Clean Water Act Compliance Evaluation Inspection
Tamalpais Community Services District Wastewater Collection System
(Satellite Collection System to Sewerage Agency of Southern Marin
WWTP NPDES No. CA 0037711 and to Sausalito-Marin City Sanitary
District WWTP NPDES No. CA 0038067)

Date of Inspection: August 8, 2007

Inspection team: Rick Sakow, EPA

Max Kuker, PG Environmental

Facility representatives: Robert Bunce

Report prepared by: Max Kuker, PG Environmental

Date prepared: February 11, 2008

Background

On 8/7/2007, USEPA Region 9 and its contractor inspected the Tamalpais Community Services District's (the "District") sanitary sewer system located in the unincorporated county area of Tamalpais Valley, located in southern Marin County, CA (between Mill Valley and Marin City). Spills and sanitary sewer overflows (SSOs) from the sewer system are prohibited by the Clean Water Act. Additionally, spills and SSOs from the District's system are prohibited by Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, WQO No. 2006-0003. The District is an enrollee under the Statewide General Waste Discharge Requirements. Additionally, the Agency is required to comply with the San Francisco Bay Regional Water Quality Control Board's July 2005 Section 13267 of the California Water Code letter that establishes earlier deadlines for submittal of Sewer System Management Plan (SSMP) components than the SSMP deadlines present in WQO No. 2006-003. As such, the Agency must comply with both the Section 13267 letter and WQO No. 2006-003 requirements.

The primary purpose of the inspection was to document the history of sewage spills, determine the adequacy of the District's spill response and prevention programs, evaluate sewer maintenance activities, and assess the accuracy and reliability of its spill reporting procedures. The primary on-site facility representative was Mr. Bob Bunce. Mr. Max Kuker from PG Environmental, LLC led the inspection accompanied by Rick Sakow from USEPA Region 9. The inspection included an interview held within the District's office and a tour of a pump station (Bell Lane Pump Station) located in the District's Municipal Yard. The weather at the time of inspection was sunny.

The District provides sewer, garbage, and parks services to citizens of the unincorporated county areas in Tamalpais Valley. The District's service area encompasses the Tamalpais Valley of Southern Marin County. The District's sewer service area is divided into eight zones based on the configuration of the sewer system. The District has an estimated population of approximately 6,000, with approximately 2,500 households and a small complement of commercial sites. The District is close to full build-out and expects approximately 5-10 new connections per year. According to the District's Sewer System Management Plant (Phase I), the District has approximately 812 maintenance access structures (582 manholes and 230 rodholes).

The District owns and operates approximately 27 miles of gravity sewer pipes, less than one mile of force main, and two pump stations. Two additional pump stations were under construction at the time of the inspection. Approximately 38% of the sewer in the District is located in private easements which has created difficulty in maintaining a large portion of their system, according to District staff. A large percentage of the District sewers are made of clay and were installed in the 1950s and 1960s.

At the time of the inspection, sewage from the entire District, except Kay Park, was pumped south to the Sausalito-Marin County Sanitary District (SMCSD) for treatment and disposal. Discharges from the SMCSD wastewater treatment plant into Richardson

Bay are regulated under NPDES permit No. CA0038067. Sewage from Kay Park, a small subdivision, was pumped north to the Sewerage Agency of Southern Marin (SASM) wastewater treatment plant. Discharges from the SASM wastewater treatment plant into Raccoon Strait (Central San Francisco Bay) are regulated under NPDES permit No. CA0037711.

According to Mr. Bunce, the District is making efforts to inventory their system, investigate possible areas of Inflow and Infiltration (I&I), and identify additional "hot spots." The District entered into a contract with E2, approximately six months prior to the inspection, to close caption circuit televise all 27 miles of their gravity sewer system. The televising is currently in progress, but a completion date was not provided. According to Mr. Bunce the District has also smoke tested many areas of their sewer system twice within the last 29 years.

Mr. Bunce stated that the average dry weather flow was approximately 300,000 gallons per day (gpd) and their average peak wet weather flow was approximately 800,000 gpd, indicating a peaking factor of approximately 2.5 to 3. The District stated that their estimated peak wet weather flow was approximately 1.9 million gallons per day on December 31, 2005 during an extreme wet weather event. The District is billed by the SASM wastewater treatment plant based on the number of connections rather than flow which provides no incentive to reduce I&I. Mr. Bunce stated that the District is currently incorporating a significant I&I review into the sewer televising project.

The District currently and historically has had an un-written agreement with Roto-Rooter for off-hour SSO response. This agreement is for 'on-call' sewer maintenance, blockage, and spill response after hours, on weekends and on holidays. According to Mr. Bunce, approximately 40 percent of all calls to his office to report an overflow or blockage are directed to call Roto-Rooter who investigates and corrects the problem. Roto-Router then provides documentation to Mr. Bunce regarding the volume of the spill, the cause of the spill, and the corrective actions taken to mitigate the spill, along with an invoice for its services.

Under section 301(a) of the Clean Water Act (CWA), it is unlawful for any person to discharge any pollutant from a point source into "waters of the United States" except in compliance with a NPDES permit. The Tamalpais Community Services District does not have an NPDES permit that authorizes the discharge of sewage spills. Therefore, any sewage spill from the District's collection system that flows to "waters of the United States" constitutes a violation of the Clean Water Act.

Attached to this inspection report are the following documents:

- Attachment 1 Tamalpais Community Services District's Annual Budget for Fiscal Years 2005/2006 and 2006/2007;
- Attachment 2 Tamalpais Community Services District's SSO Tracking Sheet;

- Attachment 3 Tamalpais Community Services District's Sanitary Sewer Overflow Report; and
- Attachment 4 Roto Rooter After-Hours, Weekend, Holiday Response Checklist.

Findings

1. Occurrence of spills. Discharges to waters of the United States without a permit are prohibited under Section 301(a) of the Clean Water Act. Additionally, as per Part C.1 Prohibitions of the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems, WQO No. 2006-0003, any spill that results in a discharge of untreated or partially treated wastewater to waters of the United States is prohibited. The District reported seven sewage spills in calendar year 2005, eight sewage spills in calendar year 2006, and eight spills through May 1, 2007 from its collection system to the California Regional Water Quality Control Board. According to the reports, six of seven of the spills in the 2005 reporting period were a result of blockages due to roots, all but one of the eight spills in 2006 were caused by blockages in the system from multiple sources including roots, grease, and multiple unidentified sources, and five of the eight spills reported for the selected period of 2007 were caused by blockages due to roots. Combined, the reported spills total approximately 10,950 gallons with approximately 9,175 gallons reaching waters of the State. All spills listed in this report were reported to the San Francisco Bay Regional Water Quality Control Board via the Regional Water Board's SSO website and within the District's Annual Report. Based on 28 miles of sewers in the Tamalpais Community Services District, the spill rate was 25 spills/100 miles/yr in 2005 and was 28.5 spills/100 miles/yr in 2006. A listing of the reported spills is provided in Table 1 below.

Since May 2007, the District has been required to report all sewage spills to the State Water Resources Control Board via the California Integrated Water Quality System (CIWQS) website. The spills reported to the CIWQS system were not included in this report.

Table 1. Reported Spills from January 1, 2005 through April 30, 2007 from the District's Collection System

Incident Date	SSO Estimated Volume (gal)	SSO Estimated Volume Recovered	SSO Destination	nation Cause of SSO

9/4/2005	100	0	YARD/LAND	BLOCKAGE	ROOTS

2. Failure to maintain adequate records for reported and unreported spills. As per Part B.5 of the Monitoring and Reporting Program (MRP) No. 2006-0003-DWQ, the District is required to maintain records of all SSOs. At the time of the inspection, the District representatives provided a tracking sheet (see Attachment 2) of the spills responded to by the District staff and a separate response log that is prepared by Roto-Rooter for spills responded to by Roto-Rooter staff. The tracking sheet used by the District staff contains only the following information: address, Water Board tracking number, and date of the spill. Mr. Bunce stated that no other forms or field reports are used to document any additional details of the spill, including the start and end times of the spill, cause of the spill, estimated

volume of the spills, etc. Therefore, very little documentation was available to confirm the accuracy of the information submitted to the Regional Water Board regarding spills. The District contracted a vendor to assist them in the development of a Sanitary Sewer Overflow Report form (see Attachment 3) to be used in the field that appears to meet the requirements of the MRP, but the District had not implemented the use of the form at the time of the inspection. The documentation provided to the District by Roto-Rooter (see Attachment 4) does appear to provide adequate field documentation regarding its spill response although it is encouraged that Roto-Rooter implement the use of the District's new Sanitary Sewer Overflow Report form to provide additional information that will assist the District during evaluations of their maintenance and response programs.

3. Failure to contain and mitigate the impacts of an SSO. As per Part D.3 of the State Water Resources Control Board Order No. 2006-0003-DWQ, in the event of a spill, the enrollee shall take all feasible steps to contain and mitigate the impacts of an SSO. The District relies on a verbal agreement with Roto-Router to respond to spills and correct problems which may have caused the spill. Mr. Bunce stated that Roto-Rooter responds to overflows that occur on weekends, after hours, and holidays and account for approximately 40% of the overflows in the District overflows. The average distance between the District and Roto-Rooter in Novato is approximately 20 miles; therefore, it is unlikely that a response time would be less than 30 minutes. Other factors could lengthen the time considerably, e.g., traffic on US 101. According to Mr. Bunce, the response times varies but typically ranges between 30 minutes and 1-hour. During the period from January 1, 2005 through April 30, 2007, the District reported 23 spills totaling approximately 10,950 gallons. The District was only able to recover approximately 1,500 gallons, accounting for 13.7 percent of the total volume.

There is no written or verbal agreement between the District and Roto-Router regarding the maximum response time for SSOs. In addition, the District is limited to tasking Roto-Rooter with small jobs (under \$15,000 for any one project) without procuring the work through a contract with a bid and proposal process. This limitation could possibly prevent the Roto-Rooter from properly responding in the event of a catastrophic spill.

Summary

The information gathered during the inspection indicates a lack of adequate documentation of maintenance and spill records, reporting, and tracking. The lack of this documentation appears to stem from a failure to implement a mechanism to clearly track the operation and maintenance of the sewer system, spills and associated activities, and planning for future maintenance activities. These mechanisms are essential for enabling the District to evaluate its activities to decrease the number or eliminate spills completely from its sewer system. Tracking spills and maintenance is important to identify areas

where increased maintenance may be necessary. For example, the District identified root intrusion as primary cause of spills; tracking root intrusion "hot spots" as well as tracking maintenance activities related to these hot spots will assist the District in preventing future spills. The District does not perform proactive routine maintenance of their overall system. The District has a hand-written "Tamalpais Community Services District Sewer Maintenance Schedule" identifying "hot spots" dated 2000; District personnel stated that this has been updated.

The District is encouraged to augment their current spill data acquisition and tracking to collect information such as the source and mechanism of initial identification of a spill (e.g., resident via government pages listing for Sanitary District) and response time. The District collected some relevant information on a tracking form that was completed by personnel in the office, but the form does not contain enough information to document the specific events of a spill. Better tracking and evaluation of the information would allow for future performance tracking and reporting.

ATTACHMENT 3 Tamalpais Community Services District's Sanitary Sewer Overflow Report

Tamalpais Community Services District Sanitary Sewer Overflow Report *= Required Fields

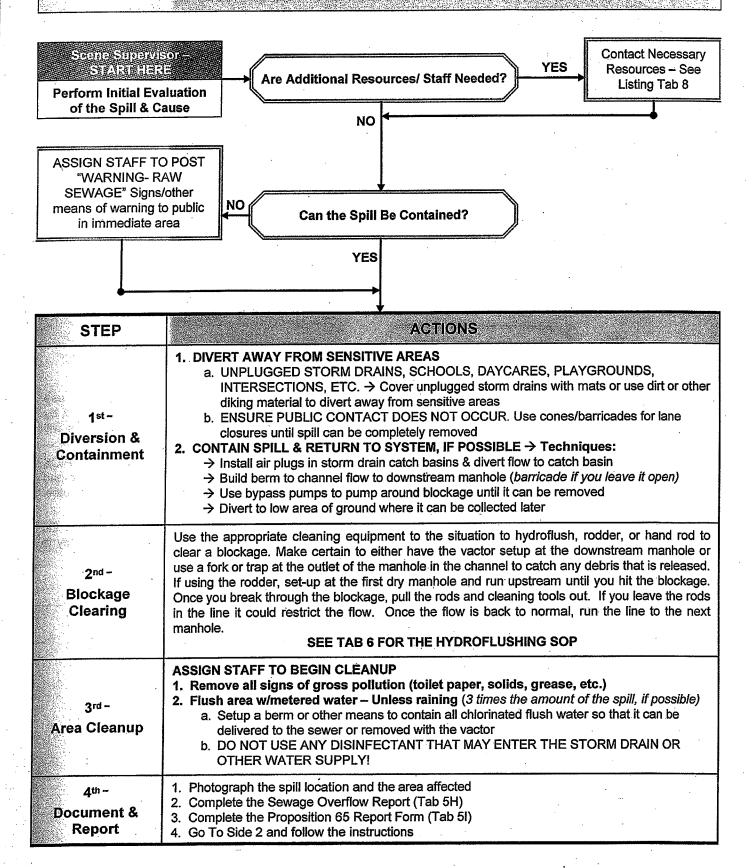

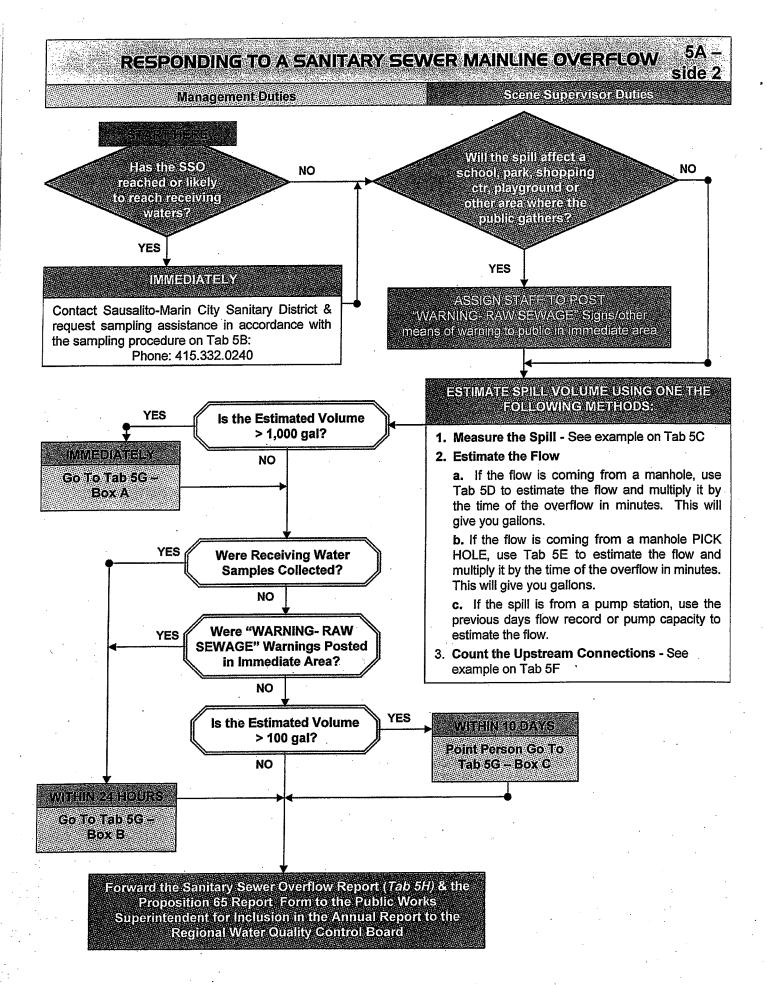

This Report is (check one): ☐ Preliminary ☐ Final ☐ Revised Final
A. SSO OCCURRING TIME Date SSO originally reported:*// SSO Date:*// SSO Time:*:
SSO End Date:*//
SSO Reported To:
SSO Reported By: Phone: Prior 72hours: Supply Weather Cloudy Weather Rainy Weather Rain for Several Days
Weather conditions prior 72 louis. ☐ Suffry Weather ☐ Cloudy Weather ☐ Rain Weather ☐ Rain of Several Bays B. SSO DESCRIPTION SSO Source:* ☐ Manhole- Structure ID#: ☐ Pipe ☐ Clean Out ☐ Pump station ☐ Other
- If Other, please specify:
Final spill destination: * ☐ Storm Drain ☐ Capture in Storm Drain ☐ Building Structure ☐ Yard/Land
□ Street/Curb & Gutter □ Surface Water Impact □ Ground Water Impact □ No Water Involved □ Unknown
Did incident reach State water?* ☐ Yes ☐ No Any Fish Killed?* ☐ Yes ☐ No
Estimate volume spilled:* (in gallons) Method Calculated:
Volume of SSO recovered/contained:* (<i>gal</i>) Volume of SSO discharged to State water:* (<i>gal</i>) Were photos taken? ☐ No ☐ Yes – How many?: C. SSO LOCATION Street address/Site:*
City:*
☐ Animal carcass ☐ Construction Debris ☐ Multiple Causes
- If spill caused by Infrastructure Failure, please specify: □ Breakage of collection system
☐ Damage to collection system ☐ Leaks to collection system ☐ Pump station failure ☐ Multiple causes
- Specify other cause:
E. INCIDENT RESPONSE Visual inspection result of receiving water:*
Were response/corrective actions taken? * □ Yes □ No Were clean-up actions taken? * □ Yes □ No
Were disinfections actions taken? * ☐ Yes ☐ No Were samples collected? * ☐ Yes ☐ No
Any on-going investigation? * □ Yes □ No - If Yes, Please specify completion date:/
- Status: Open Active Open Enforcement Closed
Were health warning posted? ☐ Yes ☐ No # Days warnings posted: Any beach closure? * ☐ Yes ☐ No
Health warning/Beach closure posting/details:
-F
of overflows w/in 1000ft of this location in last 12 months: List dates:
