

December 7, 2015

Mr. Tom Mahler On-Scene Coordinator U.S. Environmental Protection Agency, Region 7 11201 Renner Boulevard Lenexa, Kansas 66219

Subject: Emergency Response Activity Report Bridgeton Brush Fire Response, Bridgeton, Missouri U.S. EPA Region 7 START 4, Contract No. EP-S7-13-06 Task Order No. 0001.024 Task Monitor: Tom Mahler, On-Scene Coordinator

Dear Mr. Mahler:

Tetra Tech, Inc. is submitting the attached Emergency Response Report documenting tasked activities following a brush fire in Bridgeton, Missouri, on October 24, 2015. The brush fire occurred on Republic Services, Inc. property, between the Bridgeton Landfill Site and the Westlake Landfill Site. If you have any questions or comments, please contact the Project Manager at (314) 395-3157.

Sincerely,

for Dave Kinroth, CHMM START Project Manager

Ted Faile, PG, CHMM START Program Manager

1.0 INCIDENT

Tetra Tech, Inc. (Tetra Tech) was tasked by the U.S. Environmental Protection Agency (EPA) Region 7 Superfund Division, under the Superfund Technical Assessment and Response Team 4 (START 4) contract, to provide technical support for an emergency response and assessment activities following a brush fire on the Republic Services, Inc. property between the Bridgeton Landfill Site and the Westlake Landfill Site in Bridgeton, Missouri, on October 24, 2015 (see Appendix A, Figure 1). The local Pattonville Fire Department responded to the report of a small brush fire near the intersection of St. Charles Rock Road and Taussig Road at approximately 2:15 p.m. that day. The fire was extinguished within about 20 minutes (Fox 2 News KPLR 2015). The fire had been started by a faulty switch that generated sparks on an Ameren utility pole along the fenceline at the entrance driveway to the Republic Services transfer station located there. Ameren personnel also responded to the scene and repaired the electrical problems that afternoon (Fox 2 Now St. Louis KTVI 2015).

An area of relatively thick dry grass approximately 120 by 80 feet had burned before the fire was extinguished. The burned area was south-southeast of the Westlake Landfill Site Operable Unit 1 (OU1) perimeter fence where radiologically impacted material (RIM) is known to be buried, so news of the brush fire generated local public concern.

EPA On-Scene Coordinator (OSC) Tom Mahler contacted START Member (SM) Dave Kinroth on the evening of October 24 to notify START to be on stand-by status for response to the incident scene if requested. Mahler then prepared to mobilize to the scene from Kansas City. Shortly thereafter, Kinroth was contacted by local EPA OSC Adam Ruiz and informed that Ruiz would mobilize to the scene that evening to meet with the Missouri Department of Natural Resources (MDNR) duty officer performing air monitoring around the perimeter of the Bridgeton and Westlake Landfill Sites that afternoon. Ruiz met with Mike Ruddy of MDNR at the scene and confirmed that the fire had been localized within an area approximately 100 feet wide along the fenceline at the entrance driveway to the Republic transfer station, and did not appear to have reached the OU1 RIM area of the Westlake Site. At that point, START was instructed to stand down from response activity that evening, and was requested to contact OSC Mahler the following morning for further instruction.

1

2.0 **RESPONSE ACTIVITIES**

SM Kinroth contacted OSC Mahler the following morning on October 25, 2015, and was requested to mobilize to the scene with a camera and global positioning system (GPS) documentation equipment, radiation monitoring equipment, and soil sampling supplies. Kinroth met Mahler at the MDNR duty office trailer on the Hussman Refrigeration Company parking lot across St. Charles Rock Road from the Bridgeton Landfill Site and the Republic transfer station. The team staged here temporarily until arrangements were made for Republic Services personnel to meet and provide access to the burn area inside the property fenceline. In the meantime, SM Kinroth started two radiation monitors; a Ludlum Measurements, Inc. Model 192 gamma radiation screening instrument; and a Ludlum 2241-2 digital scalar/ratemeter with a pancake Geiger-Mueller (PGM) detector probe. SM Kinroth then recorded initial background readings (see Table 1). During the response activities, SM Kinroth photographed the burn area and vicinity (see photographic log in Appendix B).

At 11:15 a.m., the team met with Jim Getting of Republic Services, was escorted to the burn area inside the site fence, and was given access to assess the scene. Mahler first performed a gamma radiation screening survey of the burn area using the Ludlum 192 instrument by walking five transect lines across the area beginning along the fenceline where the fire had started and moving sequentially northward to the northern extent of the burn perimeter. All readings observed during this survey were in the 7 to 10 micro-Roentgens per hour (μ R/hr) range, consistent with area background levels.

A GPS tracklog was recorded by walking the perimeter of the entire burn area with a Garmin[®] GPSMAP 60CSx handheld unit, and a second tracklog was recorded while walking along the fence perimeter of the Westlake OU1 north of the burn area. The burn area was approximately 120 feet east to west by 80 feet south to north, and the north perimeter of the burn area was approximately 100 feet from the south fence of the OU1 RIM area perimeter (see Appendix A, Figure 2).

The team then collected three soil samples within the burn area. Toward the center of the burn area was an elevated berm running from east to west, and runoff from the firefighting efforts had traveled south toward the fence along the Republic entrance drive and also north toward a drainage swale that trended northeast from the burn area. Soil samples were collected as follows:

• The first soil sample (designated BBFR-001) was collected on the south perimeter of the burn area against the fence along the Republic Services entrance driveway to its transfer station. Apparently, most water used to put out the fire on the south side of the berm had run off at this location and onto the Republic entrance driveway.

- The second soil sample (BBFR-002) was collected near the center of the burn area at the top of the berm.
- The third soil sample (BBFR-003) was collected approximately 10 feet outside and north of the burn area in the drainage swale trending north-northeast. All water used to put out the fire that flowed off the north side of the berm would have continued to drain via this pathway.

GPS coordinates recorded at the sampling locations are depicted on Figure 2 in Appendix A. GPS coordinates at sample location BBFR-002, nearest to the center of the burn area, were 38.769317 degrees north latitude and 90.440300 degrees west longitude.

The soil samples were screened for gamma/beta activity by use of the Ludlum 2241-2 with PGM probe while in aluminum pie pans (prior to transfer into sample jars). Readings from the samples fluctuated between 9 and 15 μ R/hr, again consistent with background levels. Nothing from this screening indicated presence of RIM in or near the burn area. Table 1 summarizes all radiation screening readings recorded during this effort.

TABLE 1

	Screening	Instrument

RADIATION FIELD SCREENING DATA SUMMARY BRIDGETON BRUSH FIRE RESPONSE – BRIDGETON, MISSOURI

Note:

µR/hr micro-Roentgens per hour

The soil samples were delivered to the Test America St. Louis laboratory facility in Earth City, Missouri, the following morning on October 26, 2015, for analyses for the following radiological parameters:

- 9310 Gross Alpha/Beta
- GA-01-R Gamma Spec
- 9315 Total Alpha Radium (TAR) and Radium-226
- A-01-R Isotopic Thorium
- A-01-R Isotopic Uranium

During the response, EPA had assessed the proximity of the burn area to known locations of sub-surface West Lake RIM, and had estimated that the nearest sub-surface RIM was approximately 390 feet northwest of the burn area within the fenced West Lake OU 1 (see Appendix D).

This completed the field activities for this emergency response task.

3.0 ANALYTICAL RESULTS

The final laboratory data packages for the suite of requested analyses was received from Test America on November 5 and December 3, 2015. The data were submitted to a Tetra Tech START chemist for review and validation, and the Data Validation Reports (DVR) are included along with the full data packages in Appendix C to this report. Table 2 summarizes the data listing activities of radionuclides in the naturally occurring uranium-235, uranium-238, and thorium-232 decay chains. The radionuclides in these decay chains encompass the radionuclides of concern at the West Lake Landfill.

Table 2 also includes the range of radionuclide activity detected in background samples collected by EPA and START during an investigation of the Bridgeton Municipal Athletic Complex (BMAC) (Tetra Tech 2014) as well as in samples collected across the United States and Missouri during a study of naturally occurring radionuclides by Oak Ridge National Laboratory (ORNL) (Mryrick et al 1983). Review of the data shows that nearly all reported radionuclide activities exhibited by the Bridgeton brush fire response soil samples (BBFR-001, -002, and -003) are within the range of radionuclide activities found in the background samples collected for the BMAC investigation and the ORNL study. The one exception is the estimated (J-coded) thallium-208 (TI-208) activity in sample BBFR-003 of 0.496 picoCuries per gram (pCi/g), which is marginally above the maximum TI-208 activity found in the BMAC reference samples of 0.486 pCi/g (TI-208 activities were not reported in the ORNL study). Overall, based on the similar radionuclide activities among the Bridgeton brush fire response samples, the background area BMAC samples, and the ORNL study samples, radionuclide activities exhibited in samples BBFR-001, -002, and -003 appear indicative of naturally occurring background concentrations.

LABORATORY DATA SUMMARY BRIDGETON BRUSH FIRE RESPONSE – BRIDGETON, MISSOURI

Notes:

All units are reported in picoCuries per gram (pCi/g).

- ^a Reference area samples were collected and analyzed during a 2014 study of the Bridgeton Municipal Athletic Complex (BMAC). Values shown are the range of activities at the Blanchette Park and Koch Park reference areas (see Tetra Tech 2014).
- ^b Background radionuclide concentrations in surface soil measured by the Remedial Action Survey and Certification Activities Group of the Health and Safety Research Division at Oak Ridge National Laboratory and reported by Myrick, Berven, and Haywood (see Mryrick et al 1983). Values shown are the range of activities found in samples collected across the U.S. and Missouri.
- J The analyte was positively identified; the associated numerical value is the approximate concentration
- NA Sample not analyzed for this analyte
- ND Not detected
- NS Radionuclide not studied
- U Analyte not detected above the reported sample quantitation limit.

4.0 SUMMARY

On October 24, 2015, the Pattonville Fire Department responded to the report of a small brush fire near the intersection of St. Charles Rock Road and Taussig Road in Bridgeton, Missouri. The fire, caused by sparks from a faulty electrical switch on a utility pole, was found to be on property lying between the Bridgeton Landfill Site and the Westlake Landfill Site, and was quickly extinguished. The burned area was south-southeast of the Westlake Landfill Site OU1 perimeter fence where RIM is known to be buried.

On October 25, 2015, EPA and START performed a screening survey of the burned area by use of radiation monitors (a Ludlum Model 192 gamma radiation screening instrument and a Ludlum 2241-2 digital scalar/ratemeter with a PGM detector probe), and obtained readings consistent with area background levels. The team then collected three soil samples within the burn area that were submitted to Test America in Earth City, Missouri, for analyses for isotopic uranium/thorium, total alpha-emitting radium, and other radionuclides via gamma spectroscopy. Also during the response, EPA mapped the burn area and estimated that its distance from the nearest sub-surface RIM (northwest of the burn area) was approximately 390 feet.

Upon receipt of the soil sampling analytical data from TestAmerica, EPA and START compared the data to previously acquired analytical data from background samples collected during a radiological investigation of the BMAC (Tetra Tech 2014) as well as data from a nationwide study of naturally occurring radionuclides in soil conducted by ORNL. Compared radionuclide activities among the burn area samples and the background BMAC and ORNL study samples were substantially similar, suggesting that radionuclide activities exhibited in samples BBFR-001, -002, and -003 were indicative of naturally occurring background concentrations.

4.1 REMOVAL CONSIDERATIONS

Based on START and EPA's field observations, field screening, and soil sampling during the Bridgeton brush fire emergency response, no removal activities appear warranted.

4.2 PRE-REMEDIAL CONSIDERATIONS

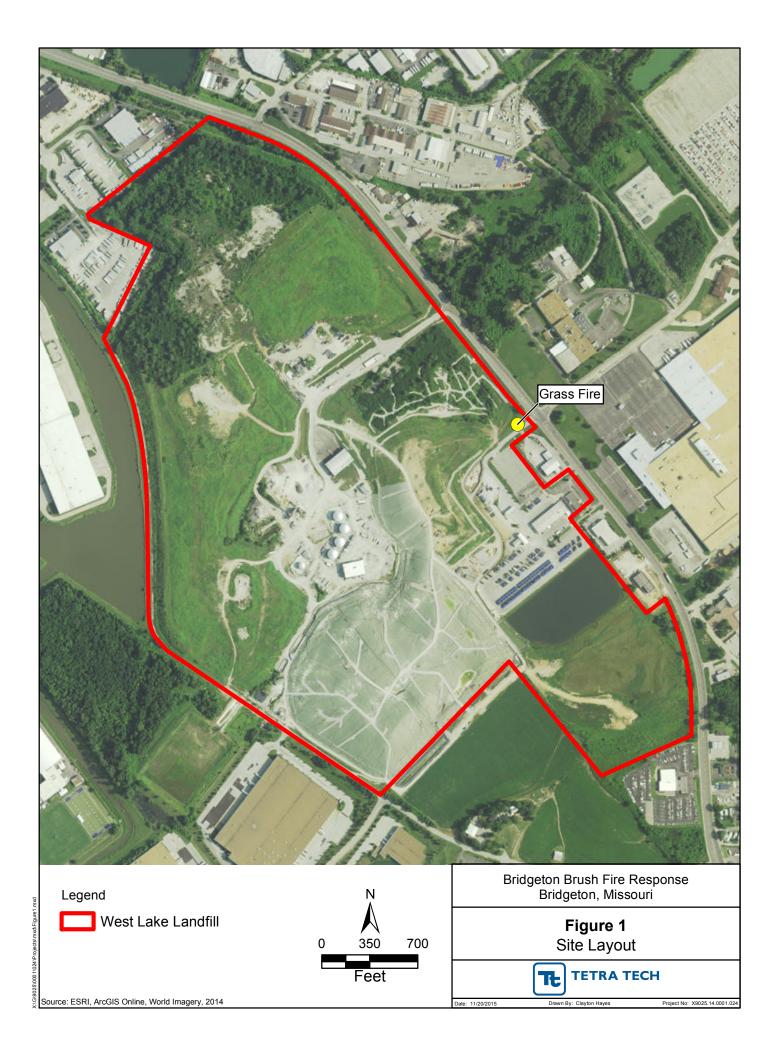

Because no adverse effects on human health or the environment are expected related to the brush fire on October 24, 2015, no pre-remedial activities are warranted at this time.

LABORATORY ANALYTICAL RESULTS WITH DATA VALIDATION REPORT

Tetra Tech, Inc. DATA VALIDATION REPORT LEVEL II

Site:	Bridgeton Brush Fire Response, Bridgeton, Missouri
Laboratory:	TestAmerica Laboratories, Inc. (Earth City, Missouri)
Data Reviewer:	Harry Ellis, Tetra Tech, Inc. (Tetra Tech)
Review Date	December 7, 2015
Sample Delivery Group (SDG):	J14480
Sample Numbers:	BBFR-001, BBFR-002, and BBFR-003
Matrix / Number of Samples:	3 Soil Samples

The data were qualified according to the U.S. Environmental Protection Agency (EPA) Region 7 documents entitled "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review" (9240.1-48), June 2008. In addition, the Tetra Tech document "Review of Data Packages from Subcontracted Laboratories" (February 2002) and the EPA and others document "Multi-Agency Radiological Laboratory Analytical Protocols Manual" (July 2004) were used along with other criteria specified in the applicable methods.

The review was intended to identify problems and quality control (QC) deficiencies that were readily apparent from the summary data package. The following sections discuss any problems or deficiencies that were found, and data qualifications applied because of non-compliant QC. The data review was limited to the available field and laboratory QC information submitted with the project-specific data package.

I, Harry Ellis, certify that all data validation criteria outlined in the above-referenced documents were assessed, and any qualifications made to the data accorded with those documents.

any N. Elis

7 December 2015

Certified by Harry Ellis, Chemist

Date

DATA VALIDATION QUALIFIERS

- U The analyte was not detected above the reported sample quantitation limit.
- **J** The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit, which is estimated.
- **R** The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. Presence or absence of the analyte cannot be verified.

DATA ASSESSMENT

Sample delivery group (SDG) J14480 included three (3) environmental soil samples and no QC samples. Samples were analyzed for gross alpha and beta radiation by EPA SW-846 Method 9310, for uranium isotopes by Department of Energy (DOE) Method A-01-R, for cesium-137 and other gamma-emitters by DOE Method Ga-01-R and (later) for radium-226 by EPA SW-846 Method 9315. The following summarizes the data validation that was performed.

RADIOANALYTICAL ANALYSES

I. Holding Time and Chain of Custody (COC) Requirements

The samples were received by the laboratory and analyzed within the established holding time of 6 months from sample collection to analysis. No data were qualified.

II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

There was insufficient sample for MS/MSD analyses. LCS and duplicate sample analysis provided adequate data on precision and accuracy. No qualifications were applied.

III. Blanks

The laboratory (method) blanks yielded no detectable activities. No qualifications were applied.

IV. Laboratory Control Sample (LCS)

All percent recoveries from the LCS analyses were within established control limits. No qualifications were applied.

V. Surrogates

The uranium isotope and radium-225 analyses use a "tracer", which functions as a surrogate. All recoveries were within QC limits so no qualifications were applied.

VI. Comments

Some detected activities were less than their reporting limits ("RL"). These low-concentration results were qualified as estimated (flagged "J").

VII. Overall Assessment of Data

Overall data quality is acceptable, with no significant qualifications applied. All data are usable as qualified for their intended purposes.

Narrative

CASE NARRATIVE

Client: Tetra Tech EM Inc.

Project: Bridgeton Brush Fire Response

Report Number: 160-14480-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica St. Louis attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/26/2015; the samples arrived in good condition, properly preserved. The temperature of the coolers at receipt was 20.0 C.

GROSS ALPHA AND GROSS BETA RADIOACTIVITY

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Gross Alpha and Gross Beta Radioactivity in accordance with SW-846 Method 9310. The samples were dried on 10/26/2015, and prepared and analyzed on 10/28/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ISOTOPIC URANIUM (ALPHA SPECTROMETRY)

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Isotopic Uranium (Alpha Spectrometry) in accordance with DOE. The samples were dried on 10/26/2015, prepared on 10/27/2015 and analyzed on 10/30/2015.

Job ID: 160-14480-1 (Continued)

Laboratory: TestAmerica St. Louis (Continued)

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CESIUM-137 & OTHER GAMMA EMITTERS (GS)

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Cesium-137 & Other Gamma Emitters (GS) in accordance with DOE GA-01-R. The samples were dried on 10/26/2015, and prepared and analyzed on 10/27/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is = background as measured by a survey meter.</td <td>True</td> <td></td>	True	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Method Summary

Client: Tetra Tech EM Inc. Project/Site: Bridgeton Brush Fire Response

Method	Method Description	Protocol	Laboratory
9310	Gross Alpha / Beta (GFPC)	SW846	TAL SL
A-01-R	Isotopic Uranium (Alpha Spectrometry)	DOE	TAL SL
GA-01-R	Cesium-137 & Other Gamma Emitters (GS)	DOE	TAL SL

Narrative

CASE NARRATIVE

Client: Tetra Tech EM Inc.

Project: Bridgeton Brush Fire Response

Report Number: 160-14480-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica St. Louis attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/26/2015; the samples arrived in good condition, properly preserved. The temperature of the coolers at receipt was 20.0 C.

TOTAL ALPHA RADIUM (GFPC)

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Total Alpha Radium (GFPC) in accordance with SW- 846 Method 9315_Total alpha radium. The samples were dried on 10/26/2015, prepared on 10/28/2015 and analyzed on 10/30/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ISOTOPIC THORIUM (ALPHA SPECTROMETRY)

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Isotopic Thorium (Alpha Spectrometry) in accordance with DOE A01R_Th. The samples were dried on 10/26/2015, prepared on 10/27/2015 and analyzed on 10/30/2015.

Job ID: 160-14480-2 (Continued)

Laboratory: TestAmerica St. Louis (Continued)

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is = background as measured by a survey meter.</td <td>True</td> <td></td>	True	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Client: Tetra Tech EM Inc. Project/Site: Bridgeton Brush Fire Response

Method	Method Description	Protocol	Laboratory
9315	Total Apha Radium (GFPC)	SW846	TAL SL
A-01-R	Isotopic Thorium (Alpha Spectrometry)	DOE	TAL SL

Protocol References:

DOE = U.S. Department of Energy

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

Narrative

CASE NARRATIVE

Client: Tetra Tech EM Inc.

Project: Bridgeton Brush Fire Response

Report Number: 160-14480-3

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica St. Louis attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/26/2015; the samples arrived in good condition, properly preserved. The temperature of the coolers at receipt was 20.0 C. Additional analysis requested per the client and not listed on the CoC.

RADIUM-226 (GFPC)

Samples BBFR-001 (160-14480-1), BBFR-002 (160-14480-2) and BBFR-003 (160-14480-3) were analyzed for Radium-226 (GFPC) in accordance with SW- 846 Method 9315. The samples were dried on 10/26/2015, and prepared and analyzed on 11/30/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Method Summary

Client: Tetra Tech EM Inc. Project/Site: Bridgeton Brush Fire Response
