-632-2720**

1 Q -- concerning the Klasner fault zone?

2 A I believe based on, for example, the testimony by Dr.  
3 Karasaki yesterday that really seeing a fracture doesn't  
4 necessarily -- in a borehole doesn't necessarily mean that  
5 you're going to actually get water coming out of that; you  
6 actually have to hydraulically test that. So I think that's  
7 an important point to make here.

8 Q And by "hydraulically testing" do you mean intercepting the  
9 major water-conductive features in the zones of interest?

10 A Attempting to do that -- and I have seen a map that suggests  
11 that there are some boreholes in that location, but it  
12 doesn't seem to be a priority to have gone out there and  
13 hydraulically test the zones, so you really can't confirm  
14 whether there is or there isn't good, major hydraulic, you  
15 know, water-conductive features in that zone.

16 MR. HAYNES: The next slide.

17 Q Dr. Prucha, on slide number 5 of your presentation you have  
18 reviewed the testimony of Mr. Logsdon, have you not?

19 A Small portions of it associated with these two issues.

20 Q And did Mr. Logsdon say in his testimony that not much water  
21 would flow through the crown pillar?

22 A That's my understanding.

23 Q And did he also testify that the crown pillar will in effect  
24 remain saturated, therefore limiting the air flow --

25 A That's right.

Page 8286

**NetworkReporting**

**1-800-632-2720**

1 Q -- through the crown pillar?

2 A That's right.

3 Q Now, in your view are these statements conflicting?

4 A It does seem like they conflict, because in one case you  
5 can't have it saturated and then have it dewater at the same  
6 time. And by the dewatering of those pores his implication  
7 is that the flow of water through that crown pillar area  
8 reduces to a small amount. So I think those conflicts in  
9 that statement, it's either one or the other.

10 Q I see. And to test the veracity of one or both of these  
11 statements, did you review the results from the FEFLOW model  
12 for the crown pillar -- or for the mine area?

13 A I did.

14 Q And on slide 5 have you presented the results of the FEFLOW  
15 model that was on the file submitted by Kennecott?

16 A Right. And that file name is located down on the lower  
17 left.

18 Q For the record that's "Eagle\_97\_base\_Case\_Version\_01.fem";  
19 is that right?

20 A That's right. And my --

21 Q And -- go ahead. I'm sorry.

22 A My understanding is that this is the one that was developed  
23 in December of 2007 and I believe that that had the latest  
24 adjustments for the crown pillar and that -- being adjusted  
25 in height.

Page 8287

**NetworkReporting**

**1-800-632-2720**

1 Q All right. And would you then take the pointer and explain  
2 for Judge Patterson the results of this FEFLOW model  
3 developed by Kennecott in relation to the question of the  
4 saturation of the crown pillar?

5 A Right. And really the column I want to focus on is the one  
6 that says, "Percent saturation" second from the right. And  
7 this table basically outlines the model layers. The model  
8 is made up of layers and the layer number is on the left  
9 column. And the next two columns say "top elevation" and  
10 "bottom elevation" of that layer. And effectively the crown  
11 pillar, the bottom of the crown pillar at 327 and a half  
12 feet -- or meters is occurring in layer -- sort of the  
13 bottom of layer 3, and you can see in column -- the column  
14 that says "percent saturation" that it is partially  
15 unsaturated from their own code. But still my point would  
16 be that, you know, the results from the model show that you  
17 get between 60 and 210 gallons per minute, so a significant  
18 portion of that water comes from the overburden and  
19 effectively will come through that crown pillar area just  
20 based on this FEFLOW model that they performed.

21 Q And when you say for layer 3 of the crown pillar that  
22 there's 87 percent saturation, that means that there's 13  
23 percent of the area has voids or --

24 A Has air in it, and air is starting to creep into the voids,  
25 but water still flows under those conditions.

Page 8288

**NetworkReporting**

**1-800-632-2720**

1 Q I see.

2 A It may -- it just doesn't flow quite as much as if it's  
3 fully saturated. So if it said 100 percent saturation,  
4 that's the maximum -- you know, and it would depend on the  
5 amount of head, but that would -- okay? Yeah.

6 Q All right. And just for the record, Dr. Prucha, the table  
7 that you prepared that's on slide 5 is taken from the  
8 Kennecott model; correct?

9 A Yes. I prepared this table.

10 Q Right, but you -- but there is -- but the figures in -- the  
11 numbers in the table are derived from the Kennecott model;  
12 is that right?

13 A That's right.

14 Q You didn't make up these numbers yourself?

15 A I didn't modify the model at all; I just -- it was run and  
16 those were the numbers that it produced.

17 MR. HAYNES: All right. The next slide, please.

18 Q Dr. Prucha, when you reviewed the testimony of Mr. Ware did  
19 you review his testimony where he testified that he assisted  
20 Dr. Pope in developing Kennecott Exhibit 214?

21 A Yes.

22 Q And when -- you reviewed that exhibit, have you not?

23 A Yes.

24 Q And have you found in your view problems in that exhibit?

25 A Well, I did.

Page 8289

**NetworkReporting**

**1-800-632-2720**

1 Q And what are they?

2 A I guess the issue I saw related to the development of the  
3 conceptual model for the bedrock flow system and then the  
4 bedrock flow model was that this 90-meter total vertical  
5 depth delineation between the upper bedrock and the lower  
6 bedrock, which is an important break in the bedrock and an  
7 important conceptual feature and it does affect the flow  
8 results. That depth seems to come into question. And this  
9 Exhibit 214 shows a series of fault traces at different  
10 levels that extend into the upper bedrock zone and those  
11 fault traces seem to indicate that you have fault trace -- a  
12 fault that extends through there.

13 In the bedrock model, in the conceptual model that  
14 was -- there was an implicit assumption that the faulting --  
15 faults in that lower bedrock didn't extend up into the upper  
16 bedrock. And in my initial testimony I -- and the modeling  
17 that I had done before associated with that I had extended  
18 those faults because I thought those -- up to the  
19 overburden. I thought that was an important oversight in  
20 the conceptual model, and it just seemed interesting that  
21 this Exhibit 214 didn't -- wasn't taken into consideration  
22 in developing that 90-meter depth.

23 Q And in your view should that fault trace -- should it have  
24 been taken into consideration in the modeling that was  
25 performed by Kennecott?

Page 8290

**NetworkReporting**

**1-800-632-2720**

1 A Right; I do think that. And I do think they -- this was  
2 just occasion for extending the faults that you see in the  
3 lower bedrock into the upper bedrock, even to the  
4 overburden.

5 Q Dr. Prucha, when you reviewed the testimony of Mr. Ware did  
6 you note that on page 3179 he testified that the fault  
7 displacement must be observed to verify its existence?

8 A Yes.

9 Q And do you see a problem with that testimony?

10 A I do.

11 Q And what is that?

12 A I don't believe it has to be -- that you have to demonstrate  
13 that it shows displacement to actually be a water-conductive  
14 zone.

15 Q Why is that?

16 A I think that the displacement could be, you know, two planes  
17 coming apart a little bit and water can still flow through  
18 those, and --

19 Q And what would you have done in view of your finding a  
20 problem with Mr. Ware's testimony?

21 A Attempted to more adequately characterize those fault zones  
22 and brecciated zones along with that, and then testing those  
23 hydraulically.

24 Q And did you observe that that was ever done by Kennecott?

25 A No.

1 MR. HAYNES: All right. The next slide.

2 Q We heard a lot of testimony about this -- the flow of --  
3 through the system and the conceptualization of the flow  
4 through this groundwater system, Dr. Prucha. And you've  
5 reviewed the testimony of Mr. Ware where he described the  
6 conceptualization by Mr. Segerstrom; is that right?

7 A Yes.

8 Q And that is in -- that was in Intervenor -- I think  
9 Kennecott Exhibit 323; correct?

10 A That's what I remember, yes. It's on this --

11 Q Yes. And what is your understanding of the Segerstrom  
12 conceptualization as it relates to either surface or  
13 subsurface features?

14 A Well, I think the discussion was -- and these cross sections  
15 come from that paper and I -- my sense was that they -- that  
16 Kennecott was using this as a basis for their  
17 conceptualization and they were using it to describe the  
18 development of this Negaunee moraine and the general  
19 structure of the plains and also its relation to the Salmon  
20 Trout and the Yellow Dog River.

21 Q And in your review of the Segerstrom paper did you note  
22 whether or not Segerstrom Met the subsurface structures?

23 A I didn't see any indication of that, and I think that's kind  
24 of a big oversight because he was really limited to  
25 interpretations at the surface; whereas, the current data

1 set that's available has a significant amount of subsurface  
2 information available.

3 Q And so in your view did Mr. Ware rely or over-rely on the  
4 Segerstrom conceptualization for purposes of conceptualizing  
5 the system flow?

6 A Yes. One other point I want to add is that I drew the  
7 yellow intrusives here and I put an arrow to the Eagle Mine.  
8 And I think what I see in the data set and being mapped by  
9 people like Klasner and even the Kennecott geologists is  
10 that there are other additional dikes throughout the area,  
11 and I think that this could easily have helped in the  
12 development of that whole Yellow Plains -- Yellow Dog Plains  
13 geomorphology and stratification, so --

14 Q In reviewing Mr. Ware's testimony, Dr. Prucha, did you note  
15 that Mr. Ware said that, "The Segerstrom report concluded  
16 that the hydrology of the principle aquifers in the area is  
17 controlled by the main drainage at the Salmon Trout River"  
18 on page 5052 of the transcript?

19 A Yes.

20 Q And do you see a problem with that view?

21 A I do.

22 Q And what is your -- what is your opinion about that view?

23 A Well, I didn't see anywhere that Segerstrom really gets into  
24 discussing groundwater. It really wasn't the point of this  
25 paper. So I think it was sort of stretching what

1            Segerstrom's paper was about. And he doesn't really even  
2            indicate that the Salmon Trout River is the main surface  
3            drainage in the Yellow Dog Plains. In fact it's the Yellow  
4            Dog River that the plains are named after that -- and that  
5            river was active throughout the whole glaciation period.  
6            And Segerstrom's trying to make a point that the Salmon  
7            Trout is more currently attempting to head up towards the  
8            Yellow Dog. But I would have probably improved on this  
9            Segerstrom conceptualization and not relied on it so  
10           directly; used more subsurface information, the current  
11           information to enhance that.

12                            MR. HAYNES: All right. The next slide.

13    Q            Dr. Prucha, we've had several witnesses for Kennecott and  
14            for the DEQ testify that the geology of nearby mines in the  
15            Marquette iron range is dissimilar to the geology at the  
16            proposed Eagle Mine. You've reviewed that testimony,  
17            haven't you?

18    A            Yes.

19    Q            And in your view considering the proximity of the nearby  
20            mines in the Marquette iron range, what would a prudent  
21            hydrologist or a prudent modeler do in relation to those  
22            nearby mines?

23    A            I think it's -- a prudent hydrogeologist would not ignore  
24            that range of inflows and would look into what's causing  
25            that and what are the ranges and try and relate that back to

Page 8294

**NetworkReporting**

**1-800-632-2720**

1 the Eagle Mine.

2 Q And why would that be? Can you explain based upon the  
3 bullet points in slide 10 why a prudent hydrogeologist or  
4 modeler would look at those nearby iron mines?

5 A Well, I believe they're more similar than dissimilar, and  
6 there certainly are differences but I think some of the key  
7 features are the same in terms of the hydrology. And I  
8 think, for example, both bedrock systems or the  
9 metasediments -- both Eagle and the Marquette area have  
10 similar overburdens soil types and thicknesses, so they  
11 consist of outwash, sands and tills. That's an important --  
12 probably one of the most important points, because the  
13 majority of water is really stored in those overburden  
14 sediments. They have similar climates, similar fracturing  
15 and dike intrusion in the area where I would expect  
16 brecciated zones to exist, offer conduits.

17 And I think the last point is that the mines in  
18 the -- in this Marquette iron mining district don't have a  
19 river running over it like at Eagle, so I think that's kind  
20 of an important distinction to make, that at Eagle you  
21 have -- you run a greater possibility of water coming  
22 directly into the mine by river leakage.

23 Q Dr. Prucha, we've had a lot of discussion during this  
24 hearing among modelers and hydrogeologists concerning the  
25 FEFLOW bedrock model calibration. You've testified in that

1 regard, and others have testified in that regard. And in  
2 particular Mr. Zawadzki testified regarding the calibration  
3 on page 4871 of the transcript where he said that he  
4 calibrated the modeling transient mode to the pumping test  
5 in hole 084. You've reviewed that testimony, haven't you?

6 A Yes.

7 Q And you've reviewed the modeling results as well, have you  
8 not?

9 A Yes.

10 Q And do you see problems with Mr. Zawadzki's statement?

11 A Right. I reviewed his presentation of the modeling results  
12 and --

13 Q And what problems did you see?

14 A Well, I have them numbered here, bulleted, but I don't  
15 believe he calibrated the natural flow conditions in the  
16 bedrock flow system; he calibrated to the pump test, but it  
17 seems to me that it would have been better to calibrate to  
18 the actual natural flow conditions so that you have an  
19 understanding of how that system changes once you start  
20 pumping.

21 Q And the second problem that you have with Mr. Zawadzki's  
22 calibration?

23 A Well, this kind of goes back to what Dr. Karasaki said  
24 yesterday, but they didn't calibrate both the bedrock and  
25 overburden flow systems simultaneously, and that -- as a

1 modeler that's a real important point, because that --  
2 trying to disassociate these two zones with two different  
3 models leads to a lot of problems. And they didn't attempt  
4 to simulate the whole system as one. The whole system is  
5 one aquifer system.

6 Q And what about the density-dependent flow?

7 A Well, the reason I bring that up is because the FEFLOW code  
8 is capable of simulating density-dependent flow.

9 Q And tell us please for those of us who don't model for a  
10 living what density-dependent flow is.

11 A Sure. The fact that the TDS appears to increase with depth  
12 means the density of the water increases; it's heavier down  
13 at depth. This would have been nice to see what kind of  
14 effects occur when you're dewatering a substantial area for  
15 the mine. The density-dependent flow will be an important  
16 factor I think at some level.

17 Q And so having reviewed Mr. Zawadzki's calibration and  
18 considering the problems that you have identified, what  
19 should Mr. Zawadzki have done in his calibration?

20 A Well, I believe to calibrate the natural flow systems in the  
21 bedrock and overburden simultaneously, they should have  
22 started by characterizing the bedrock system better. I  
23 think they should have considered effects of all the major  
24 structural features that -- in that -- that have been mapped  
25 or inferred. They should have considered a direct

Page 8297

**NetworkReporting**

**1-800-632-2720**

1 connection to the Salmon Trout River where their own maps  
2 show that the overburden is absent, and the Salmon Trout  
3 River goes right over it.

4 Q Let me stop you there for a moment. When you say the  
5 "overburden is absent" what do you mean by that?

6 A The unconsolidated soil that occurs over the bedrock, so  
7 the --

8 Q That is absent because of what reason? What causes its  
9 absence?

10 A Its erosion. And then the last two bullets, the -- they  
11 should have simulated the simultaneous flow in the bedrock  
12 and overburden, and then attempted to simulate the density-  
13 dependent flow. And that's probably more important when  
14 they do the -- you know, they pull the water down through  
15 dewatering and then watch it come back up.

16 Q And are these points that you've made points that are tasks  
17 that a prudent modeler would take in order to calibrate a  
18 model?

19 A Yes.

20 MR. HAYNES: The next slide.

21 Q Dr. Prucha, Mr. Zawadzki testified at page 4974 of the  
22 transcript that they pumped 1.6 gallons per minute during  
23 the pump test at well 84 and saw 195 meters of drawdown at  
24 the well, and he further testified that this pump test  
25 information was used to calibrate the Golder bedrock model.

Page 8298

**NetworkReporting**

**1-800-632-2720**

1 Do you remember reviewing that testimony?

2 A Yes.

3 Q And do you find a problem with that technique and those  
4 efforts?

5 A Well, I -- as I testified before my main concern about that  
6 pump test was that it isolated a small fracture and that it  
7 was presumed to be the major water-conductive feature  
8 throughout the mine areas, which certainly is a lot bigger  
9 area that was actually tested. It doesn't appear to be the  
10 major conductor just based on the faults that were mapped,  
11 fault lines that were mapped. And the breccia zones.

12 Q And so what should Mr. Zawadzki have done rather than  
13 focusing on this small fracture?

14 A I think looked at more appropriate well testing locations  
15 and more rigorous hydraulic testing.

16 MR. HAYNES: The next slide.

17 Q Dr. Prucha, Mr. Zawadzki also testified on page 5032 of the  
18 transcript that he extended the mine workings 30 meters in  
19 all directions to be conservative and to take into account  
20 Dr. Carter's findings. You've reviewed the testimony,  
21 haven't you?

22 A Yes.

23 Q And do you find a problem with what Mr. Zawadzki testified  
24 about?

25 A I do.

Page 8299

**NetworkReporting**

**1-800-632-2720**

1 Q And what is your -- what problems did you find?

2 A Well, in the review of the FEFLOW model input that we  
3 obtained this zone didn't appear to be continuous; the zone  
4 around the tunnels from the portal all the way down to the  
5 mine where it starts entering the mine. And I think that's  
6 important because it runs -- or limits the amount of water  
7 that could potentially come in from the overburden or near  
8 the surface down through that zone. In fact that was one of  
9 the modifications that I made in the original runs with  
10 FEFLOW, the sensitivity runs. The second thing was just it  
11 seemed in the Sainsbury report -- and I don't know the name  
12 or the number of that exhibit off the top of my head, but it  
13 seems he was suggesting that the zone of increased  
14 permeability several orders of magnitude was more like 400  
15 feet around and not the 30 meters, which is about a hundred  
16 feet.

17 Q And would you agree with that suggestion from Dr. Sainsbury?

18 A It seems like that should have been tested. I'm not a rock  
19 mechanics person so I wouldn't know exactly what distance  
20 out.

21 Q And so in view of what Mr. Zawadzki said about extending the  
22 mine workings 30 meters, what in your view should a prudent  
23 modeler have done when testing this question?

24 A Again, it's the same point that I've been making before. I  
25 think they should have just simulated a combined model. And

Page 8300

**NetworkReporting**

**1-800-632-2720**

1 the reason I say that is that if they had included the  
2 overburden in this particular case they may have seen more  
3 drainage from shallow zones down into the mine workings as  
4 they dewater along these permeable zones, so --

5 Q Dr. Prucha, on page 4974 of the transcript Mr. Zawadzki  
6 testified that model results aren't really sensitive to the  
7 topmost model boundary because, as he says, "it doesn't  
8 matter." Do you have a problem with his view about that?

9 A I do.

10 Q And what is your problem?

11 A Well, when you assign the boundary condition that he did to  
12 the top of the bedrock model that he was simulating, he  
13 didn't simulate the overburden, so he made an assumption  
14 that it -- with a very simple boundary condition at the top  
15 and it requires specification of two different factors: one  
16 is you have to specify the level of water you think is in  
17 the overburden, and I didn't see any documentation to  
18 justify what he put in there or what the values were. The  
19 second factor is effectively a resistance or a -- you know,  
20 a conductance that allows the water to flow through at what  
21 rate from the overburden into the bedrock.

22 Again, there was no information I could see on how  
23 they -- what values they used, but there's no way that he  
24 could have calibrated the amount of water coming through  
25 because he didn't simulate the overburden. So these numbers

Page 8301

**NetworkReporting**

**1-800-632-2720**

1 are really questionable and to me it says that the simulated  
2 amount of inflow, which is very dependent on the overburden  
3 and how you simulate that, really isn't realistic. It's  
4 just not realistic. And I really feel like they should have  
5 used the FEFLOW model just -- it's a capable code to  
6 simulate these conditions. They should have combined the  
7 overburden and bedrock into one model.

8 Q Dr. Prucha, we've had testimony from many witnesses about  
9 the sensitivity analysis of these various models, and in  
10 fact Mr. Zawadzki says that he performed various sensitivity  
11 simulations and that's on slide 17 of his presentation,  
12 which comes from Kennecott Exhibit 399, Figure 4. Have you  
13 reviewed that slide and that exhibit?

14 A Yes.

15 Q And what -- do you have a differing view from Mr. Zawadzki  
16 about the effectiveness of the sensitivity analysis  
17 performed by Kennecott?

18 A Yes.

19 Q And what is your view?

20 A Well, I felt he was biased in the adjustments that he made  
21 to the model input.

22 Q When you say "biased" what do you mean?

23 A Well, for example, in the graph that he showed here all of  
24 the changes that he made were to individual parameters in  
25 the model, and I think Dr. Karasaki yesterday mentioned that

1 he thought they should be in a combined fashion. And I --  
2 my former modeling was in a combination, which means I  
3 didn't just adjust one parameter and see what happens and  
4 then go back to the BASECASE and adjust another parameter; I  
5 put all of those features in at once. And in a sense this  
6 is a worst-case scenario and I believe those changes were  
7 all very realistic. And I think he should have looked at  
8 the combination.

9 The second point was I think it's important to  
10 distinguish that in this graph it says "upper bound" and  
11 "lower bound"; that that shouldn't be confused with the  
12 upper bound model case that they ran, which -- they only ran  
13 this with the BASECASE model, so they didn't test the  
14 sensitivity on their upper end case; they only did it with a  
15 BASECASE model that simulated 60 gallons per minute. So if  
16 they'd run this with the 210 gpm or gallons per minute  
17 model, the one that had some faults in it, water-conductive  
18 features, that that would have produced even more  
19 significant changes I believe.

20 Q And that would have been -- the way that you would have  
21 conducted the sensitivity analysis is the way that a prudent  
22 modeler would have done this?

23 A Absolutely.

24 Q Is that standard operating procedure for modeling?

25 A Yes.

1 Q That was not performed here by Kennecott's consultants as  
2 far as you can tell?

3 A No.

4 Q Dr. Prucha, Mr. Zawadzki in his testimony on slide 18 of his  
5 presentation said that he simulated a three-kilometer-long,  
6 hundred-meter-wide fault zone 100 meters from the tunnel.  
7 Do you remember that, --

8 A Yes.

9 Q -- reviewing that in his testimony and in his presentation?

10 A Yes.

11 Q And in your view was that simulation an appropriate  
12 simulation?

13 A No.

14 Q Why not?

15 A Well, from the start I wouldn't have even really considered  
16 running that because you already know the results. And you  
17 know the results because the bedrock matrix conductivity  
18 starts out -- is specified as being pretty low. So you  
19 just -- if you put a high permeability zone and don't  
20 connect it to the mines, it's being limited by the low  
21 permeability rock between that fault and the mine opening.  
22 So there's really not going to be much flow through here no  
23 matter what you do to this fault. So it sounds like it's  
24 really permeable and that they tested this Klasner fault  
25 zone, but in reality the Klasner fault zone was 500 meters

Page 8304

**NetworkReporting**

**1-800-632-2720**

1 wide; goes right through the access tunnel. And I believe  
2 that that is sort of misleading. What they should have done  
3 was connect it to a mine tunnel or a fracture coming off of  
4 the mine tunnel so that it has a way to essentially "hook up  
5 the pipes," to so speak.

6 Q All right. And just for the record, Dr. Prucha, the portion  
7 of Mr. Zawadzki's presentation was taken from Kennecott  
8 Exhibit 399, page five; is that right?

9 A Yes.

10 MR. HAYNES: The next slide.

11 Q Dr. Prucha, Mr. Zawadzki said that he "simulated two  
12 additional 'BASECASE' sensitivity simulations that extended  
13 the faults to the upper bedrock and the lower upper bedrock  
14 bottom contact." Do you remember seeing that in his  
15 presentation?

16 A Yes.

17 Q And reviewing that in his testimony?

18 A Yes.

19 Q And do you find problems with his technique?

20 A Yes, it's for the same reasons as the previous slide.

21 Q And why is that?

22 A Well, he uses the BASECASE model instead of the upper bound,  
23 so you really don't get a good sense of what it does to --  
24 in a worst-case scenario. But he also specifies 120 meters  
25 total vertical depth and I'm wondering why wouldn't it be

Page 8305

**NetworkReporting**

**1-800-632-2720**

1 maybe 200. I believe he should have done a simulation that  
2 combined these effects.

3 Q And why would 200 meters total vertical depth be more  
4 appropriate than 120 meters?

5 A I'm not saying it's more appropriate; I just think that that  
6 would have been testing a bigger zone that's possible in my  
7 opinion. I didn't see the justification for choosing 120.

8 Q And is there a reason for choosing 200 then?

9 A When I looked at some of the electrical conductivity logs it  
10 seems like it's possible that that could extend down. I  
11 didn't see any indication that that 90-meter depth break  
12 between the upper and lower bedrock was -- had been defined  
13 accurately.

14 Q And so rather than simulating these two additional BASECASE  
15 scenarios, what should Mr. Zawadzki have done?

16 A I just question why he used 120, but ultimately he should  
17 have combined the effects of all of these modifications, so  
18 changing that depth, adding -- extending fault lengths.

19 MR. HAYNES: Your Honor, one moment if I may.  
20 Thank you.

21 Q Dr. Prucha, Exhibit 29LL from the Part 31 case is -- shows  
22 the prediction -- shows the FEFLOW model under-predicts most  
23 of the mine inflow; is that right?

24 A Yes.

25 Q And you have put up here on slide 18 a longitudinal section  
Page 8306

**NetworkReporting**

**1-800-632-2720**

1 of the mine workings. And can you explain for Judge  
2 Patterson what the relevance of this figure is?

3 A Sure. When I looked at the simulated drawdown plots that  
4 were provided in the reports -- and I don't recall exactly  
5 what report off the top of my head, but I think in  
6 Exhibit -- the one in parenthesis it says "Exhibit 29LL";  
7 that should be "29QQ."

8 Q I see.

9 A But that simulated drawdown appears to be inadequate to  
10 actually drop the water table down into the -- you know, so  
11 that it's below the access tunnel.

12 Q And what's important about drawing the water table down  
13 below the access tunnel?

14 A Well, I would expect a lot of inflow into that mine and it's  
15 not being accounted for in the mine inflow estimate. And  
16 from my -- just looking at the plan view plots of the  
17 drawdown and then looking at this cross section, and they  
18 have on here one horizontal line that represents the upper  
19 and lower bedrock contact at 90 meters total vertical depth,  
20 I come up with about a hundred feet of simulated water level  
21 above that tunnel. And all I can think is that they're not  
22 simulating enough drawdown, which would only increase the  
23 mine inflow if you actually did draw it down below the mine  
24 tunnel.

25 Q I see.

Page 8307

**NetworkReporting**

**1-800-632-2720**

1 A So this is another scenario where I think they should have  
2 done a combined bedrock and overburden simulation.

3 Q To more accurately predict the mine inflows?

4 A Right.

5 Q I see. Now, on the next slide, which is number 19 -- you've  
6 reviewed the testimony of Dr. Council; is that right?

7 A Yes.

8 Q And Dr. Council testified that the drawdown in the wetlands  
9 could be as -- up to six inches -- from six inches up to  
10 several feet in the upper aquifer. Do you remember that?

11 A Yes.

12 Q And do you find a problem with that statement?

13 A Yes.

14 Q And what is that?

15 A Well, I think he fails to consider the potential for direct  
16 connection of the bedrock, especially the brecciated dike  
17 zone, which is in this area of the mine; it's connection to  
18 the stream and wetland, and --

19 Q All right. On slide 19 you've attached Figure 13 from  
20 Appendix B-1 to the EIA, which is the Quaternary Deposit  
21 Isopach. By the way, what's an isopach?

22 A It's the thickness that unit.

23 Q All right. And can you show on this figure where the  
24 bedrock connection is to the stream and wetland?

25 A Well, I would expect that just based on this drawing -- what

Page 8308

**NetworkReporting**

1-800-632-2720

1 this drawing is showing is these contours represent  
2 different thicknesses of the unconsolidated material  
3 overlying the bedrock. And where it says "zero" here over  
4 this large area they're -- basically the conclusion there is  
5 that there is no soil, so bedrock's right at the ground  
6 surface. And the stream, you can see the Salmon Trout River  
7 going right through that over a fair distance, but I would  
8 expect that to be a zone where bedrock would be in direct  
9 contact with the stream. And I don't think they did  
10 adequate characterization or testing to even look at whether  
11 the current bedrock system is being influenced hydraulically  
12 by the stream, but I would guess it could very well be.

13 Q And in your view would a prudent modeler take that into  
14 account in modeling the effects of the drawdown on the  
15 wetland and the stream?

16 A Absolutely.

17 Q Dr. Prucha, you've reviewed the testimony and the  
18 presentations of Mr. Zawadzki and Mr. Wozniewicz; correct?

19 A Yes.

20 Q And in your view did they simulate worst-case predictive  
21 scenarios of mine subsidence?

22 A I don't -- I didn't see that.

23 Q All right. And what do you define as a worst case from a  
24 modeling standpoint?

25 A Well, I couldn't imagine a case going beyond that based on

Page 8309

**NetworkReporting**

1-800-632-2720

1 reasonable assumptions about the system.

2 Q And did they simulate worst-case predictive scenarios of  
3 increased permeability?

4 A Associated with?

5 Q Associated with mine subsidence.

6 A No.

7 Q And did they simulate worst-case predictive scenarios of  
8 direct connections to the Salmon Trout River?

9 A No.

10 Q And in your view did any of the models that they performed  
11 do these worst-case scenarios?

12 A No.

13 Q And what should they have done?

14 A Well, I think they should have simulated potential  
15 subsidence in the area and looked at its impact to the  
16 Salmon Trout and estimated what could be coming in as a  
17 maximum amount of inflow.

18 Q And in your view would that be prudent because of the  
19 proximity of the Salmon Trout River to the proposed mine?

20 A That and because other nearby mines had had that problem and  
21 generated lots of inflow.

22 Q Now, Dr. Prucha, for slide 21 you have prepared a figure  
23 that shows various -- has various lines and figures drawn on  
24 it around the proposed mine area. Can you explain for Judge  
25 Patterson what this is?

Page 8310

**NetworkReporting**

**1-800-632-2720**

1 A Well, this is a map that -- I just have this information in  
2 the Geographical Information System which is a mapping  
3 software you can effectively line up things. I think I  
4 testified to this originally. But the idea here is that the  
5 fact that, you know, Klasner's mapped faults here and other  
6 folks have mapped fault lines and dikes through this area --  
7 this is superimposed on the surface topography where the  
8 darker green colors are lower elevation and the lighter  
9 white areas are topographic high, that it didn't seem like  
10 there's an explanation for the topographic high in terms of  
11 shallow groundwater levels up towards this area and how the  
12 structures could possibly influence that.

13 Q And could you for our benefit explain the various colored  
14 lines that appear on this figure?

15 A Well, the orange ones are the --

16 Q Let me back up. Tell us again where you derived the  
17 information that you plotted on this figure.

18 A Well, from several sources. One is the DEQ's website, GIS,  
19 and then the Klasner information I got from his report. And  
20 the well points here that are shown in different colors are  
21 from the maps that I -- the reports that I reviewed.

22 Q The reports prepared by Kennecott and its consultants?

23 A Kennecott; right. And the red lines here represent my input  
24 here that follow surface drainage features. And I guess one  
25 of the main points to this diagram was to -- I'm still

1           perplexed about the -- in general as a hydrologist you run  
2           with theories where shallow groundwater generally tend to  
3           mimic the surface topography and what I see here is the  
4           Salmon Trout River here going by the mine ends up going up  
5           the north along the stream and that drainage is pretty well  
6           defined. But there is another drainage feature that heads  
7           off around to the east and down to Yellow Dog River, and it  
8           seems like those -- that depression is actually larger  
9           topographically than the Salmon Trout River. In fact a  
10          wetland comes up into this area. And one could argue just  
11          based on the faults-and-dike structure that Klasner has  
12          drawn here that that feature has been developed, as the  
13          Kennecott geologists have suggested. And it doesn't seem  
14          like these features were really considered in the  
15          development of the conceptual model or the numerical model.  
16          But it does show a drainage feature going towards the south.  
17    Q       And would a prudent modeler have taken these features into  
18           account in doing the modeling for the proposed inflow to the  
19           mine?

20    A       Yes. I mean, it is -- I think as Dr. Karasaki pointed out  
21           yesterday, we always want more data to get a better  
22           understanding of what goes on below the surface. But in  
23           this case I'm trying to point out that there are obvious  
24           data that don't really cost too much money that you should  
25           be taking into account in trying to correlate. In a lot of

Page 8312

**NetworkReporting**

**1-800-632-2720**

1 cases I've been involved with these features are pronounced  
2 and they're generally correlated with subsurface structures.

3 Q And was that the case here?

4 A Well, I don't believe that they necessarily considered that  
5 in their conceptualization.

6 Q Okay. Now, Dr. Prucha, slide 22 contains another figure  
7 that -- did you prepare the figure on slide 22?

8 A I did.

9 Q And what did you -- where did you derive the information  
10 shown on the figure on slide 22 from?

11 A Well, basically it has the same information that I had on  
12 the previous plot that I described, but in addition I added  
13 dikes as mapped by Klasner to the south of the Eagle  
14 orebody.

15 Q And how are those dikes represented on this figure?

16 A As the large red lines that extend here for miles and keep  
17 going off to the west.

18 Q These are lines that seem to trend east and west?

19 A That's right. And it's kind of a coarse depiction. I mean,  
20 I had to go off of his old report and try and bring that in  
21 and line it up. But in addition the purple lines are the  
22 lines -- represent dikes that were mapped by Kennecott  
23 geologists.

24 Q These are the purple lines that trend east and west?

25 A East and west. And then there are dark red lines here

1 heading off to the northwest. And I think I've shown that  
2 before. Those are faults that were mapped by the Kennecott  
3 geologists. And of course, then I have the Klasner  
4 information in here in the -- looks like this is dying.  
5 There you go. So I will add that these lines heading off to  
6 the northeast were lines that I drew.

7 Q And why did you draw those lines?

8 A Well, the intent of those was to kind of follow up on the  
9 suggestion, not just by the Kennecott geologists, that the  
10 drainage features and Yellow Dog Plains and the area  
11 generally are -- you know, their belief is that they're  
12 aligned because of the faulting in the area, major  
13 structure, but you know, in other reports that I've read in  
14 the area that seems to be the case too. So I took these  
15 lines and aligned them with drainages as possible inferred  
16 fault locations. And it seems like in some cases they can  
17 justify the abrupt 90-degree-angle turns on things like the  
18 Salmon Trout River.

19 Q And why would the -- why would there be a relationship  
20 between the abrupt 90-degree-angle turns on the Salmon Trout  
21 River and these inferred faults?

22 A The basis is that those are large structural features that  
23 happened a long time ago and as the basin develops the  
24 things like the rivers tend to follow those lines.

25 Q I see.

1 A And I just didn't see that even this level of an attempt to  
2 identify features like this was made, so the location of the  
3 boreholes and testing didn't seem to want -- you know,  
4 wasn't designed around identifying impacts of these possible  
5 features; and yet, I think they -- as Dr. Karasaki pointed  
6 out yesterday, they can dominate the flow field.

7 Q And in your view an effort similar to the one that you  
8 performed here on slide 22 would be sort of an elementary  
9 first level attempt at characterizing the subsurface  
10 structures for purposes of modeling groundwater inflows to  
11 mines?

12 A Yes; yes. Given the importance of faults and the dikes,  
13 which have brecciated zones around them that can be there.  
14 But this is certainly, you know, a complicated diagram;  
15 shows a lot of information, but I just didn't get the sense  
16 that this was taken into account in the characterization or  
17 a conceptualization or the modeling.

18 Q Now, Dr. Prucha, did you review the testimony of Mr.  
19 Chatterson from the DEQ?

20 A I did.

21 Q And did you review the testimony of Mr. Chatterson on pages  
22 7509 and 7510 of the transcript where he testified that the  
23 model -- or the predicted mounding effect on Rico Torreano's  
24 property was -- in his view there would be no appreciable  
25 impact on Mr. Torreano's property?

Page 8315

**NetworkReporting**

1-800-632-2720

1 A Yes.

2 Q And what is your view of his -- of Mr. Chatterson's  
3 testimony based upon your review of the documents in this  
4 case?

5 A Well, I believe that you could see impacts at his property  
6 and that they would increase the amount of flow that you  
7 would have going through that area.

8 Q And would you expect, based upon your review of the  
9 documents in this case, to expect an observable impact on  
10 the Mr. Torreano's property from the mounding from the TWIS?

11 A Yes.

12 MR. HAYNES: At this time petitioners move to  
13 admit as substantive evidence from the slides presented by  
14 Dr. Prucha the FEFLOW model results table on page five. If  
15 we could go back to that, please. And that would be  
16 Petitioner's Proposed Exhibit 192.

17 JUDGE PATTERSON: I'm sorry. 192?

18 MR. HAYNES: Yes. We move to admit that exhibit.

19 JUDGE PATTERSON: Okay. I'm waiting for --

20 MR. LEWIS: Well, I'll object. As I understand it  
21 this is new information, a new table that Dr. Prucha  
22 created. We were given no opportunity to -- we didn't have  
23 this beforehand; we had no opportunity to review the data on  
24 which he claims to have relied for this, so no opportunity  
25 to cross-examine on it. And I think if counsel's intent had

Page 8316

**NetworkReporting**

— 1-800-632-2720 —

1           been to submit this as substantive evidence they would have  
2           given this to us in a more timely manner and -- so that we  
3           could have examined it ahead of time.

4                   MR. HAYNES: Well, your Honor, we presented this  
5           to counsel yesterday as part of the rebuttal slides for Dr.  
6           Prucha. And the figures are taken from Kennecott -- or the  
7           numbers here on this table are taken from a Kennecott model,  
8           so it's really -- it really should be no surprise to  
9           counsel.

10                   JUDGE PATTERSON: It's just a recompilation of --

11                   MR. HAYNES: It's a compilation of their data.

12                   JUDGE PATTERSON: That was my understanding.

13                   MR. HAYNES: Right.

14                   JUDGE PATTERSON: I'll overrule the objection and  
15           admit Petitioner's 192.

16                           (Petitioner's Exhibit 632-192 received)

17                   MR. HAYNES: Next petitioners move to admit from  
18           slide 21 -- if we can go to that slide -- the figure  
19           prepared by Dr. Prucha that he -- as Petitioner's Exhibit  
20           193. The data shown on this or the figures shown on this  
21           slide as he testified were developed from either Kennecott  
22           data or data that's available on the DEQ website, and for  
23           that reason it's available data. And also from the  
24           Kennecott -- materials from the Kennecott data. So since  
25           it's available data, available to all sides we move to admit

Page 8317

**NetworkReporting**

**1-800-632-2720**

1 it as Petitioner's Exhibit 193.

2 MR. LEWIS: Same objection, your Honor. And I  
3 would add to that; when I was presented with these slides I  
4 assumed it was -- these were going to be offered as  
5 demonstrative evidence, and again had no indication that  
6 counsel intended to offer any of these as substantive  
7 evidence in this case. Secondly, as to the foundation, I  
8 believe that Dr. Prucha -- I may be wrong, but I believe Dr.  
9 Prucha added these red lines at least, and I don't think  
10 there's been any foundation for whatever he said or meant to  
11 say with those red lines.

12 MR. REICHEL: Your Honor, may I voir dire?

13 JUDGE PATTERSON: Sure.

14 VOIR DIRE EXAMINATION

15 BY MR. REICHEL:

16 Q Dr. Prucha, you said that you took some of this information  
17 from the DEQ GIS or Geographic Information System website,  
18 is that correct?

19 A That's what I --

20 Q So what type of information? Is it just the base map  
21 basically?

22 A I think in this case that the den, the topo information.

23 Q So that was the only source?

24 A That's right, but it's --

25 Q From the DEQ?

Page 8318

**NetworkReporting**

**1-800-632-2720**

1 A I believe for this particular figure, right.

2 Q And when did you --

3 A Well, actually the roads that you see on here I believe also  
4 were from that.

5 Q Okay. But basically you're talking about the geographic  
6 features as opposed to the colored fault lines, your red  
7 line that follows the Salmon Trout River, et cetera?

8 A Yeah; that's right.

9 Q Dr. Prucha, when did you prepare this document?

10 A This document or the figure?

11 Q The figure. I'm sorry.

12 A The figure, yeah. In the preparation of this rebuttal  
13 testimony, so over the last couple of weeks; I don't recall  
14 the exact day.

15 MR. REICHEL: Your Honor, in addition to the  
16 objection raised by Mr. Lewis in looking at the substance or  
17 the content of this -- first of all, it's not immediately  
18 clear to me that this properly characterizes rebuttal. I  
19 mean, to a large extent this appears to be a rehash of some  
20 of the testimony offered by Dr. Prucha in their case in  
21 chief several weeks ago. There's nothing on this figure, as  
22 far as I'm able to determine, that is truly rebuttal to any  
23 testimony offered by either Kennecott or by the DEQ. In  
24 other words, this is something that is simply just trying to  
25 reiterate or bolster Dr. Prucha's opinions in their case in

Page 8319

**NetworkReporting**

**1-800-632-2720**

1 chief. I don't think this properly characterizes rebuttal.

2 MR. HAYNES: Well, your Honor, on the other hand,  
3 in response to the objections: First, a great deal of  
4 effort was expended by the Kennecott witnesses to deprecate  
5 the Klasner mapping of the various faults, and so this  
6 exhibit is an effort to show why the Klasner mapped dikes  
7 and faults are relevant to a modeling exercise here. So  
8 it's directly responsive to the evidence submitted by  
9 Kennecott and the DEQ. Secondly, as to the generation of  
10 the various figures shown on this -- the lines and so on.  
11 As Dr. Prucha testified he inferred some of the lines, like  
12 the red lines showing the drainage areas, drainage patterns;  
13 otherwise, this is information that is either readily  
14 available, or taken from the Kennecott information.

15 So in that sense it is truly a rebuttal exhibit  
16 meant to meet or explain or rebut the testimony of in  
17 particular Kennecott witnesses who, as I said, deprecated  
18 the Klasner study as somehow irrelevant to this entire  
19 exercise that we have before us. So we think it's entirely  
20 rebuttal.

21 JUDGE PATTERSON: All right. I'm going to  
22 overrule the objection and admit. So P-193?

23 MR. HAYNES: That would be 193, your Honor.

24 (Petitioner's Exhibit 632-193 received)

25 MR. HAYNES: With that I have no further questions  
Page 8320

**NetworkReporting**

— 1-800-632-2720 —

1 at this time.

2 JUDGE PATTERSON: Okay.

3 MR. EGGAN: I'm prepared to proceed, your Honor,  
4 with some additional questions for Dr. Prucha.

5 JUDGE PATTERSON: Okay.

6 MR. EGGAN: Bear with me, Judge.

7 JUDGE PATTERSON: Okay.

8 DIRECT EXAMINATION

9 BY MR. EGGAN:

10 Q Dr. Prucha, I have some questions too related to groundwater  
11 related issues and we're looking at slide number 24 which is  
12 simulated -- titled, "Simulated groundwater mounding." Can  
13 you talk about that a little bit and why this slide is here?

14 A Actually, I think that might have been related to this issue  
15 about Rico Torreano. I think that was a graphic that we  
16 wanted to have on that. And this was the simulated output  
17 from the recent GeoTrans model for the BASECASE and I was  
18 asked whether the Rico Torreano property would be impacted.  
19 And I think one thought just in looking at this diagram is  
20 that if the upper bound case had been run, then I would  
21 expect more of an impact in that property area.

22 Q Okay. We can move on to the next slide then. All right.  
23 Let's go ahead then and talk now about discharge permit  
24 issues. And just to give a preview of what it is, some of  
25 the issues we're going to be talking about, we're going to

Page 8321

**NetworkReporting**

— 1-800-632-2720 —

1 be talking about an issue that you thought was important in  
2 your direct testimony -- two issues: characterization and  
3 conceptualization. What are we going to be talking about  
4 with respect to that? Again, just an overview of what we're  
5 going to be talking about.

6 A Well, basically how they characterized the hydrogeology  
7 beneath the TWIS and the groundwater flow conditions beneath  
8 the TWIS, where that water flows to: seep areas,  
9 downgradient.

10 Q And we're also going to be talking about modeling I take it?

11 A That's right.

12 Q And the mounding issues, the flow direction and velocity as  
13 well as the discharge location?

14 A That's right.

15 Q I think we're also going to talk a little bit about the  
16 monitoring, aren't we?

17 A That's right.

18 MR. EGGAN: Okay. Let's go ahead to the next  
19 slide.

20 Q Before we begin the next slide, Doctor, I need to ask you  
21 just a basic question about the information you read. And  
22 it sounds like you read a lot of testimony from witnesses  
23 who testified in Kennecott's case and the Department of  
24 Environmental Quality case. Is there anything in the  
25 information you read or the materials that you reviewed that

Page 8322

**NetworkReporting**

**1-800-632-2720**

1 would have led you to change the conclusions you offered in  
2 your direct testimony?

3 A No.

4 Q Okay. So that testimony from your perspective remains the  
5 same; we don't need to repeat it or modify it?

6 A That's right.

7 Q Okay. Then let's begin with a statement by a Department of  
8 Environmental Quality witness, Mr. Eric Chatterson. He  
9 indicated that there is not going to be mounding beneath the  
10 treated water infiltration system. First of all, that comes  
11 from page 7505 of his testimony. What is your observation  
12 with respect to that? Why is that issue important in this  
13 case?

14 A Well, I think as he points out --

15 MR. REICHEL: Well, I'm going to interpose an  
16 objection here to the -- I don't think there's a foundation  
17 for counsel's statement that Mr. Chatterson testified there  
18 wouldn't be mounding beneath the TWIS in reality or in the  
19 transcript, including the page cited on the slide that was  
20 written by Dr. Prucha or counsel. In fact, if you look at  
21 page 7505 of the transcript there's no such statement.

22 Q Dr. Prucha, you pulled that statement out. What is your  
23 thought?

24 A It's Respondent Exhibit 189, page eight that this text comes  
25 from, and then 7505 is from the testimony.

Page 8323

**NetworkReporting**

**1-800-632-2720**

1 MR. REICHEL: Well, maybe we need to read it back,  
2 but, your Honor, my -- Mr. Egan's initial question I  
3 believe stated as a premise that Mr. Chatterson had  
4 testified that there would not be mounding beneath the TWIS  
5 and that there is -- that is absolutely without foundation.  
6 Q Dr. Prucha, let me show you page 7505 and ask you to find  
7 that reference for us.

8 A Of course, that was sort of paraphrasing, but I believe if  
9 you go back to page 7504 the one question on line --  
10 starting line 18 starts talking about groundwater perching  
11 over some clay lenses or clay formations and that the -- in  
12 the vicinity of the proposed TWIS. And then on 7505 it  
13 continues and I think the question goes into asking Mr.  
14 Chatterson about whether that's possible.

15 Q Let me -- maybe I can --

16 A I can read it exactly.

17 MR. REICHEL: Well, your Honor, the question was  
18 mounding. Mounding is not perching. The word "mounding"  
19 does not appear in that transcript; there was no foundation  
20 for the question.

21 MR. EGGAN: All right. Hold on, Mr. Reichel.  
22 We'll get this corrected.

23 Q Mr. Prucha, maybe a better way of phrasing this -- how about  
24 if we ask it this way? Mr. Chatterson indicates that there  
25 won't be an issue pertaining to groundwater collection in

Page 8324

**NetworkReporting**

**1-800-632-2720**

1 the area above the non-permeable layer. Does that make  
2 sense?

3 A Yes.

4 Q Is that a more -- is that more accurate in response to Mr.  
5 Reichel's concern?

6 A Or we could just use the word "perch" as well, --

7 Q "Perch." Okay.

8 A -- which is what is stated here.

9 Q All right. Well, let's go ahead with that then. Mr.  
10 Chatterson indicates that there won't be perching beneath  
11 the TWIS, and what is your observation?

12 MR. REICHEL: And again, I don't think that's an  
13 accurate representation of the testimony.

14 Q Well, let me ask you this: Would Mr. Chatterson stipulate  
15 then that there will be perching in the area above the  
16 TWIS -- beneath the TWIS?

17 MR. REICHEL: Counsel, this is not a question of  
18 stipulation. You asked a question; I'm saying there's no  
19 foundation for it. The transcript at 7505 speaks for  
20 itself.

21 MR. EGGAN: It does and at 7504 and 7505 there is  
22 clearly a discussion and Mr. Chatterson's view is that there  
23 will not be this perching effect that will occur in the area  
24 beneath the TWIS.

25 MR. LEWIS: I think, your Honor, if counsel wishes  
Page 8325

**NetworkReporting**

**1-800-632-2720**

1 to pose questions based on prior testimony that there ought  
2 to be some care in what that testimony is. And secondly, I  
3 would suggest that if Mr. Prucha wants to offer, again, his  
4 views on perching that that could be done with a question  
5 simply soliciting or asking him to again restate his views  
6 on perching and we can avoid this argument.

7 MR. EGGAN: And that's absolutely right. And I'd  
8 be very happy to do that, but every time we've attempted to  
9 do that we have had an objection suggesting that we are not  
10 engaged in rebuttal; that we are engaged in repeating  
11 testimony that has been offered in the direct case. And so  
12 we simply wanted to make a reference to the witness who  
13 talked about this issue. And we even provided a transcript  
14 page where the issue was discussed. And so that's where  
15 this is going and --

16 MR. REICHEL: And which has mischaracterized the  
17 testimony.

18 MR. LEWIS: I'm just suggesting --

19 MR. EGGAN: Well, it has not mischaracterized the  
20 testimony, Mr. Reichel. If you look at 7504 and 7505, it  
21 doesn't say that. What it says is a series of questions  
22 related to perching in that area beneath the TWIS.  
23 Absolutely does; you know it does.

24 MR. REICHEL: Well, we can -- the line of  
25 questioning, your Honor -- and we can bring this out -- is

1 denying the existence of those potential clay lenses. I  
2 think his opinion was just that those wouldn't cause any  
3 significant perching that would reach ground level.

4 MR. EGGAN: That would reach the ground level;  
5 that's correct.

6 JUDGE PATTERSON: Right.

7 MR. EGGAN: Well, we would like to counter that,  
8 your Honor. Dr. Prucha has some thoughts on that and we  
9 would like to be able to offer --

10 JUDGE PATTERSON: Okay. I've read Mr.  
11 Chatterson's testimony. Go ahead.

12 Q Dr. Prucha, let's go ahead with this. With respect to this  
13 issue of perching, you've indicated that there is a  
14 reference in Respondent Exhibit 189 related to this. Let's  
15 talk about it.

16 A Okay. This text I pulled directly out of that basically  
17 indicates that --

18 Q Directly out of?

19 A Directly out of Respondent Exhibit 189 on page eight. And  
20 it says,

21 "Upon entering the subsurface environment the  
22 discharge is expected to perch on top of the low  
23 permeable deposits that have been identify as  
24 transitional deposits located directly below the  
25 discharge area at approximately 50 plus feet below

Page 8328

**NetworkReporting**

**1-800-632-2720**

1 ground surface."

2 Q Go on.

3 A "These low permeability -- low permeable deposits  
4 may be present across some of the southwest portions of  
5 the discharge area but do not appear to be present in  
6 the downgradient flow direction northeast."

7 Q Very good. Does what we read in Exhibit 189 -- is that  
8 consistent with the testimony that you believe was rendered  
9 by Mr. Chatterson?

10 A Not the way I understood it.

11 Q Why?

12 A Well, because of the wording. It just seems like he's  
13 indicating that he doesn't believe that the groundwater will  
14 perch above these low permeability units that he's  
15 identified in this Respondent Exhibit 189. He does go on to  
16 say he doesn't believe that they'll mound at the surface,  
17 but I think offer some additional information towards that.

18 Q Okay. What should he have done?

19 A I believe he should have acknowledged that those exist in  
20 his testimony and that that should have been something that  
21 he looked at in the assessment by -- in the discharge permit  
22 application and how that might influence the mounding and  
23 flow from the TWIS, away from the TWIS; being discharged at  
24 the TWIS.

25 MR. EGGAN: Let's go on to the next slide.  
Page 8329

**NetworkReporting**

**1-800-632-2720**

1 Q In his testimony, I asked Mr. Chatterson about some contour  
2 maps. And your testimony was that the groundwater in those  
3 contour maps actually shows groundwater some 30 feet above  
4 the surface of the ground. When I asked Mr. Chatterson  
5 about that, he indicated that that was acceptable. What is  
6 your -- do you have an opinion as to that -- on that issue?

7 A I do.

8 Q What is your opinion?

9 A Well, I think that's incorrect and misleading. I don't  
10 think it's a standard industry approach. I've never seen  
11 that, especially where you have acknowledged information in  
12 various reports that the seeps are groundwater discharge.  
13 And as such, you know their groundwater elevations. You  
14 have a surface topography. You know where they come out.  
15 They're effectively known as contact springs. The  
16 conceptual models that have been presented in the reports  
17 don't indicate any potential for developing artesian  
18 pressure, or they don't have a confining layer over it so  
19 that that would allow the pressure below there to somehow  
20 rise above ground surface.

21 I just think, in the area where the groundwater  
22 seeps out to the north -- as they say, "seep" -- I don't see  
23 any evidence for groundwater -- any rationale for  
24 groundwater being 30 feet above the ground surface. And I  
25 think the most important point is, as a hydrogeologist, you

Page 8330

**NetworkReporting**

**1-800-632-2720**

1 want to develop the most accurate possible groundwater flow  
2 map -- groundwater potential metric map, a map of the  
3 groundwater surface, and that allows you to understand where  
4 groundwater is actually flowing to. From those maps you  
5 actually can draw flow arrows, indicating where the seeps  
6 come out.

7 Now, if it's 30 feet off at the drainages, you're  
8 not indicating where that groundwater flow actually goes.  
9 It's incorrect at a variety of levels and to use this  
10 information as sort of one of the fundamental inputs to  
11 models in developing conceptual models and then the  
12 numerical models. So if this is flawed, the whole series of  
13 analysis after that is flawed.

14 Q What do you think they should have done? When you see that  
15 sort of condition on the contour map, what should they have  
16 done?

17 A Well, he talked about some hydrologist's map contours going  
18 back upstreams. I think in every case I've ever seen you  
19 want to do that to reflect the fact that the groundwater is  
20 below the surface, as in this case here.

21 MR. EGGAN: Can I go back one slide, Jan?

22 Q Dr. Prucha, I want to just correct one minor thing with  
23 respect to your reference to a statement by Mr. Chatterson  
24 regarding the perching issue that we talked about. You  
25 referred to Respondent Exhibit 189 at page 8. It's

Page 8331

**NetworkReporting**

1-800-632-2720

1 actually --

2 MR. EGGAN: Your Honor, this is correcting -- it's  
3 a typographical error there. It's 198. It's Respondent  
4 Exhibit 198 and not 189.

5 Q Dr. Prucha, there was some testimony from Mr. Chatterson  
6 related to the contours. And the Department of  
7 Environmental Quality rules appear to require contours and  
8 contour mapping that show 1-foot contour intervals. He  
9 indicated it was acceptable to accept the 10-foot  
10 groundwater contours. Do you have an opinion about that?

11 A Yes.

12 Q What is your opinion?

13 A I think the 10-foot contours are too coarse. And I think  
14 the observed data that was contoured up into potential  
15 metric maps or groundwater surface maps and the simulated  
16 maps in several cases were just too coarse to actually  
17 determine what the flow directions were in key areas like  
18 the mine dewatering or the TWIS infiltration area. So I  
19 think those -- one easy way that I've, you know, addressed  
20 that in reports that I've done is to just simply zoom into  
21 those areas and make a map that provides more detail at --

22 Q Well, that, I think, was Mr. Chatterson's response when I  
23 asked him. He said, "Look. You really can't -- if you  
24 accept 10-foot -- 1-foot contours in an area like this,  
25 you're just going to end up with one solid line." What is

Page 8332

**NetworkReporting**

**1-800-632-2720**

1 your thought on that?

2 A Well, I think you --

3 MR. REICHEL: Objection to the form of the  
4 question. I didn't think he said 10 foot. He was talking  
5 about 1 foot, Counsel.

6 MR. EGGAN: You're right. He was. Let me  
7 rephrase.

8 Q I indicated that, if you -- he was indicating that, if you  
9 utilized 1-foot contours, that it would just end up as one  
10 solid dark line and be virtually impossible for someone like  
11 him to read. How would one handle that?

12 A By creating a zoomed-in plot of the key areas at -- with  
13 contours at an appropriate level to reflect what you think  
14 the flow directions actually are and what the levels of the  
15 groundwater are and what controls those levels.

16 Q The next slide, sir, slide number 29, is titled  
17 "Hydrogeologic Characterization." And it's got quite a bit  
18 of information on it, and it -- what it relates to is  
19 testimony from Mr. Wiitala indicating that he really sees no  
20 southeast gradients -- gradient on his maps. Let's talk  
21 about that. What -- let's deal with the area on the  
22 left-hand side of this slide first, the area that shows the  
23 map with the contours on it. First of all, where did that  
24 figure come from?

25 A Figure 29, Appendix B-8 in the EIA.  
Page 8333

**NetworkReporting**

— 1-800-632-2720 —

1 Q So this is material submitted to the Department of  
2 Environmental Quality?

3 A Minus a couple of arrows that I've drawn on this map and  
4 then the text labels.

5 Q All right. Why don't you -- using that as our background,  
6 why don't you explain what this is and how this relates to  
7 Mr. Wiitala's claim that he sees no southeast gradient on  
8 his maps?

9 A Well, this green boundary right here is the boundary of the  
10 TWIS and --

11 Q And that's the small green rectangular boundary area?

12 A Right. It's oriented lengthwise to the northwest. And  
13 that's superimposed on a series of light-blue contours,  
14 which represent the -- I believe it's the A zone groundwater  
15 levels. Actually, it might be the D zone. The -- and these  
16 red lines are inferred groundwater flow directions that show  
17 flow going up to the northeast. But keep in mind that we  
18 have no data up here at all, so this is --

19 Q So we have no data up to the northeast?

20 A Right. So these lines aren't dashed, but they should be to  
21 indicate that this is really inferred up in this direction.  
22 It's -- to the level of the groundwater. And then this  
23 green line that I've placed here -- well, actually, let me  
24 start with the two red lines. These are approximately in  
25 the direction and location of the cross-sections -- not

1 direction but the locations of the two cross-sections that I  
2 show on the right.

3 Q All right. Let's talk about the cross-sections, then, that  
4 you have provided on the right. What are those  
5 cross-sections, and where do they come from?

6 A Well, these are sections EE prime and FF prime. I don't  
7 recall the exact figure numbers, but they're from Appendix  
8 B-8 in the EIA.

9 Q Very good.

10 A And these are two cross-sections that show several boreholes  
11 and the geology interpretation and a groundwater table in  
12 dark blue. And these cross-sections are slices or profiles  
13 along these -- approximately on these two red lines here.  
14 And I have shown two yellow arrows here, indicating the  
15 groundwater gradient is in this direction or the slope is  
16 off to the southeast. So these cross-sections are viewed as  
17 though you're standing in the southwest -- southwest of the  
18 TWIS looking to the northeast.

19 So the left side of this cross-section is up here  
20 on the northwest side, and the right side is on the  
21 southeast side. And I clearly see a strong gradient from  
22 the northwest to the southeast, and yet the flow arrows here  
23 that were shown on this original diagram show a groundwater  
24 gradient heading to the northeast that are developed based  
25 on available wells in this area southwest of the TWIS. But

Page 8335

**NetworkReporting**

**1-800-632-2720**

1 the important point that I want to make here is that, when  
2 you look at the degree of the slope going to the southeast,  
3 it's actually almost twice the slope going to the northeast.  
4 And to me that means that the water is -- if you add up  
5 those two slopes, that there's going to be a greater slope  
6 that results from those across these -- the length of these  
7 two cross-sections heading to the east, southeast.

8 So that's what I used to justify my original  
9 testimony that I believe the gradient could be east of  
10 southeast in this area. And remember, there's just no data  
11 in this area or to the south to confirm away from the TWIS  
12 that the groundwater gradient doesn't continue going east,  
13 southeast.

14 Q Now, I've asked several witnesses about the absence of data  
15 between the TWIS and the seeps. How would that data have  
16 assisted us in determining groundwater direction?

17 A Could you repeat that question?

18 Q Yes. I've asked several witnesses in this case --

19 A Yeah.

20 Q -- about the absence of monitoring points between the TWIS  
21 and the seeps, --

22 A Right; right.

23 Q -- that area up -- that you're referring to up to the  
24 northeast.

25 A Up northeast, yeah.

Page 8336

**NetworkReporting**

**1-800-632-2720**

1 Q Yeah. And what I'm -- and you just mentioned it in your --  
2 and made reference to it.

3 A Uh-huh (affirmative).

4 Q Would information, data points, monitoring wells in that  
5 area have assisted us in determining the groundwater flow  
6 direction?

7 A Yeah, I -- yes, I believe that you would have determined a  
8 couple of very important things. One is, do the  
9 low-permeability units that you see beneath the TWIS  
10 actually pinch out, as being suggested, without the aid of  
11 data, and what happens to the groundwater? Does it really  
12 continue down like this, or is there perching to the north?

13 Q All right. I want to just focus in on these cross-sections  
14 we have on the right-hand side of this slide. Those are  
15 cross-sections that are from Figures 24 and 25 of Appendix  
16 B-8, information provided by Kennecott to the DEQ; is that  
17 right?

18 A That's right.

19 Q And the yellow lines there that -- the yellow arrows you  
20 have there showing the gradient, what direction does -- do  
21 those yellow lines show in terms of groundwater flow?

22 A Well, they're facing in the direction of these red arrows  
23 that I've shown on this plan view diagram on the left, and  
24 they point to the southeast.

25 Q How could they have done this directly and done it better?

Page 8337

**NetworkReporting**

**1-800-632-2720**

1           What should they have done?

2    A           I guess that brings into question the methodology for  
3           developing the groundwater surface maps. But in general I  
4           think they should have improved the characterization and  
5           conceptualization and then the modeling of this area, and it  
6           should have included this kind of information.

7                       MR. EGGAN: Next slide, please.

8    Q           The next slide is titled "Wetland Characterization." And  
9           there was testimony from Mr. Wiitala related to wetland  
10          piezometers and stream hydrographs. What is it about the  
11          information that you've provided on this slide down on the  
12          left-hand slide that you wish to comment on?

13   A           Well, on this slide he shows the water elevation and --

14   Q           All right. Let's first identify where this -- there's  
15          information down in the left-hand corner of our slide, and  
16          we need to tell Judge Patterson where that came from.

17   A           This is page 38 in Wiitala's -- Mr. Wiitala's presentation.

18   Q           It's page 38 of Mr. Wiitala's slide show; right?

19   A           Right.

20   Q           Okay. Go ahead. Now, what does that depict, and what is  
21          your thought on that?

22   A           Well, his plot shows water elevation data. And on the left  
23          column it's water elevation in feet above mean sea level,  
24          and on the bottom axis it's months. I guess they're not at  
25          every point. They're jumping in months. But this shows the

Page 8338

**NetworkReporting**

— 1-800-632-2720 —

1 wetland piezometer 025 and the stream gauge 011, and it  
2 plots in time the change in the water levels at these two  
3 locations. And at the wetland piezometer they show the  
4 water level that they've measured at different depths below  
5 the water table.

6 And I guess the problem I have with this is that  
7 they show an intermediate and upper level at 1 foot and  
8 4-1/2 feet, so the purple dot -- I don't know exactly what  
9 color that is -- and the red line -- seem to be at a lower  
10 elevation than the stream, which is plotted as a dark purple  
11 line that seems to overlap this green line, which is the  
12 water level in the lowest piezometer at 9-1/2. But I guess  
13 what bothers me about this is I don't see how that's  
14 possible, because you have the groundwater discharging to  
15 the stream as it passes by the mine. And this stream gauge  
16 011 is several-hundred feet downgradient past the mine.  
17 Wetland well 025 is east of the mine in the wetland.

18 And to me it just suggests there is a data  
19 accuracy problem, because I can't imagine how you could have  
20 a lower -- what this suggests is that the stream is actually  
21 flowing towards the wetland well by this data, so I'm not  
22 quite sure how that happens in almost any scenario.

23 Q What should they have done to handle that issue?

24 A I think they should have checked the survey data. I mean,  
25 this to me would have -- I would have really questioned. I

Page 8339

**NetworkReporting**

**1-800-632-2720**

1 can't think of a conceptual picture that explains that  
2 behavior so -- and it -- you know, giving the importance of  
3 wanting to know how mine dewatering might affect the  
4 wetlands, I think that was -- that would be an important  
5 thing to do.

6 Q There was testimony by Mr. Chatterson indicating that,  
7 "2-dimensional groundwater contour plots provided by  
8 Kennecott were adequate to show a 3-dimensional flow path."  
9 There is a rule that the MDEQ has that requires an applicant  
10 to provide information evidencing the 3-dimensional flow  
11 path. That was not done here. What is your comment on that  
12 issue?

13 A Well, it is complex to try and show a 3-dimensional flow  
14 path on a 2-D piece of paper but -- and I agree to some  
15 extent that you -- you know, I've seen this in the past  
16 where you want to show contour plots to show 2-dimensional  
17 groundwater flow paths. But you really have to provide two  
18 contour plots, one in plan view and then one in profile and  
19 recognize that those represent just two planes and not the  
20 full 3-dimensional picture. And I guess, when I looked at  
21 things like the Golder -- Golder's model of the TWIS  
22 mounding, it was oversimplified. And they presumed a  
23 northeast flow direction to start, so right there they're  
24 not even predicting -- the model's not even predicting a  
25 flow path.

Page 8340

**NetworkReporting**

**1-800-632-2720**

1                   But the second point is that they did provide  
2                   contours in a 2-D -- and arrows in a 2-D plan view, but they  
3                   never provided arrows on a third profile. So somebody left  
4                   reviewing this is left on their own judgment to assume where  
5                   they think the flow might be going. And this Golder model  
6                   is oversimplified so -- in my mind, and I think it wasn't  
7                   really attempting to try and determine that flow path.

8    Q            When you say, "The Golder model was oversimplified," which  
9                   of the Golder models are we referring to?

10   A            This would be the one developed, I believe, in 2006 as part  
11                  of the discharge permit.

12   Q            Now, does this relate to shallow perching -- to the issue  
13                  of -- the shallow perching issue that we talked about  
14                  earlier?

15   A            I believe it does.

16   Q            In what way?

17   A            Well, I believe that both Golder's analysis and Eykholt's  
18                  analysis didn't consider the effect of shallow perching on  
19                  flow path. I believe that, if you're going to define a  
20                  3-dimensional flow path, you ought to start at the point at  
21                  which it discharges from the TWIS. And I believe that that  
22                  has -- by not considering that, you're missing a big part of  
23                  where you think the flow is going to go.

24                               MR. EGGAN: Can I go back to -- I think it's slide  
25                               25.

Page 8341

**NetworkReporting**

**1-800-632-2720**

1 Q I want to talk about this shallow perching issue in the  
2 context of the two cross-sections that we have on slide  
3 number 29. Okay? Talk about where you see this perching  
4 occurring and why it is you believe it's going to occur in  
5 the area beneath the TWIS.

6 A Right. Remembering that these two cross-sections are  
7 located lengthwise along this TWIS, I believe EE is located  
8 out here and -- to the northeast, and section FF I believe  
9 is located to the southwest. But the low-permeability units  
10 are really shown with the red and the purple. And I don't  
11 believe this is necessarily accurate -- an accurate  
12 depiction of those low-permeability units. I think another  
13 slide I have points that out. But the groundwater would  
14 essentially come down over this area and infiltrate down  
15 through what they're showing as being unsaturated sands, and  
16 that water, as I see it, would perch over these  
17 low-permeability units.

18 Q Now, this is the area -- this area where this perching is  
19 going to occur, is that above the groundwater?

20 A The groundwater table is located here with a blue line so,  
21 to answer your question, it is above the blue line and --

22 Q And beneath the TWIS?

23 A And directly beneath the TWIS, over the majority of the  
24 TWIS. And I think -- well --

25 Q One of the questions I asked Mr. Chatterson about is whether

Page 8342

**NetworkReporting**

**1-800-632-2720**

1 or not he knows whether or not these -- this area is  
2 continuous beneath the TWIS. And he indicated that he was  
3 actually standing at the site and watched them pull out a  
4 core and that there was no permeable -- no low-permeable  
5 material in the core that he observed. What are your  
6 thoughts on that?

7 A Above the water table?

8 Q Above the water table. That's right.

9 A Right. I think that's true, because the -- that well that  
10 he was looking at is this well 008. I believe that's this  
11 one on Section EE. I can't quite read it but -- which  
12 doesn't show any low-permeability material above the water  
13 table, but all of the other ones seem to show that.

14 Q When you say "all of the other ones seem to show that," how  
15 do you know that?

16 A With the exception of 036, just based on looking at this  
17 cross-section, but I've also looked at those logs and their  
18 reports.

19 Q Well, talk about that, that you've looked at the logs, and  
20 what does that show?

21 A Well, it reflects that they do have low-permeability  
22 material that's above the water table, as these  
23 cross-sections indicate.

24 Q What is the real impact if there is this low-permeable soil  
25 in that area? What is the ultimate impact?

Page 8343

**NetworkReporting**

**1-800-632-2720**

1 A Well, depending on the rate of flow coming in and where  
2 those low-permeability units sit, you could get groundwater  
3 reaching the ground surface right in the TWIS area. In  
4 fact, because we don't know what the configuration of these  
5 units are to the northeast, it's hard to tell what will  
6 happen -- or to the south, really, it's hard to tell what --  
7 whether these are continuous or disappear, as been -- as has  
8 been suggested.

9 Q Well, water perches there. What difference does that make?  
10 If water that is discharged from the TWIS gets down to this  
11 area and perches, what ultimately --

12 A Yes.

13 Q -- what difference does that make?

14 A Well, I believe, if it reaches the ground surface, then that  
15 violates the permit -- the discharge permit.

16 Q Is that the breakthrough issue that Mr. Chatterson was  
17 talking about?

18 A That's right.

19 Q So there is a potential for breakthrough?

20 A That's right.

21 Q Will this have any effect -- any impact on monitoring at the  
22 location?

23 A I believe it will.

24 Q What is that impact?

25 A Well, in terms of where the monitoring wells that I've seen

1 described or located, they were really located more around  
2 where the current water table is. But if you're not  
3 locating those wells in this -- to cover this perched area,  
4 you might in fact entirely miss where the water discharging  
5 from the TWIS actually goes. It may not actually even  
6 intercept in a significant way the groundwater immediately  
7 below the TWIS, the current groundwater table.

8 Q What should they have done to have resolved or investigated  
9 this issue?

10 A Well, I believe they should have considered these  
11 low-permeability units in terms of their analysis of the  
12 mounding or perching -- actually, not perching but the  
13 mounding beneath the TWIS and where that water eventually  
14 goes.

15 Q Flow direction?

16 A Flow direction.

17 Q Okay. We're at slide 32, sir. Mr. Chatterson, when I asked  
18 him about the simulation of the perched condition, I asked  
19 him whether or not a MODFLOW program can be used to simulate  
20 a perched condition. Mr. Chatterson had indicated that he  
21 was familiar with MODFLOW, does not -- had not done as much  
22 work with FEFLOW, but he was very familiar with MODFLOW.  
23 And I asked him whether or not MODFLOW could simulate this  
24 perched condition, and he said, "Oh, yes, it can." What are  
25 your thoughts on that?

Page 8345

**NetworkReporting**

**1-800-632-2720**

1 A Well, MODFLOW was developed to simulate what is called  
2 saturated groundwater flow. That means that the pores are  
3 completely filled with water, and they call it a  
4 single-phase code. And it clearly can't simulate it. It  
5 wasn't designed to simulate perched conditions where the  
6 zone below those low-permeability units were names in this  
7 partial saturation state. And in order to simulate that  
8 correctly, you can't use a code like MODFLOW. It's really  
9 well-known in the industry that it can't simulate perched  
10 conditions.

11 Q What should they have done?

12 A I believe they should have used what is better known in the  
13 industry as a variable saturation code. There are numerous  
14 codes that are able to simulate variable saturated  
15 conditions. In other words, when perching develops and  
16 there's zones around it that are unsaturated or below it --  
17 more importantly, are unsaturated, that those codes are able  
18 to handle that condition.

19 Q Now, Mr. Eykholt also talked about some simulations that he  
20 did, and one of the things he did was used an analytical  
21 solution to simulate mounding beneath the TWIS. We know  
22 that from his testimony. Do you have any observations with  
23 respect to the tool that he used?

24 A I do.

25 Q And what are they?

Page 8346

**NetworkReporting**

**1-800-632-2720**

1 A Again, this code is a simple analytic math tool that's used  
2 to estimate the mounding beneath the TWIS and how it  
3 radiates away from that. And I don't -- again, this tool  
4 clearly doesn't consider the flow that can develop above  
5 low-permeability units. So just by design it's not even  
6 applicable to this problem of evaluating the flow that  
7 builds up above the low-permeability units above the water  
8 table.

9 Q Now, Mr. Eykholt also indicated that there's really little  
10 chance of the groundwater -- a groundwater breakthrough to  
11 the surface. What are your thoughts on that?

12 A Well, when I -- I looked at those initial cross-sections  
13 that we had on that former slide, EE and FF, and I noticed  
14 that they had plotted those low-permeability units. But I  
15 went back to the original logs, and I was sort of surprised  
16 to see that in well 41 and 42 that it did show  
17 low-permeability material, which I would have classified as  
18 low permeability and put on those logs -- on those  
19 cross-sections. The one that really struck me was well 41  
20 that shows a silty sand from 30 to 45 feet below ground  
21 surface.

22 Q Is that the reference to "SM" there, the silty sand?

23 A That's right. And that -- that's a reference to silty sand.  
24 It's a code -- standard code that's used to describe silty  
25 sand. And I guess the implication of that is that, taking

1 Eykholt's estimate of between 30 and 33 feet mounding,  
2 assuming that that actually would develop, that, if you have  
3 low-permeability material that's at 30 feet belowground and  
4 you have 30 to 33 feet of potential mounding, just in that  
5 scenario alone in that area you could get breakthrough at  
6 the ground.

7 Q Let's talk about this in -- a little more slowly. You're  
8 indicating that Eykholt estimated a mound of approximately  
9 30 to 33 feet beneath the TWIS?

10 A That's right.

11 Q Okay. And then just explain how your review of the well  
12 information contradicts that.

13 A The borehole geology indicates that the material from 30 to  
14 35 -- 45 feet below the ground surface at well 041 is the  
15 silty sand. It's a lower-permeability unit. And that has  
16 the potential for building up groundwater -- perching the  
17 groundwater above that layer. And it's not characterized in  
18 the northeast or anywhere outside of those immediate  
19 boreholes.

20 Q And how does that suggest to you that there's going to be a  
21 breakthrough, I guess is the ultimate question.

22 A Well, my experience with modeling unsaturated zone flow  
23 where you're introducing water at the surface, the  
24 permeability of that unit is very sensitive in terms of its  
25 ability to mound water above it. So I think it's really

Page 8348

**NetworkReporting**

— 1-800-632-2720 —

1 important to consider in this kind of an environment if  
2 you -- if you're looking at mounding.

3 Q Let's talk about the modeling that was done in the TWIS  
4 discharge area and focus for a few minutes on what Mr.  
5 Council's testimony was. Initially I want to note that Mr.  
6 Council noted a problem of dry cells in the  
7 Fletcher-Driscoll 2006 model, and he concludes that the  
8 calibration quality is good. That's from slide 23 of his  
9 presentation. What are your thoughts with respect to Mr.  
10 Council's comments on the dry cell issue in the  
11 Fletcher-Driscoll model and his conclusion that the  
12 calibration quality is good?

13 A Well, I agree with Mr. Council's conclusion that the  
14 Fletcher-Driscoll models were seriously flawed in that  
15 respect, this dry cell problem. And I guess, though, I'm  
16 also concerned that he fails to note that MODFLOW really  
17 doesn't simulate the unsaturated zone flow.

18 Q Why is that a concern?

19 A Well, because he's using it in his modeling.

20 Q So Mr. Council's model is based on MODFLOW?

21 A That's right. And I don't -- he doesn't actually simulate a  
22 worst-case scenario like the Fletcher-Driscoll 2006 model  
23 did, where they're trying to simulate the effect of  
24 dewatering at the mine -- below the mine. But I suspect  
25 that's the model that Fletcher-Driscoll had problems with

Page 8349

**NetworkReporting**

**1-800-632-2720**

1 dewatering when they tried to simulate the bedrock and  
2 dewatering occurred just by design, because you're  
3 dewatering the mine area, and MODFLOW doesn't simulate that.  
4 So I think he's only -- in this model that's developed by  
5 Mr. Council, he's only simulating the overburden. But he's  
6 transferring the boundary conditions of the mine inflow from  
7 the Golder model, and he doesn't simulate that Upper Bound  
8 or worst-case -- what they called a worst-case, I guess,  
9 scenario.

10 Q Is that important?

11 A Very important.

12 Q Why?

13 A Well, because if your cells go dry in the model, the model  
14 basically shuts off those cells from any further  
15 calculation, and you actually would probably limit the  
16 amount of flow that would be draining into the mine.

17 Q What impact would that have on the results of your model?

18 A Well, they would be inaccurate.

19 Q Now, you also indicate in one of your bullet points that  
20 there's no indication that the 2006 predictive model was  
21 ever calibrated. Talk about that.

22 A Well, I think there were things noted by Mr. Council as to  
23 the problems with the Fletcher-Driscoll model in 2006. But  
24 my understanding of it was that they developed a preliminary  
25 model in 2005 that they used to calibrate to the natural

Page 8350

**NetworkReporting**

**1-800-632-2720**

1 system unstressed. And then they took that model, and in  
2 2006 they made a number of what I believe were significant  
3 changes to that input; changed the recharge; changed the  
4 hydraulic conductivity; started simulating the bedrock down  
5 in a layer they hadn't before. And he didn't seem to  
6 acknowledge that that model -- I mean, to me that would have  
7 been a bigger problem if the model wasn't calibrated, so I  
8 would have said, "That's -- you really can't use that for  
9 predictive simulations."

10 Q What should they have done?

11 A I think they should have acknowledged these problems and  
12 used probably FEFLOW to simulate the combined bedrock and  
13 overburden.

14 Q All right. We're again talking in slide 36 about Mr.  
15 Council's testimony, and it relates to this issue of  
16 predicted flux. Talk about your thoughts pertaining to Mr.  
17 Council's testimony.

18 A Well, this is a plot here with the colors down below that I  
19 obtained from his report, and it basically shows the  
20 information he took and used as input into his MODFLOW  
21 model. The zones of higher -- the higher-color zones in the  
22 center represent higher amount of water that's flowing into  
23 the -- being withdrawn from the overburden back -- right  
24 over the crown pillar area you see a higher -- much higher  
25 flux and then over the area of the access tunnel, and then

Page 8351

**NetworkReporting**

1-800-632-2720

1 it diminishes as you go out.

2 But he takes that data -- information and applies  
3 that as a boundary condition in his MODFLOW model to  
4 simulate just in the overburden the effect of the mine  
5 dewatering. I guess my problem is it seems like he fails to  
6 acknowledge that that Golder FEFLOW model doesn't  
7 realistically simulate the overburden for the reasons that I  
8 mentioned earlier today.

9 Q A question about the -- about slide 36. We've got this  
10 depiction in the lower right-hand side. And just to make  
11 sure that we're all on the same page here, where does that  
12 depiction come from?

13 A His report, I believe.

14 Q Mr. Council's report?

15 A The -- yes, and --

16 Q What should he have done?

17 A Well, I believe, again, as I've stated before, this really  
18 would have been a lot simpler and probably more realistic to  
19 simulate both the bedrock and the overburden simultaneously  
20 using a code like FEFLOW. It's fully capable of doing that.

21 Q What impact would that have had? How would that have  
22 changed the ultimate result?

23 A Well, I wouldn't question the flows between the overburden  
24 and bedrock as much, because you're letting the model  
25 calculate that instead of assuming what it might be.

Page 8352

**NetworkReporting**

**1-800-632-2720**

1 Q It would have perhaps decreased the uncertainty?

2 A To some extent.

3 MR. EGGAN: Next slide, please.

4 Q On slide 37, Dr. Prucha, we've got two slide references down  
5 on the bottom. Let's talk first on this slide what the  
6 slide reference is down on the bottom left.

7 A This is a picture of the confining unit thickness, so these  
8 are the low-permeability units in the unconsolidated  
9 material between the A and the D zone, which are permeable  
10 aquifer materials. And so this is from slide --

11 Q Where does that -- yeah, that's my question.

12 A This is slide 30 from his presentation.

13 Q Okay. And then on the right-hand side we have another  
14 reference showing contours. What is that?

15 A Well, this is the same plot but taken from his report.

16 Q Talk about this issue of confining unit thickness and some  
17 differences in the report and the presentation.

18 A Well, it's pretty standard when you draw an interpretation  
19 of, say, a thickness over an area that you're putting into  
20 your model to show the points that you use or the borehole  
21 locations that you use to construct that so that an external  
22 reviewer can look and say, "Well, I know that he has a lot  
23 of data in this location but hardly any here, so I know that  
24 this is more of a guess than the area where he has a lot of  
25 data that's constrained by that actual data." So I guess,

Page 8353

**NetworkReporting**

**1-800-632-2720**

1 when I looked at these two, I was uncertain why he placed  
2 what looks to be four -- like, four wetland piezometers in  
3 this location.

4 Q "In this location." Now, we want to make sure we know for  
5 the record where we're talking about here. On slide 30  
6 you're talking about the three dark --

7 A Four dark -- four, yeah.

8 Q -- dots -- four dark dots on the slide 30 from his  
9 presentation indicating wetland piezometers?

10 A Right.

11 Q Okay.

12 A But my main point on this was that, even on the plot to the  
13 right where he does show boreholes that he's using the  
14 constrained -- this pretty complex contour plot depicting  
15 the thickness of the -- this confining unit, he shows  
16 several blue areas where it's apparently absent. And you'll  
17 notice the one blue area that I'm pointing to, which starts  
18 kind of at the mine and heads up --

19 Q And this is on Figure 10 of his report?

20 A On Figure 10 of his report. It's on both figures -- but  
21 Figure 10 of his report. And I don't see any control points  
22 in the middle of that blue zone. I don't see anything  
23 controlling. He stops it right at the Salmon Trout River,  
24 but the problem with that is it means that it's really  
25 unconstrained. And I could have made this five times as

Page 8354

**NetworkReporting**

1-800-632-2720

1 big. I could have made it five times as small. And this is  
2 an important feature in the model. It controls how the  
3 drawdown or the mine dewatering in the bedrock translates  
4 into the overburden and how that affects the drawdown that  
5 you're predicting all around the mine. But you can also see  
6 there are other zones around the TWIS off here.

7 You have one point in a large area, and he's  
8 predicting that confining unit to exist over here, but  
9 that's -- you know, this is probably a mile. I mean, I  
10 don't have the scale.

11 Q Now, the area that we're pointing to is on Figure 10 of his  
12 report. It appears to be a large area to the north --

13 A To the east.

14 Q It would be to the east of the TWIS?

15 A Right; immediately to the east and then sort of oriented up  
16 to the northeast. But my point is that, in his simulations  
17 and his sensitivity analyses, he doesn't consider the  
18 uncertainty and changes to that zonation. And the -- in  
19 other words, I mean, he doesn't consider what -- if I had  
20 assumed, because I don't have any constraints on this map,  
21 that those blue areas are half the size or a tenth the size  
22 or ten times the size, how does that change my model  
23 results? And this is what I mean by "uncertainty," and this  
24 is sort of more typically referred to as conceptual  
25 uncertainty.

Page 8355

**NetworkReporting**

**1-800-632-2720**

1                   It's not so much the standard approach where you  
2                   just adjust one value for the whole zone. This is actually  
3                   changing the configuration, and it's all interpreted. Your  
4                   interpretations have uncertainty. And this just doesn't  
5                   translate into how uncertain the predictions are.

6    Q            What would a prudent modeler, what would a prudent  
7                   hydrologist have done to correct this problem?

8    A            You would have acknowledged that uncertainty. I mean, it is  
9                   challenging in a field where you have limited data, but it  
10                  is what it is, and given that, you just acknowledge that you  
11                  have limited data. And the general industry standard these  
12                  days is to develop multiple interpretations of this that  
13                  test the range of what you think might happen there. So  
14                  when I think that blue area off the orebody might be half  
15                  the size or a fifth the size, let's try it at ten times  
16                  that. Look at the output and see how much it varies. If  
17                  you find that the output changes dramatically or your  
18                  conclusions change dramatically, that's a good indication  
19                  that you need to go back to the field and collect more data  
20                  to refine the understanding of that area. It's a sensitive  
21                  parameter.

22                                   MR. EGGAN: Next slide, please.

23   Q            In his testimony Mr. Council indicated that there is a low  
24                   hydraulic conductivity zone over the orebody in the model  
25                   that he created. What is your observation with respect to

Page 8356

**NetworkReporting**

**1-800-632-2720**

1           that?

2    A       This is pretty much the same feature -- observation I made  
3           on the previous slide; same concept. He's developed another  
4           distribution of important model input. And this is the  
5           hydraulic conductivity of the aquifer but -- of a certain  
6           layer in the aquifer, and I just -- I guess I was surprised  
7           that this only occurs in this area of model, and he's  
8           modeling quite a large area.

9    Q       We need to give some context to this slide. It's our slide  
10           38, and in the lower left-hand corner you have inserted  
11           what? A slide from his presentation or a reference to his  
12           report?

13   A       That's right; yeah, from his presentation, I believe. I  
14           don't know the slide number, actually.

15   Q       Okay. And what does this depict? What does this --

16   A       Well, this is a distribution of the hydraulic conductivity  
17           in one of his layers in the model. And in particular he  
18           shows one zone that he's defined from the orebody running  
19           kind of along downstream of this Salmon Trout River, and  
20           it's just kind of a blob sitting there. And he does show  
21           points that I'm not quite sure. I mean, it says "monitoring  
22           stations," but I'm not quite sure. Usually you'd say  
23           "borehole locations," because the borehole information is --  
24           or actually "monitoring stations," I guess. Forget that.  
25           Either way, I'm not sure that those were the actual points

Page 8357

**NetworkReporting**

**1-800-632-2720**

1 that he used to create this contour map.

2 But the zonation -- and it doesn't really show up  
3 well -- has several points within this brown area. Most of  
4 those are actually wetland piezometers and, from what I can  
5 tell in the report, those were slug tested. And for the  
6 same reason that Dr. Karasaki pointed out yesterday, the  
7 slug tests always kind of bias your hydraulic properties to  
8 the low side. And unconsolidated material, when you do slug  
9 tests, you don't test much of the area around a piezometer  
10 or well, and so you typically are biased towards the low  
11 side. It could be easily an order of magnitude. But this  
12 zone bothers me because, again, it doesn't seem constrained  
13 outside. I don't see any data points outside of it, so that  
14 zone could be much bigger, or it could be much smaller.

15 Q Ultimately what is the impact on the accuracy of his  
16 predictions?

17 A Well, for the same reasons as before, it -- I didn't see  
18 that he tested this kind of adjustment in the model input in  
19 terms of how it affects the model output, and it could be  
20 very significant.

21 Q And are we to -- when we're talking about Mr. Council, are  
22 we talking about the 2008 GeoTrans model?

23 A That's my understanding, yes.

24 Q That's the April 2008 model?

25 A That's right.

Page 8358

**NetworkReporting**

**1-800-632-2720**

1 Q Okay.

2 MR. EGGAN: Next slide, please.

3 Q Again, I think we're referring now to -- continuing to refer  
4 to model inputs that were utilized by Mr. Council. And you  
5 indicate in this slide number 39 that Mr. Council specified  
6 a top of bedrock for a model input. What is the issue here?

7 A It's the same issue as the last two slides. Again, it's  
8 another surface that's being generated over a very large  
9 area. I don't think this is the same 87-square kilometers,  
10 but it's a large area. And this is the top of bedrock,  
11 another important input for the model. And I see in some  
12 areas that the lowest point in the bedrock is this big  
13 hole -- big depression right just east of the TWIS, which --

14 Q All right. Now, I need to slow us down just for a minute.  
15 On our slide number 39, we have inserted a figure. Where  
16 does that figure come from?

17 A This comes from Figure 8 in Exhibit 591.

18 Q So it's Exhibit 591 -- Intervenor's Exhibit 591?

19 A Correct, which I believe was the report.

20 Q Yes. And you were indicating that -- you were talking about  
21 the problem, and I interrupted you. Talk about the issues  
22 that you are seeing with respect to this.

23 A Well, again, it's an interpolated surface. It's estimated  
24 based on available data, and it's only going to be as good  
25 as the available data and where you've located those data.

Page 8359

**NetworkReporting**

**1-800-632-2720**

1 But it clearly seems like you have a very high bedrock  
2 elevation kind of radially going out from both the orebody  
3 and Eagle Rock. And everywhere else it seems to fall off,  
4 and then you end up with depressions, the lowest point in a  
5 surface, and I don't see any data points concerning that low  
6 point. And you generally don't come up with an estimate on  
7 the surface that's outside the range that you see from  
8 available data in the field that you collect.

9 Q And this is an issue related to inputs in his model?

10 A That's right.

11 Q Ultimately what was the impact? What is the issue or the --  
12 I'm sorry. What is the impact of this issue on his  
13 predictions?

14 A Well, again, it's, in my mind, fairly uncertain, and that  
15 certainty in this model input wasn't considered in  
16 evaluating model output uncertainty.

17 Q You know, I asked witnesses who testified in this case about  
18 whether they did an uncertainty analysis, and I don't really  
19 recall from the testimony whether they gave me an answer.  
20 But can you talk about uncertainty and what you saw in the  
21 answers that were given by their witnesses with respect to  
22 uncertainty?

23 A It seems like there's a confusion between a sensitivity  
24 analysis and a more classic uncertainty analysis.

25 Q Are they two separate analyses?

1 A Completely different.

2 Q All right. Talk about those differences and why it makes a  
3 difference in this case.

4 A Well, there are two types of sensitivity analysis. One I  
5 think we went over in my testimony earlier on calibration  
6 sensitivity, where you're looking at the sensitivity as you  
7 calibrate the model when you're developing it initially.  
8 And then there's what's called predictive sensitivity  
9 analysis, where you look at the output -- the predictive  
10 model you've developed. You've changed parameter. You're  
11 trying to simulate something in the future, and you run  
12 another sensitivity to look at how sensitive your prediction  
13 output is to changes in your parameters.

14 And an uncertainty analysis really is much  
15 broader, where you have -- I mean, first of all, you should  
16 be aware that uncertainty encompasses things like not just  
17 parameter uncertainty, where you're adjusting the parameter  
18 values in a model, but there's also terms called conceptual  
19 model uncertainty or structural uncertainty, which go kind  
20 of towards the structure of your model, and also input  
21 uncertainty; what kind of data you're using to drive the  
22 uncertainty. And all of these things are contributing to  
23 the amount of uncertainty that you get in the output. And  
24 in my estimation, they were really only looking at in their  
25 sensitivity analysis adjusting parameter values, but they

Page 8361

**NetworkReporting**

**1-800-632-2720**

1 weren't really looking at uncertainty in the output and  
2 trying to bracket that.

3 Q Do you have the impression that the modeling that was done  
4 by Kennecott included this uncertainty analysis?

5 A No.

6 Q What was your impression from the witness testimony that you  
7 looked at?

8 A Well, they looked at sensitivity predictions. But I think,  
9 like Dr. Karasaki pointed out yesterday, they looked at  
10 changing one parameter one at a time. And if you're going  
11 to do anything that even approaches a more standard  
12 uncertainty analysis, you would start adjusting combinations  
13 of those parameters and looking at the full solution space  
14 that's possible. And that's important because, if you're  
15 just changing one thing at a time, it's not all of the  
16 possible solutions. There are many, many more possible  
17 solutions that would yield an equivalently -- you know, an  
18 equivalent calibrated model; one that's equally valid.

19 Q Did you have an impression that the witnesses that talked  
20 about an uncertainty analysis here knew what uncertainty  
21 analysis was?

22 A I didn't get that sense.

23 Q Would a prudent modeler have utilized an uncertainty  
24 analysis in the modeling that was done at this site?

25 A I would.

1 Q Was it done?

2 A It wasn't done.

3 Q This is a reference to Mr. Council's testimony and a  
4 scenario 2 from his model analysis. I'm sorry. It's from  
5 scenario 1, isn't it?

6 A 2.

7 Q Is it from scenario 2?

8 A Yeah.

9 Q I'm confused by the --

10 A I'm sorry. That's a typo. It should say "scenario 2" in  
11 the text to the right.

12 Q Okay. All right. Very good. On slide 40, then, what we  
13 have is a map, and it looks to me like these are some  
14 references that you have created?

15 A These are the wells that were used in the latest GeoTrans  
16 model, and I'm simply showing the results for what is being  
17 considered to be a calibrated model, scenario 2. He ran two  
18 scenarios. And the point here is that at these well  
19 locations these values show the difference between the  
20 predicted and the actual or observed level that was measured  
21 in the field. And the idea is, when you develop the model,  
22 to develop an adequate conceptualization and  
23 characterization of the model that you are able to reproduce  
24 the observed levels where -- you know, you'd want to  
25 reproduce them exactly. But because the models are

Page 8363

**NetworkReporting**

**1-800-632-2720**

1 typically a simplification, there is some difference.

2 But in this case I thought it was useful to point  
3 out that the single statistic that people often -- modelers  
4 often throw out to represent how good their calibration is  
5 often masks the distribution of the model performance across  
6 an area. And I think, in my mind, the two most important  
7 areas in a model to calibrate well, which is where you tend  
8 to have more data, are around the orebody and around the  
9 TWIS. And these differences in feet --

10 Q Now, you're showing these differences in feet. What  
11 reference are you making?

12 A I'm pointing to wells around both the orebody and around the  
13 TWIS. The numbers -- I've seen numbers like 22 feet  
14 over-simulating the observed, and nearby them -- near the  
15 TWIS I'm at minus 14.05 feet.

16 Q So these are the numbers in the little yellow boxes on this  
17 slide?

18 A Little -- yes, the yellow boxes, the labels, right.

19 Q Yes. The 22 that you referred to is here where this red dot  
20 is, number 22?

21 A That's right.

22 Q And again, what is -- what do these numbers represent? And  
23 talk in lay terms, because I, at least, am not a  
24 groundwater --

25 A The bigger the number, either positive or negative, is a

1 bigger error. Your model is doing the worst job at  
2 predicting what it should be. So a number like 22 means  
3 that the model is trying to predict a level that's 22 feet  
4 higher than the actual level it's observed in that well  
5 and --

6 Q What would a good number be?

7 A Zero is the ideal number.

8 Q Zero. Okay.

9 A But maybe in this -- I think around, say, for instance, the  
10 mine when they're -- when you're trying to predict drawdowns  
11 that you're saying are within a foot, half a foot, that  
12 makes a difference. The errors here are well above that or  
13 well above it, so they're greatly over-simulating and  
14 greatly under-simulating in a key area. There are some  
15 wells that appear to have, you know, a closer value. But in  
16 general I wouldn't -- I think this is why I always tend to  
17 plot the difference between simulated and observed data  
18 physically, as opposed to giving one number, to try and  
19 represent how good your calibration number is.

20 And in this case the -- it ended up averaging out  
21 to make it look like it was maybe 1 -- on the order of a  
22 1-foot error. But you see a lot of pluses and minuses here,  
23 and they tend to cancel each other out. But to me this is  
24 to some extent the result of what I think is oversimplifying  
25 the aquifer system.

Page 8365

**NetworkReporting**

**1-800-632-2720**

1 MR. EGGAN: Next slide, please.

2 Q This is slide number 41, and it relates to Mr. Council's --  
3 the results of Mr. Council's predictive sensitivity -- his  
4 predictive sensitivity results. On the right-hand slide  
5 you -- on the right-hand side of this slide, we have a  
6 reference to slide 51 from his presentation?

7 A That's right.

8 Q What are we showing here? What's the issue?

9 A Well, as part of his predictive sensitivity analysis, he's  
10 showing two things. One is a value called RMSE, this upper  
11 line in blue, that is meant to represent the degree that  
12 you're -- you know, how well your model is calibrated. And  
13 on the bottom he's showing maximum drawdown at this wetland  
14 024 piezometer close to the orebody. And I see a pretty  
15 noticeable change as you're changing the anisotropy or the  
16 ratio of the horizontal-to-vertical hydraulic conductivity  
17 as you're heading to the left here, lower numbers.

18 And I guess what I -- what struck me was that for  
19 this plot I see that effectively any of these changes in  
20 this parameter result in a model that you could call  
21 calibrated based on his definition here, and yet you're  
22 changing the drawdown at a very important well or piezometer  
23 near the orebody in the wetland by several feet, and that's  
24 very important in the wetland. And when you look at ASTM  
25 standards for sensitivity -- conducting a sensitivity

Page 8366

**NetworkReporting**

**1-800-632-2720**

1 analysis, this, based on their text, represents a  
2 sensitivity-type IV. In other words, as I read here:

3 "Type-IV sensitivity can invalidate model results,  
4 because over the range of that parameter in which the  
5 model can be considered calibrated, the conclusions of  
6 the model change. A Type-IV sensitivity generally  
7 requires additional data collections to decrease the  
8 range of possible values to that parameter."

9 So that means that, because this blue line stays fairly  
10 constant as you're adjusting these parameters and the green  
11 line goes up, which is your conclusion, more -- something  
12 should have been noted about that. That would have raised a  
13 flag in my mind and suggested, "Maybe my model's too simple.  
14 Maybe I don't have enough data."

15 Q This would be referred to as a Type-IV sensitivity?

16 A Based on ASTM standards 5611.

17 MR. EGGAN: Your Honor, ASTM standard 5611 from  
18 2002 is Intervenor's Exhibit 66 in this case.

19 Q Do you consider the modeling that was done, then, by Mr.  
20 Council to be contrary to ASTM 5611?

21 A I don't know that it's contrary as much as just not  
22 considering implications of this standard.

23 Q All right. This is a reference -- the next slide, which is  
24 slide 42, is a reference to Mr. Wiitala's 2-dimensional  
25 conceptual profile from slide 9 of his presentation. In the

Page 8367

**NetworkReporting**

**1-800-632-2720**

1 lower left-hand side of this particular slide, we have a  
2 reference to an exhibit, Intervenor 007, which is from the  
3 application at B-1, Figure 6. Tell Judge Patterson what the  
4 issue is with respect to the 2-dimensional conceptual  
5 profile that Mr. Wiitala offered.

6 A Well, these conceptual models are used to build your model  
7 upon, and they are supposed to represent your best  
8 understanding of how the system operates.

9 Q Now, Mr. Wiitala didn't do a model?

10 A I know.

11 Q Okay. Then how does this fit into the model at issue?

12 A Well, this is a conceptual figure that it's just -- is  
13 presented and, you know, presumably used to develop models  
14 on. And I guess what's interesting about this is that it  
15 does show an intrusive dike here in the Yellow Dog Plains  
16 that clearly shows a drop in the water table across both  
17 sides of it, implying that the dike has a pretty noticeable  
18 impact on the groundwater flow. Groundwater flows down here  
19 through these metasedimentary rocks, reaches granite and  
20 gneiss that appears to go all the way to Lake Superior. And  
21 I guess -- I know I'd seen maps showing that Jacobsville --  
22 I think that's spelled wrong -- sandstone off of Lake  
23 Superior, not that it really would influence what's being  
24 modeled here.

25 But I guess the main point I wanted to make on  
Page 8368

**NetworkReporting**

**1-800-632-2720**

1 this is that, if you show one dike and you're conceptually  
2 thinking this has a pretty significant impact on the  
3 groundwater flow as it moves through the system, even on the  
4 flow in the overburden, that -- I showed that map earlier  
5 that showed several dikes going off to the north and to the  
6 south of this intrusive at Eagle. Why wouldn't you assume  
7 that those could have controls also on the groundwater flows  
8 and possibly the whole structure of the sediments in this  
9 area?

10 Q What should they have done?

11 A I think they could have spent more time developing more  
12 realistic, better-supported conceptualization. Things like  
13 this, this is really important in terms of where you think  
14 TWIS water is going to go. And I think in my original  
15 testimony I'd suggested that an alternative was that water  
16 could flow to the east, southeast, and one reason might be  
17 starting because they're not really even considering major  
18 structures; that clearly at Eagle deposit where they have  
19 all this data they know that it comes up, blocks flow. But  
20 where they don't have data and they don't show the other  
21 dikes that have been mapped, even by their own geologists,  
22 in addition to Klasner, those could offer pretty important  
23 clues as to what's happening northeast of the TWIS where we  
24 don't have any data.

25 Q Conceptualization is the issue here?

Page 8369

**NetworkReporting**

**1-800-632-2720**

1 A And to some extent characterization.

2 Q And conceptualization and characterization are the building  
3 blocks, aren't they, of a hydrogeologic investigation?

4 A That's right.

5 MR. EGGAN: Next slide, please.

6 Q This again relates to Mr. Wiitala's testimony and these clay  
7 deposits pinching out north of the TWIS. Can you talk about  
8 that issue, please? What issue do you see with that?

9 A Well, if the lack of stream clay deposits tend to pinch out  
10 to the north in a nice, big lake that occurred in the area,  
11 you know, a long time ago, this -- I'm not sure that I fully  
12 buy that, you know, the clay units would just pinch out  
13 right at the TWIS. I mean, this map tends to show that  
14 there's a break between the outwash and coarse, textured  
15 till.

16 Q Maybe we should talk a little bit about the map that is  
17 depicted on this particular slide number 43. Where does  
18 that map come from?

19 A I believe I obtained this as -- it's a 1982 quaternary  
20 geology map from the MDEQ website.

21 Q Okay. And what about the lines that are depicted on this  
22 geology map? Where did they come from?

23 A These are the same lines that I had shown on a previous plot  
24 earlier in the testimony that -- well, these are fault lines  
25 and dikes from the Kennecott geologists that they've mapped,

Page 8370

**NetworkReporting**

**1-800-632-2720**

1 and then, as --

2 Q Okay. So these are lines that you put on there. And  
3 explain to Judge Patterson what those lines depict and how  
4 they impact your testimony here with respect to these clay  
5 deposits.

6 A Well, I'm just trying to use this as a diagram to say, you  
7 know, from the TWIS I don't know that I'm convinced that --  
8 you know, the confining unit that you see south of it pretty  
9 well disappears and pinches out. And, I see a break in the  
10 geology well north, kind of at the top of the slope  
11 outwash -- between the outwash sands and material to the  
12 south and then a coarser textured till to the north. But  
13 that's well north of that TWIS, so it seems like that  
14 would --

15 Q Well, what impact could that have?

16 A Well, in terms of where water goes from the TWIS, I believe,  
17 you know, if -- the low-permeability units that I am seeing  
18 and the majority of boreholes beneath the TWIS well above  
19 the water table, if those don't pinch out to the north,  
20 northeast immediately around the TWIS, you know, that water  
21 would be perched for a good distance away from the TWIS.

22 Q And again, what impact could that have?

23 A Well, you're not going to know where it goes, but there is  
24 the potential, like I showed before, that it could reach the  
25 surface. And I think more importantly those

Page 8371

**NetworkReporting**

**1-800-632-2720**

1 low-permeability units -- the configuration of those below  
2 where you're discharging is very important to map out,  
3 because that water's going to perch on it and then be  
4 directed based on the configuration of that low-permeability  
5 unit.

6 Q Have they done a good job of mapping that?

7 A I don't believe they've done a good job of mapping it or  
8 really describing and showing what's going to happen.  
9 There's this -- I still feel there's this presumed northeast  
10 direction to the groundwater flow and, without data between  
11 the TWIS to the north, northeast, it's kind of an open  
12 guess.

13 Q What should they have done?

14 A Well, put more data here; better characterized this area all  
15 around the TWIS where you thought -- and even to the south.  
16 There's a possibility -- just based on the cross-sections  
17 that I showed earlier with the gradients going southeast  
18 right at the TWIS, there's a possibility that groundwater  
19 could go southeast and into the Yellow Dog River Watershed.

20 Q We talked about characterization and conceptualization a  
21 moment ago. Is this more evidence about the  
22 characterization and conceptualization that was done that  
23 was a building block of their hydrogeologic investigation?

24 A Yes.

25 Q Was it adequate?

Page 8372

**NetworkReporting**

**1-800-632-2720**

1 A I don't believe so.

2 MR. EGGAN: Next slide, please.

3 Q Let's talk about monitoring in the area of the TWIS. And  
4 what are your thoughts on that?

5 A Well, could I just draw a simple diagram?

6 Q Yes, please.

7 (Witness draws diagram)

8 A What I want to show is just sort of a cross-section that  
9 might represent the TWIS here, and maybe this is the area  
10 where the water is infiltrating down from the TWIS. And the  
11 current groundwater table looks like it's sloping off this  
12 way, but you have those low-permeability units in here that  
13 I -- seems to me that they occur about the same elevation,  
14 so I would be connecting these as though they were  
15 connected.

16 And I think, if you're putting in monitoring wells  
17 within 150 feet of the TWIS, which is where I saw the  
18 monitoring wells being proposed, and you're assuming that  
19 the mounding all occurs on your current groundwater table,  
20 which I'll denote with a little inverted triangle, and your  
21 wells go down and they're screened over this current water  
22 table, maybe a little higher to see the mounding that is  
23 presumed to occur here, but in fact, all the water that  
24 infiltrates comes down and it starts mounding instead on  
25 this zone here, the low-permeability units -- and in fact,

Page 8373

**NetworkReporting**

**1-800-632-2720**

1 remember, one of the wells I actually said I saw 30 -- from  
2 30 to 45 feet belowground. I saw a silty sand, which is a  
3 low-permeability unit. That water could mound above this  
4 low-permeability unit and breach the surface in that area.  
5 But more importantly, this water will mound up above this  
6 and --

7 Q When you say "this," it'll mound up above the --

8 A The low-permeability units above the water table. But we  
9 don't know what's happening in most of the directions other  
10 than southwest -- what's happening to these low-permeability  
11 units. These could continue up. They could continue in a  
12 variety of directions. They could go up or down, but we  
13 just don't have information outside of the TWIS. So I think  
14 that, if they do continue, this monitoring may never see the  
15 effect of this mounding. This could go out here and -- you  
16 know, this clay unit could go out here, and the water could  
17 drain down here, completely missing these monitoring wells.

18 Q What is the impact of that, Doctor? What difference does  
19 that make?

20 A Well, I just think, if you're not monitoring and, based on  
21 Dr. Maest's discussion yesterday -- and this water does have  
22 water quality issues -- this is the last point before it  
23 actually goes out to the north and seeps out of the seeps.  
24 Their wells currently are farther beyond the seeps or these  
25 contact springs. So basically there would be no knowledge

Page 8374

**NetworkReporting**

**1-800-632-2720**

1 that you had water seeping out past the TWIS if -- and in  
2 fact did have the water quality issue, and you wouldn't know  
3 it until it was in the surface water.

4 Q Is that because of the testimony that we have from witnesses  
5 that there are no monitoring wells or no wells between the  
6 TWIS or 150 feet from the TWIS and then on almost a mile to  
7 those seeps? Is that the area you are talking about?

8 A That's right. That's my understanding. And just based on  
9 the regulations, it is -- you have to put a monitoring well  
10 within 150 feet. But it seems to me that this clay layer  
11 already just over, say, 3 of the boreholes from the  
12 southwest going up to the -- southeast to the northwest  
13 along that cross-section show shallow low-permeability  
14 units. So why would -- I mean, that's a distance of -- you  
15 know, if the TWIS is 1,000 feet long, that's 750 feet. It's  
16 pretty easy to imagine those could continue out beyond this  
17 150 feet.

18 Q And what favorable impact would having those wells out  
19 there, that you're talking about, out to the northeast have?

20 A Well, it would be -- if they were put out there in terms of  
21 detection, at least you would know if you didn't -- if this  
22 did occur, that you would have some opportunity to detect  
23 some impact to the groundwater.

24 Q Before we get to your conclusions, I do have a question for  
25 you. One of the witnesses, a Mr. Fassbender, who testified

1 in this case and who have done some work related to a  
2 project in Wisconsin related to the Crandon Mine, testified  
3 he couldn't recall some information pertaining to the  
4 Crandon Mine related to inflow that was predicted for the  
5 Crandon Mine. Did you have an opportunity to review  
6 materials pertaining to inflow at the Crandon Mine?

7 A I did.

8 Q What did you review?

9 A The discharge permit application.

10 Q Okay. What did you learn from your review of those  
11 materials pertaining to input in the Crandon Mine  
12 specifically pertaining to predicted inflows?

13 A Well, my understanding is that a Base Case and an Upper Case  
14 inflow were estimated by the permit application permittee, I  
15 guess, and that was submitted, and apparently that wasn't --  
16 the Base Case and Upper Bound estimates or the flow weren't  
17 high enough. And so I guess the values of the inflow or --  
18 for discharge purposes were increased by a required increase  
19 by the --

20 Q Do you remember what the predicted inflow was?

21 A I believe it was in the 400 to 800 range, something like  
22 that, and then they used 600 gallons per minute, I guess, as  
23 a design basis.

24 Q Okay. And what did the Wisconsin Department of Natural  
25 Resources require?

Page 8376

**NetworkReporting**

**1-800-632-2720**

1 A In the end 1500 gpm is what I believe I saw.

2 Q Okay. So they were predicting between 400 and 800, yet the  
3 Wisconsin Department of Natural Resources required almost  
4 twice as much, 1500?

5 A That was my understanding.

6 Q Okay. And did the materials you reviewed indicate who was  
7 it -- who it was or what company it was that had prepared  
8 the input data for that particular matter --

9 A I believe it was --

10 Q -- at the Crandon Mine?

11 A I believe it was Foth & VanDyke.

12 Q Okay. And did you happen to notice who the professional  
13 hydrologist was that essentially signed or stamped those  
14 documents for the Wisconsin study?

15 A I think there were three different engineers.

16 Q Was one of them -- was one of them Stephen Donohue?

17 A I believe so, yes.

18 MR. EGGAN: Okay. I have no further questions.

19 Q Oh, let's go to your conclusions. And these are conclusions  
20 with respect to your rebuttal testimony. We're not going to  
21 go back and revisit the conclusions you offered initially.

22 A Right.

23 Q So go ahead.

24 A Well, the first conclusion is just I think I pointed out  
25 that I feel like the hydrogeologic characterization and

Page 8377

**NetworkReporting**

**1-800-632-2720**

1 conceptualization were, in my opinion, wrong on a number of  
2 accounts. And I would also say that the subsequent  
3 development and application of numerical models is,  
4 therefore, flawed. And finally, I think uncertainty in the  
5 predictions really wasn't assessed, from what I can see.  
6 These predictions that are put out aren't really qualified  
7 to assess that uncertainty.

8 Q Any other conclusions, Doctor?

9 A No.

10 MR. EGGAN: Thank you. I have nothing further.  
11 Your Honor, at this point I would offer the slide  
12 presentation that Dr. Prucha prepared in this matter as  
13 Exhibit 191.

14 JUDGE PATTERSON: And, again, it's for  
15 demonstrative purposes?

16 MR. EGGAN: Yes.

17 MR. LEWIS: No objection.

18 MR. REICHEL: No objection.

19 JUDGE PATTERSON: Okay. No objection, then that  
20 will be entered.

21 (Petitioner's Exhibit 632-191 received)

22 JUDGE PATTERSON: Can we take about five minutes?

23 (Off the record)

24 MR. LEWIS: I don't think it will take long. I  
25 think Counsel have agreed collectively that the due date for

Page 8378

**NetworkReporting**

**1-800-632-2720**

1 post-hearing briefs would run from today, and then they will  
2 be due 55 days from today. I think we're going to start  
3 counting tomorrow, and that that means the date would be  
4 September 9, Your Honor.

5 MR. HAYNES: That's a Tuesday.

6 JUDGE PATTERSON: Okay. Tuesday? Okay.

7 MR. LEWIS: Hello, Dr. Prucha. I'm Rod Lewis. We  
8 met the first time you were here. I represent Kennecott  
9 Eagle Minerals Company, as you understand.

10 THE WITNESS: Good morning.

11 MR. LEWIS: Could I look at Dr. Prucha's slide 41?  
12 Do you have that available?

13 CROSS-EXAMINATION

14 BY MR. LEWIS:

15 Q Do you have the slides up there, Dr. Prucha, a copy?

16 A Not the one that says 41.

17 MR. LEWIS: We can do it without the projector, if  
18 you'd just give him a copy of the slide.

19 Q Slide 41 --

20 A Yes.

21 Q -- is the slide where you had a table on there titled  
22 "Sensitivity Analysis Anisotropy," and you discussed the two  
23 lines on that graph being -- one being so-called calibration  
24 error and the other being maximum drawdown at a particular  
25 well. And I just wanted to clarify, the upper line there

Page 8379

**NetworkReporting**

**1-800-632-2720**

1 indicates the calibration; that's right?

2 A Calibration error.

3 Q Okay. And the bottom line indicates various depths of  
4 drawdown?

5 A That's my understanding.

6 Q And this is from Mr. Council's model for the modeling of the  
7 potential drawdown in the glacial aquifer?

8 A Slide 51 of his presentation, yes.

9 Q "Yes"? I'm sorry.

10 A Slide 51 of his presentation.

11 Q And that was the subject matter?

12 A Yes.

13 Q And I just wanted to clarify, because I think in the prior  
14 testimony it was indicated that the bottom line, which  
15 indicates the range of potential drawdown, was several feet,  
16 that line shows, does it not, Dr. Prucha, that the range  
17 would be from roughly zero to a little less than three feet?

18 A That's my understanding, yes.

19 Q Let's maybe look at your slide two a moment, then, Dr.  
20 Prucha.

21 MR. HAYNES: Excuse me, Counsel. I think I'm  
22 going to have to take back my copy of the slide. So could  
23 we switch the projectors and have the slides --

24 MR. LEWIS: Well, that's fine. You can just have  
25 it. I can ask him whatever I need to ask him, I think,

Page 8380

**NetworkReporting**

**1-800-632-2720**

1 without him having a copy.

2 Q That's the slide where you listed the various testimony that  
3 you had reviewed, testimony and exhibits and reports and so  
4 forth. And you listed a number of people there, Dr. Prucha.  
5 And just to review that, you listed Mr. Beauchamp. He's  
6 from Golder. And you understand that he did  
7 characterization of the rock mass qualities for the crown  
8 pillar; right?

9 A I do.

10 Q You interviewed (sic) the testimony and reports of Trevor  
11 Carter, also with Golder, also offered testimony and reports  
12 as to the crown pillar stability; right?

13 A I read his testimony and looked at his PowerPoint, yes.

14 Q And you've listed Mr. Chatterson of the DEQ. I believe  
15 that's as to the groundwater issues; correct?

16 A Yes.

17 Q And Mr. Council who did some groundwater modeling and  
18 predictions of potential drawdown in the glacial aquifer and  
19 potential effects on the streams and the mining; right?

20 A Yes.

21 Q Mr. Jerry Eykholt, who offered some testimony as to the TWIS  
22 and the flow of water that would be released from the water  
23 treatment system, which you discussed again today; right?

24 A Yes.

25 Q Mr. Janiczek with the DEQ also on groundwater issues?

Page 8381

**NetworkReporting**

**1-800-632-2720**

1 A Yes.

2 Q And remember Logsdon, you talked about him some today. He's  
3 actually -- he testified on the subject of geochemistry;  
4 right?

5 A Yes.

6 Q Mr. Thomas, is that Chuck Thomas of the DEQ?

7 A That's my understanding.

8 Q Also on the groundwater issues?

9 A Yes.

10 Q And Mr. Ware, now he's with Kennecott. And you understand  
11 him to be a Kennecott geologist? You indicated you reviewed  
12 his testimony so you know that he was largely responsible  
13 for the drilling program undertaken by Kennecott?

14 A Yes.

15 Q And he was responsible and testified about the geological  
16 investigation conducted by Kennecott; you understand that?

17 A Yes.

18 Q And Dan Wiitala, he prepared various reports for the mine  
19 permit application and also testified about the groundwater  
20 characterization studies that he did; right?

21 A Yes.

22 Q And Mr. Wozniewicz and Mr. Zawadzki, also from Golder,  
23 prepared reports and testified about the bedrock  
24 hydrogeology and the modeling of the potential water inflows  
25 into the mine; you understand that?

1 A Yes.

2 Q And you in fact have offered testimony both in your initial  
3 direct examination several weeks ago and again today  
4 criticizing the work and conclusions by all of these people,  
5 have you not, Dr. Prucha?

6 A I wouldn't say that I criticized work on everybody's.

7 Q What are the exceptions?

8 A I don't know off the top of my head, but I don't -- I mean,  
9 it's a good bit of information here.

10 Q Oh, I agree. That's why I'm asking the question.

11 A Well, I mean, I think that the presentation I put forth had  
12 kind of specific points from specific testimony. So, for  
13 example, I didn't talk about Beauchamp or necessarily Carter  
14 in some of my responses. That's not my area.

15 Q Okay. Let's take a few of them. You have talked certainly  
16 about Andrew Ware and his testimony and conclusions about  
17 the geological characterization, have you not?

18 A Yes.

19 Q And you in fact disagree and offer a different opinion as to  
20 what Mr. Ware testified about as to the potential presence  
21 of the so-called Klasner fault; correct?

22 A That's right.

23 Q And as to Mr. Wiitala, you testified in your earlier  
24 examination and again today that you disagree with his  
25 studies on the groundwater characterization and his

1 conclusions about those studies, did you not?

2 A Some of the points, yes.

3 Q And Messieurs Wozniewicz and Zawadzki from Golder who did  
4 the bedrock hydrogeology characterization and the  
5 hydrogeology modeling of potential mine inflows, you  
6 disagree with their reports and their conclusions also, do  
7 you not?

8 A Some of their points and conclusions, yes.

9 Q And Mr. Eykholt who did some work on the modeling of the  
10 TWIS and the discharge of water there, you disagree with his  
11 work and his conclusions, do you not?

12 A Some of his points and conclusions, yes.

13 Q And Mr. Greg Council who, again, you talked about him the  
14 first time you were here and again today, you disagree with  
15 the work he did and the conclusions he reached, do you not?

16 A Some of the points and conclusions, yes.

17 Q Also as to Mr. Eric Chatterson of the DEQ, also as to Mr.  
18 Chuck Thomas of the DEQ, you disagree with the conclusions  
19 that they reached as well, do you not, Dr. Prucha?

20 A Certain points and conclusions, yes.

21 Q And in many instances, if not all, when you reviewed your  
22 criticisms of the various testimony and work done by these  
23 people from various companies and the DEQ, you were often  
24 asked questions as to, "Did they get it right?" You  
25 answered, "No." And then you were asked a question of how

1           you would have done it; do you recall that, Dr. Prucha?

2    A       Yes.

3    Q       And in all those instances, your testimony was you would  
4           have done it differently; right, Dr. Prucha?

5    A       For the points that I introduced in the presentation, yes.

6    Q       I wanted to -- it would take a lot of time for me to review  
7           with you the basis for the conclusions and opinions reached  
8           by that long list of people and in those various reports and  
9           in their testimony. So I think all I'll do today is spend a  
10          little time with you on one of those witnesses and one of  
11          those subject areas, if I might. And it goes to, I think,  
12          an issue that seems to be of some importance for your  
13          opinions. It's referenced -- it was referenced heavily in  
14          your first direct examination and your second direct  
15          examination and your slides today, and that's the potential  
16          presence and potential effect of this so-called Klasner  
17          fault on mine inflows and the potential for effects on the  
18          glacial aquifer and perhaps the stream. So I wanted to  
19          review with you some of Mr. Ware's testimony, he being one  
20          of those people on the list, again, the geologist whose work  
21          and conclusions you disagree with.

22                       And I'm putting here on Mr. Elmo what was  
23                       discussed with Mr. Ware in his testimony. It was Intervenor  
24                       Exhibit 596. And then I want to read to you some of his  
25                       testimony about this exhibit.

Page 8385

**NetworkReporting**

**1-800-632-2720**

1 MR. LEWIS: This is page 2986 of Mr. Ware's  
2 testimony, Counsel.

3 MR. HAYNES: I'm sorry. Counsel, again?

4 MR. LEWIS: 2986.

5 MR. HAYNES: Thank you.

6 Q Mr. Ware was asked during his examination the following  
7 questions and gave the following answers: Question,

8 "Would you describe what's depicted on this  
9 figure, please?" And again, this is in reference to  
10 this figure in Exhibit 596. Answer, "This map shows  
11 drill holes that are being completed on the Eagle  
12 project. Those red dots, color locations, the black  
13 lines are what we call the trace of the hole."

14 Now, do you see the dashed lines there on the figure, Dr.  
15 Prucha?

16 A Yes.

17 Q Mr. Ware put those dashed lines on there to indicate the  
18 potential presence of this so-called Klasner fault. Do you  
19 recognize that?

20 A I recognize those two lines as representing the fault zone  
21 that Klasner said was between those that's about 500 meters  
22 wide.

23 Q But in general that's what Mr. Ware's depicting there? You  
24 understand that?

25 A That's my understanding.

Page 8386

**NetworkReporting**

**1-800-632-2720**

1 Q And you see the red dots, which probably show up black in  
2 this view, but those represent drill holes. And he's going  
3 to talk about here. Okay, Dr. Prucha?

4 "Those red dots, color locations, the black lines  
5 are what we call the trace of the hole. So essentially  
6 what you're doing is looking down on the drill plan.  
7 And if the hole's at an angle, that black line  
8 indicates where that hole went in relation to that  
9 color. These two black lines indicating the Klasner  
10 outline of his CP interpreted fault zone. Within that  
11 fault zone we have 14 drill holes drilled at varying  
12 angles that to date don't indicate either the existence  
13 of an approximately 500 yard wide fault zone or indeed  
14 the existence of discrete features that could be  
15 represented by these black lines."

16 MR. HAYNES: Counsel, just for the record, my copy  
17 of the transcript on page 2987 at line three says 13 drill  
18 holes.

19 MR. LEWIS: That's what I said, isn't it?

20 MR. HAYNES: I think you said 14.

21 MR. LEWIS: If I did, I mis-spoke.

22 JUDGE PATTERSON: I heard 14.

23 MR. LEWIS: It does say 14. "Within that fault  
24 zone we have 14 drill holes."

25 MR. HAYNES: I'm looking at the final transcript,  
Page 8387

**NetworkReporting**

**1-800-632-2720**

1 and it says 13.

2 MR. LEWIS: There may have been a correction,  
3 then. Well, let the record --

4 MR. HAYNES: 13 or 14.

5 MR. LEWIS: -- indicate that I'm referring to the  
6 first preliminary version of the transcript. Perhaps Mr.  
7 Haynes is referring to the second. So one version says 13,  
8 one says 14.

9 MR. HAYNES: I think I have the final version, but  
10 go ahead.

11 MR. LEWIS: Okay. Well, it's the only explanation  
12 I know.

13 Q And then I'm going to put the next figure up here that Mr.  
14 Ware talked about also from Intervenor Exhibit 596 and read  
15 to you what he had to say about that. Now, the first part  
16 of what I read to you is about some of the drill hole  
17 information. And I believe that you had indicated and  
18 implied in your testimony both the first time and again  
19 today that in your view the potential existence of this  
20 fault was not adequately searched for and characterized.  
21 Another point of your testimony, I believe, Dr. Prucha,  
22 again, is your reliance on this Klasner article from 1979.  
23 That's the main basis, as I understand it. But you've also  
24 referenced geophysical studies by Kennecott itself. So I  
25 wanted to read to you what Mr. Ware said about this figure

Page 8388

**NetworkReporting**

1-800-632-2720

1 and Kennecott's geophysical studies that you referred to.  
2 Question, "And did you prepare another figure to help  
3 illustrate" --

4 MR. HAYNES: I'm sorry to interrupt, Counsel.  
5 Which page are we on?

6 MR. LEWIS: Continuing on page 2987.

7 MR. HAYNES: Thank you.

8 Q "And did you prepare another figure to help  
9 illustrate that point?" Answer, "I did. There should  
10 be a figure showing the magnetics that we flew over the  
11 area." "Is that the figure?" Answer, "That is the  
12 figure." Question, "What does this show?" "Again, it  
13 shows the drill holes as distributed at Eagle and Eagle  
14 East. It shows the Klasner interpreted fault zone. It  
15 also shows very clearly this feature here, which is a  
16 dike. It's a magnetic dike." And I believe he's  
17 referring to the horizontal coloring below the two  
18 purple circles. "That's a magnetic high. It shows  
19 it's got another dike to the south of it. That's a  
20 magnetic low. And these are responses from peridotite  
21 rich sediments. Peridotite is a magnetic mineral that  
22 is commonly found in sedimentary rocks. The point of  
23 this is that these sediments dip at an angle. There's  
24 two lines of evidence that those faults don't exist.  
25 There's no offset on this dike." Question, "What does

Page 8389

**NetworkReporting**

**1-800-632-2720**

1 think the reference really should be pyrrhotite, rather than  
2 peridotite.

3 MR. LEWIS: That's fine. We'll go with  
4 pyrrhotite.

5 MR. HAYNES: All right. I just want to make sure  
6 the record's clear.

7 Q So, again, as an example here, Dr. Prucha, you simply  
8 disagree with Mr. Ware's conclusions as to what both the  
9 drilling information shows and as to what the geophysical  
10 information shows as to the existence of this so-called  
11 Klasner fault? You disagree with that; right?

12 A To some extent I do, yes.

13 MR. LEWIS: That's all I have, Your Honor.

14 JUDGE PATTERSON: Mr. Reichel?

15 MR. REICHEL: Yes. Dr. Prucha, again, my name is  
16 Bob Reichel. I represent the DEQ, as you recall. I just  
17 have a few questions.

18 CROSS-EXAMINATION

19 BY MR. REICHEL:

20 Q One of the things that Mr. Eggan asked you about earlier  
21 this morning had to do with testimony by Mr. Chatterson  
22 regarding contour intervals in the depiction of the area in  
23 the vicinity of the TWIS; do you recall that?

24 A I do.

25 Q Okay. Let me ask you this, sir: Based upon your training

Page 8391

**NetworkReporting**

**1-800-632-2720**

1 and experience in hydrogeology, would you agree or disagree  
2 with the following proposition that 10 percent of the  
3 overall groundwater elevation change in the area subject to  
4 study is a commonly accepted method for determining a  
5 contour interval?

6 A I'm not sure I understand that question fully.

7 Q Okay. Let me try to rephrase it.

8 A Yeah.

9 Q When a hydrogeologist is determining what contour interval  
10 is appropriate, --

11 A Right.

12 Q -- would you agree with the proposition that a commonly  
13 accepted method for determining what contour interval is  
14 appropriate would be to look at an interval that represented  
15 10 percent of the overall groundwater elevation change in  
16 the area under study?

17 A I think that would be fine if the complexity that you knew  
18 existed. And if you had no knowledge of how complex a  
19 system was over that drop, I think that would be fine.

20 Q So that is a commonly accepted principle; correct?

21 A Caveated with if it's a fairly -- I mean, if you're just  
22 doing an initial cut and you don't know anything about the  
23 subsurface and it's simple, you could do that. But once you  
24 start learning more information and it becomes more complex,  
25 your understanding of how the system operates, I don't think

Page 8392

**NetworkReporting**

**1-800-632-2720**

1 I've run into a case where you don't want to increase the  
2 contours around key areas. So I don't like to just choose  
3 10 percent.

4 Q No, that wasn't my question, sir, whether or not that was a  
5 commonly accepted method. And I take it your answer that in  
6 general, yes, that is true?

7 A It can be.

8 Q Okay. Now, Dr. Prucha, did you -- you've testified that  
9 you've reviewed testimony by a number of witnesses,  
10 including Mr. Chatterson. In reviewing Mr. Chatterson's  
11 testimony, did you read all of his testimony or just certain  
12 portions of it that you highlighted -- either you or counsel  
13 highlighted in response?

14 A I read through the entire document. I mean, it's a lot of  
15 information, so I don't --

16 Q Certainly.

17 A -- recall every sentence.

18 Q Understood. But you did read it all?

19 A That was my -- yes.

20 Q Okay. Now, in your slide 32, do you have those available to  
21 you, sir?

22 A I don't have the same number.

23 Q Here, let me give you a copy.

24 MR. EGGAN: I can give him -- I can give him one.

25 MR. REICHEL: Okay. Thank you.

Page 8393

**NetworkReporting**

**1-800-632-2720**

1 MR. EGGAN: Did you say 32?

2 MR. REICHEL: Yes, I did; yes. And for the  
3 record, this has the heading "Modeling - TWIS Discharge."

4 Q Do you see that, sir? Actually, the --

5 A Yes.

6 Q And at the top of the slide it says Statement. "Chatterson  
7 indicates MODFLOW code can simulate perched conditions" and  
8 there's a parenthetical reference to the transcript page  
9 7588. Is that correct? That's your understanding of what  
10 Mr. Chatterson's testimony was?

11 A Paraphrased.

12 Q Yeah. Okay. Do you recall whether or not, sir, within a  
13 line or two after that he testified on that subject he  
14 further qualified his answer?

15 A I understand there was discussion about that whole topic.  
16 But what I took from it was that it appeared that he didn't  
17 readily say MODFLOW is unable to simulate unsaturated zone  
18 flow. I mean, I can't repeat what --

19 Q No. I'm not asking you to repeat it. My question is, do  
20 you recall whether or not after giving that response he  
21 qualified that?

22 A I can't remember the statement or not.

23 Q Okay. Well, let me --

24 A Or the statements.

25 Q Let me read to you from the transcript at page 7588, which  
Page 8394

**NetworkReporting**

**1-800-632-2720**

1 you cite here in your slide. Beginning at line 22 -- well,  
2 let me start at line 16.

3 "We know that MODFLOW" -- this is a question by  
4 Mr. Egan. "We know that MODFLOW really cannot  
5 simulate the impact of these kinds of conditions."  
6 Answer, "Yes, it can." "Can MODFLOW simulate perched  
7 flow conditions?" "Yes." "Okay." Mr. Chatterson at  
8 line 22, "Well, I mean, I guess you have to qualify  
9 that, but" -- question, "Well, qualify it. Go ahead  
10 and tell us what the qualification is." Answer, "You  
11 can simulate all of, I guess, different layers within  
12 MODFLOW. You can break it up into as many layers as  
13 you want. And you have the ability in MODFLOW to  
14 interpret what layers. So you could -- at the area  
15 where the clay zone is, you could put in a very low  
16 hydraulic conductivity. And the areas lateral to that  
17 have sand and you can put in a higher hydraulic  
18 conductivity and you can interrelate the cell -- all  
19 the cells in between. So you can actually model it in  
20 that regard. There are some you can model there are  
21 certain assumptions that would make it difficult, I  
22 guess, so I guess you can't maybe model. MODFLOW  
23 doesn't handle perched zones real well. But there are  
24 ways you can, I guess, model it and ascertain a certain  
25 amount of information."

Page 8395

**NetworkReporting**

**1-800-632-2720**

1 So in fact, the -- Mr. Chatterson's testimony on this  
2 subject was not an unqualified statement that MODFLOW can  
3 simulate perched conditions; isn't that true, sir?

4 A I wouldn't say that. I mean, I gathered from the last  
5 statements he made that MODFLOW can't really simulate it  
6 well. He doesn't say that MODFLOW can't simulate it in that  
7 dialogue. And so I just -- my understanding of it was that  
8 it wasn't that he still thought it might be able to by  
9 adding more layers and then --

10 Q Well, in any event, the excerpt that you quoted at page 7588  
11 was taken out of context; correct?

12 A Maybe an additional page.

13 MR. REICHEL: Nothing further.

14 MR. HAYNES: I don't have any further questions.

15 MR. EGGAN: I may have an additional question.

16 Bear with me, Your Honor. I wrote a note to myself, and I'm  
17 looking for it.

18 JUDGE PATTERSON: Okay.

19 REDIRECT EXAMINATION

20 BY MR. EGGAN:

21 Q Dr. Prucha, I wanted to follow-up on a question actually  
22 that I asked with respect to monitoring. Okay? Is there to  
23 be any monitoring between that TWIS area, 150 feet from the  
24 TWIS, and the area where the seeps are? Is there to be any  
25 chemical data that you know of that we're going to get

Page 8396

**NetworkReporting**

**1-800-632-2720**

1           pertaining to the direction of that flow or to the -- or to  
2           the speed at which it is moving?

3    A           I haven't seen any information.

4    Q           Okay. But do you understand whether there will or won't be  
5           any monitoring at the groundwater-surface water interface  
6           there at the seeps?

7    A           Based on Dr. Maest's testimony yesterday, my understanding  
8           is no.

9    Q           Okay. So we'll never have any data with respect to that,  
10           will we?

11   A           That's my understanding.

12   Q           Okay. What about in the area -- you've indicated that there  
13           may be a southeast trend to the groundwater flow. Will we  
14           get any data based on monitoring that they've established if  
15           the water is indeed going that direction?

16   A           Not at a sufficient distance away from the TWIS to, you  
17           know -- it'd be within 150 feet, roughly. But, no, I don't  
18           believe they would collect -- or it seems like they won't  
19           collect that data from what I can see.

20   Q           Would you have expected them to have collected that data?

21   A           Yes.

22                           MR. EGGAN: I have nothing further. Thank you.

23                           MR. LEWIS: Nothing further.

24                           MR. REICHEL: May I have a moment, Your Honor?

25                           (Counsel reviews notes)

Page 8397

**NetworkReporting**

**1-800-632-2720**

1 MR. REICHEL: I have nothing further.

2 MR. HAYNES: Your Honor, one final bit of  
3 housekeeping with Dr. Prucha. When he was here several  
4 weeks ago, we introduced certain slides from Petitioner's  
5 Exhibit 63. And similarly with Dr. Maest, I have pulled out  
6 the slides that Dr. Prucha actually testified about and made  
7 them into a new exhibit, which is Petitioner's Exhibit 155.  
8 I've given those -- I've given the new exhibit to Counsel  
9 containing slides 13, 14 and 31 from Dr. Prucha's initial  
10 testimony, and move the admission then of Exhibit 155  
11 containing those three slides.

12 MR. LEWIS: I can't recall, Mr. Haynes, are they  
13 proposed as a demonstrative or substantive?

14 MR. HAYNES: No; no. These were taken from the  
15 Proposed Exhibit 63, which was provided as part of the  
16 exhibits in the case. And Dr. Prucha testified only about  
17 three slides of that proposed exhibit. And per Mr. Lewis'  
18 (sic) suggestion, I've pulled those slides out, put them  
19 into a separate exhibit so that we're clear on what slides  
20 are actually going to be proposed to be admitted.

21 MR. REICHEL: Yes, I recall that discussion,  
22 Counsel. This is what you showed me, yes.

23 MR. HAYNES: Yes. I provided these to Counsel two  
24 days ago.

25 MR. LEWIS: I have no objection, Your Honor.  
Page 8398
