1.0 INTRODUCTION

This J-1 Range Munitions Source Assessment examines the potential for any remaining Unexploded Ordnance at the J-1 Range to act as a source of groundwater contamination. This analysis is based on lines of evidence collected from literature searches, aerial photographs, range records, and the results of investigation findings and recent munitions clearance activities conducted at the J-1 Range Study Area.

1.1 Background/Purpose of Report

Historical use of the J-1 Range for various military training activities as well as ordnance testing by Defense contractors has resulted in the deposition of significant quantities of munitions, including unexploded ordnance, on the ground surface and within shallow subsurface areas of the range. These items have the potential to cause environmental contamination resulting from the release of munitions constituent compounds to soil and groundwater. The purpose of this report is to provide a summary of munitions investigations and clearance related activities conducted at the J-1 Range and to evaluate the likelihood for residual unexploded ordnance on the range to cause groundwater contamination in the future.

1.2 Report Organization

The report includes a brief summary of results of previous munitions investigations and activities, as well as the results of the recent robotics-based, unexploded ordnance clearance technology demonstration performed in various portions of the range by the Air Force Research Laboratory. Section 1.0 of this report describes the J-1 Range site background, including a brief history of past military activities conducted at the range. Section 2.0 presents the J-1 Range conceptual site model (CSM), including the basis of the site model; the results of munitions investigations; and a discussion of the potential for residual munitions on the range. Section 3.0 provides the report findings.

1.3 Site Description/ History

The J-1 Range is located adjacent to and partially within the Impact Area (Figure 1). The J-1 Range is approximately 2,000 meters long and between 50 and 250 meters wide. The range is oriented southeast to northwest, with the southeastern "uprange" end near Greenway Road and the northwestern "downrange" portion of the range extending several hundred meters beyond Chadwick Road into the Impact Area. There are six large man-made berms located at various distances along the length of the range. Two of the berms are "tunnel" barriers, located toward the southeastern end of the range, and have eight foot diameter concrete culverts buried within them. These were designed to constrain the trajectory of fired rounds, which would pass through the tunnels in their flight toward targets placed in front of steel plate-faced impact berms located 1,000 and 2,000 meters (a and b) downrange. Off-target rounds would be stopped by the tunnel barriers, preventing untargeted downrange flight. A 150 meter berm is located near the 1,000 meter berm. The current layout of the J-1 Range is depicted in Figure 1.

The J-1 Range operated from the 1930s until the late 1980s. The following present a general summary of the historical use and designation of the range:

- 1935 to 1950s – **I Range**; used as an estimation range, rifle range and anti-tank range;

- 1940s to 1950s – **J-1 Transition Range**; used as a small arms range;
- 1957 to late 1980s – **J-1 Contractor Test Range**; used for munitions testing.

Limited data can be found in the *Archive Search Report* (ASR) (USACE, 1999a) on the munitions used up until the time the range transitioned to a Contractor Test Range. Contractor testing on the range from the late 1950s through the mid-1980s included 4.2-inch, 8-inch, 155 millimeter (mm), 105 mm, 81 mm, 60 mm, 40 mm, 37 mm, and 20 mm projectiles, and small caliber ammunitions. Although the munitions fired at the J-1 Range included both practice and high explosive (HE) rounds, available records indicate that the large majority of the items fired were practice rounds that do not contain explosives (USACE 1999a).

A detailed description of military and contractor activities and munitions used during the evolution of the J-1 Range can be found in the *J-1 Range Remedial Investigation/Feasibility Study Report* (2009 pending) and the ASR. More recent investigative activities on the range including intrusive munitions investigations, geophysical surveys, and detailed reconnaissance are discussed in Section 2.0.

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

2.0 RANGE CONCEPTUAL SITE MODEL

The range conceptual site model is a summary of what is known about the natural conditions, range characteristics, munitions use and disposition, and contamination at a site. The conceptual site model integrates the results of available investigations and is used to identify potential contaminant sources, to assist in understanding contaminant fate and transport, and to support the evaluation of potential risk of harm to human health and the environment. The conceptual site model of soil contamination on the range is presented in Section 6.0 of the J-1 Range RI/FS. The conceptual site model developed here focuses on activities conducted on the range and munitions use. Specific findings for disposal, testing, and training activities are supported by evaluation of each round type identified on the range. Range activity-specific conceptual site models are presented in Section 2.3, after a discussion of investigation findings. The investigation findings are synthesized in the development of the CSMs.

J-1 Range is a multi-purpose range where military training, munition testing, and munition disposal occurred. Past munitions use on the J-1 Range mainly involved contractor testing. Military training, pre-dating contractor activities and possibly concurrent with contractor activities, occurred predominantly within the Impact Area, coincident with the downrange (northwest) portion of the range. The items fired consisted of various types and sizes of projectiles and ammunition. Although the munitions included practice and HE rounds, available information suggests that the majority of the items fired were inert practice/test rounds. This conceptualization is supported by records detailed and summarized in the ASR and numerous intrusive investigations conducted in the range, as described below.

Munitions testing on the range included direct fired projectiles (rounds aimed and fired directly at a visible target) and indirect firing (e.g., mortar fire) at downrange targets. Testing activities included direct fire to evaluate penetration and round dispersion at various downrange distances, and fuze function and warhead performance testing. The principal round was the 105 mm High Explosive Anti-Tank (HEAT) munition and Sabot rounds. Similarly, mortar testing and howitzer projectiles (indirect fired munitions) (principally 60 mm and 81 mm mortars, and 105 mm and 8-inch rounds) were fired to test fuze performance and spotting round performance. Site records suggest that contractors routinely collected the test rounds from the floor of the range after firing to conduct performance testing of the fuze and warhead. Other testing, including munition cook-off tests to assess the heat required to detonate various rounds, were conducted on the range. Burning of excess propellant, munitions, and miscellaneous explosive debris was conducted at a steel lined pit and munition disposal occurred at a few locations on the range.

2.1 Basis of the Site Model

The initial general range use conceptual site model was developed based on available data sources including: (1) aerial photographs, (2) range records, (3) field observations, and (4) round characteristics. Insights gained from these data sources are discussed briefly below.

- In all aerial photo years, the predominant vegetation clearance occurred within the current range floor, consistent with descriptions of range boundaries and use as described in the ASR. Impact cratering associated with the Impact Area (northwest of the range) is visible beyond the range footprint, especially in the 1955 photograph;

- Range records and field observations indicate that inert 105 mm projectiles were the predominant munition found in the downrange (Interberm and Impact Area) portion of the range and 60 mm and 81 mm mortars were the predominant round detected in the uprange portion of the range;
- The downrange (northwest) portion of the range footprint as it is known today was constructed on-top of the existing Massachusetts Military Reservation Impact Area.

The conceptual site model was further refined and areas where munitions were encountered were mapped as a result of the investigations described below. The investigation findings provide a more thorough understanding of range use and munition characteristics and distribution and are the basis for assessment of potential residual UXO as presented in Section 2.3. Where appropriate, key findings described in Section 2.2 are used in support of describing range use and are summarized in Section 2.3. The range activity-specific CSMs are described in Section 2.3, below.

2.2 Munitions Investigations

Intrusive munitions investigations at the J-1 Range have occurred since 1999. Disposal pits were found during early well pad clearances. Recently, a robotics munitions clearance technology demonstration was performed by the Air Force Research Laboratory at four J-1 Range berms (150 meter, 1000 meter, 2000 meter (a), and 2000 meter (b)). A brief summary of the munitions investigations are described below. A list of major investigation finds is located in Table 1. It is noted Table 1 does not include incidental munitions recovered during road or well pad clearances. For a list of all MEC and Inert - Post BIP/CDC Determination items found in the range, see Table 2. Table 4 provides the weights of explosives in filler materials.

2.2.1 Munitions Survey Program

The Munitions Survey Program (MSP) was conducted in three phases between 1999 and 2002. MSP investigations at the J-1 Range occurred in Phases I and III. The overall objective of the MSP was to identify sites where munitions and other materials were disposed of, through burial and other means, which may present a threat to human health because of their potential to contaminate groundwater.

The MSP Phase I used airborne magnetometry (AIRMAG) and ground-based geophysical surveys to detect and map various sized surface and subsurface anomalies. The results of the AIRMAG surveys are presented in the Draft *AIRMAG Technology Evaluation Report* (Tetra Tech 2002). While the overall conditions at Massachusetts Military Reservation were not optimal for the detection of ordnance with AIRMAG technology, the surveys did provide valuable information to focus follow-on ground-based studies and were effective in identifying some areas of interest that were later addressed through follow-on investigation.

Ground-based geophysical surveys were conducted in February and March of 2001 using time-domain electromagnetic metal detection technology (EM-61). The geophysical data collected in MSP Phase I was then evaluated to identify anomalous areas. From this interpretation, geophysicists encircled large groupings of anomalies and designated these as “polygons”.

Seventeen polygons were investigated as part of the MSP Phase III field program with the results of these investigations documented in the *Munition Survey Project Phase 3 (MSP3), J-1 Range Report* (USACE 2003). Polygons J1P-1 through J1P-5 were identified in the southern

US EPA ARCHIVE DOCUMENT

portion of the J-1 Range (Figures 2 and 3). These five polygons were located where the firing points for the 1000 meter and 2000 meter berms were located, based on historical references and data interpretation of where mortar disposal areas were suspected. Polygons J1P-6 through J1P-17 were identified in the northern portion of the J-1 Range (Figures 5, 6, and 7). Polygon J1P-6 was located between Tunnel Berm #2 and the 1000 meter berm. Polygons J1P-7 through 16 were sited in the Interberm Area (IBA) where the impact points for the 150 meter and 1000 meter berms and mortar disposal areas were suspected, based on historical references and data interpretation. Polygon J1P-17 was located in the extreme northern portion of the range near the 2000 meter berms. A bulleted summary describing the munitions recovered during the investigation is provided below.

- J1P-1: Two burn pits and two burial pits were discovered within the J1P-1 footprint. Munition items were found in both of the burn pits and included 41- 81 mm mortars (M524), 11- 60 mm mortars (M302), and one fuze (M524). The mortars were blown-in-place (BIP) and a post-BIP determination revealed that all these munitions were inert. The fuze was staged at a safe handling area for disposition. Munitions items were found in both burials pits and included: 200 suspect 81 mm mortars (M374) with no fuzes (brought to Safe Handling Area (SHA)), 76- 81 mm mortars (M374A1) with suspect fuzes (BIP), and three 105 mm projectiles (M51) with suspect fuzes (BIP). All BIP items were determined to be inert filled. All the suspect munitions taken to the SHA were further analyzed using the thermal neutron analysis (TNA) device to verify the filler as inert. Three, 81 mm mortars (M374A1) (with suspect fuzes on two), one 81 mm mortar (suspect fuze, unknown filler), and one fuze (M524) were also uncovered in the polygon and BIP (post-BIP determination: all inert munitions). Four adaptor boosters (M567) with fuzes were disposed of in the Contained Detonation Chamber (CDC);
- J1P-9: One munitions burn pit was discovered. Munitions included propellant grains (CDC) and one M524 fuze (taken to SHA);
- J1P-10: Twelve 105 mm cartridge cases with suspect primers were taken to the SHA and later demilitarized;
- J1P-14 and 15: These two polygons were combined into a single location due to the close proximity and the conditions experienced in the field. Three burial pits were discovered at the polygon. Munitions recovered included: 316- 105 mm cartridge cases (taken to SHA and later demilitarized), ten 105 mm projectiles with suspect fuzes (BIP), eighteen 105 mm (HEAT) rounds (BIP), and one 2.36 inch rocket (BIP). All BIP items were determined to be inert filled.

No munitions were found at any of the other polygons investigated. Additional details of the MSP investigations can be found in the *J-1 Range RI/FS Report* and the *Munition Survey Project Phase 3* (MSP3), J-1 Range Polygon Investigation Report (USACE 2003).

2.2.2 Supplemental Geophysical Anomaly Investigations

After completion of the MSP polygon investigations, 34 additional polygon features (Polygons 18 through 51) were incorporated into a comprehensive, grid-based, investigative approach. The approach considered the increasing amount of soil and groundwater data from other ongoing investigations to complete the soil characterization at the J-1 Range. A total of 53 "grids of concern" were identified in the J-1 Range for further investigation (Figures 2 through 7). These 30 meter by 30 meter grids were prioritized for investigation based on their likelihood to contain potential sources of contamination, the results of previous investigations and items

US EPA ARCHIVE DOCUMENT

found, the available historical data, and the proximity of the anomalies to known areas of contamination and plumes.

The fifty-three (53) grids were categorized into four prioritization groups as detailed in the Priority 1 (17 grids), Priority 2 (6 grids), Priority 3 (12 grids), and Non-Priority (18 grids), Final J-1 Range Supplemental Geophysical Anomaly Investigation Work Plan (ECC, 8/16/05). Intrusive investigations were performed at select areas/locations within the 17 Priority 1 grids (grids H-0, I-0, I-37, I-38, J-0, J-12, J-36, J-37, K-34, K-36, K-37, K-38, K-40, K-41, K-42, K-43, and L-40) (Figures 2, 3, and 6). During the course of field activities, eight "polygons" (Polygons J1-18 through J1-25) were added to the scope of investigation. Intrusive investigations were conducted between July and November 2005. The results of these activities are documented in the *Final J-1 Range Priority 1 Grids Supplemental Geophysical Anomaly Investigation Report – Technical Memorandum* (ECC 2006). A summary describing the munitions recovered during the investigation is provided below.

- Grid I-37: One- 105 mm Projectile (HE, M1) was discovered and BIP (post-BIP determination: explosive filled);
- Grid J-36: A munition burn pit [J36-BNP-001] was uncovered. Munitions removed from this pit included five 30 mm propellant pieces and four M82 percussion primers (presumed live with a small quantity of energetic material) which were disposed in the CDC ;
- Grid K-34: One 81 mm mortar was discovered and subsequently BIP (post-BIP determination: inert filled);
- Grid K-36: A munition burial pit [K36-BLP-001] was identified at Polygon J1-42 (Figure 6). Munitions removed from this pit included multiple electric explosive devices (CDC) and stab detonators (approved off-site disposal facility). A second munition burial pit [K36-BLP-002] was identified at Polygon J1-43. Munitions removed from this pit included an 81 mm mortar (M374)(BIP) and M30 propellant (CDC). A post-BIP determination indicated the mortar was inert;
- Grid K-38: A munition burial pit [K38-BLP-001] was identified during the investigation. Bulk high explosive pellets were found in this pit and disposed in the CDC;
- Grid K-40: One 81 mm mortar (M374) and one 105 mm projectile (HE, M1) were discovered at location J1-45 and BIP (post-BIP determination: both items inert);
- Grid K-41: Two 81 mm mortars (M374) were discovered and BIP (post-BIP determination: both items inert filled);
- Grid I2: A munitions burial pit, I2-BLP-001, was identified at Polygon J1-18 in grid I-2. Rocket motor propellant was found in this pit and disposed in the CDC.

No other munitions were found at any of the other grids investigated.

During the investigation of the Priority 1 grids, J-1 Range EM-61 survey data was being further evaluated using discrimination analysis criteria previously established at the J-2 Range. The analysis used known millivolt (mV) readings and spatial extents from previous geophysical investigations to determine which anomalies may be indicative of burial pits. Details regarding this analysis can be found in the *Draft J-2 Range Supplemental Geophysical Anomaly Investigation Report - J-2 Range Priority 1 Grids Technical Memorandum* (ECC 2005). Based on this analysis, 41 discrimination targets (Locations 1 through 41) were chosen to be investigated in the J-1 Range following completion of the Priority 1 grids (Figures 2 through 8). These targets were intrusively investigated in 2006. A bulleted summary of the munitions recovered is described below.

US EPA ARCHIVE DOCUMENT

- Location 2: One 105 mm (HEAT, M456) projectile was discovered in grid K67 and BIP (post-BIP determination: inert filled);
- Location 4: One 105 mm (HEAT, M456) projectile and one 105 mm (HE, M1) projectile were discovered in grid K66 and BIP (post-BIP determination: both munitions were inert filled);
- Location 16: Four 105 mm (HEAT, M456) projectiles were discovered in grid J15 and BIP (post-BIP determination: all items were inert filled);
- Location 19: One 14.5 mm (Spotter/Trainer, 183A1) projectile (presumed live with a small quantity of energetic material) was discovered in grid J39 and disposed in the CDC;
- Location 32: One 105 mm (HEAT, M456) projectile was discovered in grid I68 and BIP (post-BIP determination: inert filled).

All but one suspect munition from the J-1 Range Supplemental Geophysical investigation that were BIP were determined to be inert (one- 105 mm Projectile (HE, M1) was determined to be explosive filled). All propellant that was disposed in the CDC was assumed to be energetic.

2.2.3 Data Gap Assessment Investigations

In an effort to summarize previous investigations and measure the effectiveness of the associated munitions clearance, a Project Note (ECC 2007) prepared to address potential data gaps in the J-1 Range investigation (J-1 Range Detailed Reconnaissance, EM-61 Survey and Aerial Photo Assessment - Summary and Recommendations (ECC 2007)). The Project Note (PN) also detailed additional fieldwork; these are briefly described in the three sub-sections below.

2.2.3.1 J-1 Range QC Target Investigation

Thirty-three grids (30m x 30m) in the J-1 Range were re-surveyed to measure the effectiveness of previous munitions investigations and retrievals. The selected grids were L1, L2, H2, I2, J36, J37, K35, K36, K37, K38, L38, M38, N38, M39, N39, H38, I38, H39, I39, J39, J40, K40, L40, K41, H41, H42, I41, I42, H35, H36, K27, J15, and J12 (Figure 2, 4, 5, and 6). These grids were staked out and cleared of vegetation that had grown since the original geophysical survey in 2001. The geophysical survey was conducted using an EM-61 MK2 time-domain electromagnetic instrument. Targets in 18 of the 32 grids were selected for intrusive investigation. Two additional grids were later added. Individual targets in these 20 grids (L1, L2, I2, K38, K36, K35, L38, N38, N39, H38, H39, J39, J40, K40, K41, H41, H35, H36, K27, and J12) were labeled as “Areas” with Area 1 always representing the largest geophysical response in the grid. Each target was intrusively investigated.

No munitions were found at 15 of the QC targets investigated. A summary of the munitions recovered at the other 5 is provided below.

- Grid L1: A munitions Burn Pit L1-BNP-001 was discovered at Area 1. A total of 236 Fuzes (M524)(presumed live with a small quantity of energetic material) were disposed in the CDC;
- Grid K27: Three 81 mm mortars (M374) were discovered (two at Area 5 and one at Area 6) and BIP (post-BIP determination: inert items);
- Grid J39: A munitions Burn Pit J39-BNP-001 was discovered at Area 10. A total of 1175-14.5 mm (Trainer/Spotter) projectiles, three M52 point detonating fuzes (presumed live), and one 37 mm cartridge casing (presumed live with a small quantity of energetic material) were found and sent to the CDC;

US EPA ARCHIVE DOCUMENT

- Grid J40: One 105 mm (HEAT, M456) projectile was recovered at Area 4 and BIP (post-BIP determination: inert item); and
- Grid K40: Seven 557 point detonating fuzes (presumed live) and six cartridge actuated devices (presumed live with a small quantity of energetic material) were discovered at Area 2 and disposed in the CDC.

All suspect munitions from the J-1 Range QC Target investigation that were BIP were determined to be inert.

2.2.3.2 J-1 Range Detailed Reconnaissance Investigation

The second component of the data gap investigation was a detailed reconnaissance conducted in early 2007 at J-1 Range in grids M1, M2, M3, M4, L3, L4, K4, K5, I8, and I9 (Figures 2 and 3). The reconnaissance consisted of several Unexploded Ordnance Technicians utilizing magnetometers and recording the spatial extents of responses while noting surface and cultural features. These responses were surveyed with a GPS unit and then plotted on a figure. The response size was based on Unexploded Ordnance Technician's experience and judgment and was put into the corresponding categories: Subsurface A (<6"), B (6"-1'), C (1'-3'), D (3'-6'), E (6'-13'), and F (>13'). The sub-surface anomalies were evaluated and intrusively investigated in two phases of reconnaissance.

The first intrusive phase of the detailed reconnaissance occurred in early April 2007 and consisted of investigating targets in grids I8 and I9. Only one selected location in grid I8 Area 2 contained munitions. Both items were 81 mm mortars with suspect fuzes and were subsequently BIP (post-BIP determination: both mortars were inert).

The second intrusive phase of the detailed reconnaissance occurred in late April and early May 2007. This consisted of investigating targets in L3 and K4 that met the discrimination analysis criteria (applied to the Year 2001 geophysical data). During the course of investigation, grids M1 and part of M0 were recommended for an EM-61 survey (based on previous discoveries in Polygon J1P-1) as well as two targets in K1 that also met the discrimination analysis criteria (applied to the 2001 geophysical data). The reconnaissance identified a munitions burial pit in grid K-4 Area 1 which was labeled K4-BLP-001. Two 81 mm mortars (M374A2E1) (suspect fuzes with a small quantity of energetic material) were discovered and disposed of in the CDC.

The EM-61 survey performed in grids M1 and part of M0 resulted in eight areas being investigated in grid M1. The investigation revealed the presence of a munitions burial pit in grid M1 Area 1, designated as M1-BLP-001. Two munitions, both suspect 105 mm projectiles (HE, M1), were discovered in the pit and were BIP (post-BIP determination: both projectiles were inert filled). In grid M1 Area 6, 32 suspect M51 series fuzes (presumed live with a small quantity of energetic material) were discovered and transported to the CDC for disposition.

All suspect munitions from the J-1 Range Detailed Reconnaissance Investigation that were BIP were determined to be inert.

2.2.3.3 J-1 Range Aerial Assessment Investigation

As the third part of the data gap investigation, an aerial assessment was conducted throughout the J-1 Range using photographs from 1943, 1955, 1966, 1977, 1986, 1991, 1994, and 1997. Locations were chosen based on disturbances noted in the photos and consideration of ASR

US EPA ARCHIVE DOCUMENT

documentation, witness interviews, previous investigations, and site knowledge. Forty-six locations were selected to be investigated in the J-1 Range based on aerial photograph interpretations. A detailed reconnaissance was performed at each of the locations by Unexploded Ordnance Technicians using hand-held magnetometers. The magnetometer responses and features such as old jeep paths, cratering, target control pits, and sparse vegetation were recorded. During these site reconnaissances, seventeen additional features of interest were noted bringing the total number of features to be investigated to 63 locations. While nothing significant was found at the vast majority of locations, several locations contained munitions as described below and shown on Figures 2, 5, 6, and 7.

- Location 44 Area 1: A munitions burial pit (J1APA-BLP-001) was discovered with the following items : 176- 37 mm (T324 E23) projectiles (inert filler with presumed live fuze-CDC), 307- 14.5 mm (Trainer/Spotter) projectiles (unknown filler-CDC), one 105 mm (HEAT M456) projectile (unknown filler-BIP), one 105 mm (HE, M1) projectile (unknown filler-BIP), and one 60 mm mortar (M49A2)(unknown filler-BIP). Another 60 mm mortar, M49A2 (unknown filler-BIP) was found in Area 2. Post-BIP and post-demolition determinations revealed that all items were inert filled;
- Location 59: Three 81 mm mortars (M374)(unknown filler) and one 105 mm (HEAT, M456) projectile (unknown filler) were BIP (post-BIP determination: inert filled);
- Location 55: One 105 mm (HEAT) projectile (presumed live with a small quantity of energetic material) and one 81 mm mortar (unknown filler) were BIP (post-BIP determination: both items were inert filled);
- J-1 Fenced Area: Two 81 mm mortars (M374)(unknown filler) were BIP (post-BIP determination: inert filled);
- J1 H33: One 105 mm (HEAT, M456) projectile (unknown filler) was BIP (post-BIP determination: inert item);
- J1H38: One 81 mm mortar (M43)(unknown filler) was BIP (post-BIP determination: explosive filled);
- J1 H39: 17- 60 mm illumination candles (presumed pyrotechnics) were disposed in the CDC; and
- J1 H40: One partial 105 mm (HE, M1) projectile, (unknown filler) was disposed in the CDC; one 81 mm mortar, (M374) (unknown filler) was BIP, and three M1 propellant bags were disposed in the CDC. The 81 mm mortar was determined to be inert. The propellant was assumed to be energetic.

All but one of the suspect munitions recovered during the J-1 Range Aerial Assessment Investigation that were BIP were determined to be inert. The propellant disposed in the CDC was assumed to be energetic.

2.2.4 Robotics Technology Demonstration

In 2008, a remote-controlled robotic technology demonstration was conducted at several Massachusetts Military Reservation ranges using crews and equipment from Air Force Research Laboratory. The technology demonstration at the J-1 Range involved the removal of soil and munitions from the 1,000 meter, 150 meter and 2,000 meter berms (a and b) using a remotely operated excavator with a rotating, screened (2-inch slot) bucket attachment to separate rocks and any munitions (“overs”) from finer soil materials. These materials were placed into separate stockpiles for further characterization. An EM-61 geophysical survey was conducted on the berm face to evaluate the completeness of the operation. A small number of

US EPA ARCHIVE DOCUMENT

discrete items that remained in each berm were subsequently investigated by Unexploded Ordnance Technicians.

The "overs" stockpile was spread out for Unexploded Ordnance Technicians to sort through and catalogue as munitions, munitions debris or range-related debris. All unexploded ordnance items were moved by remotely operated robotic equipment to a pre-determined area for disposition. The following is a cumulative list of munitions recovered from the four berms that were BIP as part of the multiple J-1 Range consolidated shots:

- Four 155 mm Projectiles (HE, M107)(post-BIP determination: two explosive filled, two inert filled);
- 35 105 mm Projectiles (HE, M1)(post-BIP determination: all inert filled);
- 85 105 mm Projectiles (HEAT, M456)(post-BIP determination: all inert filled);
- One 8-Inch Projectile (HE, M106)(post-BIP determination: inert filled)
- One 83 mm Rocket (unknown model)(post-BIP determination: inert filled);
- Two 81 mm mortars (Illumination)(post-BIP determination: both pyrotechnics filled);
- Six 81 mm mortars (HE, M374)(post-BIP determination: two HE filled, four inert filled);
- Two fuzes (point detonating, M557) (post-BIP determination: both small quantity energetic).

The individual consolidated shots were controlled BIP events used to destroy multiple munitions found during the Air Force Research Laboratory demonstration. The shots followed protocols outlined in the Summary of the Consolidated Shot Procedure for the J-1 Range (IAGWSP, September 22, 2008).

2.3 Activity-Specific Conceptual Site Models

The findings from the munitions investigations summarized above, site background information on range use presented in the ASR and range records, aerial photographs, munition characteristics, and comparison of finds to ground-based geophysics and ground features were used to develop activity-specific conceptual site models for the J-1 Range. These conceptual models reflect the general use patterns and characteristics of the range and locations where munitions were discovered. Field observations detailing munition characteristics and spatial distribution of HE finds, and consideration of published munition use and ballistics information, provide insight on likely areas on the range that may have the potential for residual unexploded ordnance. It is noted that all munitions discussed in the following sections have been removed from the range. There are no known residual HE rounds on the range.

To help conceptualize the three CSMs, areas where munitions were identified were delineated (Figures 9 and 10). This delineation was based on the spatial mapping of inert and HE rounds, qualitative assessment of the distribution and spatial relationship of munitions debris to munition finds, and comparison of finds to ground-based geophysics and ground features. Aerial photographs also helped conceptualize range use areas and relate period land use with the production time frame for specific munitions. The extent of intrusive investigations and the characteristics of those areas not cleared, specifically the geophysical response in these un-cleared areas and proximity to neighboring HE finds, was considered to help assess the likelihood for additional rounds outside the mapped munition use area. The extent of UXO clearance on the range is illustrated in Figure 11 and indicates that there is UXO intrusive finds data coincident with the spine of the range and at the identified high use portions of the range. The geophysical response of areas not investigated and their proximity to neighboring HE finds

US EPA ARCHIVE DOCUMENT

were also taken into account during mapping of the various munition finds areas and during development of the CSMs. The mapping of the munition finds areas and formulation of the CSMs was an iterative process.

The three CSMs were principally constrained by records of site physical activity (e.g., berm, firing point locations, etc.), interpretation of cleared areas in period aerial photographs (e.g., testing activities would only be reflected on post-1957 aerial photos), and corresponding munition finds (Figure 10). The munition use areas within the three CSMs are delineated as polygons or ellipses. The shape of the polygons and orientation of the ellipses is principally controlled by: the pattern of detected munitions and observations on munitions debris distribution; assumptions about target location and munition firing trajectory (e.g., predominantly distributed along the long axis of the range); munition disposal patterns (burial pit distribution); geophysical results; aerial photograph interpretation of vegetation cleared areas; and ground features.

The conceptual site model is based on the concept of three general activities being performed within the J-1 Range boundaries: disposal, testing and training. Military training specific to the J-1 Range occurred from the mid 1930s to the 1950s. This training consisted of estimating distances, tracking and leading moving targets at simulated distances, and firing of small caliber ammunition and M9 grenades. Other training that occurred near the J-1 Range that resulted in munition impacts within the range footprint included indirect firing from neighboring gun and mortar positions. Contractor testing occurred from the mid 1950s to the late 1980s. Testing was performed to evaluate munition dispersions at various distances, fuze and warhead performance, fuze functioning, and interior ballistics and velocity of projectiles (ASR, USACE 1999a). Disposal occurred through burning or direct burials of excess propellants, unexploded ordnance (HE and inert), munitions debris, and range related debris.

Based on investigations to date, historical data, and aerial photograph interpretations, testing, training, and subsequent disposal occurred in the J-1 Range South; testing and disposal occurred in the Interberm Area; and training occurred in the J-1 North or Impact Area (Figure 10). For ease of data presentation and discussion, the Disposal, Testing and Training CSMs are segregated into J-1 South (from the southeast end of the study area northwest to grid 20), IBA (from grid 21 northwest to grid 48), and Impact Area (grid 49 through the north end of the study area in grid 72) (Figure 9).

2.3.1 Disposal Activity CSM

Specific areas have been identified as general disposal areas and munitions burial areas. The majority of burials investigated have been a combination of munitions debris and range related debris. These burials account for the greatest quantity of munitions items found within the J-1 Range. Munitions burials have been found within the J-1 Range South firing line area and within the J-1 Range IBA. Below discusses the specific Disposal Area CSM development within the J-1 Range.

2.3.1.1 J-1 Range South

Based on site documentation, site characteristics and the munitions discovered it appears that this area was used as the firing points for much of the direct and indirect fired munition testing activities on the range. The disposal areas within the J-1 Range South Area are located to the northeast of the firing line area. In addition, a small disposal pit and metal plates were identified in front of the firing line berm. Only one energetic item, LAW rocket propellant, was identified in

US EPA ARCHIVE DOCUMENT

this area. The remainder of items discovered was inert. There is no indication that any additional burials or HE rounds exist in this portion of the range.

A burial area was delineated based on the investigation of several burial pits in the vicinity of the firing points and the geophysical results for the area surrounding the identified burial pits (Figure 12). The delineation is constrained by areas where no burial pits were identified and the lack of notable geophysical response in the surrounding area. This portion of the range had significant disposal activity. This area of the range was the focus of several investigations, geophysical studies, and intrusive clearance actions and there is no indication that any additional burials exist in this portion of the range.

2.3.1.2 J-1 Range IBA

The IBA had the greatest density of rounds within the J-1 Range, with a majority of the rounds found in pits (Figure 13). The predominant rounds found in the burials include 105 mm and 81 mm rounds.

Disposal activity in the IBA is characterized by general disposal and burial areas. These disposals/burials were conservatively mapped to encompass all munitions burials, disposal areas, and burn areas. The predominant inert items found in the disposal area include 105 mm and 81 mm rounds (Figure 13). The boundaries of this area were determined by evaluating and mapping all burials containing multiple quantities of items and all disposal and burn areas. The geophysics results were also used to decipher the likely conservative footprint of disposal in areas where intrusive investigation was limited. It is noted that this portion of the range is one of the most critically investigated portions of Camp Edwards. The various investigations in this portion of the range focused on assessing known disposal and burn areas and large geophysical anomalies.

While mapping multiple quantity burials and disposal areas was the focus of this disposal area, all nearby, single HE item finds are coincidently located within the boundaries of this footprint (Figure 13). The finds within this area principally consisted of munitions debris and range related debris.

This area of the range was the historic source of contamination for the J-1 North groundwater plume. Declines in groundwater contaminant concentrations in wells immediately downgradient of this CSM area suggest that the sources within this area have appreciably attenuated. No other known or suspected sources exist in this area.

The distribution of munitions burial and burn areas within the IBA are illustrated on Figure 13. This area encompasses all multiple quantity munitions burials pits and burn pit areas. The boundaries of this area were determined by evaluating and mapping all burials where multiple quantities of potentially explosive items were encountered and all burn areas. The dominant rounds encountered in this area of the range include 60 mm, 81 mm, and 105 mm munitions. The extent of this area is fully encompassed within the area of the general disposal and burial area.

2.3.1.3 J-1 Range North (Impact Area)

A reported disposal area near the 2000 meter berm was investigated; however, no burials were detected.

US EPA ARCHIVE DOCUMENT

2.3.2 Testing Activity CSM

The testing activity CSM was developed to indicate specific areas within the J-1 Range where testing had occurred. The J-1 Range features indicative of testing activities includes the static firing points, tunnel berms, impact berms and localized impacted mortar areas. Testing activities are generally conducted from a static platform with controlled increment charges, as in the case of testing specific mortar types. A key characteristic of testing activities results in a tighter pattern for impacted rounds as compared to training activities. This also supports the collection of fired rounds. Since munitions were being tested for fuze response, ballistics and other factors, tested rounds were collected for further analysis and evaluations.

The 105 HEAT round was the predominant round tested within the J-1 Range. This round was fired from a static firing position. Two mortar testing areas were identified within the J-1 Range. The finds in these areas indicated a tight spatial density of rounds that would suggest they were fired under a controlled situation. The mortar round model types are newer styles of the 81 mm and 60 mm mortar, M374 and M720, respectively, indicative of contractor testing period activities.

2.3.2.1 J-1 Range South

The J-1 Range South Testing area includes the static firing points, tunnel berms, and one of the localized areas for impacted rounds. Only 81 mm and 60 mm inert rounds were identified in this area.

A clustering of inert 81 mm M374 and 60 mm M720 rounds were discovered in grid 15-18 (Figure 14). The mapped limit of these rounds was based on a qualitative assessment of the spatial relationship among the rounds and the density of rounds in the area. The majority of these rounds was recovered during the initial surface sweep of the J-1 Range and prior to the ground based geophysical survey.

2.3.2.2 J-1 Range North (IBA)

Inert 81 mm, 60 mm and 105 mm HEAT rounds were detected within the IBA. Similar to the 81 mm and 60 mm rounds identified within the J-1 Range South Testing area (as described above), an area of inert 81 mm and 60 mm rounds was identified within the southern end of the J-1 Range IBA. These rounds were discovered in grid rows 29-34 (Figure 15). It is assumed that this area was used for testing indicated by the tight distribution pattern of discovered rounds. The limits of the inert round finds were based on a qualitative assessment of the spatial relationship among the rounds and the density of rounds in the area. In addition, the results of the geophysical survey indicate a high density of small spatial extent anomalies interpreted to be the 81 mm and 60 mm rounds; the geophysics was also used to help demarcate the boundaries of the area.

The delineation of these inert rounds was not meant to capture every round on the range (there are a few inert rounds northwest and southwest of the mapped footprint), however, the area is reflective of the higher density of rounds within grid Rows 29 through 34. This area is characterized by a relatively high density of inert rounds as compared to other locations on the range.

US EPA ARCHIVE DOCUMENT

2.3.2.3 J-1 Range North (2000m Berm)

The J-1 Range North (impact berm) area is the downrange component of the munitions testing that originates near the firing points in the J-1 South area. The area is characterized by impact berms and localized impacted rounds. There was no mappable distribution of HE rounds in the impact berm area (Figure 16).

As discussed above, the 105 mm HEAT round was used solely for testing activities. While the majority of these rounds impacted the backstop berms, they have been found throughout the J-1 Range probably as a result of missing the target or as a result of various testing applications. These inert rounds were not mapped as their occurrence was fairly ubiquitous. All of the 105 mm HEAT rounds were determined to be inert.

2.3.3 Training Activity CSM

There is little site documentation detailing training within the J-1 Range. Round type, age of the rounds, ballistics and round distribution play a role in defining the training areas at the range. In general, the nature of training results in a wider distribution of rounds. Both HE and inert rounds associated with training activities have been found sporadically throughout the J-1 Range footprint and many are likely incidental to the J-1 Range having been fired upon from other ranges/gun and mortar firing points.

2.3.3.1 J-1 Range South

There is little information regarding formal training activities within the J-1 southern portion of the range other than indications from aerial photographs that pop-up targets were used in the 1950s and from inference based on the types of rounds encountered in the range. Training rounds identified within the southern J-1 Range were M9 Grenade (Figures 10 and 17). Understanding of the key characteristics of the training CSM for the J-1 southern area is based primarily on the mapping of projectile distribution. The text below outlines the specific munitions found that are associated with training activities in the J-1 Range southern area.

M9 Grenade HE Area

The distribution of the M9 Grenade is constrained by the areas where no grenades were discovered (Figure 17). This grenade type was used for training and is likely associated with the pop-up targets situated along the north side of the J-1 Range. There is range activity visible in the 1955 aerial photograph that may correspond to this training activity. Three HE M9 grenades were identified during a surface sweep and well pad clearance. It is noted that the one location where investigation/clearance was conducted north of the Range Road (to access a well pad) HE rounds were encountered. In addition, the 1955 aerial photograph suggests that activity did encroach on the north side of Range Road. In October 2009, an additional site investigation was performed in grids J11-17 and K11-17. During the site investigation, six M9 Rifle Grenades were discovered. These items were BIP and determined to be HE. Additional items were found during the investigation, for a list of all MEC and inert items, see Table 1. Section 4.1.1 of the RI/FS contains information regarding BIP sampling protocols. It is anticipated that HE M9 grenades may be found further northeast in grids L12- L17 and M12-17.

US EPA ARCHIVE DOCUMENT

Other Areas

Other round types detected in the J-1 Range South that are likely due to training activities include: 105 mm and 155 mm projectiles (in grid J8). These rounds were not mapped as only a few items were discovered in the range and generally their spatial distributions were random and could not be delineated. A complete list of munitions removed from the range is presented in Tables 2 and 3.

2.3.3.2 J-1 Range North (IBA)

There are very few finds suggestive of training activities in this portion of the range and no mappable distribution of rounds attributable to training activities.

2.3.3.3 J-1 Range North (Impact Area)

The J-1 Range North (Impact Area) area is considered the downrange portion of the J-1 Range and inherently includes those rounds associated with training activities in the greater MMR Impact Area (Figures 10 and 18). Much of the debris discovered at the northwest end of the range is the residue of detonation of 105 mm and possibly 155 mm rounds.

2.4 Residual Unexploded Ordnance

Significant intrusive clearance actions in the range have been conducted in support of the various investigations described in Section 2.2. The investigation of suspect burials, destruction structures (Popper Kettle), various single geophysical anomalies, and investigation and clearance of areas of concern noted in the ASR and during site reconnaissance suggest that the area was well characterized. The extent of investigation in most of these areas was extensive and no known significant munition quantities remain on the range.

Potential burial areas were investigated repeatedly over a decade with many being investigated more than once. It is unlikely that significant uninvestigated burials remain and with very few explosive rounds found in the burials, it is even more unlikely significant explosive rounds remain.

Testing activities used primarily inert munitions and many of those were collected for examination. In addition, the testing impact berms were cleared during the robotics demonstration. Thus it is unlikely any significant explosive rounds remain from testing activities.

It is likely that areas of the J-1 Range within the MMR Impact Area would contain some unexploded ordnance from mortar and artillery firing. There may also be an occasional stray round on other parts of the range as well.

An additional investigation for the M9 grenades was conducted in grid rows/columns J12-17 and K12-17, six additional HE M9 grenades were found. As a result of this area being a former pop-up target area, additional M9 grenades could be found northeast of this area. Based on the distribution and density of rounds found during this investigation, large quantities of HE munitions are not anticipated in the area northeast of this area.

US EPA ARCHIVE DOCUMENT

3.0 FINDINGS

Site background documentation and field clearance activities indicate that the overwhelming majority of rounds fired on the range were inert munitions. An unknown quantity of rounds was likely fired during training activities from firing points outside the J-1 range boundaries. The types of munitions reportedly used and identified in the field include many direct fire and indirect fire rounds including 105 mm, 105 mm HEAT, 81 mm, 60 mm, 8-inch, and several lesser used rounds. The predominant round used was the 105 mm munition and a majority of these are attributable to testing activities. Testing activities focused on fuze testing, projectile testing, perforation assessment, spotting charge evaluation and several static tests such as determining the heat required to detonate various rounds.

Investigation and remediation of the range has been ongoing since 1999 and have resulted in a good understanding of munitions use and likely final disposition. The investigations critically assessed and cleared potential munition burial areas, addressed burn and testing locations, and investigated areas of interest identified in the ASR as well as during numerous site reconnaissance efforts. The investigation activities led to the identification and remediation of the sources of groundwater contamination and unexploded ordnance clearance conducted in support of these investigations and removal actions resulted in the removal of known munitions from the range.

Even though the range was rigorously investigated based on multiple lines of evidence, there will always be some uncertainty as is typical with all environmental investigations. It is noted however, that all potential burials have been investigated and contents removed. Based on the analysis presented in this report, while no new potential burials were identified, there is one localized area on the range that has not been completely investigated and where clearance coverage is limited. This area is north of the Range Road, in the vicinity of grid row/column L12-17 and M12-17.

Investigations in the southern portions of the range (Rows 0 to 6) identified disposal pits, single MEC items and munitions debris. While there is a potential for residual single MEC items, the investigation findings suggest that there is a low likelihood of the presence of uninvestigated MEC burials or the potential for widespread distribution of MEC items.

All large geophysical anomalies in the Southern flyover area (Rows 7 to 29) have been investigated. Large anomalies that still remain are associated with steel plates. Most of the anomalies were related to munitions debris and other metallic debris. There were no disposal pits identified. Some small to medium anomalies still remain, and it is possible that some single 60 mm of 81 mm mortars remain on the range.

Findings in the IBA included disposal pits, MEC items (both HE and inert with live fuzes) and small quantities of raw propellant. Investigations in the IBA included a quality control survey with an intrusive investigation of residual anomalies over most of the area. Therefore, remaining geophysical anomalies are small and scattered and are likely residual munitions debris and other metallic debris. It is unlikely that any subsurface burials still remain in the IBA.

Findings in the northern flyover area (Rows 45 to 64) identified primarily munitions debris. One area of M49 60 mm mortars was identified in grids L51 and L52. There is a potential for additional 60 mm mortars to be present in grids L50 through L54.

US EPA ARCHIVE DOCUMENT

Investigations in the 2,000 meter berm area (Rows 65 to 72) recovered mostly munitions debris and other metallic debris. This area of the range falls within the impact area, and geophysical data indicates that this area is heavily saturated with metallic items. Individual MEC items both HE and inert with live fuzes could still remain in this portion of the range.

NOTES:

IN = Inert
PRJ = Projectile
GRR = Grenade, Rifle
FUZ = Fuze
CDC = Contained Detonation Chamber
CAD = Cartridge Activated Device
BLK = Bulk
SAA = Small Arms Ammunition
RKT = Rocket
PYR = Pyrotechnic
HE = High Explosives; HE includes any munition item with the potential to contain explosives including potential HE items that are later determined to be inert, inert rounds witth live fuzes, etc.

NOTES:

IN = Inert

HE = High Explosives; HE includes any munition item with the potential to contain explosives including potential HE items that are later determined to be inert, inert rounds witth live fuzes, etc.

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

Item	Filler weight
M524 PD fuze	0.00318 Kg RDX
M509 PIBD fuze	0.00742 Kg Tetryl
M51 PD Fuze	0.0235 Kg Tetryl
M525 PD fuze	0.017 Kg RDX
M567 adapter booster	0.023 Kg RDX
M49 60mm HE mortar	0.154 Kg TNT or 0.191 Kg Composition B
M720 60MM HE Mortar	0.157Kg Composition B
M43 81mm HE mortar	0.553 Kg TNT or 0.585 Kg Composition B
M329 4.2 HE inch mortar	3.37 Kg TNT
M1 105mm HE projectile	2.17 Kg TNT or 2.3 Kg Composition B
M374 81mm HE mortar	0.952 Kg of Composition B
T330 30mm HEI projectile	MOX-2B (0.0396 Kg) and RDX (0.0064 Kg).
M181/M182/M183 14.5mm trainer-spotter/smoke composition	0.00648 Kg of zinc chloride
M456 105mm HEAT projectile	0.971Kg Composition B
M760 105MM HE projectile	2.09 Kg TNT
M107 HE Projectile 155mm	6.62 Kg TNT or 6.99 Kg Composition B

1.0 GROUNDWATER MODELS

This appendix describes the development and calibration of the 2007 J-1 Range North and 2009 J-1 Range South groundwater flow and transport models used for the remedial investigations/feasibility study (RI/FS). Groundwater modeling was used to predict the fate and transport of the J-1 Range North and South plumes under ambient (no pumping) conditions and to evaluate active remedial alternatives. The J-1 Range North and South models were also used to migrate historical detections in monitoring wells as part of plume shell development (Appendices K and L).

1.1 J-1 Range North Groundwater Model Development and Calibration

The development and calibration of the J-1 Range North model is presented in the following sections.

1.1.1 J-1 Range North Flow Model Development

The 2001 Air Force Center for Engineering and the Environment (AFCEE) regional model (AFCEE 2002) was used as the basis for development of the J-1 Range North model. The regional model encompasses western Cape Cod, including all of the Massachusetts Military Reservation (MMR) and is the repository for all site characterization data.

1.1.1.1 J-1 Range North Flow Model Domain and Boundary Conditions

The J-1 Range North Model domain and grid is shown on Figure J-1. Constant head boundaries are used on all sides of the model based on the regional model solution. The domain of the model extends from south of Snake Pond, to north of Deep Bottom and Grassy ponds. The eastern boundary is located approximately 4000 feet east of Snake Pond and the western boundary is close to Deep Bottom Pond. Recharge distribution and magnitude are the same as in the 2001 AFCEE regional model and average 32 inches/year.

1.1.1.2 Discretization

Discretization of the J-1 Range North Model domain is shown on Figure J-1. Discretization of the model was designed to allow for long-term transport modeling of the J-1 Range North plume. Discretization is variable with a maximum 400-foot spacing near the boundaries and a minimum 30-foot spacing in the study area. Average layer thickness ranges from 5.9 feet near the water table to 5.1 feet near bedrock. The model has 38 layers with 3,550,492 active cells.

1.1.1.3 Hydraulic Conductivity and Porosity

The J-1 Range North Model is based on the 2001 AFCEE regional model gradational hydraulic conductivity (K) field. Within the model domain, Mashpee Pitted Plan K values range from 65 to 280 feet/day with anisotropy ratios ranging from 3:1 to 25:1. The Buzzards Bay Moraine and Sandwich Moraine K values range from 22 to 150 feet/day

and 39 to 106 feet/day, respectively. Lakes and ponds are represented with hydraulic conductivities of 1,000,000 feet/day. The porosity (0.3) is consistent with previous AFCEE regional and southeast ranges subregional models.

Low-K silt and silty-sand units, described in borehole logs, were incorporated into the J-1 Range North Model based on boring logs from J-1 Range North and surrounding area monitoring wells. The horizontal extents of several of the units are restricted to circular areas around single wells due to the lack of correlation with stratigraphy in nearby wells.

1.1.2 J-1 Range North Model Calibration

The calibration of a groundwater flow model is the process of adjusting model input parameters (K and anisotropy) and boundary conditions (e.g., recharge, stream and drain conductance) to obtain a reasonable match between observed and simulated hydraulic conditions. In practice, this usually involves an iterative process of adjusting hydraulic properties and/or boundary conditions assigned in the model. Several calibration targets were used to insure reasonable calibration of the J-1 Range North flow and transport model.

1.1.2.1 Water Table Configuration

Spatial distribution of monitoring wells and availability of groundwater elevation data were considered in selecting the most appropriate water level data points to use for the J-1 Range North Model calibration. Another consideration was the density of data from the various monitoring events and whether the data were representative of average conditions. Typically, average water level measurements made over an appropriate period, or a synoptic event representative of long-term average conditions, are used during model calibration to represent steady-state conditions.

As a first step in model calibration, the model-predicted water table was compared to observed water tables based on synoptic events from data collected in August 2003 and May 2004, when water levels on western Cape Cod were generally representative of average conditions (Figure J-2). These synoptic data sets have been used during previous model calibrations at the J-1, J-2, J-3 and L-Ranges. A detailed description of these datasets, including locations, survey coordinate data and synoptic water level results are presented in Section 2 and Appendix A of the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007a). Overall, the model-predicted and observed water levels are in general agreement, indicating that the combination of model inputs is reflective of observed water table conditions. This match in water table slope suggests that the model should be a good predictor of groundwater flow directions. The modeled top of mound position is located within the area of top of mound determined for previous synoptic water level events (Figure J-3).

1.1.2.2 Head Residuals

Head residuals, also known as water level residuals, are defined as the difference between observed and model simulated groundwater elevations. Positive residuals indicate that the model is under-predicting the hydraulic head; whereas, negative residuals indicate that the model is over-predicting the head. For the J-1 Range North

US EPA ARCHIVE DOCUMENT

Model, head residuals were calculated for the 2003 and 2004 synoptic events (AFCEE 2002).

The majority of the residuals for both water tables are less than 1 foot within the domain, indicating very good calibration (Figure J-4). Based on these data sets, there is some evidence that the model-predicted gradient is slightly smaller than observed, although it is likely within the normal variation based on the relatively small residual values. Normally, a calibration is considered good if the ratio of the residual standard deviation to the head range is less than 10 to 15 percent (Rumbaugh et al. 1999). The ratio of residual standard deviation (0.56 feet) to the head change across the model (5.5 feet) is 10.1 percent for the 2003 data set, indicating a good calibration. The ratio of residual standard deviation (0.48 feet) to the head change across the model (10.9 feet) is 4.4 percent for the 2004 data set, indicating a very good calibration. Overall, the water table and head residual data indicates the J-1 North Model is well calibrated and suggests it should be a good predictor of groundwater flow conditions.

1.1.2.3 Hydraulic Gradients and Magnitudes

A triangular network of monitoring wells was used to determine hydraulic gradient directions and magnitudes based on groundwater elevation data from the 2004 synoptic event. These gradients were then compared to model-predicted values from the J-1 Range North model (Figure J-5). In general, the model does a good job of matching the observed gradient directions and magnitudes. The largest discrepancies in gradient direction are near the upgradient areas of the plume. In this area, close to the top of mound, gradients are small and slight changes in water levels result in relatively large changes in gradient direction.

1.1.2.4 Plume Trajectory

Particle tracking was also used to verify calibration of the J-1 Range North model. The particle tracking analysis examined the plume trajectory based on forward tracks of particles placed at the water table in the J-1 Range North source area (Figure J-6). The trajectories of the particle tracks were compared to the observed plume outlines. In general, the model matches the plume trajectory well across the length of the plume. It is noted that these are steady-state condition particle tracks and do not represent the transient nature of the flow field due to variable recharge and migration of the top of mound over time. Previous evaluations of the effects of the top of mound migration on plume trajectories have been modeled using a simplified version of the regional model and variable recharge based on 40 years of precipitation data on Cape Cod. These evaluations generally indicate that while the top of mound migration does influence short-term plume trajectories, in general the majority of the plumes remain well within their observed boundaries representative of long-term trajectories and in particular, the J-2 North plume. An example of a previous transient particle tracking evaluation of the J-2 North plume is included in the *Responses to Comments on the Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007b).

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

1.2 J-1 Range South Groundwater Model Development and Calibration

The development and calibration of the J-1 Range South model was based on the 2009 J-1 Range South RDX plume and is presented in the following sections.

1.2.1 J-1 Range South Flow Model Development

Groundwater sampling conducted in 2008-2009 in the downgradient portions of the J-1 South RDX plume indicated the leading edge trajectory of the plume is more southerly than the previously mapped upgradient portion, which is oriented along a northwest-southeast axis. In 2007, prior to the complete delineation of the downgradient portion of the plume, the J-1 South subregional model was calibrated to the southeasterly trajectory of the upgradient portion of the plume. The resulting model-predicted trajectory of the plume was generally to the southeast in both the upgradient and downgradient areas. Before revising the model to reflect a more southerly plume trajectory, potential causes for the change in trajectory were evaluated. These included (1) transient effects of the top of mound position on plume trajectory over time, due to varying precipitation; (2) transient effects of other MMR remedial system operation and in particular, the nearby FS-12 system; and (3) hydraulic conductivity values and distributions. The initial evaluation consisted of transient effects on flow field trajectory only (1 and 2), to determine if hydraulic conductivity changes to the model (3) were necessary.

The evaluations of potential transient conditions on flow field trajectory included the following:

- A particle tracking evaluation of forward particle tracks from the suspected J-1 South source area using a version of the regional model developed in 2004. This model used monthly stress periods to simulate the hydraulic effects of 40 years of varying recharge on the regional flow field and top of mound position/configuration.
- Steady-state versions of the J-1 South parent regional model were simulated with high and low recharge values to determine the potential effect on the trajectory of J-1 South.
- Steady-state versions of the J-1 South parent regional model were simulated with and without the MMR remedial systems operating to determine the potential effect on the trajectory of J-1 South.
- A 24-year simulation of the J-1 South parent regional model with multiple stress periods was conducted. Non-operational conditions for the MMR remedial systems were simulated for the initial 13 years of the model and then each system was incorporated at its approximate startup date through spring 2009.

The results of the transient evaluation indicated that it was unlikely that changes in top of mound position over time could have resulted in the observed plume trajectory at J-1 South and that operation of the MMR remedial systems, and FS-12 in particular, was likely responsible for the more southerly trajectory of the leading edge of the plume. Forward particle tracks from the suspected J-1 South source area in the 24-year simulation of the regional model that incorporated MMR remedial systems over time provided a good match to the observed plume trajectory (Figure J-7). Based on the results of this evaluation, a revised version of the J-1 South Model was developed. The

model domain was enlarged and boundary conditions were inherited from an operational condition parent model with FS-12 operating at its approximate current pumping conditions (360 gpm extraction rate). In addition, to better reflect the hydraulic stresses of FS-12 operation in the model, a modified version of the AFCEE regional model calibrated in 2005 (AFCEE 2006) was used as the parent model for the J-1 South Model. A key characteristic of the AFCEE model is a lower recharge value due to the incorporation of fine-grained units in areas that have not been investigated for hydrostratigraphy. One effect of the lower recharge value is a slightly increased propagation of hydraulic stresses of system operation due to less available water.

Due to differences in model-predicted and observed long-term plume trajectories, modification of the AFCEE regional model was required to serve as the parent model for J-1 South. In addition to including all secondary stratigraphic units defined during previous investigations of the Impact Area, ranges and surrounding areas, modification of the hydraulic conductivity value of the northern section of the Buzzards Bay Moraine was also required. These changes to hydraulic conductivity were not required to achieve a curvilinear flow field for the J-1 South plume.

1.2.1.1 J-1 Range South Flow Model Domain and Boundary Conditions

The J-1 Range South Model domain and grid is shown on Figure J-8. Constant head boundaries are used on all sides of the model based on the operational regional model solution. Future-predicting simulations of plume fate and transport presented in Sections 11 and 14 used the current pumping condition for FS-12 (360 gpm extraction rate). The domain of the model extends from south of Mashpee Pond, to north of Ox Pond. The eastern and western boundaries are located approximately 2,500 feet east of Wakeby Pond and approximately 4000 feet west of Weeks Pond, respectively. Recharge in the model averages 27.5 inches/year.

1.2.1.2 Discretization

Discretization of the J-1 Range South Model domain is shown on Figure J-8. Discretization of the model was designed to allow for long-term transport modeling of the J-1 Range South plume. Discretization is variable with a maximum 500-foot spacing near the boundaries and a minimum 15-foot spacing in the study area. Average layer thickness ranges from 3.7 feet near the water table to 9.2 feet near bedrock. The model has 40 layers with 3,450,880 active cells.

1.2.1.3 Flow Model Parameters

The J-1 Range South Model is based on the 2005 AFCEE regional model gradational K field. Within the model domain, Mashpee Pitted Plan K values range from 70 to 280 feet/day with anisotropy ratios ranging from 3:1 to 25:1. The Buzzards Bay Moraine and Sandwich Moraine K values range from 35 to 146 feet/day and 46 to 127 feet/day, respectively. Lakes and ponds are represented with hydraulic conductivities of 1,000,000 feet/day. The porosity (0.3) is consistent with previous AFCEE regional and southeast ranges subregional models.

US EPA ARCHIVE DOCUMENT

Low-K silt and silty-sand units, evident from borehole logs, were incorporated into the J-1 South Model based on the results of drilling conducted from 2005 to 2007. The low-K units are generally located beneath the plume in the upgradient areas and extend downgradient near Pimlico Pond. In general, the incorporation of these units results in a more southerly trajectory to the J-1 Range South Plume in the model and provided a better match to long-term observed trajectory of the plume.

1.2.2 J-1 Range South Model Calibration

The calibration of a groundwater flow model is the process of adjusting model input parameters (K and anisotropy) and boundary conditions (e.g., recharge, stream and drain conductance) to obtain a reasonable match between observed and simulated hydraulic conditions. Several calibration targets were used to insure reasonable calibration of the J-1 Range South flow and transport model.

1.2.2.1 Water Table Configuration

Spatial distribution of monitoring wells and availability of groundwater elevation data were considered in selecting the most appropriate water level data points to use for the J-1 Range South Model calibration. Another consideration was the density of data from the various events and whether the data were representative of average conditions. Typically, average water level measurements made over an appropriate period, or a synoptic event representative of long-term average conditions, are used during model calibration to represent steady-state conditions.

As a first step in model calibration, the model-predicted water table was compared to observed water tables based on synoptic data collected in August 2003 and May 2004, when water levels on western Cape Cod were generally representative of average conditions (Figure J-9). Overall, the model-predicted and observed water levels are in general agreement, indicating that the combination of model inputs is reflective of observed water table conditions. This match in water table slope suggests that the model should be a good predictor of groundwater flow directions. The modeled top of mound position falls within the area of top of mounds determined for previous synoptic water level events (Figure J-10).

1.2.2.2 Head Residuals

For the J-1 Range South Model, head residuals were calculated for the 2003 and 2004 synoptic events (AFCEE 2002). The majority of the residuals for both water tables are less than 1 foot within the domain, indicating very good calibration (Figure J-11). Based on these data sets, there is some evidence that the model-predicted gradient is slightly steeper than observed, although it is likely within the normal variation based on the relatively small residual values. Normally, a calibration is considered good if the ratio of the residual standard deviation to the head range is less than 10 to 15 percent (Rumbaugh et al. 1999). The ratio of residual standard deviation (0.52 feet) to the head change across the model (9.1 feet) is 5.7 percent for the 2003 data set, indicating a very good calibration. The range of head change in the 2004 data set (3.72 feet) is too small to provide a meaningful statistical indication of model calibration. This is due to the fact that most of the data points are located in the vicinity of the top of mound and not in the

US EPA ARCHIVE DOCUMENT

more downgradient areas of the model domain. Overall, the water table and head residual data indicates the J-1 South Model is well calibrated and suggests it should be a good predictor of groundwater flow conditions.

1.2.2.3 J-1 Range South Hydraulic Response to System Startup

During J-1 Range South extraction, treatment, and infiltration system startup in October 2007, continuous water level measurements were recorded to determine the aquifer response to system operation. These measurements were then compared to model-predicted responses under steady-state conditions. The results of this comparison are presented in the *Final J-1 Range South Groundwater Rapid Response Action 6-Month System Performance Monitoring (SPM) Report* (USACE 2009). The model-predicted and observed drawdown and mounding in the vast majority of the monitoring wells were very similar, with 22 of 27 values having differences of less than 0.10 feet. Although this evaluation was conducted in 2008 using the 2007 J-1 South Model, in general the hydraulic conductivity distributions of both the primary and secondary units are very similar, indicating the 2009 model should also accurately simulate the hydraulic stress of the J-1 South remedial system.

1.2.2.4 Hydraulic Gradients and Magnitudes

A triangular network of monitoring wells was used to determine hydraulic gradient directions and magnitudes based on groundwater elevation data from a November 2005 synoptic event. These gradients were then compared to model-predicted values from the J-1 South model (Figure J-12). The 2005 dataset was selected for this evaluation due to the high density of data points in the J-1 South area. In general, the model does a good job of matching the observed gradient directions and magnitudes, in particular the downgradient effects of Fuel Spill-12 system operation. It is noted the water levels in November 2005 were approximately 2 feet higher than water levels considered average for J-1 Range South.

1.2.2.5 Plume Trajectory

The particle tracking analysis examined the plume trajectory based on forward tracks of particles placed at the water table in the suspected J-1 South source area (Figure J-13). Due to the hydraulic influence of FS-12, the particles were initially simulated in the J-1 South sub-regional model under ambient (non-pumping) conditions for a period of 18 years. The ending locations of these tracks were then used as starting locations for the particles in the J-1 South sub-regional model under operational conditions for the MMR remedial systems for the remainder of the particle track. The trajectory of the particle tracks were compared to the observed plume trajectory. In general, the model represents the plume trajectory well, with the particles initially migrating to the southeast, passing the location of extraction well J1EW0001. Under operational conditions reflective of the MMR remedial system pumping the particles then take a more southerly path and eventually migrate toward Pimlico Pond.

1.0 PLUME SHELL DEVELOPMENT

The J-1 Range North hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) and perchlorate 2008 plume shells, both representative of the respective plume as of May 31, 2008, are discussed in the following sections.

US EPA ARCHIVE DOCUMENT

2.0 DATA COMPILATION AND MIGRATION

Recent and historical perchlorate and RDX observations were obtained by querying the U.S. Army Corps of Engineers Environmental Data Management System (EDMS) database for sampling results from locations in and near the J-1 Range North plume. The analytical results were used as input to the kriging program. The kriging data set included data from groundwater samples collected from monitoring wells and borehole screening samples collected during drilling. The perchlorate kriging data set consisted of 739 analytical results, with a maximum concentration of 66 micrograms per liter (µg/L). The RDX kriging data set consisted of 861 analytical results, with a maximum concentration of 36.5 µg/L.

The historical data were migrated to their probable current coordinates using the J-1 North model with particle trajectories calculated using Modpath (USGS 2003). These migrated older data represented current conditions, provided a more complete (greater spatial distribution) data set from which to construct the contaminant shells, and filled-in spatial gaps in the data coverage. The data were migrated without degradation, retardation, or dispersion, thus concentrations were unchanged from the sample values.

The data were segregated by sampling date into thirteen migration-period groups ranging from October 2002 to June 2008. The analytical results used as kriging input are presented in Table K-1 as recent (unmigrated) and migrated locations. For each location- and migration-period-specific group, if a location was sampled more than once, only the highest-concentration observation was retained in the data set.

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

3.0 ASSIGNMENT OF CONTAMINANT CONCENTRATIONS TO A 3-D GRID

The following discussion is only a brief summary of the kriging method. A more thorough description of the kriging method is provided in the Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study (ECC 2007).

3.1 Software

Kriging was performed using an extended version of the *KT3D* module of GSLIB (Deutsch and Journel 1998), revised to estimate concentrations around single points in a manner consistent with kriging, which requires two or more points.

3.2 Kriging the Plume Shell

The contaminant concentration data were mapped to the kriging grid using the revised *KT3D* program. Kriging zones were developed to fit the kriged concentration fields to the conceptual model of the plume. Plan-view outlines were constructed for these zones, as illustrated in Figure K-1.

Groundwater flow directions in plan view are effectively uniform to the north-northwest over the area of the J-1 North plume. Groundwater flow directions vary in the vertical direction along the length of the plume, with a greater downward component at the trailing edge, trending closer to horizontal about midway through the longitudinal extent of the plume and beyond. Changes in the flow field were implemented by using zone-specific sets of kriging input parameters and associated masking arrays (masks). The differences in flow field were represented by generalized kriging search ranges (longitudinal, transverse, and vertical), which were based on flow trajectories (azimuth and dip) for each distinct zone.

Control points (artificial location-concentration data) were used to fill gaps between widely-separated measured and migrated observations. The J-1 Range North RDX and perchlorate 2008 plume shells are shown in plan view in Figure K-2. The control points were adjusted until the resulting contaminant shell fit the conceptual model of known data as closely as possible and hydrologically plausible. Groundwater transport model input includes all concentrations, without restriction by a concentration cut-off. Table K-2 summarizes the mass and volume of the plume shells.

The perchlorate mass associated with concentrations greater than 2 µg/L is 19.84 pounds (lb). The volume of contaminated groundwater in the J-1 Range North perchlorate 2008 plume shell with perchlorate concentrations greater than 2 µg/L is 24.4 by 10^6 $feet^3$. The perchlorate mass associated with concentrations greater than nondetect (0.35 µg/L) is 21.41 lb. The volume of contaminated groundwater in the J-1 Range North perchlorate 2008 plume shell with perchlorate concentrations greater than 0.35 µg/L is 49.9 by 10^6 $feet^3$.

The dissolved RDX mass associated with concentrations greater than 2 µg/L is 5.52 lb. The volume of contaminated groundwater in the J-1 Range North RDX 2008 plume shell

with RDX concentrations greater than 2 µg/L is 15.2 by 10^6 $feet^3$. The RDX mass associated with concentrations greater than nondetect (0.25 µg/L) is 7.79 lb. The volume of contaminated groundwater in the J-1 Range North RDX 2008 plume shell with RDX concentrations greater than 0.25 µg/L is 60.8 by 10^6 $feet^3$.

US EPA ARCHIVE DOCUMENT

4.0 SOURCES OF UNCERTAINTY

There are several sources of uncertainty that contribute to the overall uncertainty in the contaminant shell, including the spatial and temporal distribution of the initial data sets, the migrated data sets, the kriging process, use of control points, masking and alternate specification of the plume boundaries, and the assumed porosity. All of these sources of uncertainty are discussed in the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007). The limited horizontal and vertical density of observations in the downgradient portion of the J-1 Range North plume shells is a specific area of uncertainty. The downgradient extent of the plume shells were estimated based on migrated data, observations from other Massachusetts Military Reservation plumes, and professional judgment.

US EPA ARCHIVE DOCUMENT

5.0 MAPPING OF CONTAMINANT SHELLS TO THE TRANSPORT MODEL GRID

The 3-D concentrations created by *KT3D* (kriging of a 3-dimensional rectangular grid) for the J-1 North 2008 plume shells were re-gridded to the J-1 Range North model grid to define the initial conditions for contaminant transport modeling. A summary of initialization of the plume shells into the model grid is provided in the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007).

Table K-2 summarizes the J-1 North 2008 plume shells. These data include the percent mass retained for plume shells following re-gridding of each shell to the model grid. The methods applied during plume shell development and the comparison with current understanding of the plume support the use of the J-1 Range North perchlorate and RDX 2008 plume shells as a representation of the plumes as of 2008.5 (31 May 2008).

TABLE K-2
J-1 Range North 2008 Plume Shells Summary

Shell	Concentration [1] Cut-Off (µg/L)	Plume Water Volume [2, 3] (10^6 ft^3)	Maximum Concentration in Plume Shell [4] (µg/L)	Maximum Concentration in Model Grid (µg/L)	Total Mass in Plume Shell [5] (pounds)	Mass Above Cut-Off in Plume Shell (pounds)	Dissolved Mass in Model Grid (pounds)	Fraction of Mass in Model Grid [6] (percent)
RDX	2.00	15.2	41.3	39.9	8.00	5.52	8.00	99.91%
RDX	0.60	40.1	41.3	39.9	8.00	7.26	8.00	99.91%
RDX	0.25	60.8	41.3	39.9	8.00	7.79	8.00	99.91%
Perchlorate	2.00	24.4	75.0	71.0	21.63	19.84	21.63	100.00%
Perchlorate	0.35	49.9	75.0	71.0	21.63	21.41	21.63	100.00%

Notes:

[1] represents the lowest concentration for which volume and mass are calculated

[2] above the specified concentration cut-off

[3] assumes a porosity of 30 percent

[4] maximum concentration after the plume shell was krieged

[5] includes modeled mass below the specified concentration cut-off

[6] mass in model grid relative to total mass in plume shell, rather than the mass above the specified concentration cut-off

ft^3 = cubic feet

RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine

µg/L = micrograms per liter

1.0 PLUME SHELL DEVELOPMENT

The J-1 Range southern hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) 2010 plume shell, representative of the plume as of January 01, 2010, is discussed in the following sections.

2.0 DATA COMPILATION AND MIGRATION

Recent and historical RDX observations were obtained by querying the U.S. Army Corps of Engineers Environmental Data Management System (EDMS) database for sampling results from locations in and near the J-1 Range southern RDX plume. The analytical results were used as input to the kriging program. The kriging data set included data from groundwater samples collected from monitoring wells and borehole screening samples collected during drilling. A total of 405 analytical results were used, with a maximum attenuated RDX concentration of 67.6 micrograms per liter (µg/L).

The historical data were migrated to their probable current coordinates using the J-1 South model, with particle trajectories calculated using *Modpath* (USGS 2003). These migrated older data represent present conditions (January 2010), provide a more complete (greater spatial distribution) data set from which to construct the contaminant shells, as well as filled-in spatial gaps in the data coverage. All data used to develop the plume shell that was older than one year was attenuated based on previous studies at the J-3 Range and model-predicted decreases in concentration using the Southeast Range transport model. Additional discussion of the method employed to attenuate the concentrations is provided below.

All of the data was migrated a number of days based on the difference between the representative plume shell date of January 01, 2010 and its original sample date. The analytical results used as kriging input are presented in Table L-1.

To attenuate concentrations within the core zone of the plume, a combination of model-predicted and observed data was used. The Southeast Range transport model was used to determine annual decreases in concentrations along individual flow paths with no active pumping. Particles in the model were placed in a variety of locations, including the core and edges of the J-3 plume. Concentrations at the yearly positions of the particles were determined for the initial five years of the simulation. The decrease in concentrations was tabulated as a percentage of the initial value to determine an appropriate value of attenuation for the plume shell core data. However, the initial decrease in concentrations is likely affected disproportionately by numerical dispersion in the model, which results in an overestimation of the percentage of attenuation for the first year. Therefore, the attenuation applied to concentrations measured between 1 and 2 years prior to January 2010 was conservatively reduced by 20 percent, based on the results of an attenuation study at the J-3 Range (ECC 2008), which indicated an average annual decrease in concentrations along a flow path of 20 percent, primarily due to dispersion. This was significantly lower than the average first-year model-predicted

decline in concentrations of 33 percent. For years 2, 3, 4 and 5, the average model-predicted decreases in concentration were applied to the observed data. The resultant attenuation rate that was applied to the migrated data of the plume is as follows: a 20 percent decrease in concentrations for 1-year old data, a 40 percent total decrease in concentrations for 2-year old data, a 48 percent total decrease in concentrations for 3-year old data, a 52 percent total decrease in concentrations for 4-year old data, a 55 percent total decrease in concentrations for 5-year old data.

After migration of the historic data, several observed values were removed from the data set after the migrated particles were captured by extraction well J1EW0001. These included several of the higher concentration data points from DP-389, DP-391, DP-384, DP-507, MW-398 and MW-488. The highest analytical result (migrated or unmigrated) included in the final dataset used for plume krigging was an attenuated value of 67.6 µg/L (based on an unattenuated original value of 130 µg/L) observed at monitoring well MW-398M2 in February 2006. A value of 57.6 µg/L at monitoring well MW-398M2 was removed from the dataset during early plume shell development due to conflicts with the plume conceptual model. The migrated data point was located in the vicinity of monitoring well MW-481, in which the most recent detection was 4.75 µg/L.

3.0 ASSIGNMENT OF CONTAMINANT CONCENTRATIONS TO A 3-D GRID

The following discussion is only a brief summary of the kriging method. A more thorough description of the kriging method is provided in the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007).

3.1 Software

Kriging was performed using an extended version of the *KT3D* module of GSLIB (Deutsch and Journel 1998), revised to estimate concentrations around single points in a manner consistent with kriging, which requires two or more points.

3.2 Kriging the Plume Shell

The contaminant concentration data were mapped to the kriging grid using the extended *KT3D* program. Kriging zones were developed to fit the kriged concentration fields to the conceptual model of the plume. Plan-view outlines were constructed for these zones, as illustrated in Figure L-1.

Groundwater flow directions in plan view are to the southeast from the source area of the J-1 Range southern RDX plume to about the MMR boundary area, where flow is slightly more southerly. Changes in the flow field were implemented by using zone-specific sets of kriging input parameters and associated masking arrays (masks). The differences in flow field were represented by generalized kriging search ranges (longitudinal, transverse, and vertical), which were based on flow trajectories (azimuth and dip) for each distinct zone.

US EPA ARCHIVE DOCUMENT

Control points (artificial location-concentration data) were used to fill gaps between widely-separated measured and migrated observations. The J-1 Range southern RDX 2010 plume shell is shown in plan view in Figure L-2. The control points were adjusted until the resulting contaminant shell fit the conceptual model of known data as closely as possible and hydrologically plausible. Groundwater transport model input includes all concentrations, without restriction by a concentration cut-off. Table L-2 summarizes the mass and volume of the plume shell at concentration cut-offs of 2, 0.6, and 0.25 µg/L.

The dissolved RDX mass associated with concentrations greater than 2 µg/L is 0.54 kilograms (Kg). The volume of contaminated groundwater in the J-1 Range southern RDX 2010 plume shell with RDX concentrations greater than 2 µg/L is 2.9 by 10^6 $feet^3$. The RDX mass associated with concentrations greater than nondetect (0.25 µg/L) is 0.72 Kg. The volume of contaminated groundwater in the J-1 Range southern RDX 2010 plume shell with RDX concentrations greater than 0.25 µg/L is 10.0 by 10^6 $feet^3$.

4.0 SOURCES OF UNCERTAINTY

There are several sources of uncertainty that contribute to the overall uncertainty in the contaminant shell, including the spatial and temporal distribution of the initial data sets, the migrated data sets, the kriging process, use of control points, masking and alternate specification of the plume boundaries, and the assumed porosity. All of these sources of uncertainty are discussed in the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007). The limited horizontal and vertical density of observations downgradient of MW-481 required the addition of more control points than elsewhere. The applied attenuation rate was also a source of uncertainty.

5.0 MAPPING OF CONTAMINANT SHELLS TO THE TRANSPORT MODEL GRID

The 3-D concentrations created by *KT3D* (kriging of a 3-dimensional rectangular grid) for the J-1 Range southern RDX 2010 plume shell were re-gridded to the J-1 Range southern model grid to define the initial conditions for contaminant transport modeling. A summary of initialization of the plume shell into the model grid is provided in the *Draft J-2 Range Groundwater Remedial Investigation and Feasibility Study* (ECC 2007).

Table L-2 summarizes the J-1 Range southern RDX 2010 plume shell. These data include the percent mass retained for plume shells following re-gridding of the shell to the model grid. The methods applied during plume shell development and the comparison with current understanding of the plume support the use of the J-1 Range southern RDX 2010 plume shell as a representation of the plume as of 2010.0 (January 01, 2010).

TABLE L-1
J-1 Range Southern 2010 Plume Shell Measured and Migrated Locations

Location	Matrix	Date	Easting (NAD83 UTM meters)	Northing (NAD83 UTM meters)	Elevation (ft msl)	Concentration (µg/L)*	Analyte	Qualifier	Detection Limit (µg/L)	Migration Duration (Days)
XXFS1290WT19	WG	06/21/06	373948.52	4617274.30	61.00	ND	RDX	U	0.094	1290

Notes:
* - concentrations may be attenuated based on age.
ft = feet
J = estimated result
msl = mean sea level
NA = not available
NAD83 = North American Datum of 1983
ND = nondetect, replaced with 0.00 µg/L for kriging
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
U = no detection
UTM = Universal Transverse Mercator projection
WA = borewater sample
WG = groundwater sample
µg/L = micrograms per liter

TABLE L-2
J-1 Range Southern 2010 Plume Shell Summary

Shell	Concentration [1] Cut-Off (µg/L)	Plume Water Volume [2, 3] (10^6 ft^3)	Maximum Concentration in Plume Shell [4] (µg/L)	Maximum Concentration in Model Grid (µg/L)	Total Mass in Plume Shell [5] (Kg)	Mass Above Cut-Off in Plume Shell (Kg)	Dissolved Mass in Model Grid (pounds)	Fraction of Mass in Model Grid [6] (percent)
RDX	2	2.9	60	55	0.73	0.54	0.73	100.00%
RDX	0.60	7.4	60	55	0.73	0.69	0.73	100.00%
RDX	0.25	10.0	60	55	0.73	0.72	0.73	100.00%

Notes:

[1] represents the lowest concentration for which volume and mass are calculated

[2] above the specified concentration cut-off

[3] assumes a porosity of 30 percent

[4] maximum concentration after the plume shell was krieged

[5] includes modeled mass below the specified concentration cut-off

[6] mass in model grid relative to total mass in plume shell, rather than the mass above the specified concentration cut-off

ft^3 = cubic feet
Kg = kilograms
RDX = hexahydro-1,3,5-trinitro-1,3,5-triazine
µg/L = micrograms per liter

TABLE M-3
J-1 Range North Groundwater Alternative 2
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Site prep/UXO Support/Restoration-well area	3	WELL	$ 50,000	$ 150,000		Per well cluster.	
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500			
Monitoring Well Drilling	3	EA	$ 95,000	$ 285,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster will include three screens.
IDM	3	LS	$ 5,000	$ 15,000			
Surveying	3	LS	$ 1,200	$ 3,600			
SUBTOTAL					$ 475,100		
Overhead & Support	1	LS		$ 47,510			
TOTAL					$ 522,610		
TOTAL ESCALATED					$ 576,178	Escalated from 2008.	
ANNUAL COSTS - ANNUAL GROUNDWATER MONITORING							
Monitoring and Reporting	1	LS	$ 59,872	$ 59,872			Beginning in 2015, scope of monitoring decreases by 5 percent every 2 years. After 2080, the decrease in the monitoring program is ceased.
Overhead & Support	1	LS		$ 5,987			
TOTAL				$ 65,859			
TOTAL ESCALATED					$ 72,610	Escalated from 2008.	
CAPITAL COSTS - WELL ABANDONMENT							
MW cluster abandonment	1	LS	$ 81,700	$ 81,700			3 well clusters a day, 16.3 days
Overhead & Support	1	LS		$ 8,170			
TOTAL					$ 89,870		
TOTAL ESCALATED					$ 99,082	Escalated from 2008.	
DIRECT COSTS - SITE CLOSEOUT REPORT

TABLE M-5
J-1 Range North Groundwater Alternatives 3a and b
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - TREATMENT SYSTEM DESIGN, CONSTRUCTION AND STARTUP COSTS							
Extraction Well Installation Mobilization							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		Includes NHESP fee.	
Engineering							
Modeling/design	1	LS	$45,000	$ 45,000		Wellfield modeling; pump design.	
System Engineering Design	1	LS	$45,000	$ 45,000		Includes engineering design for the pipeline, trench, new treatment units, and startup engineering.	
Extraction Well Construction							
Site prep/UXO Support/Restoration-well area & Pipeline Run	1	WELL	$ 203,250	$ 203,250			
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation	1	EA	$ 350,000	$ 350,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	
SPM Well Drilling	1	EA	$ 95,000	$ 95,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	1	LS	$ 5,000	$ 5,000		1 EW and 1 SPM well cluster.	
EW pump, motor & assoc. materials	1	WELL	$ 22,361	$ 22,361		Includes installation.	Maximum design flow will be 125 gpm.
Pit less adapter	1	WELL	$ 5,000	$ 5,000		Includes installation and mechanical work.	
Access Roads - Clear & Grub	21,000	SF	$ 0.30	$ 6,300		Clearing and grubing access road from the plant to the EW.	
Access Roads - Grade & Fill	2,100	LF	$ 35	$ 73,500		Access roads to extraction wells and infiltration trench.	
Pipe Installation	2,100	LF	$ 33	$ 69,300		Includes labor and materials for influent piping, Assumes no UXO construction support required per USACE.	
Power, electric, communications, Overhead	4,700	LF	$ 75	$ 352,500		From Greenway Road to plant.	
Power, electric, communications, U/G	1,750	LF	$ 100	$ 175,000		From plant to extraction well.	
Surveying	2	LS	$ 1,200	$ 2,400		Extraction wells and SPM wells.	
125 gpm stand-alone treatment system	1	LS	$ 300,000	$ 300,000		Includes all equipment, materials, labor, subcontracts, overhead, fee, etc.	
Infiltration Trenches	1	EA	$ 35,000	$ 35,000			
SUBTOTAL					$ 1,806,111		
Overhead & Support				$ 180,611			
TOTAL					$ 1,986,722		
TOTAL ESCALATED					$ 2,190,361	Escalated from 2008.	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		Includes NHESP fee.	
Site prep/UXO Support/Restoration-well area	3	WELL	$ 50,000	$ 150,000		Per well cluster.	
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500

Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
Monitoring Well Drilling	3	EA	$ 95,000	$ 285,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	3	LS	$ 5,000	$ 15,000			
Surveying	3	LS	$ 1,200	$ 3,600			
SUBTOTAL					$ 475,100		
Overhead & Support	1	LS		$ 47,510			
TOTAL					$ 522,610		
TOTAL ESCALATED					$ 576,178	Escalated from 2008.	
CAPITAL COSTS - BASELINE HYDRAULIC MONITORING							
Baseline Performance and Environmental Sampling							
New EW	1	LS	$ 35,000	$ 35,000			
Baseline Report	1	LS	$ 65,000	$ 65,000			
SUBTOTAL					$ 100,000		
Overhead & Support	1	LS		$ 10,000			
TOTAL					$ 110,000		
TOTAL ESCALATED					$ 121,275	Escalated from 2008.	
CAPITAL COSTS - SYSTEM AND WELL ABANDONMENT							
MW cluster abandonment	1	LS	$ 73,300	$ 73,300			3 well clusters a day, 14.6 days.
EW abandonment	2	WELL	$ 10,000	$ 20,000			
SUBTOTAL					$ 93,300		
Overhead & Support	1	LS		$ 9,330			
TOTAL					$ 102,630		
TOTAL ESCALATED					$ 113,150	Escalated from 2008.	
ANNUAL COSTS - OPERATIONS AND MAINTENANCE							
Treatment System	1	YR	$ 420,000	$ 420,000		125 gpm	
SUBTOTAL					$ 420,000		
Overhead & Support	1	LS		$ 42,000			
TOTAL					$ 462,000		
TOTAL ESCALATED					$ 509,355	Escalated to 2008.	
ANNUAL COSTS - ANNUAL GROUNDWATER MONITORING							
Monitoring and Reporting	1	LS	$ 110,706	$ 110,706			Beginning in 2018, annual cost decreases by 10 percent every 2 years.
Overhead & Support	1	LS		$ 11,071			
TOTAL					$ 121,777		
TOTAL ESCALATED					$ 134,259	Escalated from 2008.	
DIRECT COSTS - SITE CLOSEOUT REPORT							
Report	1	LS	$ 60,000	$ 60,000			
Overhead & Support				$ 6,000			
TOTAL					$ 66,000		
TOTAL ESCALATED					$ 69,300	Escalated from 2008.

Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Engineering							
Modeling/design	1	LS	$60,000	$ 60,000		Wellfield modeling; pump design.	
System Engineering Design	1	LS	$70,000	$ 70,000		Includes engineering design for the pipeline, trenches, tying into new treatment units, and startup engineering.	
Extraction Well Construction							
Site prep/UXO Support/Restoration-well area & Pipeline Run	2	WELL	$ 145,000	$ 290,000			
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation	2	EA	$ 350,000	$ 700,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	
PME Well Drilling	2	EA	$ 95,000	$ 190,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	2	LS	$ 5,000	$ 10,000		1 EW and 1 SPM well cluster.	
EW pump, motor & assoc. materials	2	WELL	$ 22,361	$ 44,723		Includes installation.	Maximum design flow will be 125 gpm.
Pit less adapter	2	WELL	$ 3,898	$ 7,796		Includes installation and mechanical work.	
Access Roads - Clear & Grub	27,300	SF	$ 0.30	$ 8,190		Clearing and grubing access road to the wells.	
Access Roads - Grade & Fill	3,500	LF	$ 35	$ 122,500		Access roads to extraction wells and infiltration trench.	
Pipe Installation	3,500	LF	$ 33	$ 115,500		Includes labor and materials for influent piping.	
Power, electric, communications, Overhead	4,700	LF	$ 75	$ 352,500		From Greenway Road to plant.	
Power, electric, communications, U/G	2,275	LF	$ 100	$ 227,500		From plant to extraction wells.	
Surveying	2	LS	$ 1,200	$ 2,400		Extraction wells and SPM wells.	
125 gpm stand-alone treatment system	2	LS	$ 300,000	$ 600,000		Includes all equipment, materials, labor, subcontracts, overhead, fee, etc.	
Infiltration Trenches	2	EA	$ 35,000	$ 70,000		Assumes no UXO.	125 gpm.
SUBTOTAL					$ 2,892,609		
Overhead & Support	1	LS		$ 289,261			
TOTAL					$ 3,181,870		
TOTAL ESCALATED					$ 3,508,012	Escalated from 2008.	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Site prep/UXO Support/Restoration-well area	1	WELL	$ 50,000	$ 50,000		Per well cluster.	
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500			
Monitoring Well Drilling	1	EA	$ 95,000	$ 95,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	1	LS	$ 5,000	$ 5,000			
Surveying	1	LS	$ 1,200	$ 1,200			
SUBTOTAL					$ 172,700		
Overhead & Support	1	LS		$ 17,270

Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - TREATMENT SYSTEM DESIGN, CONSTRUCTION AND STARTUP COSTS							
Extraction Well Installation Mobilization							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Engineering							
Modeling/design	1	LS	$60,000	$ 60,000		Wellfield modeling; pump design.	
System Engineering Design	1	LS	$70,000	$ 70,000		Includes engineering design for the pipeline, trenches, tying into new treatment units, and startup engineering.	
Extraction Well Construction							
Site prep/UXO Support/Restoration-well area & Pipeline Run Wood Road Well	1	WELL	$ 7,250	$ 7,250			
Site prep/UXO Support/Restoration-well area & Pipeline Run Mid-Plume Well	1	WELL	$ 145,000	$ 145,000			
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation	2	EA	$ 350,000	$ 700,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	
SPM Well Drilling	2	EA	$ 95,000	$ 190,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	2	LS	$ 5,000	$ 10,000		1 EW and 1 SPM well cluster.	
EW pump, motor & assoc. materials	2	WELL	$ 22,361	$ 44,723		Includes installation.	Maximum design flow will be 125 gpm.
Pit less adapter	2	WELL	$ 3,898	$ 7,796		Includes installation and mechanical work.	
Access Roads - Clear & Grub	31,200	SF	$ 0.30	$ 9,360		Clearing and grubing access road to the wells .	
Access Roads - Grade & Fill	2,600	LF	$ 35	$ 91,000		Access roads to extraction wells and reinjection trench.	
Pipe Installation	6,900	LF	$ 33	$ 227,700		Includes labor and materials for influent piping.	
UXO support of pipe installation along Wood Road	1	LS	$ 36,120	$ 36,120		$2,100/day at 250 ft/day for 4300 linear feet.	
Power, electric, communications, U/G	6,900	LF	$ 100	$ 690,000		From plant to extraction wells.	
Surveying	4	LS	$ 1,200	$ 4,800		Extraction wells and SPM wells.	
125 gpm stand-alone treatment system	2	LS	$ 300,000	$ 600,000		Includes all equipment, materials, labor, subcontracts, overhead, fee, etc.	
Infiltration Trenches	2	EA	$ 35,000	$ 70,000		Assumes no UXO.	
SUBTOTAL					$ 2,985,249		
Overhead & Support	1	LS		$ 298,525			
TOTAL					$ 3,283,774		
TOTAL ESCALATED					$ 3,620,361	Escalated from 2008.	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Site prep/UXO Support/Restoration-well area	1	WELL	$ 50,000	$ 50,000		Per well cluster.	
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500

TABLE M-13
J-1 Range North Groundwater Alternative 6
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - TREATMENT SYSTEM DESIGN, CONSTRUCTION AND STARTUP COSTS							
Extraction Well Installation Mobilization							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Engineering							
Modeling/design	1	LS	$85,000	$ 85,000		Wellfield modeling; pump design.	
System Engineering Design	1	LS	$115,000	$ 115,000		Includes engineering design for the pipeline, trenches, tying into new treatment units, and startup engineering..	
Extraction Well Construction							
Site prep/UXO Support/Restoration-well area & Pipeline Run	1	LS	$ 345,350	$ 345,350			
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation	5	EA	$ 350,000	$ 1,750,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	
SPM Well Drilling	3	EA	$ 95,000	$ 285,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	
IDM	5	LS	$ 5,000	$ 25,000		1 EW and 1 SPM well cluster.	
EW pump, motor & assoc. materials	5	WELL	$ 22,361	$ 111,806		Includes installation.	Maximum design flow will be 125 gpm.
Pit less adapter	5	WELL	$ 3,898	$ 19,491		Includes installation and mechanical work.	
Access Roads - Clear & Grub	36,960	SF	$ 0.30	$ 11,088		clearing and grubing access road to the wells .	
Access Roads - Grade & Fill	4,305	LF	$ 35	$ 150,675		access roads to extraction wells and infiltration trench .	
Pipe Installation	4,305	LF	$ 33	$ 142,065		Includes labor and materials for influent piping, Assumes no UXO construction support required per USACE.	
Power, electric, communications, Overhead	4,700	LF	$ 75	$ 352,500		From Greenway Road to plant.	
Power, electric, communications, U/G	3,080	LF	$ 100	$ 308,000		From plant to extraction wells.	
Surveying	5	LS	$ 1,200	$ 6,000		Extraction wells and SPM wells.	
125 gpm stand-alone treatment system	5	LS	$ 300,000	$ 1,500,000		Includes all equipment, materials, labor, subcontracts, overhead, fee, etc.	
Infiltration Trenches	5	EA	$ 35,000	$ 175,000		Assumes no UXO.	
SUBTOTAL					$ 5,403,475		
Overhead & Support	1	LS		$ 540,348			
TOTAL					$ 5,943,823		
TOTAL ESCALATED					$ 6,553,065	Escalated from 2008.	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000			
Site prep/UXO Support/Restoration-well area	1	WELL	$ 50,000	$ 50,000		Per well cluster.	
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500			
Monitoring Well Drilling	1	EA	$ 95,000	$ 95,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster of three screens.
IDM	1	LS	$ 5,000	$ 5,000			
Surveying	1	LS	$ 1,200	$ 1,200			
SUBTOTAL					$ 172,700

J-1 Range Southern Groundwater Alternative 3
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Cultural Resource Survey	0	LS	$ -	$ -			Assume NGB is conducting survey
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		Two monitoring wells.	All drilling will be off-base.
Site prep/Restoration-well area	2	WELL	$ 10,000	$ 20,000		For two monitoring wells.	All drilling will be off-base.
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500		Mobilization for drilling two monitoring wells.	
Monitoring Well Drilling	2	EA	$ 95,000	$ 190,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster of three screens.
IDM	1	LS	$ 5,000	$ 5,000			
Surveying	1	LS	$ 1,200	$ 1,200			
SUBTOTAL					$ 237,700		
Overhead & Support	1	LS		$ 23,770			
TOTAL					$ 261,470		
TOTAL ESCALATED					$ 288,271	escalated from 2008	
CAPITAL COSTS - WELL ABANDONMENT							
MW cluster abandonment	1	LS	$ 31,500	$ 31,500			3 well clusters a day, 6.3 days
EW abandonment	1	WELL	$ 10,000	$ 10,000			
SUBTOTAL					$ 41,500		
Overhead & Support	1	LS		$ 4,150			
TOTAL					$ 45,650		
TOTAL ESCALATED					$ 50,329	escalated from 2008	
ANNUAL COSTS - OPERATIONS AND MAINTENANCE							
Treatment System Operations and Maintenance	1	YR	$ 153,000	$ 153,000		Based on current J-1 South RRA costs.	Operating at 45 gpm.
Overhead & Support	1	LS		$ 15,300			
TOTAL				$ 168,300			
TOTAL ESCALATED					$ 185,551	escalated from 2008	
ANNUAL COSTS - MONITORING							
Chemical and Hydraulic Monitoring	1	LS	$ 15,000	$ 15,000			Monitoring costs are decreased by 45 percent after the ETI system shutsdown and performance monitoring ends and long-term monitoring continues. Beginning in 2024, annual cost decreases by 10 percent every 4 years assuming fewer wells are monitored as plume footprint diminishes.
Reporting	1	LS	$ 35,000	$ 35,000			
SUBTOTAL					$ 50,000		
Overhead & Support	1	LS		$ 5,000			
TOTAL				$ 55,000			
TOTAL ESCALATED					$ 60,638	escalated from 2008	
DIRECT COSTS - SITE CLOSEOUT REPORT							
Report	1	LS	$ 60,000	$ 60,000			
Overhead & Support				$ 6,000			
TOTAL					$ 66,000		
TOTAL ESCALATED					$ 72,765	Escalated from 2008.

TABLE M-21
J-1 Range Southern Groundwater Alternative 4
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - TREATMENT SYSTEM DESIGN, CONSTRUCTION AND STARTUP COSTSTreatment System Design, Construction & Startup Costs							
Extraction Well Installation Mobilization							
Cultural Resource Survey	0	LS	$ -	$ -			Assume NGB is conducting survey
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		One new J-1 South extraction well and one SPM well.	All drilling is off-base.
Chemical and Hydraulic Study	0	LS		$ -		No necessary due to data density and recent shutdown-startup test for existing system.	
Engineering							
Modeling/design	1	LS	$50,000	$ 50,000		Wellfield modeling; pump design	One new EW.
System Engineering Design	1	LS	$10,000	$ 10,000		Includes engineering design for the pipeline and startup engineering.	One new EW, no change to system or existing trench
Extraction Well Construction							
Site prep/Restoration-well area	1	WELL	$ 10,000	$ 10,000			All drilling is off-base.
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation (180 ft bgs) 12" borehol 8" casing	1	EA	$ 280,000	$ 280,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	Pilot boring to bottom of screen (~180 ft bgs), 8-inch diameter well to 180 ft bgs with 30 ft screen
SPM Well Drilling	1	EA	$ 95,000	$ 95,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster of three screens.
IDM	1	LS	$ 5,000	$ 5,000		1 EW and 1 SPM well cluster	
EW pump, motor & assoc. materials	1	WELL	$ 22,361	$ 22,361		Includes installation	Maximum design flow will be 125 gpm.
Pit less adapter	1	WELL	$ 3,898	$ 3,898		Includes installation and mechanical work	
Pipe Installation in unpaved, wooded areas	417	LF	$ 33	$ 13,761		Includes labor and materials for influent piping.	
Pipe installation in paved areas	2,121	LF	$ 48	$ 101,808		Includes labor and materials for influent piping. Includes asphalt curring and repair of 3 feet wide section.	
Power, electric, communications	1	LS	$ 128,000	$ 128,000		Includes instrumentation and in-line delivery, control system delivery, service connection, and E&I, including grounding and surge protection. Includes permits, testing, and installation, of all power, electric, and communications including VFD.	Power available adjacent to EWs
Surveying	1	LS	$ 1,200	$ 1,200			
SUBTOTAL					$ 742,528		
Overhead & Support	1	LS		$ 74,253			
TOTAL					$ 816,781		
TOTAL ESCALATED					$ 900,501	escalated from 2008	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Cultural Resource Survey	0	LS	$ -	$ -			Assume NGB is conducting survey
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		Two monitoring wells.	All drilling will be off-base.
Site prep/UXO Support/Restoration-well area	2	WELL	$ 10,000	$ 20,000		For two monitoring wells. No UXO support required per USACE. No BIPS.	The drilling will be off-base.
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500		Mobilization for drilling two monitoring wells.

TABLE M-23
J-1 Range Southern Groundwater Alternative 5
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
CAPITAL COSTS - TREATMENT SYSTEM DESIGN, CONSTRUCTION AND STARTUP COSTSTreatment System Design, Construction & Startup Costs							
Extraction Well Installation Mobilization							
Cultural Resource Survey	0	LS	$ -	$ -			Assume NGB is conducting survey
Property Access Support (ROA)	2	LS	$ 13,000	$ 26,000		One new J-1 South extraction well and one SPM well.	All drilling is off-base.
Chemical and Hydraulic Study	0	LS		$ -		No necessary due to data density and recent shutdown-startup test for existing system.	
Engineering							
Modeling/design	1	LS	$50,000	$ 50,000		Wellfield modeling; pump design	One new EW.
System Engineering Design	1	LS	$10,000	$ 10,000		Includes engineering design for the pipeline and startup engineering.	One new EW, no change to system or existing trench
Extraction Well Construction							
Site prep/UXO Support/Restoration-well area	2	WELL	$ 10,000	$ 20,000			All drilling is off-base.
EW driller mobilization	1	LS	$ 8,500	$ 8,500			
EW Drilling & Installation (180 ft bgs) 12" borehol 8" casing	2	EA	$ 280,000	$ 560,000		Includes all labor, subcontractor cost and materials for pilot boring, well drilling, screen installation and development.	Pilot boring to bottom of screen (~180 ft bgs), 8-inch diameter well to 180 ft bgs with 30 ft screen
SPM Well Drilling	2	EA	$ 95,000	$ 190,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster of three screens.
IDM	2	LS	$ 5,000	$ 10,000		1 EW and 1 SPM well cluster	
EW pump, motor & assoc. materials	2	WELL	$ 22,361	$ 44,723		Includes installation	Maximum design flow will be 125 gpm.
Pit less adapter	2	WELL	$ 3,898	$ 7,796		Includes installation and mechanical work	
Pipe Installation in unpaved, wooded areas	915	LF	$ 33	$ 30,195		Includes labor and materials for influent piping, Assumes no UXO construction support required per USACE	
Pipe installation in paved areas	2,173	LF	$ 48	$ 104,304		Includes labor and materials for influent piping, Assumes no UXO construction support required per USACE. Includes asphalt curring and repair of 3 feet wide section.	
Power, electric, communications	1	LS	$ 128,000	$ 128,000		Includes instrumentation and in-line delivery, control system delivery, service connection, and E&I, including grounding and surge protection. Includes permits, testing, and installation, of all power, electric, and communications including VFD.	Power available adjacent to EWs
Surveying	1	LS	$ 1,200	$ 1,200			
125 gpm stand-alone treatment system	1	LS	$ 300,000	$ 300,000		Includes all equipment, materials, labor, subcontracts, overhead, fee, etc.	
Infiltration Trench	1	LS	$ 35,000	$ 35,000		125 gpm	
SUBTOTAL					$ 1,525,718		
Overhead & Support	1	LS		$ 152,572			
TOTAL					$ 1,678,290		
TOTAL ESCALATED					$ 1,850,314	escalated from 2008	
CAPITAL COSTS - DOWNGRADIENT MONITORING WELL CONSTRUCTION							
Cultural Resource Survey	0	LS	$ -	$ -			Assume NGB is conducting survey
Property Access Support (ROA)	1	LS	$ 13,000	$ 13,000		Two monitoring wells.	All drilling will be off-base.
Site prep/Restoration-well area	2	WELL	$ 10,000	$ 20,000		For two monitoring wells.	The drilling will be off-base.
Drilling Subcontractor mobilization	1	LS	$ 8,500	$ 8,500		Mobilization for drilling two monitoring wells.	
Monitoring Well Drilling	2	EA	$ 95,000	$ 190,000		Includes all labor, subcontractor cost and materials for well drilling, screen installation, development, and pump installation. Also includes analytical.	One well cluster of three screens.

TABLE M-23
J-1 Range Southern Groundwater Alternative 5
Cost Basis

ITEM	QUANTITY	UNITS	UNIT COST	TOTAL	SUBTOTAL	COMMENTS	ASSUMPTIONS
IDM	1	LS	$ 5,000	$ 5,000			
Surveying	1	LS	$ 1,200	$ 1,200			
SUBTOTAL					$ 237,700		
Overhead & Support	1	LS		$ 23,770			
TOTAL					$ 261,470		
TOTAL ESCALATED					$ 288,271	escalated from 2008	
CAPITAL COSTS - WELL ABANDONMENT							
MW cluster abandonment	1	LS	$ 28,500	$ 28,500			3 well clusters a day, 5.7 days
EW abandonment	2	WELL	$ 10,000	$ 20,000			
SUBTOTAL					$ 48,500		
Overhead & Support	1	LS		$ 4,850			
TOTAL					$ 53,350		
TOTAL ESCALATED					$ 58,818	escalated from 2008	
CAPITAL COSTS - BASELINE HYDRAULIC MONITORING							
Baseline Performance and Environmental Sampling							
New EWs	1	LS	$ 60,000	$ 60,000			Hydraulic and chemical monitoring of new EW and SPM wells
Baseline Report	1	LS	$ 60,000	$ 60,000		Incremental cost for incorporating additional data into previously-scoped annual report for J-1 South RRA	Assume separate report not required. Data will be rolled into previously-scoped annual report
SUBTOTAL					$ 120,000		
Overhead & Support	1	LS		$ 12,000			
TOTAL				$ 132,000			
TOTAL ESCALATED					$ 145,530	escalated from 2008	
ANNUAL COSTS - OPERATIONS AND MAINTENANCE							
Treatment System Operations and Maintenance	1	YR	$ 550,000	$ 550,000		250 gpm	
Overhead & Support	1	LS		$ 55,000			
TOTAL				$ 605,000			
TOTAL ESCALATED					$ 667,013	escalated from 2008	
ANNUAL COSTS - ANNUAL GROUNDWATER MONITORING							
Chemical and Hydraulic Monitoring	1	LS	$ 20,000	$ 20,000			Monitoring costs are decreased by 45 percent after the ETI system shutsdown and performance monitoring ends and long-term monitoring continues. Beginning in 2015, annual cost decreases by 10 percent every 2 years assuming fewer wells are monitored as plume footprint diminishes.
Reporting	1	LS	$ 40,000	$ 40,000			
SUBTOTAL					$ 60,000		
Overhead & Support	1	LS		$ 6,000			
TOTAL				$ 66,000			
TOTAL ESCALATED					$ 72,765	escalated from 2008	
DIRECT COSTS - SITE CLOSEOUT REPORT							
Report	1	LS	$ 60,000	$ 60,000			
Overhead & Support				$ 6,000			
TOTAL					$ 66,000		
TOTAL ESCALATED					$ 72,765	Escalated from 2008.
