Contract No. DACW33-03-D-0006

SDMS Doc ID 564584

**DISCLAIMER**

This document has been prepared pursuant to government administrative orders (U.S. EPA Region I SDWA Docket No. I-97-1019 and 1-2000-0014) and is subject to approval by the U.S. Environmental Protection Agency. The opinions, findings, and conclusions expressed are those of the authors and not necessarily those of the Environmental Protection Agency.

# TABLE OF CONTENTS

**EXECUTIVE SUMMARY ..... ES-1**

**1.0 INTRODUCTION ..... 1-1**
1.1 Purpose of Report ..... 1-1
1.2 Report Organization ..... 1-1

**2.0 SITE BACKGROUND ..... 2-1**
2.1 Site Description ..... 2-1
2.2 Site History ..... 2-1
2.2.1 H Range (1935 to 1950s) ..... 2-1
2.2.2 Hillside and Barrage Rocket Areas (1966 – 1970s) ..... 2-2
2.2.3 DoD Contractor Test Range (1968 to 1997) ..... 2-2
2.2.4 J-3 Range Features ..... 2-2
2.2.4.1 Area 1 - Melt/Pour Area ..... 2-3
2.2.4.2 Area 2 - Workshop Building, 20mm/30mm Firing Ranges and Burn Kettle/Conex Area ..... 2-3
2.2.4.3 Area 3 - Artillery and Warhead Firing Range, Demolition Area and Explosive Storage Bunker Area ..... 2-4
2.2.4.4 Area 4 - Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area ..... 2-6
2.2.4.5 Area 5 - Hillside Study Area ..... 2-7
2.2.4.6 Area 6 - Barrage Rocket Study Area ..... 2-7
2.2.5 Decommissioning Activities ..... 2-8
2.3 Environmental Setting ..... 2-8
2.3.1 Geographic Setting ..... 2-8
2.3.2 Cultural Setting ..... 2-9
2.3.3 Ecological Setting ..... 2-9
2.3.4 Climate ..... 2-10
2.3.5 Geology ..... 2-10
2.3.6 Hydrogeology ..... 2-11

**3.0 GROUNDWATER CHARACTERIZATION ACTIVITIES AND NATURE AND EXTENT OF CONTAMINATION ..... 3-1**
3.1 Groundwater Characterization Activities ..... 3-1
3.1.1 Monitoring Well Installation and Sampling ..... 3-1
3.2 Nature and Extent of Groundwater Contamination ..... 3-1
3.2.1 RDX and Perchlorate ..... 3-3
3.2.2 Other Compounds ..... 3-6
3.2.3 Water Quality Parameters ..... 3-7
3.2.4 Snake Pond Investigations ..... 3-7

**4.0 J-3 RANGE SOURCE CHARACTERIZATION ..... 4-1**
4.1 Source Characterization Activities ..... 4-1
4.1.1 Soil Sampling ..... 4-1
4.1.2 Geophysical Surveys and Investigations ..... 4-3
4.2 Source Characterization Findings ..... 4-5

## TABLE OF CONTENTS – cont'd

4.2.1 Area 1 Melt/Pour Area ....4-6
4.2.1.1 Area 1 Findings ....4-7
4.2.1.2 Area 1 Source Characterization Conclusions ....4-8
4.2.2 Area 2 - 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area ....4-8
4.2.2.1 Area 2 Findings ....4-9
4.2.2.2 Area 2 Geophysical Investigations/Findings ....4-10
4.2.2.3 Area 2 BIP-Related Sampling ....4-10
4.2.2.4 Area 2 Source Characterization Conclusions ....4-11
4.2.3 Area 3 – Artillery Range, Demolition Area, Explosive Storage Bunker Area ....4-11
4.2.3.1 Area 3 Findings ....4-12
4.2.3.2 Area 3 Geophysical Investigation/Findings ....4-17
4.2.3.3 Area 3 BIP-Related Sampling ....4-19
4.2.3.4 Area 3 Source Characterization Conclusions ....4-20
4.2.4 Area 4 – Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area ....4-20
4.2.4.1 Area 4 Findings ....4-21
4.2.4.2 Area 4 BIP-Related Sampling ....4-22
4.2.5 Area 5 – Hillside Study Area ....4-23
4.2.5.1 Area 5 Findings ....4-23
4.2.5.2 Area 5 BIP-Related Sampling ....4-24
4.2.5.3 Area 5 Source Characterization Conclusions ....4-24
4.2.6 Area 6 – Barrage Rocket Study Area ....4-25
4.2.6.1 Area 6 Findings ....4-25
4.2.6.2 Area 6 Geophysical Investigations/Findings ....4-26
4.2.6.3 Area 6 BIP Samples ....4-27
4.2.6.4 Area 6 Characterization Conclusions ....4-28

**5.0 RESPONSE ACTIONS ....5-1**
5.1 Source Removal ....5-1
5.2 J-3 Groundwater RRA System ....5-2

**6.0 CONCEPTUAL SITE MODEL ....6-1**
6.1 Source ....6-1
6.2 Pathway ....6-1
6.3 Receptors ....6-2

**7.0 RISK SCREENING ....7-1**
7.1 Introduction ....7-1
7.2 Groundwater Evaluation ....7-1
7.2.1 Explosives and Perchlorate ....7-1
7.2.2 Metals and Inorganics ....7-2
7.2.3 Pesticides and Herbicides ....7-3
7.2.4 Polycyclic Aromatic Hydrocarbons (PAHs) ....7-3
7.2.5 VOCs/SVOCs ....7-4
7.2.6 Polychlorinated Biphenyls ....7-4
7.2.7 Radionuclides ....7-5

## TABLE OF CONTENTS – cont'd

7.2.8 Summary of Site-Wide Groundwater Screening ....7-5
7.3 Soil Screening....7-6
7.3.1 Area 1 - Melt/Pour Building....7-7
7.3.1.1 Explosives and Perchlorate....7-7
7.3.1.2 Metals and Inorganics....7-7
7.3.1.3 PAHs....7-8
7.3.1.4 Pesticides and Herbicides....7-8
7.3.1.5 VOCs and SVOCs....7-8
7.3.1.6 Radionuclides....7-8
7.3.2 Area 2 – 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area....7-9
7.3.2.1 Explosives and Perchlorate....7-9
7.3.2.2 Metals and Inorganics....7-10
7.3.2.3 PAHs....7-11
7.3.2.4 Pesticides and Herbicides....7-11
7.3.2.5 VOCs and SVOCs....7-12
7.3.2.6 Polychlorinated Biphenyls....7-13
7.3.3 Area 3 - Artillery Range, Demolition Area and Explosive Storage Bunker....7-13
7.3.3.1 Explosives and Perchlorate....7-13
7.3.3.2 Metals and Inorganics....7-14
7.3.3.3 PAHs....7-16
7.3.3.4 Pesticides and Herbicides....7-16
7.3.3.5 VOCs and SVOCs....7-17
7.3.3.6 Polychlorinated Biphenyls....7-18
7.3.3.7 Aliphatic and Aromatic Hydrocarbons....7-18
7.3.4 Area 4 - Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area....7-18
7.3.4.1 Explosives and Perchlorate....7-18
7.3.4.2 Metals and Inorganics....7-18
7.3.4.3 PAHs....7-19
7.3.4.4 Pesticides and Herbicides....7-19
7.3.4.5 VOCs and SVOCs....7-20
7.3.5 Area 5 - Hillside Study Area....7-20
7.3.5.1 Explosive Compounds and Perchlorate....7-20
7.3.5.2 Metals and Inorganics....7-21

# EXECUTIVE SUMMARY

This *J-3 Range Remedial Investigation/Feasibility Study (RI/FS)* presents the results of soil and groundwater characterization, geophysical/unexploded ordnance (UXO) investigations, and an evaluation of remedial alternatives for contaminated groundwater associated with the J-3 Range, located at the Joint Base Cape Cod (JBCC) on Cape Cod, Massachusetts.

The J-3 Range is located in the southeast portion of the JBCC and is bounded to the north by the L Range and J-1 Range. From 1935 through the late 1990s, the J-3 Range was used for training and testing purposes. Military training activities conducted in the area from 1935 to the mid-1960s primarily involved small arms, mortar and rocket training. The J-3 Range was developed specifically as a testing range by Textron, Inc., beginning in 1968, to conduct testing work required under various military contracts. Textron constructed and operated facilities at the J-3 Range until the late 1990s, conducting activities that included ordnance development, assembly, testing and disposal. Activities associated with historical range uses, primarily munitions testing and disposal, have resulted in releases of energetic compounds to the soil which are the likely source of groundwater contamination beneath the site.

The groundwater underlying and downgradient of the J-3 Range is primarily contaminated by hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) and perchlorate. For the presentation of the source area characterization, the range was subdivided into six subareas, based on investigations and land use history.

## Characterization

The J-3 Range groundwater plume consists of both perchlorate and RDX. The main lobe of the perchlorate plume, as defined by perchlorate above the Massachusetts Maximum Contaminant Level (MMCL) (2 micrograms per liter [µg/L]), is approximately 3,500-feet long and approximately 450-feet wide at the widest point. Concentrations above 200 µg/L are no longer found in the monitoring well network and the conceptualized >200 µg/L concentration contour is downgradient of MW-198 and upgradient of J3EWIP1. However, concentrations as high as 350 µg/L were detected in drive point profile samples collected in 2012 upgradient of J3EWIP1. Through mass removal via the J-3 Range rapid response action (RRA) Extraction Treatment Reinjection (ETR) system and natural attenuation, perchlorate concentrations have decreased throughout most of the plume. The vertical extent of the plume, based on the 2 µg/L contour is comparable to previous depictions; however, the major difference is the thinning of the higher concentration contours in the plume.

The plume, as defined by RDX concentrations above the health advisory (HA) (2 µg/L), is approximately 2,500-feet long and 200-feet wide. The extent of the J-3 Range RDX plume, as defined by concentrations of RDX above 0.6 µg/L (3,400-feet long and 500-feet wide), does not extend as far downgradient and is not as wide as depicted prior to the startup of the groundwater RRA ETR system (4,800-feet long and 900-feet wide). The change in RDX extent is due to mass removal from the J-3 Range ETR system and natural attenuation. The current maximum RDX concentration is lower (7.5 µg/L, MW-198M4) than the pre- RRA maximum of 35 µg/L (MW-343M2, 2005). However, historic concentrations (37.6J µg/L) in this well indicate that the core of the RDX plume has migrated from MW-343 south and is currently downgradient of

MW-227. This is also reflected in the increase in RDX concentrations in the two downgradient extraction wells (J3EW0032 and 90EW0001).

The Conceptual Site Model, based on known range use activities and the presence of soil contaminants, suggests disposal and testing activities in the Demolition/Artillery Area and testing activities at the Melt Pour Area, as the major source of the J-3 Range plume.

A risk screening was conducted for the J-3 Range groundwater. The objective of the risk screening was to identify any contaminant detected in the J-3 Range groundwater that requires further evaluation. The maximum detected concentration of each analyte was compared against its MCL, HA, RSL or GW-1 standard. The screening identified a widespread presence of RDX and perchlorate at concentrations exceeding the screening criteria. Therefore, RDX and perchlorate will be further evaluated in the Feasibility Study. Other compounds were identified at concentrations exceeding some risk screening criteria, but these compounds were detected infrequently, are associated with naturally occurring background conditions, or are laboratory-related contaminants and, therefore, were not carried forward to the feasibility study.

During the period from 1997 through March 2013, 1,700 soil samples were collected from 505 locations within the J-3 Range investigation area. In addition, numerous intrusive investigations of geophysical anomalies were conducted in the J-3 Range study area. Results of historical releases and soil investigations in the Demolition and Artillery Areas as well as the Melt Pour Area show soil contamination that is consistent with explosives found in downgradient groundwater. These areas are located in Areas 1 and 3 and the extent of the groundwater plume is consistent with sources in these locations. Explosive and perchlorate soil contamination associated with these source areas has been removed as discussed in Section 5.0.

For the soil risk screen, J-3 Range soil data was divided into six discrete subareas, based on investigations and land use history. The risk screen identified concentrations of explosives compounds (2,4-dinitrotoluene [2,4-DNT], 2,6-dinitrotoluene [2,6-DNT], 2-amino-4,6-dinitrotoluene [2A-4,6-DNT], 4-amino-2,6-dinitrotoluene [4A-2,6-DNT], 2-NT, tertyl, nitroglycerin, nitrobenzene, HMX, RDX, TNT and perchlorate) exceeding the screening criteria. However, the subarea averages did not exceed the S-1/GW-1 standards. In addition, many of these locations are associated with blow-in-place (BIP) activities and were allowed to remain in place under BIP protocols. Other contaminants were occasionally detected above screening levels but only at low frequencies. Based on the above findings, there is no further action warranted for soils at the J-3 Range.

**Munitions**

The most widespread occurrence of high explosive (HE) projectiles found during intrusive investigations are likely associated with training activities that pre-date the establishment of the J-3 Range. The testing activities that were conducted mainly used inert projectiles with possible live fuzes. Several burial pits were found in the northern portion of the Demolition Area. These pits were likely associated with the testing of projectiles and subsequent burning/burial.

Any HE items that remain on the J-3 Range are likely associated with training activities. High explosives items that could remain on the range include the MK3 4.5-inch Barrage Rockets, M3 4.2-inch mortars, M56 and M43 81mm mortars, and the M49 60mm mortars. It is possible that additional M9 HEAT Rifle Grenades could be found in the southern portion of the J-3 Range. The M6 2.36-inch HEAT rockets that were associated with the testing maybe found in the vicinity of the J-3 Range Demolition Area. The M433 40mm HEDP grenades could be found around the presumed M550 berm area and contain live fuzes. However, extensive clearance work has been conducted in these areas and the likelihood of finding additional HE items is low.

**Feasibility Study**

A Feasibility Study was prepared to describe the development and evaluation of remedial action alternatives for the J-3 Range groundwater study area, based on the review of various data and groundwater modeling results. The Feasibility Study alternatives were developed to achieve the following response action objectives: to restore the useable groundwater to its beneficial use wherever practicable, within a timeframe that is reasonable given the particular circumstances of the site; to provide a level of protection in the aquifer that takes into account that the Cape Cod aquifer, including the Sagamore Lens, is a sole source aquifer that is susceptible to contamination; and to prevent ingestion and inhalation of groundwater containing contaminants of concern (COCs) in excess of federal maximum contaminant levels, Health Advisories, drinking water equivalent levels (DWELs), applicable State standards or an unacceptable excess lifetime cancer risk or non-cancer Hazard Index. Estimated cleanup times frames and costs for each alternative are summarized in Table 11-1. The following alternatives were evaluated:

Alternative 1 – No Further Action.

Monitoring wells and the existing treatment system would be abandoned and site closeout documentation would be completed. The source area soils have been removed. Perchlorate concentrations are predicted to decrease through natural attenuation process, to below 2 µg/L by 2079. RDX concentrations are predicted to decrease through natural attenuation processes to below 2 µg/L by approximately 2018 and to below 0.6 µg/L by 2043. The response action would be complete when the existing groundwater-monitoring-well network is abandoned. The present value cost of this alternative is $228,000.

Alternative 2 – Monitored Natural Attenuation and Land-Use Controls

Alternative 2 includes long-term groundwater monitoring and land-use controls, although the existing treatment system would be removed. The source area soils have been removed. Perchlorate concentrations are predicted to decrease through natural attenuation processes to below 2 µg/L by 2079. RDX concentrations are predicted to decrease through natural attenuation processes to below 2 µg/L by approximately 2018 and to below 0.6 µg/L by 2043. The Army may propose that the response action is complete, and request regulatory concurrence, when two years of monitoring in conjunction with groundwater modeling indicate that that the goals have been achieved. The present value cost of this alternative is $1,792,000.

Alternative 3 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land-Use Controls (Existing System)

Alternative 3 would provide for the continued long-term operation of the current J-3 Range groundwater plume extraction system. The J-3 Range groundwater plume ETR system consists of three axial extraction wells pumping at a combined rate of 195 gallons per minute (gpm) and reinjection wells located southeast of the J-3 plume. Active treatment of the plume removes perchlorate and RDX from the extracted groundwater and returns the treated water to the aquifer. The source area soils have been removed. Perchlorate concentrations are predicted to decrease below 2 µg/L by approximately 2052 and RDX concentrations would decrease below 2 µg/L by approximately 2016 and to below 0.6 µg/L by approximately 2032. The present value cost for this alternative is $7,876,000.

Alternative 4 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land-Use Controls (Existing System Optimized)

Alternative 4 involves increased pumping within the existing J-3 Range groundwater ETR system. This alternative includes the option of modifying the system to optimize system performance. The conceptual design includes the three existing extraction wells in the current J-3 RRA ETR system pumping at a combined rate of 265 gpm. The source area soils have been removed. Perchlorate concentrations are predicted to decrease below 2 µg/L by approximately 2039. RDX concentrations are expected to decrease below the 2 µg/L by approximately 2016 and below 0.6 µg/L by 2031. The present value cost for this alternative is $7,785,000.

Alternative 4A – Focused Extraction with Four Wells, Monitored Natural Attenuation and Land-Use Controls (Existing System Optimized)

Alternative 4A involves the optimization of the pumping rates within the existing J-3 Range groundwater ETR system and the addition of one new extraction well (on-base) operating at a total combined pumping rate of 265 gpm. The source area soils have been removed. Perchlorate concentrations are predicted to decrease below 2 µg/L by approximately 2022. RDX concentrations are predicted to decrease below 2 µg/L by approximately 2015 and below 0.6 µg/L by 2021. The present value cost for this alternative is $4,884,000.

Alternative 5 – Focused Extraction with Six Wells, Monitored Natural Attenuation and Land-Use Controls

Alternative 5 involves the optimization of pumping rates within the existing J-3 Range groundwater ETR system and the addition of three new extraction wells (two off-base, one on-base) operating at a total combined pumping rate of 315 gpm. This alternative would require expansion of the existing treatment capacity. The source area soils have been removed. Perchlorate concentrations are predicted to decrease below 2 µg/L by approximately 2024. RDX concentrations are expected to decrease below the 2 µg/L by approximately 2015 and below 0.6 µg/L by 2024. The present value cost for this alternative is $8,331,000.

# 1.0 INTRODUCTION

This J-3 Range Remedial Investigation/Feasibility Study provides a summary of activities conducted and data gathered for characterization of soil, unexploded ordnance (UXO) and groundwater contamination at the J-3 Range. The J-3 Range is among several training areas, ranges, and other sites evaluated by the Impact Area Groundwater Study Program (IAGWSP) for potential groundwater impacts. The J-3 Range investigation and cleanup were conducted under the authority of United States Environmental Protection Agency Safe Drinking Water Act Administrative Orders SDWA 1-97-1019, and SDWA 1-2000-0014 and in consideration of the substantive cleanup standards of the Massachusetts Contingency Plan (MCP).

## 1.1 Purpose of Report

The purpose of this report is to document the site characterization activities conducted for the J-3 Range, the results of the J-3 Range investigations, remedial actions completed to date, the nature and extent of UXO on the range, the nature and extent of soil and groundwater contamination, and potential impacts to groundwater quality and the risks associated with the contamination. This report also includes a Feasibility Study, which evaluates remedial actions for groundwater contaminants.

## 1.2 Report Organization

Section 2.0 of this report provides a site description of the J-3 Range, presents the history of past military and testing activities conducted at the range and describes the physical characteristics of the site. A summary of groundwater characterization activities and findings for groundwater data is presented in Section 3.0. Section 4.0 presents a summary of geophysical and soil investigations and findings. Interim removal/remedial actions are summarized in Section 5.0. The conceptual site model is presented in Section 6.0. The soil and groundwater risk screening is presented in Section 7.0. Section 8.0 presents the remedial investigation findings/conclusions. Section 9.0 introduces the groundwater feasibility study. Section 10.0 discusses the development of alternatives. Detailed analysis of the alternatives is presented in Section 11.0, while Section 12.0 provides the comparative analysis of alternatives.

# 2.0 SITE BACKGROUND

Joint Base Cape Cod (JBCC, formerly the Massachusetts Military Reservation) includes Camp Edwards, Otis Air National Guard Base, United States Coast Guard Air Station Cape Cod, Cape Cod Air Force Station, and the Veteran's Affairs Cemetery. It is located on the western side of Cape Cod, Massachusetts (Figure 2-1). The J-3 Range Investigation Area is located southeast of the Impact Area.

## 2.1 Site Description

The J-3 Range is located adjacent to the Impact Area and is the southernmost of four former military training, and defense contractor, test ranges that operated from the 1930s until the 1990s.

The J-3 Range is approximately 1,280 meters long and between 240 and 490-meters wide. The range is oriented southeast to northwest, with the southeastern "uprange" end near Greenway Road, bordered to the northeast by the L Range and the northwestern "downrange" end extending to Chadwick Road. The central area of the J-3 Range consisted of contractor facilities and an artillery range. Old training areas surround the central area on the northwest and west along topographic rises. The layout of the J-3 Range is depicted in Figure 2-2. The J-3 Range groundwater study area is depicted in Figure 2-3.

## 2.2 Site History

Military development in the J-3 Range area began between 1935 and 1941 along the west side of Greenway Road under the designation of the H Range. The H Range was used into the 1950s as a mortar and rocket range. In 1968, the area was developed by AVCO/Textron Services Corporation (Textron) as a Department of Defense contractor test range, under the designation J-3 Range, and used into the late 1990s. The primary mission of Textron was to develop and test tactical weapon systems under contract to the U.S. Army and U.S. Air Force. Textron used the following facilities at the range: headquarters trailer; workshop building; explosive loading building (melt/pour facility); ordnance assembly/X-ray building; instrumentation trailer; environmental test/assembly building; two test towers; four explosives storage bunkers; and several test range areas. Available aerial photographs are presented in Figures 2-4 through 2-8.

A general summary of the historical uses of the area with more detailed descriptions follows:

### 2.2.1 H Range (1935 to 1950s)

The H Range was originally developed between 1935 and 1941 along the west side of Greenway Road. The H Range was used into the 1950s as a mortar and rocket range.

From the 1950s until the early 1960s, small arms ammunition reportedly was used at a squad combat firing range that was also known as the H Range.

### 2.2.2 Hillside and Barrage Rocket Areas (1966 – 1970s)

Aerial photographs indicate disturbance by military activities in the hills adjacent to the J-3 Range since at least 1966. The Hillside Area is located immediately adjacent to the western side of the J-3 Range along a northwest-southeast trending ridge. A low earthen berm running along the top of the ridge on the hillside southwest of the J-3 Range Road was discovered during site investigation activities at the nearby Barrage Rocket Area. Preliminary investigation of the hillside near the berm revealed the presence of 3.5-in rockets, 81mm mortars, and a Stokes mortar.

Investigation activities at the Hillside Area were initiated under the Munitions Survey Program (MSP) in 2002-2003. A hand-held magnetometer survey of approximately 24.9 acres in this study area was performed. Based on the results of the magnetometer survey, ten 30-meter by 30-meter grids were selected and a ground-based geophysical survey was conducted and select anomalies were intrusively investigated.

The Barrage Rocket Area is located adjacent to the extreme northern portion of the J-3 Range and, like the Hillside Area, is located on a topographic rise. Investigation activities at this study area were initiated under the MSP to evaluate a clearing visible in a 1966 aerial photograph. Two 30-meter by 30-meter grids were established to investigate this clearing. As the site was cleared for ordnance, several 4.5-in barrage rockets were discovered. As a result, the investigation area was expanded around the initial 30-meter by 30-meter survey grids to cover a total of 0.9 hectare in 10 grid cells straddling the J-3 Range Road.

The firing points associated with these areas are not known for certain. The location of the areas and the types and ages of the munitions discovered suggest that these areas likely pre-date the use of the J-3 Range as a munitions testing range.

### 2.2.3 DoD Contractor Test Range (1968 to 1997)

The majority of the activity that occurred at the J-3 Range proper included shaping and loading ordnance, ordnance assembly, and ordnance testing. Other activities included evaluation of warhead deployment techniques, such as parachute drop, launcher deployment, and on-board sensor evaluation. These system tests typically required some mechanical assembly, and were generally conducted with inert warhead simulators. Ordnance ammunition testing, such as 20mm and other miscellaneous munitions testing (including warhead testing; vibration, drop and burn tests; explosive disposal; hazard classification; and explosive train tests) were also performed at the site. Additional information on contractor activities can also be found in the History of Site Operations, Phase I Environmental Site Assessment (104E Request-Revised) J-1 and J-3 Ranges, Camp Edwards, Massachussetts (Harding Lawson Associates 2000a) and the Supplemental 104E Report, History of Site Operations, Camp Edwards, Massachusetts (Harding Lawson Associates 2000b).

### 2.2.4 J-3 Range Features

Physical features of the J-3 Range fall into four general categories: contractor facilities, contractor test firing ranges, contractor disposal areas and military training areas lying adjacent to the J-3 Range proper, as depicted in Figures 2-4 through 2-8. Most investigative activities

were focused on these features. Based, in part, on land use history, the range has been divided into six subareas. Investigations and results for each subarea are discussed in Section 4.0. A description of principal range features within each subarea follows:

#### 2.2.4.1 Area 1 - Melt/Pour Area

The Melt/Pour facility consisted of a one story concrete building constructed by Textron Systems Corp. (TSC) in 1978 (Figure 2-9). The building was divided into several bays, as shown in Figure 2-10, and was used for the melting and pouring of raw explosives during the preparation/assembly of various munitions components. Different operations were conducted in each of the bays. The operations included the melt-pour explosive loading, hydraulic press consolidation, explosive loading, explosive machining, and mechanical inspection.

Site features in and around the Melt/Pour building included: a wastewater holding tank, a septic system, an above ground storage tank (AST), an underground storage tank (UST), and an old latrine. The wastewater holding tank was a subsurface tank that was used from 1979 to 1990 for storing contact cooling and cleaning water derived from Melt/Pour operations. In 1990, the tank was decommissioned and replaced with a recirculation system. A leaching tank for water from the wash sink was located to the northwest of the building. A 550-gallon AST for heating oil was located within the building. A 1,000-gallon steel UST was located on the north side of the building and was removed in 1991 (AMEC 2001a). The latrine was located south of the building.

#### 2.2.4.2 Area 2 - Workshop Building, 20mm/30mm Firing Ranges and Burn Kettle/Conex Area

The Workshop Building was a one story, wood frame building with a wood floor located in the southeast portion of the J-3 Range, north of the Melt/Pour Area (Figure 2-11). The building was provided by the Army in 1968 as a headquarters and instrumentation building for the testing range. Until 1980, it served as the site headquarters. From 1980 to 1983, the building was used for photography dark room processing. No ordnance related activities occurred at the Workshop Building.

Features in and around the Workshop Building include a former storage shed, an AST, a former septic tank, two drywells, and a water well. The former storage shed was located northwest of the building. The AST was located within the building. A 1,000-gallon septic tank for the building's restroom was located south of the building. Drywell 1 is located south of the septic tank. A suspected second drywell, Drywell 2, is located behind the northwest corner of the building. It is covered with a round concrete cap and sunk partially into the ground.

<u>20mm/30mm Firing Ranges</u>

The former 20mm/30mm firing range is approximately 100 feet northeast of the Workshop Building (Figure 2-11). Features in this area included a flammable storage building (converted from the former 20mm/30mm firing point building), storage sheds, a 100-foot firing range and an 800-foot firing range. In 2001, the storage sheds were removed during Textron's site decommissioning activities. Approximately 12,000 HE 20mm rounds were fired at the 100 and 800-foot ranges, with the majority of the tests conducted at the 100-foot range. Approximately 1,000 inert 30mm rounds were fired at the 100-foot range.

Burn Kettle/Conex Area

The southwestern portion of the J-3 Range contained a flammable storage shed, a burn kettle and four 6 by 8 by 6-foot conex containers (Figure 2-11). The flammable storage shed was a metal shed that was used to store limited quantities of gasoline, diesel fuel, and motor oil. The burn kettle was a partially buried USCG steel buoy that was converted into a burn chamber or "kettle" that was used to safely burn off excess propellant and small caliber munitions items. It is believed that the burn kettle was used primarily in the 1970s. Prior to 1977, munitions were stored in the conex containers prior to use/testing on other areas of the J-3 Range.

#### 2.2.4.3 Area 3 - Artillery and Warhead Firing Range, Demolition Area and Explosive Storage Bunker Area

The Artillery Range, located in the central part of the J-3 Range, was used as such from 1968 to 1983 (Figure 2-12). This area consists of the following features: firing points, two concrete target walls, a gas gun, an M-550 launch house, instrumentation trailer, storage trailers, and a drop tower. The gas gun structure consisted of an elevated concrete pad used to mount a 16-inch, pressurized air-operated gun barrel (gas gun) and a wooden building with a concrete floor that housed the air compressor for the gas gun. The artillery range was used reportedly for testing 8-inch rounds until 1983. The gas gun was used in part to propel 81mm and 105mm projectiles, and rocket motors toward targets situated in front of the concrete walls.

Warhead Firing Range

A warhead test firing range was located in the central portion of the J-3 Artillery Range. This area consisted of the following features: a flight line, firing point, and X-ray buildings. X-ray stations and a high-speed Cordin camera were located along the flight line. The firing point was a small concrete block building located at the southeastern end of the flight line. An X-ray building was located on the southern side of the flight line. This range is believed to have been used for the testing and development of the sensor fuzed weapon. Warheads traveled along a 175-foot flightline into steel targets. Armor targets were placed along the flight line and up to 500 feet downrange. Testing was conducted from the early 1980s until 1997.

Demolition Area and Explosive Storage Bunker

The Demolition Area overlaps the Artillery Range (Figure 2-12). This area consisted of the following features: a detonation pit, a burn area and burn box. The detonation pit and burn area was an elongated depression located along the north side of target wall #1. A former burn box on a concrete pad was located approximately 30 feet north of the gap between Target wall 1 and Target wall 2 of the former artillery range. The burn box was removed by TSC in 1999.

Activities conducted in Area 3 included the following:

- Minuteman Missile Shroud Testing;
- Projectile Testing into a Ricochet Trough;
- Drum Disposal Area;
- Giant Patriot Testing Area;
- Former Flightline Firing Position Testing
- explosives burning;

- cook-off testing;
- anti-tank mine testing;
- explosive train tests; and
- Advanced Medium Range Air-to-Air Missile (AMRAAM) fragmentation tests.

A Minuteman Missile Shroud Testing area was located in the northern portion of the J-3 Range, south of the X-Ray Building. This area included three concrete pads. No buildings were present in this area. An old M-60 tank was parked on the westernmost pad, and used generators were also stored in this area. The concrete pads were the location of a one-time Minuteman 1 Missile shroud test. The test was performed to demonstrate whether the shroud could be removed from the Minuteman 1 Missile while in mid-air. The test involved a rocket motor encased in a shroud, propellant, and linear-shaped charges. When the charges were detonated, the shroud came off.

A Ricochet Trough, consisting of a water-filled half cylinder, was reported to have been used in the 1970s as a target for frangible projectiles. The target was removed in 2000.

A Drum Disposal Area was located in the eastern central portion of the J-3 Artillery Range (Figure 2-12). In the late 1960s, process water from milling and cleaning activities was collected in 55-gallon drums. Although the drums were emptied of their contents elsewhere, the crushed drums were returned to the J-3 Range and covered with soil, creating an earthen mound approximately 15-feet by 15-feet by 6 to 8-feet high. The crushed drums were removed by TSC in March 2002.

The Giant Patriot Testing Area consisted of an approximate 20-foot by 20-foot area located in a 10-foot deep depression along the eastern side of the Artillery Range. The Minuteman 1 Missile self-destruct system was tested in this area for a few months in the early 1970s. Approximately 50 to 60 such tests were conducted in this area.

The Flightline Firing Position was used as a warhead test firing range from the early 1980s until 1997. Projectiles were fired at armored targets located up to 500 feet downrange. X-Ray stations and high-speed cameras were used to evaluate the projectiles in flight.

Various excess munitions, and/or off-specification propellants, munitions, detonators, fuzes and initiators were either burned or detonated in the detonation pit, burn area or in the burn box. The burn box was also used to conduct “cook-off” testing to determine the temperature conditions under which munitions would detonate. Antitank testing was conducted immediately north of the concrete targets. Explosive materials from Textron’s Wilmington, Massachusetts facility were destroyed in this area twice a year. These materials included propellants, detonators, rocket motors, smokeless powder and 20mm powder.

The Explosive Storage Bunkers, identified as Buildings J3-5, J3-5A, J3-5B, and J3-5C (Figure 2-12), consisted of four concrete ammunition storage bunkers within a fenced compound along the west side of the demolition area. The explosive bunkers were used exclusively for storage. No production, assembly, or other processes were conducted there.

#### 2.2.4.4 Area 4 - Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area

The Ordnance Assembly/X-Ray Building was constructed in 1983 and was located in the northern part of the J-3 Range (Figure 2-13). This area consisted of the following features: a one-story building, a UST, an AST, and a septic system. The one-story building was a wood frame and concrete structure on a concrete slab. Housed in this building were an office, a darkroom, an ordnance assembly area, and X-ray control equipment.

A 1,000-gallon, fiberglass, fuel oil UST was located at the southwestern corner of the building. The UST was closed in June 1991. A 275-gallon fuel oil AST was located in a containment shed attached to the building. All wastewater discharges from the building entered the septic system (tank and leach field) located off the south side of the building.

The Environmental Test/Assembly Building was located directly north of the Assembly/X-Ray Building. This area consisted of the following features: a building, a UST, an AST, water well, and a capture box. This building was a one-story wood frame structure on a concrete slab. The building contained shaker and temperature chambers. There was a firing room located on the western portion of the building with access provided by a garage door.

A former 500-gallon, steel fuel oil UST was located at the southwestern corner of the building. The UST was closed in June 1991. A fuel oil AST was located in the building. Water was supplied (via a pump and piping) to the adjacent Ordnance Assembly/X-Ray Building from a water well that was located on the east side of the building.

Activities conducted in the Environmental Test/Assembly Building Area included ballistic testing of 20mm, 30mm, and 40mm ammunition. Rounds were fired northwest toward the Gauntlet Area and captured in a sand-filled plywood box (capture box).

Gauntlet Area

The Gauntlet Area was located in the northern portion of the J-3 Range (Figure 2-13). This area consisted of the following features: a tower, a control building, a large level sand covered area, a projectile capture net, ground launch testing pads, and storm water ponds.

An 80-foot tower was used as a launch pad for the dispensed, scatterable, munition BLU-108 (skeet). A concrete control building at the base of the tower contained electrical control equipment.

A large level sand-covered area consisting of a geotextile fabric covered with sand was placed in this area to allow for staging of operational vehicles, target simulators, and false targets. The area was surrounded by ten telephone poles. Projectile capture nets were suspended vertically from the poles for capturing the skeet in-flight.

Projectile ground launch tests involved launching inert skeet from a crushed stone pad gun mount Wide Area Munition (WAM) launch pad located 300 feet southeast of the tower. A small gas generator was used to launch the skeet. The skeet were generally slow moving and contained sensors, electronic components, test instrumentation, or a small black powder

spotting charge. The skeet were captured in the projectile capture net, or allowed to land on the ground, and then recovered. Approximately 434 launch tests were conducted using spotting charges only. Skeet that contained instrumentation or spotting charges were launched from the tower into a net located across the sand-covered area. Approximately 300 tower launch tests were completed; 60 warheads were detonated over the sand-covered area.

Presumed M550 Berm Area

The Presumed M550 Berm area lies just north of the Demolition Area (Figure 2-13). According to historical information, this area was an impact area for 40mm grenades fired from the southern end of the Artillery Range. The grenades were reportedly practice grenades with live fuzes. This area encompasses Munitions Survey Project Phase III (MSP III) investigations identified as Polygons #6 through #10.

#### 2.2.4.5 Area 5 - Hillside Study Area

The Hillside Study Area is located immediately adjacent to the western side of the J-3 Range along a northwest-southeast trending ridge (Figure 2-14). A low earthen berm running along the top of the ridge on the hillside southwest of the J-3 Range Road was discovered during site investigation activities at the nearby Barrage Rocket Study Area. Preliminary investigation of the hillside near the berm revealed the presence of 3.5-inch rockets, 81mm mortars, and a Stokes mortar. The firing points associated with this area are not known.

Investigation activities were initiated under the MSP to further evaluate the Hillside area. A hand-held magnetometer survey of approximately 24.9 acres in this study area was performed. Based on the results of the magnetometer survey, ten 30-meter by 30-meter grids were selected and a ground-based geophysical survey was conducted and select anomalies were intrusively investigated.

The location of the area and the types and ages of the munitions discovered suggest that use of the area likely pre-dates the development of the J-3 Range as a munitions testing range. These observations also suggest that the area may be related to training associated with the former H Range.

#### 2.2.4.6 Area 6 - Barrage Rocket Study Area

The Barrage Rocket Study Area is located adjacent to the extreme northern portion of the J-3 Range and, like the Hillside Study Area, is located on a topographic rise (Figure 2-15). Investigation activities at this study area were initiated to evaluate a clearing visible in a 1966 aerial photograph (Figure 2-5). Two 30-meter by 30 meter grids were established to investigate this clearing. As the site was cleared for ordnance, several 4.5-inch barrage rockets were discovered. As a result, the investigation area was expanded around the initial 30-meter by 30-meter survey grids to cover a total of 0.9 hectare in 10 grid cells stradding the J-3 Range Road. Ensuing investigations at the site led to the discovery of thirty-eight 4.5-inch barrage rockets at or within 0.15 meter of the ground surface. Of the 38 barrage rockets discovered, 37 contained 2,4,6-trinitrotoluene (2,4,6-TNT) filler and one contained inert filler. Thirty-six of the barrage rockets were heavily corroded and two were lightly corroded. The Barrage Rocket Study Area is considered a training-related impact area. The firing points associated with this

area are not known. The location of the area and the types and age of the munitions discovered also suggest a possible association with training at the former H Range.

### 2.2.5 Decommissioning Activities

In 2004, Textron implemented a program to decommission the testing facilities at the J-3 Range. Beginning in May 2004, the removal and off-base recycling of concrete and steel was conducted from the following facilities:

- Concrete Target Wall Nos. 1 and 2
- Demolition Area concrete
- Former Burn Box concrete pad
- Drop Tower and associated concrete pads
- Former gun position concrete pads
- Concrete target blocks
- Water supply well heads and pumps

Further information on initial decommissioning activities can be found in the Final Summary Report Melt-Pour and Explosive Storage Bunker Building Decontamination, Drywell and Septic Tank Removal, Soil Delineation, and Building Demolition J-3 Range Camp Edwards, Massachusetts (MACTEC December 2004).

Additional decommissioning activities were conducted during 2007-2009 and included the following:

- Water supply well decommissioning
- Septic tank abandonment
- Storage tank removal
- Building demolition
- Explosive storage bunker demolition

Additional decommissioning activities including demolition, concrete and metal debris removal were conducted at certain other range locations. Details of these decommissioning activities are presented in the *Final Summary Report for Range Closure Activities* (MACTEC 2009).

## 2.3 Environmental Setting

### 2.3.1 Geographic Setting

The JBCC includes Camp Edwards, Otis Air National Guard Base, United States Coast Guard Air Station Cape Cod, Cape Cod Air Force Station, and the Veteran's Affairs Cemetery. It is located on the western side of Cape Cod, Massachusetts. The northern, non-cantonment area, is a wooded area on the Upper Cape that is largely undeveloped, but fringed with highways, homes, and other development (Cape Cod Commission 1998). The predominant land use surrounding the JBCC is residential or commercial development. The JBCC is situated adjacent to the towns of Bourne, Sandwich, Falmouth, and Mashpee. The J-3 Study Area is located in the southeastern portion of Camp Edwards between Greenway Road and the Impact Area.

A restricted area surrounded by fencing and guarded gates, the land is controlled by the U.S. Army under a lease with the Commonwealth of Massachusetts until at least 2051. Chapter 47 of the Acts of 2002 established the Upper Cape Water Supply to protect the water supply and wildlife habitat. Therefore, the potential for human exposure to on-site soil contaminants is limited to occasional trespassers, site workers, and military personnel. It is anticipated that the land use at the J-3 Range will not significantly change over time. An Upper Cape Regional Water Co-op operates three water supply wells.

### 2.3.2 Cultural Setting

Land use near JBCC is primarily residential and recreational, and secondarily agricultural and industrial. Portions of the JBCC are opened for deer and turkey hunting by permit from the Massachusetts Division of Fisheries and Wildlife. The major agricultural land use near the JBCC is the cultivation of cranberries. Commercial and industrial development in the area includes service industries, landscaping, sand and gravel pit operations, and municipal landfills (USACE 2002).

JBCC contains a cantonment area that includes a housing area for approximately 2,000 year-round residents. This area includes a chapel, a golf course, a base exchange, a medical dispensary, and two schools. Areas of the JBCC are used as airfields and other military support facilities. The JBCC resident population increases by as much as several thousand people during the summer training activities.

The northern area in which the J-3 Range is located is used for military training. As such, it is a restricted area surrounded by fencing and guarded gates. The land is controlled by the U.S. Army under a lease from the Commonwealth of Massachusetts running until at least 2051. Chapter 47 of the Acts of 2002 established the Upper Cape Water Supply Reserve to protect the water supply and wildlife habitat. Therefore, the potential for human exposure to on-site soil contaminants is limited to occasional trespassers, site workers, and military personnel. It is anticipated that the land use at the J-3 Range will not significantly change over time.

An archaeological survey covering 72 percent of Camp Edwards was conducted in 1987 to assess its archaeological sensitivity. One historic site and 26 prehistoric sites were identified within Camp Edwards. Findings from these surveys indicate that humans inhabited the Camp Edwards area up to 10,000 years ago.

### 2.3.3 Ecological Setting

The northern two-thirds of the JBCC are characterized as undeveloped open area, while the southern one-third is characterized as developed land. The dominant vegetation types vary accordingly. The northern portion of the JBCC consists of forested uplands dominated by stands of pitch pine and mixed oak species (*Quercus* spp.) with a diverse shrubby understory. Remnant vegetation in the southern portion of the JBCC consists of open grassland fields interspersed with scattered trees and shrubs. The present composition of these forests is a reflection of eighteenth-century logging practices, replanting strategies, and fire suppression activities. The other dominant cover type in this area consists of pitch pine and scrub oak barrens that are maintained by periodic fires (USACE 2002).

There are 39 state-listed species observed on the JBCC. About half of these are lepidoptera (i.e., moths), such as Gerhard's underwing moth (*Catocala herodias gerhardi*), the barrens daggermoth (*Acronicta albarufa*), and Melsheimer's sack bearer (*Cicinnus melsheimeri*). State-listed plant species documented on the JBCC include broad tinker's weed (*Triosteum perfoliatum*), ovate spikerush (*Eleocaris obtusa var. ovata*), Torrey's beak-sedge (*Rhynchospora torreyana*), and adder's tongue fern (*Ophioglossum pusillum*). Rare bird species on JBCC include the upland sandpiper (*Bartramia longicauda*), the grasshopper sparrow (*Ammodramus savannarum*), the vesper sparrow (*Pooecetes gramineus*), and the northern harrier (*Circus cyaneus*). These species are primarily associated with the grassland fields in the southern cantonment area. No threatened or endangered amphibians, reptiles, fish, or mammals are known to inhabit the JBCC; however, the JBCC does support a number of animals that are listed by the state as species of special concern. These include the eastern box turtle (*Terrapene carolina*), the Cooper's hawk (*Accipiter cooperii*), and the sharp-shinned hawk (*Accipiter striatus*) (USACE 2002).

### 2.3.4 Climate

The climate for Barnstable County, where the JBCC is located, is defined as humid continental. The neighboring Atlantic Ocean has a moderating influence on the temperature extremes of winter and summer. Winds of 30 miles per hour may be expected on an average of at least one day per month. Gale force winds can be common and more severe in winter. Average daily temperatures range from 29.6ºF in February to 70.4$^{o}$F in July.

Mean annual rainfall and snow melt water ranges from 45 to 48 inches. The average net recharge to groundwater of this annual rainfall is 27 inches per year. Occasional tropical storms that affect Barnstable County may produce 24-hour rainfall events of five to six inches (NGB 1990). Average snowfall is 24 inches (MAARNG 2001).

### 2.3.5 Geology

The J-3 Range is situated within the Mashpee Pitted Plain, a thick wedge-shaped deposit of unconsolidated Late Pleistocene outwash sands and gravels. The Mashpee Pitted Plain is bounded to the west and north by Buzzards Bay and Sandwich moraines, respectively. The Mashpee Pitted Plain is an outwash plain formed by streams that drained the Buzzards Bay and Cape Cod Bay lobes of retreating glaciers. Depositional environments of the Mashpee Pitted Plain range from glaciofluvial for the coarser deposits to glaciolacustrine for the finer deposits. In the Mashpee Pitted Plain, the glaciolacustrine deposits are discontinuous and commonly overlie basal till or bedrock.

Bedrock is commonly encountered between -122 and -145 feet mean sea level (msl) and consists of dark gray and black crystalline diorite/granite. The lowest stratigraphic unit is a thin discontinuous basal till which consists of a gray fine to coarse-grained sandy gravel that does not exceed 20 feet in thickness. In the vicinity of the J-3 plume glaciolacustrine deposits are finer grained sediments that overlie glacial till or bedrock. In general, the more continuous units in the vicinity of the plume occur below -50 feet msl and are described as silty sands, silts, and clays that are often interbedded with sands. These deposits represent low velocity flow deposition and are more prevalent with depth. Above approximately -50 feet msl, the

glaciolacustrine deposits are more discontinuous and are interbedded with glaciofluvial outwash sands. The glaciofluvial deposits are prevalent in the J-3 Range area and often are encountered from the ground surface to bedrock. These deposits consist of fine sands with little fines and little gravels or cobbles. Overlying this unit can be a thin (rarely more than 4 feet) layer of eolian loess, which consists of olive-brown silt or silty sand and is discontinuous across the ground surface.

### 2.3.6 Hydrogeology

The aquifer is situated in the permeable glacial outwash deposits overlying the relatively impermeable bedrock. The three hydrostratigraphic layers are the unsaturated zone, the saturated zone, and underlying impermeable bedrock. Groundwater flow in the saturated zone is controlled locally by the hydraulic properties of sands, silts, and clays that comprise the aquifer. The underlying crystalline basement is relatively impermeable and represents the bottom of the active aquifer. Groundwater enters the aquifer through recharge, predominantly from precipitation with minor contributions from water treatment plants, septic systems, irrigation, and other anthropogenic sources. Groundwater levels measured on 16 July 2013 indicate that flow is from north to south and depressions in the water table illustrate the effect of groundwater extraction on the local water table (Figure 2-16). Precipitation is variable and ranges from 45 to 48 inches annually. Less than half of the precipitation is lost to evaporative processes (evaporation and transpiration).

As presented in the *Final J-3 Range Groundwater Rapid Response Action (RRA) Plan* (ECC 2005d), saturated hydraulic conductivities (K) in the vicinity of the J-3 Range for the Mashpee Pitted Plain sediments range from 70 to 280 feet/day with horizontal/vertical anisotropy ratios ranging from 3:1 to 25:1. Hydraulic conductivities for glacial moraine sediments range from 22 to 150 feet/day with anisotropies similar to those for the Mashpee Pitted Plain sediments. Low-conductivity silts and silty sands are present in numerous boreholes in the area. K data for these silts and silty sands do not exist for the J-3 Range, however have been estimated based on the extensive K database and 3-D model of WCC hydrostratigraphy. In general, these fine-grain units have hydraulic conductivities less than 10 feet/day with anisotropies up to 100:1. Site-specific porosity (n) data have not been collected from the study area. However, other studies on upper Cape Cod have indicated that the effective porosity ($n_e$) of the coarse sand and gravel likely ranges from 0.35 to 0.42 (Masterson et al. 1997). For groundwater modeling and plume shell based estimates of mass, an effective porosity of 0.30 is assumed for the whole study area.

For the evaluation of groundwater velocities, horizontal gradients of 0.0001 and 0.0006 ft/ft (the range of gradients within the study area) were considered. Using an effective porosity of 0.3, the average linear velocities are 0.05 and 0.10 feet/day for the lowest gradient (0.0001 ft/ft). For the steepest gradient (0.0006 ft/ft), the average linear velocities increase to 0.3 and 0.6 feet/day for conductivity values of 150 and 300 feet/day, respectively.

Groundwater seepage into nearby Snake Pond in Sandwich is relevant to the J-3 Range study area because the plume is moving towards Snake Pond. The fate of the J-3 plume may be controlled by the hydraulic characteristics of the pond bottom sediments. A seepage meter

study was conducted in Snake Pond in 1997 as part of an ecological studies program performed by the Air Force Center for Engineering and the Environment (AFCEE 1998). Results indicate the highest recharge and discharge rates occur close to shorelines. Seepage rates in the northern half of the pond are positive (i.e., into the pond), with a maximum as high as 0.95 foot/day. Seepage rates decrease by an order of magnitude within 250 feet of the shoreline. The southern half of the pond has negative seepage rates indicating flow of water from the pond into the aquifer, where maximum observed rates are -0.02 foot/day.

Vertical hydraulic conductivities of pond bottom sediments ranged from 143 feet/day on the northwestern shore to 0.2 foot/day in the pond's northern neck. Mean vertical hydraulic conductivities were 23 feet/day (AFCEE 1998). Higher conductivities were found in locations near Snake Pond and the northwest shore of the pond. The higher conductivities appear to be associated with moderately permeable pond bottom materials. Muck and fine grained materials are present in the deep portion of Snake Pond and in the northern neck area. The remainder of the pond is characterized by fine to coarse sands with small areas of gravel. Conceptualization of pond bottom sediments and their impact on aquifer-pond interactions have been evaluated by the USGS (USGS 2002), by AFCEE as part of the FS-12 system design efforts (AFCEE 1998), and by IAGWSP as part of the J-3 RRA wellfield design (ECC 2005c).

# 3.0 GROUNDWATER CHARACTERIZATION ACTIVITIES AND NATURE AND EXTENT OF CONTAMINATION

## 3.1 Groundwater Characterization Activities

Intensive investigation of J-3 Range groundwater quality commenced in 2000. Investigation activities included aquifer profiling, monitoring well installation, groundwater sample collection from monitoring wells, drive points and diffusion samplers, sample analysis, water level surveys, and groundwater model development. A total of 112 new and existing well screens were sampled in 56 locations and over 1,500 samples have been analyzed. Table 3-1 lists monitoring wells installed/sampled during the J-3 Range groundwater investigation. Groundwater sample IDs and analyses are listed in Appendix A. Monitoring well chemical data results are presented in Appendix B. Water quality parameters measured during groundwater sampling are presented in Appendix C.

All monitoring well locations were surveyed with horizontal positioning referenced to the North American Datum 1983, Universal Transverse Mercator (UTM) Zone 19 North in meters and vertical datum referenced with an accuracy of 0.005 feet of vertical/horizontal control to the North American Datum of 1927 in feet. Well locations were obtained by static Global Positioning System (GPS) occupations. Elevations were calculated using post-processing software and are referenced to the top of the PVC pipe at the designated mark.

### 3.1.1 Monitoring Well Installation and Sampling

During the course of the J-3 Range groundwater investigations drilling at monitoring well locations was conducted with borewater (aquifer profile) samples collected at 10-foot intervals and analyzed for explosives by EPA method SW846/8330 and perchlorate by EPA method E314.0 later replaced by SW846/6850. Well screens were subsequently installed at each location based on the profile data, aided by groundwater modeling. Complete analytical results for samples collected from monitoring wells in the J-3 Range study area are presented in Appendix B and the water quality parameters measured during groundwater sampling are presented in Appendix C. Both borewater and groundwater sample results were used in the development of the groundwater model and the mapping of contaminant distribution in the J-3 groundwater contaminant plume.

On 1-2 May 2012, extraction well J3EWIP1 was profiled using inflatable packers. Perchlorate concentrations measured at well J3EWIP1 were highest near the bottom of the well screen, increasing from a concentration of 0.20 µg/L, at the top of the well screen (about +6 feet msl), to approximately 8 µg/L at the bottom of the well screen, from elevations of -16 to -31 feet msl, which is at the top of a low permeability layer (Table 8-1).

## 3.2 Nature and Extent of Groundwater Contamination

A large-scale plume of comingled RDX and perchlorate contaminated groundwater has been found to be migrating from sources at the J-3 Range. A significant component of the J-3 RI/FS numerical modeling involved the development of perchlorate and RDX plume shells using the existing groundwater flow model and historical measurements of contamination and not just recent measurements. (Appendix H). This approach did not include calibrating the plume shell

using measured concentrations at the extraction wells but did use all the historical data available to develop the 3D representation of the recent plume and any inconsistencies in plume mass exist because of the irregular spatial and temporal distribution of the contamination but the extent of contamination is believed to be more reliably understood. Furthermore, groundwater with a concentration greater than a low level threshold is going to occupy a much smaller volume in the model than groundwater with a concentration greater than zero. As such, an extraction well with a capture zone extending beyond the low level threshold concentration is going to remove mass that was not accounted for in the original calculation. Therefore, the potential exists for more mass to be removed by an extraction well than was estimated as being above the low-level threshold concentration.

The longitudinally elongated J-3 groundwater plume is thought to be derived from two primary source areas, the Artillery Range and Demolition Area and Melt/Pour Building Area.

Historical depictions of the plume are presented in prior year interim annual environmental monitoring reports. The interim annual environmental monitoring reports provide analyses of plume dynamics and hydraulics including assessment of model-predictions against observed behavior; monitoring program effectiveness and operational aspects of the Rapid Response Action (RRA) Extraction Treatment Reinjection (ETR) system; and the in-plant effectiveness of treating extracted groundwater. The ETR system became operational at the J-3 plume in August 2006. The configuration and migration of the plume has been significantly influenced by the J-3 groundwater RRA ETR system. Perchlorate and RDX concentrations in groundwater are presented in Tables 3-2 and 3-3. All of the chemical data results are presented in Appendices B and C, and the distribution of the primary site-related contaminants are shown on maps and cross sections.

A brief description of the J-3 range plume is provided below. Updated depictions of the J-3 RDX and perchlorate plumes are shown on Figures 3-2 through 3-7.

Samples were collected in accordance with the following work plans:

- *Final J-3 Range Supplemental Groundwater Work Plan* (1/28/2005)
- *Final J-3 Range Groundwater Rapid Response Action Plan* (3/15/2005)
- *Final J-3 Rapid Response Action System Performance and Ecological Impact Monitoring Plan* (6/21/2006)

Historical Plume Characteristics

The J-3 groundwater plume has historically been defined by the RDX and perchlorate concentrations, although HMX was shown to be present in central portion of the plume. In 2006, prior to the startup of the RRA ETR, the horizontal and vertical extent of the plume was defined as concentrations in the groundwater below the limit of detection. The September 2006 downgradient extent of perchlorate contamination was approximately 3,700 feet from the source areas. The RDX portion of the plume extended approximately 4,500 feet downgradient and then beneath Snake Pond. Based on both the perchlorate and RDX concentrations, the plume had a maximum east-west width of approximately 1,200 feet and a maximum thickness of approximately 90 feet (ECC 2006). The maximum concentrations observed in 2006 (prior to

startup of the RRA extraction wells) for RDX, HMX and perchlorate were 32 µg/L, 88 µg/L and 494 µg/L, respectively.

### 3.2.1 RDX and Perchlorate

**RDX**

Like the perchlorate plume, the RDX release likely originated at the J-3 Demolition area and/or the Melt/Pour Building area of the site. Once in groundwater, RDX migrated south with groundwater flow, toward the base boundary, ultimately turning southeast toward Snake Pond. The extent of the J-3 Range RDX plume, as defined by the recently developed RDX plume shell (Appendix H) and concentrations of RDX above 0.6 µg/L (3,400-feet long and 500-feet wide) (Figures 3-2, 3-3 and 3-4), does not extend as far downgradient and is not as wide as depicted prior to the startup of the GW RRA ETR system (4,800-feet long and 900-feet wide). The plume, as defined by RDX concentrations above the health advisory (HA) (2 µg/L), is approximately 2,500-feet long and 200-feet wide. The change in RDX extent is due to mass removal from the J-3 Range ETR system and natural attenuation. The most recent detected maximum RDX concentration is lower (7.5 µg/L, MW-198M4; 06 August 2013) than the maximum reported prior to the startup of the GW RRA ETR system (35 µg/L, MW-343M2, 2005). However, historic concentrations (37.6J µg/L) in this well indicate that the core of the RDX plume has migrated from MW-343 south to MW-227 and is currently downgradient of MW-227. This is also reflected in the increase in RDX concentrations in the two downgradient extraction wells (J3EW0032 and 90EW0001) (Table 3-1). The two small RDX plumelets downgradient of monitoring wells MW-239 and MW-157 represent migrated historical RDX concentrations and their existence has not been confirmed. While the narrow plumelet east of the downgradient RDX plume is predicted to be within the capture zone of extraction well 90EW0001 the somewhat larger plumelet located east of the J3EWIP1 extraction well is predicted to be outside of the existing ETR capture zones. Concentrations of RDX represented by this plumelet were derived by migrating profile data measured in 2002 at MW-239. The RDX contamination at this location is predicted to have entered and become relatively immobile in a low conductivity zone and the concentration of RDX is predicted to diminish to less than 0.6 µg/L by 2033.

For discussion purposes, the plume is divided into the following three segments: (1) RDX Upgradient Plume; (2) RDX Downgradient Plume; and (3) lateral RDX plumelets.

**RDX Upgradient Plume**

Residual RDX concentrations in the source area well MW-163S, in the Demolition Area, have decreased from a high of 33.0 µg/L in 2005 to 1.1 µg/L in July 2013. This declining trend indicates that the mass flux from the source area to the groundwater is declining.

The trailing edge RDX lobe is bounded by results from MW-232 and MW-243 to the west, and MW-193, MW-197 and MW-142 to the east. Historically, the highest RDX concentrations have been measured in the core of the plume at MW-198M3 at a level of 20 µg/L in 2003; however, RDX concentrations at all MW-198 well screens have declined considerably as the core of the plume has migrated toward the J3EWIP1 extraction well. This is demonstrated by the increasing RDX concentrations measured at the J3EWIP1 extraction well.

The relatively poor comparison between measured and predicted RDX concentrations at monitoring wells and extraction wells necessitated the collection of additional groundwater quality data through a drive point program. In 2012, drive points DP-574 through DP-580 were drilled to help determine the thickness of the RDX plume in the area up gradient and in the vicinity of J3EW1P1. The profile data confirmed the existence of additional RDX mass up gradient of J3EW1P1, at depths ranging from 110 to 145 feet in the plume core, and at concentrations up to 17.7 µg/L. Drive point DP-9 was subsequently drilled in 2013 approximately 200 feet down gradient of extraction well J3EW1P1 to help determine whether plume capture is being achieved under both average and high water table conditions. RDX was detected at a concentration of 4.2 µg/L from one 5-foot interval.

**RDX Downgradient Plume**

The downgradient RDX plume is separated from the upgradient because of the effect of groundwater extraction by the in-plume J3EWIP1 extraction well. Monitoring well MW-227 is near the upgradient extent of this downgradient plume and both MW-227M1 and MW-227M2 have shown a considerable decline in RDX concentrations in recent years. The core of the RDX downgradient plume is considered to be immediately upgradient of MW-247 and currently migrating toward the J3EW0032 and 90EW0001 downgradient extraction wells. The downgradient extent of the plume is contained by the extraction wells and is not believed to be entering Snake Pond.

**Lateral RDX Plumelets**

Two small plumelets are believed to exist east of the main lobes. While RDX contamination has never been measured at these locations the plumelets are predicted to exist based on the forward migration of historical concentration data. While the narrow plumelet east of the downgradient RDX plume is predicted to be within the capture zone of extraction well 90EW0001 the somewhat larger plumelet located east of the J3EWIP1 extraction well is predicted to be outside of the existing ETR capture zones. Concentrations of RDX represented by this plumelet were derived by migrating profile data measured in 2002 at MW-239. The RDX contamination at this location is predicted to have entered and become relatively immobile in a low conductivity zone and the concentration of RDX is predicted to diminish to less than 0.6 µg/L by 2033.

**Perchlorate**

The extent of the J-3 Range perchlorate plume, as defined by concentrations of perchlorate above the Massachusetts maximum contaminant level (MMCL) of 2 µg/L (3,500-feet long and 450-feet wide) (Figures 3-5, 3-6 and 3-7), has become slightly shorter and more narrow since prior to the startup of the groundwater RRA ETR (3,700-feet long and 900-feet wide). The western boundary in the downgradient portion of the plume has moved to the east of extraction well J3EW0032 where concentrations are well below the 15 µg/L previously reported due to J3EW0032 mass removal. The area where concentrations exceed 15 µg/L is also narrower, likely due to mass removal by extraction well J3EWIP1. Concentrations above 200 µg/L are no longer observed in the monitoring well network, however concentrations as high as 350 µg/L were detected in drive point profile samples collected in 2012 downgradient of MW-198 and upgradient of J3EWIP1. The vertical extent of the plume, based on the 2 µg/L contour is

comparable to the previous depictions; however, the major difference is the thinning of the higher concentration contours in the plume.

Through mass removal via the ETR system and natural attenuation, perchlorate concentrations have decreased throughout most of the plume (Figure 3-4). The location of the historic maximum plume concentration of 770 µg/L (MW-198M3, June 2005) has decreased most recently to a concentration of 2.7 µg/L (MW-198M3, 06 August 2013). Significant decreases have been observed in areas in proximity to extraction wells, specifically at locations MW-343, MW-142, and MW-247 (Figure 3-4). However, significantly higher perchlorate concentrations are currently observed in the influent to extraction well J3EWIP1 (i.e., 17.3 µg/L, July 2013), indicating the presence of much higher perchlorate concentrations within the J-3 plume than what is presently being detected by the chemical monitoring network. Perchlorate concentrations in source area well MW-163S have declined from a maximum of 120 µg/L (June 2005) to 4.5 µg/L in the latest sampling event (30 July 2013).

The overall centerline length of the perchlorate plume, as defined by perchlorate above the MMCL (2 µg/L), is approximately 3,460 feet, extending from the source area down gradient to approximately 100 feet down gradient of extraction wells J3EW0032 and 90EW0001 and the plume is approximately 440 feet wide at its widest point. This represents a significant narrowing of the plume since active treatment began in 2006, when the plume was observed to be approximately 1,200 feet wide at its widest point.

**Perchlorate Upgradient Plume**

Residual perchlorate concentrations in shallow well MW-163S, in the Demolition Area, show a significant and continued decrease in concentration over time, with the most recent results (July 2013) being 4.5 µg/L, which is significantly less than the highest concentration of 120 µg/L measured in March 2005. This declining trend indicates that the mass flux from the source area to the groundwater is declining.

The plume core, up gradient of the base boundary, contains the highest concentrations of residual perchlorate detected within the J-3 Range plume. The cross-section shown in Figure 3-5 is drawn parallel to groundwater flow along the axis of the plume and through wells exhibiting the highest historical perchlorate concentrations.

Relatively high concentrations of perchlorate have been detected in groundwater samples collected from the MW-198 well cluster since its installation in 2002. Perchlorate concentrations above 100 µg/L have been detected in samples from MW-198M3 from 2002 to 2008, peaking at 770 µg/L in 2005. Perchlorate concentrations above 100 µg/L have been detected in MW-198M2 from 2004 to 2008 and in MW-198M4 from 2002 to 2005, indicating that a significant mass of perchlorate is migrating through this area of the aquifer. Current concentrations have declined to single digit values. This is because the elevated perchlorate concentrations in the plume core have migrated down gradient beyond the MW-198 well cluster.

The relatively poor comparison between measured and predicted perchlorate concentrations at monitoring wells and extraction wells necessitated the collection of additional groundwater quality data through a drive point program. In 2012 drive points DP-574 through DP-580 were

drilled to help determine the thickness of the perchlorate plume in the area up gradient and in the vicinity of J3EW1P1. The profile data confirmed the existence of significant perchlorate mass up gradient of J3EW1P1, at depths ranging from 100 to 165 feet in the plume core, and at concentrations up to 350 µg/L. Drive point DP-9 was subsequently drilled in 2013 approximately 200 feet down gradient of extraction well J3EW1P1 to help determine whether plume capture is being achieved under both average and high water table conditions. Perchlorate was detected at concentrations up to 8.8 µg/L. These results do not suggest segmentation of the perchlorate plume down gradient of the stagnation point of the in-plume extraction well. Wells flanking the plume, east and west of the MW-198 cluster, including MW-197M2, MW-197M3, MW-295M1, MW-295M2, MW-359M2, and MW-144M2 all show continued perchlorate concentrations below the 2.0 µg/L MMCL.

**Perchlorate Downgradient Plume**

Perchlorate concentrations, downgradient of the installation boundary, are generally lower than those reported in the northern portions of the plume. In 2012, none of the wells of the MW-247 well cluster had a detection of perchlorate exceeding the 2.0 µg/L Massachusetts MMCL standard (Table 5-2) while the highest perchlorate in the MW-250 well cluster, increased from 0.31 µg/L in 2011 to 3.0 µg/L in 2012.

Though perchlorate concentrations in extraction wells J3EW0032 and 90EW0001 were below the 2.0 µg/L standard, it is assumed that some of the groundwater captured by these wells enters at a higher concentration due to the long screen lengths. Wells within the MW-247 and MW-329 clusters continue to define the western limit of the plume in the vicinity of these extraction wells with concentrations below 2.0 µg/L and the MW-157 cluster continues to define the eastern limit of the plume with similarly low concentrations

### 3.2.2 Other Compounds

Detects for all other compounds are summarized in Appendix B for the J-3 Range monitoring well samples evaluated in the groundwater risk screening (Section 7.2). In addition to perchlorate and RDX, the only other explosives detected in the J-3 plume monitoring wells defining the plume emanating from the Demolition Area/Melt Pour building were HMX and 1,3,5 trinitrobenzene. HMX is primarily found in monitoring wells on the east side of plume where it has migrated from the Melt/Pour Building source area. Recently detected concentrations of HMX in the downgradient extraction wells (J3EW0032 and 90EW0001) indicate this mass is migrating as predicted prior to the startup of the GW RRA ETR system (Table 3-1). The detections were low-level, typically one to two orders of magnitude below the HA (400 µg/L). 1,3,5 trinitrobenzene was detected once at a concentration of 0.373J µg/L in one well (MW-195S) in April 2009 (Appendix B).

Other explosives compounds have been detected in the J-3 Range groundwater samples including 1,3-dinitrobenzene, TNT, 2,4-DNT, 2-amino-4,6-dinitrotoluene, 4-amino-2,6-dinitrotoluene, 2,4-diamino-6-nitrotoluene, 2-nitrotoluene, 4-nitrotoluene, 1,3,5-trinitrobenzene and picric acid. These compounds were low-level results detected in samples collected prior to 2005 and are no longer detected in groundwater monitoring wells included in the Long Term Monitoring program.

Other detected compounds have included VOCs, SVOCs, pesticides, select metals, inorganic and radiological parameters. The detections of non-MEC related analytes are limited to samples collected during the early phases of the J-3 Range site investigations and are not considered contaminants of concern. All detected compounds are included in the risk screening discussed in Section 7.2.

### 3.2.3 Water Quality Parameters

Water quality parameters were measured at existing and newly installed monitoring wells located within the J-3 Range groundwater study area during sampling events from May 2006 to August 2013 (Appendix C). The ranges and averages were similar to previous results. The range of groundwater water quality parameters are as follows: temperature ranged from 5 to 27 degrees Celsius (°C) with a mean of 11.0°C; dissolved oxygen (DO) ranged from -0.08 to 16.7 milligrams per liter (mg/L) with a mean of 8.67 mg/L; oxidation-reduction potential (ORP) ranged from –460.1 to 354.3 millivolts (mV) with a mean of 153.7 mV; specific conductance ranged from 29 to 281 microsiemens per centimeter (µS/cm) with a mean of 78.6 µS/cm; and pH [scale for measuring aqueous hydrogen ion (H+) concentration] ranged from 4.37 to 10.38 standard units with a mean of 5.78.

### 3.2.4 Snake Pond Investigations

In May 2001, RDX was detected at 4.1 µg/L in a sample collected from MW-171M2, located on a spit of land that protrudes into the north end of Snake Pond during periods of low water table. To evaluate potential discharge of the J-3 RDX plume into the surface water in Snake Pond the USGS placed an array of 108 diffusion samplers approximately 0.5 foot into the pond bottom sediments along 12 north-south oriented transects in and south of the pond's northern cove (Figure 3-8). Trace concentrations of explosives, but no RDX or HMX, were detected at five locations. Perchlorate was not analyzed in samples collected from the diffusion samplers. Subsequently the USGS collected shallow groundwater samples from temporary drive points conducted at 14 locations, including the five locations where traces of explosives were detected in diffusion samplers. The drive point samples were collected 2-4 feet below the pond bottom. The drive point samples were analyzed for explosives and perchlorate. No explosives were detected in any of the drive point samples. Perchlorate was detected at sub-ppb levels in two drive point samples collected near the spit (USGS 2003). The results from the diffusion and drive point sampling did not indicate an area of groundwater discharge with concentrations of ordnance-related compounds that are sufficiently elevated to be detected by these methods (USGS 2003).

In 2010, aquifer profile groundwater samples were collected at three drive points located along the southern shore of Snake Pond to determine if the J-3 plume was under-flowing the pond. No perchlorate or explosives were detected in any of the profile samples.

#### Snake Pond Sampling

The IAGWSP has been sampling surface water at three locations in Snake Pond (Figure 3-9) since May 2001. The purpose of this sampling was to assess any impacts to surface water quality related to the potential discharge into the pond of the J-3 plume. Historically, the

IAGWSP has collected 12 surface water samples from three locations (36 samples total) per year. Sampling occurred monthly in April and May; then every two weeks in June, July and August; and again on a monthly basis in September, October and November. The sample locations were at the public beach off Snake Pond Road (LKSNK0005); a private property at the northwestern shore of the pond (LKSNK0006); and at the beach at Camp Good News (LKSNK007). Explosives have never been detected in the surface water samples collected from Snake Pond. Perchlorate was detected three times between May 2001 and October 2008 at a maximum concentration of 0.72 µg/L. In November 2008, the perchlorate analytical method changed from E314.0 to SW6850, which has a much lower detection limit (0.040 µg/L, vs 0.35 for method E314.0). Since method SW6850 was implemented traces of perchlorate have been detected in 43 out of 93 surface water samples with a maximum detection of 0.11 µg/L (the Massachusetts drinking water standard is 2 µg/L). The detections occurred mainly during the months of July and August with mostly non-detect results from the spring and fall sampling events. This pattern of detections suggests there may be other potential sources of perchlorate in surface water that coincide with increased activity around the pond in the summer. Complete Snake Pond surface water sampling results are provided in Table 3-4.

### Conclusions

The highest concentration area of the J-3 Range perchlorate plume is narrower and the maximum concentration has decreased significantly since the startup of the GW RRA ETR system. The J-3 Range RDX plume is also narrower since treatment began, has lower concentrations, and is less continuous. The main center of mass of the RDX plume, located between J3EWIP1 and J3EW0032 has migrated downgradient as expected. The changes in J-3 Range plume characterizations do not affect the conceptual site model for how the plumes developed or how the plumes will migrate and attenuate in the future.

These groundwater plume characterizations will be further considered in the FS (Sections 8.0 through 11.0). A long-term groundwater monitoring program at existing and new monitoring wells will be conducted to verify the effectiveness of the soil and UXO response; to ensure that ground water modeling predictions regarding the reduction and migration of contamination are correct; and to ensure that any remaining contamination remains below risk-based levels.

# 4.0 J-3 RANGE SOURCE CHARACTERIZATION

The source areas at the J-3 Range include both soil contamination and UXO (or munitions and explosives of concern [MEC]) that may be in or on the soil. Initial investigations of the J-3 Range focused on those features identified during a historical aerial photograph analysis of Camp Edwards. Additional range features were included in the investigation as more range records/information became available. Information regarding range activities has also been obtained through interviews of current and former base employees and range workers and observations noted during site reconnaissance, as previously discussed in Section 2.2. However, available records generally lacked sufficient detail to allow focused soil characterization activities.

## 4.1 Source Characterization Activities

Since 1997 a variety of field investigation methods have been employed to help locate and characterize site features that have caused, or have the potential to cause, groundwater contamination. As discussed below, multiple lines of evidence have been developed, including geophysical and soil sampling data, to characterize J-3 Range chemistry. The Range has been subdivided into six study areas for data presentation, based on geographical area and range use. The following sections describe geophysical and soil sampling activities that have been conducted at the J-3 Range.

### 4.1.1 Soil Sampling

Soil characterization investigations in the J-3 Range commenced in 1997. During the period from February 1997 to March 2013, 1,700 soil samples were collected at various depths from 505 locations within the J-3 Range Study Area.

Samples were collected in accordance with the following work plans and project notes:

- *Final J-1, J-3 and L Range Workplan [J13LWP] (Ogden 2000) August*
- *Final J-1, J-3 and L Ranges Additional Delineation Workplan No. 1 [ADWP1] (AMEC 2001b) September*
- *Final J-1, J-3 and L Ranges Additional Delineation Workplan No. 2 [ADWP2] (AMEC 2002a) September*
- *Final J-3 Range Supplemental Soil Work Plan (AMEC 2004a) November*
- *Munitions Survey Program Phase 3, J-3 Range Site Work Plans (Tetra Tech 2002b) September*
- *Draft Work Plan Melt-Pour and Explosive Storage Bunker Building Decontamination, Drywell and Septic Tank Removal, and Soil Delineation (MACTEC 2003a)*
- *Final Work Plan, Supplemental Soil Delineation, J-3 Range, (MACTEC 2003b)*
- *Revised Draft J-3 Range Barrage Rocket Additional Characterization Investigation Project Note (ECC 2009a)*
- *Final J-3 Range Barrage Rocket Area Soil Sampling Project Note (IAGWSP 2012)*
- *Final Plan for Follow-up Actions at Existing BIP Locations Project Note (IAGWSP 2012)*

- *Final Work Plan, Concrete Target Wall and Block Removal, Building Demolition, and Miscellaneous Housekeeping Activities (MACTEC 2004)*
- *Work Plan for Investigation of Depleted Uranium at J-Ranges (Tetra Tech EM January 10, 2001)*

Results from many of these investigations are summarized in the following reports:

- *Final J-1, J-3 and L Ranges Interim Results Report, TM 01-9 [J13L Interim Report No. 1]. This report includes analytical data collected from the beginning of the J-3 Range investigation in August 2000, through March 02, 2001. (AMEC 2001c March 29)*
- *Draft J-1, J-3 and L Ranges Interim Results Report No. 2, TM 01-16 [J13L Interim Report No. 2]. This report includes analytical data collected from the beginning of the J-3 Range Investigation in August 2000 through July 27, 2001 (AMEC 2001a September)*
- *Draft J-1, J-3 and L Ranges Additional Delineation Report No. 1 [ADR1]. This report present analytical results from the beginning of the J-3 Range investigation in August 2000 through April 14, 2002 (AMEC 2002b May 23)*
- *Final Summary Report, Removal of Crushed Drums and Precondition Sampling Activities, J-3 Range (Harding ESE 2003)*
- *Draft J-3 Hillside Impact Area and Barrage Rocket Site Data Summary Report (ECC 2004)*
- *Final J-3 Range Rapid Response Action(RRA) Completion Report (ECC 2005b)*
- *Final Summary Report Melt-Pour and Explosive Storage Bunker Building Decontamination, Drywell and Septic Tank Removal, Soil Delineation, and Building Demolition J-3 Range Camp Edwards, Massachusetts. (MACTEC December 2004)*
- *Final Summary Report Supplemental Soil Delineation, Melt-Pour Building J-3 Range, Camp Edwards Massachusetts Military Reservation. (MACTEC December 2004)*
- *Final Summary Report Range for Closure Activities J-3 Range Camp Edwards, Massachusetts. (MACTEC 2009 January).*
- *Depleted Uranium Investigation at the J-1, J-3, and U Ranges of the Massachusetts Military Reservation. (Tetra Tech EM, Inc. November 28, 2001)*

Types of soil samples collected include soil boring samples, discrete soil grab samples, 5-point composite soil samples, and multiple increment soil (MIS) samples. Soil samples associated with BIP activities have also been collected. The majority of the samples at J-3 Range were composite samples collected from 5-point sample grids designed to represent a 22 feet by 22 feet area. Sampling points within the grid were placed equidistant from each other; one point in the center and four points offset from each of the grid corners to form an “X” pattern. Sampling depths were typically 0 to 0.25 feet, 0.25 to 0.5 feet, and 0.5 to 1 feet below ground surface (bgs). Deeper samples or different grid dimensions may have been used depending on site features. Variations in grid dimensions, depths and/or number of composite points were defined in respective work plans. Soil samples were collected at magnetic anomalies, proposed excavation areas, from the base of excavations, at specific features noted in site records, aerial

photographs and site reconnaissance, and in support of BIP activities. Samples were also collected using systematic random sampling (using MIS) to characterize large geographic areas within the range. Typically, multiple increment soil samples were collected from a predetermined area called a decision unit following an approach outlined in Cold Regions Research and Engineering Laboratory (CRREL) TR-07-10. These decision units corresponded with the grids established for the geophysical survey of the range (see Section 4.1.2). Grab samples were typically collected at locations with visible explosives, propellant and/or burn residue and submitted for explosives and perchlorate analyses only. The circumstances and rationale for the collection of grab samples was designated in respective work plans.

Pre-BIP samples were collected from 0 to 0.25-foot depth around the UXO item combined as one sample and submitted for analysis. Post-BIP samples were collected following detonation from the bottom and sides of the BIP crater, combined and submitted for analysis.

In accordance with the *Final Revised BIP Field Sampling and Excavation Plan* (AMEC 2004), the need for further action at BIP locations was determined based on a review of post-BIP sample results. If explosives compounds were detected above the Method SW846/8330 reporting limits of 120 µg/Kg and/or if SVOC, metals and/or perchlorate results were reported at concentrations above the respective MassDEP RCS-1 values, a 5-foot by 5-foot by 1-foot area around the BIP crater was excavated.

Soil boring samples, obtained using a drill rig, were collected using stainless steel, split spoon samplers. The split spoon samplers were driven in accordance with the Standard Penetration Test (ASTM Method D1586-99) to designated sampling intervals. If required, a portion of the sample was collected for VOC analysis prior to homogenization of the soil. Sampling depths and analyses were specified at each sampling location and samples were typically collected every five to ten feet from the ground surface to the top of the water table. In general, soil borings were used to characterize the vertical extent of contamination in those areas where surface soils were contaminated or where disposal activities were believed to have occurred.

### 4.1.2 Geophysical Surveys and Investigations

UXO discoveries have primarily been made in conjunction with ordnance clearance conducted in support of intrusive drilling, surface and subsurface soil sampling, and ground-based geophysical surveys. An initial ground-based geophysical survey was conducted at the J-3 Range in 2001. The J-3 Range geophysical investigation area was developed by review of existing information, analysis of aerial photos, and site visits. Nine separate areas were identified for investigation in the J-3 Range totaling approximately 10 acres.

The goal of the geophysical investigation was to produce a digital geophysical record of the ground surface that might help locate potential munitions disposal pits and UXO items representing potential sources of contamination to the aquifer.

Site preparation included clearing the area of vegetation, conducting a UXO sweep, and establishing a reference grid throughout the investigation area. All UXO, UXO related materials, and debris encountered during the surface sweep were flagged and recorded on incident report

forms. Following the surface sweep of the study area, EM-61 geophysical systems were used to survey portions of the J-3 Range.

The geophysical investigations proceeded in a sequential manner. Each investigation used information collected during previous investigations to guide the next step of the process. The investigations typically focused on the anomalies with the highest potential to contain burial or disposal pits based on geophysical signals, field observations, witness interviews and accumulated site knowledge. Generally, the largest and/or most densely distributed anomalies were investigated during each phase, which resulted in smaller anomalies being investigated as the phases of investigation progressed.

Geophysical surveys and investigations were conducted at the J-3 Range as indicated in the table below.

| Investigation Phase | Scope | Work Plan/Report |
|---|---|---|
| Air Magnetometer (AIRMAG) Surveys | Helicopter-mounted magnetometers of four large areas of JBCC, including the J-3 Range | *Draft AirMag Technology Evaluation Report* (Tetra Tech 2002a) |
| Munitions Survey Program (MSP) Phase I | Ground-based geophysical survey (EM-61) of AIRMAG findings | MSP1 Final Report (Tetra Tech 2003b) |
| MSP Phase III | Intrusive investigations of "polygons" identified in MSP Phase I as having the potential to contain burial pits or UXO items | *Munitions Survey Project Phase 3 (MSP3)*<br>*Final J-3 Range Polygon Investigation Report* (Tetra Tech 2003a) |
| J-3 Range Barrage/Hillside Schonstedt Reconnaissance (MSP III) Investigation | Detailed reconnaissance and intrusive investigation of anomalies. | *Final Geophysical Survey Report J-3 Hillside Impact Area* (Tetra Tech 2003c)<br>*Final Geophysical Survey Report J-3 Range Barrage Rocket Site* (Tetra Tech 2003d) |
| J-3 Range Barrage/Hillside Geophysical Investigation | Intrusive investigation of potential pit targets | *Draft J-3 Range Hillside Impact Area and Barrage Rocket Site Data Summary* (ECC 2004) |
| J-3 Range Access Road Clearance | Road clearance to gain access to J-3 Range | |
| J-3 Range Rapid Response Action | Remove contaminated soil from delineated areas of J-3 Range. | *Draft J-3 Range Demolition Area Rapid Response Action (RRA) Plan* (AMEC 2003) |

| Investigation Phase | Scope | Work Plan/Report |
|---|---|---|
| Data Gap Assessment, North of Demolition Area | Conduct a geophysical survey North of the Demolition Area and intrusively investigate 13 selected anomalies. | *Final J-3 Range North of Demolition Area Geophysical Investigation Map and Location of Intrusive Investigation Project Note* (ECC 2006a)<br>*Standard Operating Procedure for Detector-Aided Reconnaissance and Spatial Data Collection* (ECC 2006b)<br>*Final J-3 Range North of Demolition Area Geophysical Anomaly Investigation Technical Memorandum* (ECC 2006c) |
| J-3 Range Barrage Rocket Investigation | Intrusive investigation of geophysical anomalies with a 34mV or higher EM-61 signal value within the transects and two grids in the southern portion of the site. Intrusive investigations of Type C or greater anomalies in four transect extensions. | *Revised Draft J-3 Range Barrage Rocket Field Activities Project Note* (ECC 2009b)<br>*Standard Operating Procedure for Detector-Aided Reconnaissance and Spatial Data Collection* (ECC 2006b) |
| J-3 Range Barrage Rocket Transect Characterization Investigation | Intrusive investigation of Type C or greater sized anomalies in Transects 4 through 21. Extended investigation between Wheelock and Chadwick Roads with six additional transects. | *Revised Draft J-3 Range Barrage Rocket Additional Characterization Investigation Project Note* (ECC 2009a) |
| J-3 Barrage Rocket Additional Intrusive Investigations | Intrusive investigation of all 6-inch and larger anomalies in areas between Transects 3 and 8 on north side of range road. | *Draft J-3 Range Barrage Rocket Follow-up Intrusive Investigation Project Note* (IAGWSP 2011) |
| Multiple Increment Soil Sampling | Multiple increment soil sampling in ten highest density munitions grids | *Final J-3 Range Barrage Rocket Area Sampling Project Note* (IAGWSP 2012) |

Geophysical data and areas intrusively investigated are depicted graphically in characterization figures for each subarea and summarized by phase in Table 4-1.

## 4.2 Source Characterization Findings

This section describes the various geophysical and soil characterization activities and results, lists the various removal actions that were conducted at the Range and presents a summary of the nature and extent of contamination/UXO at the Range. To simplify the discussion, the Range has been divided into six subareas based largely on range features and the grid layout shown in Figure 4-1. These subareas will be discussed as follows:

- Area 1 – Melt/Pour Area
- Area 2 – 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area

- Area 3 – Artillery Range, Demolition Area and Explosives Storage Bunker
- Area 4 – Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area
- Area 5 – Hillside Area
- Area 6 – Barrage Area

These subareas were chosen based on historical range use, range features and the conceptual site model of the range.

Munitions items were categorized based on their explosive characteristics. The categories developed include high explosive (HE), possible HE, Propellant/Energetic, Small Quantity Energetic, and Inert. Munitions items that were classified as HE were positively identified as HE (e.g., lot number or post-BIP results indicative of High Explosives). Items that were classified as "possible HE" were munitions items that were presumed to contain HE on initial discovery and were either disposed in the Contained Detonation Chamber (CDC) or BIP, where the actual presence of the HE was not conclusively established or was not recorded. Items classified as Propellant/Energetic include raw propellant, chunk explosives or bulk explosives. Items classified as Small Quantity Energetic were MEC items that contained small amounts of energetic materials in one or more components (fuzes, detonators, and spotting charges). Items classified as inert were munitions items that were presumed to be HE on initial discovery but post-BIP or CDC results indicated that the item was inert.

### 4.2.1 Area 1 Melt/Pour Area

The Melt Pour Area is located in the southernmost portion of the J-3 Range (Figure 4-1). The Melt/Pour building and associated features including an above-ground storage tank, a wastewater holding tank, a septic tank, and a stand-alone latrine were decontaminated, demolished, and disposed of by Textron in 2003. A suspected wastewater discharge area was also investigated and sampled (Figure 4-2).

Soil sampling was generally focused on the Melt/Pour building features discussed above (ECC 2006d). A description of each of these features was previously presented in Section 2.2. The J-3 Range Area 1 soil data set represents site investigations conducted since 1997. A total of 278 soil samples were collected from 116 locations within this portion of the range, including samples collected during the Textron decommissioning effort at the J-3 Range. In most cases, samples were collected from multiple depths at each location, resulting in a larger number of samples than actual sample locations. Additional details about soil samples collected around each feature within this subarea are discussed below and presented in Table 4-2. Table 4-3 summarizes analytical detections in soil that has already been excavated during various intrusive investigations, removal actions, or in conjunction with BIP activities. Table 4-4 summarizes analytical detections for all soil samples, which represent current in-situ site conditions. The complete database for all soil analytical results is included in Appendix D. Soil sample locations as well as locations and descriptions of MEC items identified in the field are depicted on Figure 4-2. Figure 4-3 presents excavated areas and Figure 4-4 depicts current site conditions, and includes chemical results boxes for samples with remaining explosives compounds or perchlorate detections.

#### 4.2.1.1 Area 1 Findings

**Melt/Pour Facility Area**

The Melt/Pour Facility was reportedly used for the preparation of various munitions items that were tested at the J-3 Range. A listing of sample locations, depths, and analyses associated with the Melt/ Pour Study Area is presented in Table 4-1.

A total of 278 composite and discrete samples were collected from 116 sample locations within the Melt/Pour Area from August 2000 through May 2004. This includes the Textron sampling conducted in 2003 as part of the Melt Pour decommissioning effort. Composite samples were collected from three depths (0 to 0.25 feet, 0.25 to 0.5 feet, and 0.5 to 1 feet bgs) at most locations. Samples collected for VOC analysis were discrete samples. Explosives were detected at 35 locations, with elevated detections associated with the former Melt/Pour structure, the septic tank, the wastewater holding tank and the wastewater discharge area (Figure 4-2). HMX was the primary explosive detected in these areas, with the highest detection of HMX of 1,400,000 µg/Kg at sample location SS102VD. Other explosives detected along with their maximum concentration included RDX (2,000 µg/Kg at SSJ3MP017), TNT (57,000 µg/Kg at sample location SSJ3MP017), 2A-DNT (300 µg/Kg at SS102VD) and 4A-DNT (1,400 µg/Kg at sample location SS102VA).

The Melt/Pour Area has been identified as one of two sources of the J-3 Range groundwater plume, and was targeted for excavation during the soil RRA conducted from 2004 through 2006. The RRA activities focused on areas within the Melt/Pour Area with the highest levels of explosives in soil (Figure 4-3). A total of approximately 1,146 cubic yards of soil was excavated from the Melt/Pour Area and treated in an on-site thermal treatment unit. Confirmatory samples indicated no detectable concentrations of explosives compounds remained within the RRA excavation footprint (Figure 4-4).

Soils associated with location SS102VF (2,4-DNT at 830 µg/Kg and 2,6-DNT at 52J µg/Kg) and location SS102YM (2-nitrotoluene at 160 µg/Kg) were outside of the excavation area and remain in place. It is noted that sample collected from SS102VF was non-detect for both 2,4-DNT and 2,6-DNT under EPA Method 8330 for explosives. These detections have been evaluated as part of the risk screening (Section 7.0).

**J-3 Range Soil Removal**

Prior to excavation, a UXO clearance was conducted within the general limits of the Melt/Pour facility to allow the use of mechanical equipment. In September 2007, a photo aerial assessment was conducted in the area of the Melt/Pour Facility. Four locations (J-3 Mound, J-3 Type ‘C’, J-3 Type ‘E’, and J-3 Mound Access Rd) were identified in Area 1 from site reconnaissance and historical aerial photo reviews. One MEC item was discovered at the Type ‘E’ location and consisted of an M9 Rifle Grenade HEAT that was BIP. The same munition type was discovered along the Access Road to the J-3 Mound and was also BIP. Both items were determined to contain high explosives. Several MD items, including empty projectiles and mortars, were found in the J-3 Mound and J-3 Type ‘E’ locations and are listed in Table 1 of the Munitions Source Assessment. In 2012, five 2.36-inch rockets were discovered outside of the

boundaries of Area 1. All five items were BIP and determined to contain high explosives (Appendix E).

**Area 1 BIP Samples**

A total of 26 samples were collected from 5 locations (SSJ3MTP001, SSJ3MTP002, SSJ3S001, SSJ3S002, and SSJ3S003) associated with BIP activities in Area 1 (Figure 4-2). BIP sample locations, sample identification, collection date, sample depths, and laboratory analyses associated with this area of the range are listed in Table 4-2. A pre- and post-BIP sample collected at location SSJ3S002 had a detection of perchlorate at 0.34 µg/Kg and 0.27 µg/Kg respectively. The post-BIP sample at location SSJ3S003 had a detection of 2,4-DNT at 180 µg/Kg. These detections were below the BIP excavation criteria and, therefore, remain in place. The soils associated with these locations are evaluated in the risk screening (Section 7.0).

#### 4.2.1.2 Area 1 Source Characterization Conclusions

Approximately 1,146 cubic yards of explosives-contaminated soils were excavated from the area during the 2004 RRA and thermally treated on site. Subareas excavated were located at the following: septic tank; suspected wastewater discharge, area west of wastewater holding tank; melt/pour building; area east of melt/pour building; and area east of septic tank.

The conceptual site model of munitions use in J-3 Range, Area 1 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site model is presented in Appendix E. The available information supports that Area 1 was primarily used by Textron for the warhead loading and pressing with explosives mixtures. Due to the activities conducted in this building explosives were deposited in the septic system and underground holding tank, and immediately around and in the vicinity of the building due to deposition from the roof exhaust vent and downspout, and direct wastewater discharge. The primary explosive mixture used was Octol, a mixture of TNT and HMX. The small arms ammunition, barrage rockets, and 2.36-inch rockets discovered in the southern portion of Area 1 are presumed to be related to the military training that took place prior to development of the J-3 Range as a contractor operated range. Additional single items containing HE or small quantity energetics could remain.

### 4.2.2 Area 2 - 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area

The 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area is located in the southeastern portion of the J-3 Range (Figure 4-1).

The following site features are, or were, formerly located within this subarea:

- 20mm/30mm Firing Range and Building
- Workshop Building including drywells, water wells, and septic tank
- Burn Kettle/Conex Area including former flammable storage shed

Textron has conducted the majority of the investigations in Area 2 including soil removal and building demolition activities as part of their decommissioning effort associated with the J-3 Range. In addition, an MSP III investigation was conducted in the Burn Kettle/Conex Area as

well as the 20mm/30mm Firing Range. This investigation included a UXO surface clearance, vegetation clearance, ground-based geophysical survey, and intrusive investigations at select geophysical anomaly locations.

Soil sampling was generally focused on the features listed above. A description of each of these features was previously presented in Section 2.2. The J-3 Range Area 2 soil data set represents site investigations conducted from November 2000 through November 2012. A total of 141 soil samples were collected from 28 locations within this portion of the range. In most cases, samples were collected from multiple depths at each location resulting in a larger number of samples than actual sample locations. Additional details about soil samples collected around each feature within this subarea are discussed below and presented in Table 4-5. Table 4-6A-B summarizes analytical detections for all soil samples, which represent current site conditions. Soil sample locations, as well as locations and descriptions of MEC items identified in the field, are depicted in Figure 4-5. Figure 4-6 depicts current site conditions and includes chemical results boxes for samples with explosives or perchlorate detections. The complete analytical data set for all soil results is included in Appendix D.

#### 4.2.2.1 Area 2 Findings

Composite soil samples were collected from 17 locations. Locations SS102DA through SS102DC; SS102EB, SS102ED, SS102EE and SS15014-A were collected from the 20mm/30mm Firing Range and locations SS102VK SS102VL SS15015-A through SS15021-A; and SS15115-A were collected from the Burn Kettle/Conex Area (Figure 4-5). Elevated concentrations of explosives were detected in one composite soil sample (SS102DA) collected from the 20mm/30mm Firing Range (100 foot). Explosives detections at location SS102DA included 2,4-DNT at 620 µg/Kg (via Method SW8330) and 470 µg/Kg (via Method SW8270); and nitroglycerin at 11,000J µg/Kg.

Discrete soil samples were collected from 13 locations. Locations SS102C1 through SS102C3; SS102DA; SS102EA through SS102EC were collected from the 20mm/30mm Firing Range and locations SS102VK; SS102VL; SS102W1; SS102W2; SS15020-A; and SS15021-A were collected from the Burn Kettle/Conex Area. Elevated concentrations of explosives were detected in two discrete samples. HMX was detected in location SS102C1 at 1,300 µg/Kg and 2,4-DNT and nitroglycerin were detected in location SS102EB at 150J µg/Kg and 2,700J µg/Kg, respectively.

Soil samples were collected at location BH-40 in the 20mm/30mm Firing Range area where a borehole was advanced and samples collected from 4 to 5 feet bgs and 9 to 10 feet bgs. The samples were representative of the soils below Drywell 2 (NW). Explosives were not detected in either sample. Low levels of SVOCs and metals were detected in both samples.

All detected analytes in Area 2 remain in place and are evaluated in the risk screening (Section 7.0).

#### 4.2.2.2 Area 2 Geophysical Investigations/Findings

Geophysical investigations within Area 2 consisted of MSP III Polygons as well as soil removal and building/structure removal by Textron as part of their decommissioning effort in the J-3 Range.

Three polygons (Polygons J3-P1 through J3-P3) were investigated at the Burn Kettle/Conex Area (Figure 4-5). The burn kettle was a partially buried steel buoy used to burn excess propellant and munitions items. The area also included a shed where gasoline was stored and steel CONEXs were used to store munitions prior to 1977. No MEC items were encountered at any of these three polygons. Intrusive investigations identified scrap items and a burial pit containing 97 expended 20mm cartridge cases. One polygon (Polygon J3-P46, also identified as Polygon 13) located at the backstop for the 20mm/30mm Firing Range was also identified, but not investigated in the 2002 polygon investigation. A small shed to the south of the area housed a 20mm gun that fired projectiles into the earthen backstop berm. Several subsurface anomalies were identified as concrete pads and there was a steel plate on the surface.

Textron activities associated with their decommissioning effort at the J-3 Range are described in the *Summary Report Melt-Pour and Explosive Storage Bunker Building Decontamination, Drywell, and Septic Tank Removal, Soil Delineation, and Building Demolition J-3 Range* (MACTEC 2004). No MEC items were encountered during the UXO clearance and support activities associated with the two drywells and the septic tank. During the Textron building demolition phase in 2008, three MEC items were discovered during access clearance in Area 2 (Figure 4-5). Two items, one 60mm mortar with suspect live fuze (SSJ302) and one suspect 3.5-inch Rocket (SSJ303) were BIP along the access road flanking the northern limits of Area 2. The mortar had a live fuze (small quantity energetics) and the rocket contained high explosives based on post-demolition results. The third MEC item was a 2.36-inch rocket with suspect fuze (SSJ301) found behind Drywell #1. Post-demolition results indicate that the fuze was live (small quantity energetics). Within the Conex area, three large anomalies were investigated and found to contain (from north to south) a concrete block, wood debris from a rotted picnic table and base, and a truck frame (MACTEC 2009). These anomalies are labeled “range-related debris” in Figure 4-5.

#### 4.2.2.3 Area 2 BIP-Related Sampling

A total of 14 samples were collected from three locations (SSJ301, SSJ302, and SSJ303) associated with BIP activities in this portion of the J-3 Range. All three items were discovered in support of Textron’s decommissioning activities. Elevated concentrations of explosives compounds were detected at location SSJ303 only. 2,4-DNT, 2-amino-4,6-DNT, and 4-amino-2,6-DNT were detected in the pre-BIP sample at 48 µg/Kg, 44 µg/Kg, and 39 µg/Kg, respectively. Post-BIP results at SSJ303 had elevated concentrations of 2,4-DNT at 32J µg/Kg (via Method SW8270C) and 41 µg/Kg (via Method SW8330); 2-amino-4,6-DNT at 110 µg/Kg; and 4-amino-2,6-DNT at 81 µg/Kg. These detections were below the BIP excavation criteria and, therefore, remain in place.

#### 4.2.2.4 Area 2 Source Characterization Conclusions

A total of three cubic yards of soils was excavated from the two drywells associated with Textron's decommissioning activities. Detections that were not excavated are evaluated in the risk screening.

The conceptual site model of munitions use in J-3 Range Area 2 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site models is presented in Appendix E. The available information suggests that Area 2 is comprised of former administration and storage buildings and a short range firing point for 20mm and 30mm projectiles (though no projectiles were recovered during investigations). The three MEC items encountered could have been the result of errant shots or most likely discarded military munitions. Based on the results of the investigations and known past usage of this portion of the range, it is not likely that significant numbers of additional MEC items would be found in Area 2.

### 4.2.3 Area 3 – Artillery Range, Demolition Area, Explosive Storage Bunker Area

The Artillery Range, Demolition Area, and Explosive Storage Bunker Area are located in the southern central portion of the J-3 Range (Figure 4-1). The following specific site features are or were formerly located within Area 3:

- Minuteman Missile Shroud Test Pad
- Ricochet Trough Area
- Giant Patriot Test Area
- Drum Disposal Area
- Former Flightline Firing Position and X-Ray Building
- Concrete Firing Points Pad and Drop Tower
- Former M550 Launch House and Target Walls
- Explosive Storage Bunker Area

In addition, the following geophysical investigations were conducted:

- MSP Polygons – The overall objective of the MSP Polygon investigation was to identify sites where munitions and other materials were disposed of, through burial and other means.
- North of the Demolition Area – An EM-61 survey and additional intrusive investigations were conducted on anomalies that exhibited geophysical characteristics similar to a burial pit. Quality control geophysical surveys were also conducted to confirm anomaly removals.

Soil sampling was generally focused on the features listed above. A description of each of these features was previously presented in Section 2.2. The J-3 Range Area 3 soil data set represents site investigations conducted from September 2000 through November 2012. A total of 654 soil samples were collected from 173 locations within this portion of the range. In most cases, samples were collected from multiple depths at each location, resulting in a larger number of samples than actual sample locations. Additional details about soil samples collected around each feature within this subarea are discussed below and presented in Table 4-7. Table 4-8

summarizes analytical detections in soil that has already been excavated during various intrusive investigations, removal actions, or in conjunction with BIP activities. Table 4-9 summarizes analytical detections for all soil samples that represent current in-situ site conditions. Soil sample locations as well as locations and descriptions of MEC items identified in the field are depicted on Figure 4-7 along with areas excavated during RRA activities. Figure 4-8 depicts current site conditions, and includes chemical results boxes for samples with explosives compounds or perchlorate detections. The complete analytical data set for all soil results is included in Appendix D.

#### 4.2.3.1 Area 3 Findings

**Minuteman Missile Test Shroud**

The Minuteman Missile Shroud Test Pad is located on the northern limits of Area 3 (Figure 4-7). This pad was identified in the field based on the interviews of former range personnel. The large pad was constructed with concrete and was removed by Textron in 2008 as part of their decommissioning activities at J-3 Range.

No MEC items were found around the elevated pad. A total of 14 composite samples were collected from six sample locations (SS15038-A through SS15043-A) (Figure 4-7). No explosives or perchlorate were detected in samples collected from these six locations. Low levels of metals were detected in the soil samples and are evaluated in the risk screening (Section 7.0).

In June and July 2008, the concrete slabs in the shroud test area were removed for off-base recycling. The concrete was broken up into 2-foot pieces using an excavator with a ram-hoe and the reinforcing steel removed using cutting torches. The concrete and steel were loaded into separate debris containers for off-base recycling. Following the removal action, Frank Corp. regraded the area to match surrounding topography (MACTEC 2009).

**Ricochet Trough Area**

The Ricochet Trough Area is located at the northeastern portion of Area 3 in the J-3 Range (Figure 4-7). The Ricochet Trough Area was reported to have been used as a water-filled target for frangible projectiles and was located at the top of a plateau. The trough was removed in 2000 by Textron. No MEC items were discovered at this location. Discrete soil samples (SS102GA and SS102G2) were collected in 2000 and 2001 from the ricochet area after the trough removal, based on the assumption that the contents of the trough may have spilled during transport. Concentrations of 2,4-DNT and 2,6-DNT (400 µg/Kg and 32 µg/Kg respectively) were detected at SS102G2. A concentration of 2,4-DNT was detected in sample SS102G2 at 81J µg/Kg. Multiple increment soil samples were also collected in 2008 at locations SSJ3RCTDU1 and SSJ3RCTDU2 from 0 to 0.25 feet bgs and 0.75 to 1 feet bgs and analyzed for perchlorate only. Both locations and both intervals have low concentrations of perchlorate ranging from 0.29J µg/Kg to 0.56 µg/Kg via Method SW6850.

These low-level explosives and perchlorate remain in place and are evaluated in the risk screening (Section 7.0).

### Giant Patriot Test Area

The Giant Patriot Test Area is located in the eastern portion of Area 3 and presumably was used for testing the Minuteman 1 Missile warhead self-destruction system (Figure 4-7). A total of 18 samples were collected from four sample locations between October 2000 and September 2008. Composite samples were collected from three depths at SS102MA. Discrete samples were also collected at SS102MA (for VOC analysis only), SS150023-A, and SS1024-A. Multiple increment samples were collected at SSJ3GPTA01 at two intervals (0 to 0.25 feet and 0.75 to 1 feet bgs). No explosives were detected in any of the soil samples. Perchlorate was detected at SSJ3GPTA01 ranging from 0.15J to 0.2J µg/Kg via Method SW6850. These low levels of perchlorate remain in place and are evaluated in the risk screen (Section 7.0). No MEC items were discovered in or around the Giant Patriot Test Area.

### Drum Disposal Area

The Drum Disposal Area is located adjacent to and southeast of the Giant Patriot Test Area (Figure 4-7). The area was initially investigated by Textron in March 2002 based on a witness account. Eighteen empty, crushed drums were excavated by Textron. Soil and wipe samples of the excavation and drums respectively were collected as documented in the *Final Summary Report Removal of Crushed Drums and Precondition Sampling Activities J-3 Range* (Harding ESE 2003). The area that was investigated by Textron ultimately corresponded with MSP III Polygon #4. No MEC items were encountered during Textron's investigation.

A total of nine samples were collected from five sample locations within the Drum Disposal Area between March 2002 and September 2008. Discrete samples were collected from SS102U and SS15025-A and SS15026-A. Explosives were not detected at any of these sample locations.

In 2008, Textron conducted a soil removal and screening operation on the central portion of the Drum Disposal Area as part of their decommissioning effort at the J-3 Range. During clearance activities to support the soil removal operation, one MEC item, a 2.36-inch rocket with suspect fuze, was discovered and BIP. The item was determined to contain only a small quantity of energetic material based on the demolition results. Multiple increment post-excavation samples were collected at locations SSJ3DA01 (0 to 0.25 feet bgs and 0.75 to 1 feet bgs) and SSJ3DA02 (0 to 0.25 feet bgs) following soil removal. Explosives compounds were non-detect and perchlorate was detected at estimated levels ranging from 0.091J µg/Kg to 0.5J µg/Kg. Approximately 150 cubic yards of excavated soil was sifted using a mechanical screener. The screened soil was then stockpiled in an open area. Two waste characterization samples were collected for disposal parameters. Elevated concentrations of HMX were detected in both samples with the maximum detection at 4,800 µg/Kg. Perchlorate was not detected in either sample. The soil was transported off-site and disposed of at an approved facility.

Pre- and post-BIP soil samples (SSJ3E002) were collected from the 2.36-inch rocket location. No explosives or perchlorate were detected. The soils associated with this item remain in-place and are evaluated in the risk screening (Section 7.0).

### Former Flightline Firing Position and X-Ray Building

The flightline firing position was used as a warhead test firing range from the early 1980s until 1997. Projectiles were fired at armored targets located up to 500 feet downrange. X-Ray stations and high-speed cameras were used to evaluate the projectiles in flight. No MEC items were encountered in this subarea.

Composite soil samples were collected at locations SS102LA, SS102LB, and SS102LD in September 2000. SS102LC was collected in May 2001. Explosives were not detected at any of the four initial "L" sample locations except at SS102LC where HMX was detected at 1,800 µg/Kg. The soils associated with SS102LC were excavated during the 2004 soil removal action.

Composite soil samples were collected at three intervals (0 to 0.5 feet, 0.5 to 1 feet, and 1 to 2 feet bgs) at locations SS102LCA, SS102LCB, SS102LCC, SS102IAA, and SS102IAB. Explosives were not detected at any of the locations except at SS102IAB where 2,4-DNT was detected at 20J µg/Kg. The soils associated with this location remain in place and are evaluated in the risk screening (Section 7.0).

In November 2003, one borehole, BH-51A, was advanced near the flightline. A soil sample was collected at 2, 4, and 6 feet bgs. No explosives or perchlorate were detected at any sampled interval. In June 2004, five composite soil samples (SS102YD through SS102YH) were collected near the end of the flightline. No explosives or perchlorate were detected at any of the sample locations and the residual analytes are evaluated in the risk screening (Section 7.0).

Two composite soil samples were collected to the south of the Flightline. SS15022-A was collected from 1.5 to 2 feet bgs and SS15027-A was collected from 0 to 0.5 feet and 1.5 to 2 feet bgs. No explosives or perchlorate were detected at either location.

In addition, soil sample SSJ3DM013, located to the South of the Detonation Area, was collected as a post-excavation sample during the soil removal operation in 2004. The sample was analyzed for perchlorate and explosives. Neither of the analytes was detected. An empty, crushed drum was also discovered outside the footprint of the South of the Detonation Area excavation. A discrete soil sample was collected below the drum as well as a composite sample of the soil stockpile. No explosives were detected and the stockpile soil samples are evaluated in the risk screening (Section 7.0).

### Concrete Firing Point Pads and Drop Tower

The Concrete Firing Point Pads and Drop Tower are located in the southwest portion of Area 3. The concrete pads had guns mounted and aimed north towards the Target Walls. The Drop Tower was used to test whether munitions' packaging could withstand drops without detonating. Composite soil samples were collected at locations SS102IA through SS102IO. Sample locations SS102IO, SS102IL, SS102II are located directly behind the Firing Point Pads. Sample locations SS102IN, SS102IK, and SS102IH are located adjacent to the pads and sample locations 102IM, 102IJ, and 102IG are located between the Firing Point Pads and the Target Wall. Explosives were not detected in any of these "I" locations. A discrete soil sample was also collected at sample location SS102G1 and analyzed for explosives, metals, and SVOCs. No

explosives were detected at this discrete sample location. In October 2003, a composite soil sample was collected at SS15028-A which was the location of the presumed Launch Pad (Figure 4-7). No explosives or perchlorate were detected at either interval.

Three MEC items were found in the immediate vicinity of the Firing Point Pads and Drop Tower between 2003 and 2006. MEC items consisted of one 60mm mortar and one 2.36-inch rocket, which were BIP and both were determined to contain high explosives. One 81mm mortar was disposed in the CDC and determined to contain a small quantity of energetic material.

**Former M550 Launch House and Target Walls**

The Former M550 Launch House and Target Walls are located within the limits of the Demolition Area in the central portion of Area 3 (Figure 4-7). The concrete target walls were used as targets for munitions fired from concrete pad firing points located to the south. The Former M550 Launch House was located atop the east end of Target Wall #1. A former detonation pit and burn area was located on the northern side of Target Wall #1. A former burn box was located on a concrete pad north of the gap between Target Walls #1 and #2 and was removed by Textron in 1999.

In October 2000, discrete soil samples were collected at location SS102NA and SS102NB. No explosives were detected in the samples. In May 2002, these locations were re-sampled for perchlorate. Perchlorate was detected at location SS102NA at 2.9J µg/Kg. The soil associated with this sample location was excavated and thermally treated during the 2004 soil removal action. Concentrations of 2,4-DNT and perchlorate (81J µg/Kg and 9.68 µg/Kg, respectively) were detected at location SS102NB. The soils associated with this sample location remain in-place and are evaluated in the risk screening (Section 7.0).

In November 2000, two boreholes (BH-19 and BH-20) were advanced just north of Target Wall #1. No explosives were detected in any of the intervals at either location. In August 2002, a third borehole (BH-39) was advanced adjacent to BH-19 and BH-20 and analyzed for perchlorate and dyes. Neither analyte was detected in any of the intervals at BH-39.

A total of 36 composite soil samples were collected at locations SS102UA through SS102UI in October 2001 to support the Target Wall characterization. Elevated levels of RDX were detected at sample locations SS102UC and SS102UG (420 µg/Kg and 4,500 µg/Kg respectively). The soils associated with these two sample locations were excavated and thermally treated during the soil RRA in 2004. In addition, a concentration of tetryl (140 µg/Kg) was detected at location SS102UH. The soils associated with this location remain in place and are evaluated in the risk screening (Section 7.0).

In addition, discrete soil samples at locations SS102N1 and SS102N2 were collected in October 2001 to support characterization between the Detonation Pit and the Target Wall #1. No explosives were detected at these two locations.

A total of nine composite soil samples were also collected in October 2001 from locations SS102PC, SS102PD, and SS102PE to support the burn box characterization. 2,4-DNT (74J µg/Kg) was detected location SS102PE. The soils associated with this sample remain

in-place and are evaluated in the risk screening (Section 7.0). HMX (140 µg/Kg) was detected at location SS102PC. The soils associated with this sample location were removed as part of the 2004 soil RRA.

In May 2002, 12 composite soil samples were collected from locations SS102NAA, SS102NAB, and SS102NBA. No explosives were detected in any of the samples. Concentrations of perchlorate were detected at locations SS102NAB (ranging from 16.3 µg/Kg to 234 µg/Kg) and at SS102NBA (9.49 µg/Kg). Soil at these locations was removed during the soil RRA conducted in 2004.

Between October and November 2003, a total of 57 composite soil samples were collected from locations SS15029-A to -C, SS15030-A to -E, SS15031-A to –E and at SS15032-A, SS15033-A, SS15034-A, SS15035-A, and SS15036-A. A concentration of perchlorate (1.7J µg/Kg) was detected at sample location SS15029-C and concentrations of explosives were detected at locations SS15032-A (HMX at 580 µg/Kg), SS15033-A (RDX at 1300 µg/Kg; HMX at 26,000 µg/Kg) and SS15034-A (HMX at 5,300 µg/Kg). Soils associated with these three sample locations were excavated during the 2004 soil RRA at the J-3 Range. A concentration of HMX (25,000 µg/Kg) was also detected at location SS15030-E. This soil remains in-place and is evaluated in the risk screening (Section 7.0). Discrete soil samples were also collected at locations SS15029-D and -E. No explosives or perchlorate were detected at these two sample locations.

A total of 18 composite soil samples were also collected from locations SS15044-A through SS15052-A in October 2003. No explosives or perchlorate were detected at these locations with the exception of location SS15050-A, where 2,4-DNT was detected at 86J µg/Kg, and remains in place.

In June 2004, discrete soil samples were collected at locations SS102Y, SS102YA, SS102YB, SS102YC, SS102Z, SS102ZA, SS102ZB, and SS102ZC as part of the Minuteman 1 Target Area characterization. No explosives or perchlorate were detected at these eight locations.

During the 2004 soil RRA, excavations were conducted in five separate subareas within the confines of the M550 Launch House and Target Walls area. Post-excavation composite soil samples were collected at locations SSJ3DM001 through SSJ3DM012. No explosives or perchlorate were detected in the final post-excavation soil samples. The soil removal action and the sample results are further discussed in Section 5.0. In addition, a burn pit was discovered in grid C6. A soil sample (ECCBPJ301) was collected for explosives, perchlorate, metals, SVOCs, and dioxins. Based on the analytical results, soil was removed to 8 feet bgs. A final post-excavation soil sample was collected for explosives from 8 to 8.25 feet bgs. RDX was detected at 340 µg/Kg. This soil remains in place and is evaluated in the risk screening (Section 7.0).

**Explosive Storage Bunker Area**

The Explosive Storage Bunker Area is located on the western edge of Area 3 (Figure 4-7). Four ammunition storage bunkers identified as Buildings J3-5, J3-5A, J3-5B, and J3-5C were sampled, decontaminated, and removed by Textron as part of their decommissioning effort at the J-3 Range. The activities associated with the Explosive Storage Bunkers are described in

the *Summary Report Melt-Pour and Explosives Storage Bunker Decontamination, Drywell and Septic Tank Removal, Soil Delineation, and Building Demolition J-3 Range* (MACTEC 2004). No other soil samples were collected in this general area and no MEC items were discovered within the fenced bunker area.

#### 4.2.3.2 Area 3 Geophysical Investigation/Findings

Geophysical investigations within Area 3 consisted of MSP III Polygons, Ground Penetrating Radar (GPR), a EM-61 survey to the North of the Demolition Area, and two phases of building/structure removal by Textron as part of their decommissioning effort in the J-3 Range. A soil removal action was also conducted in the Demolition Area based on analytical results from extensive soil sampling and is further described in Section 5.0.

A geophysical survey of the J-3 Range was conducted in 2000 under the MSP III. One polygon (Polygon J3-P4) was selected for investigation in Area 3 based on the geophysical signature response and spatial extent (Figure 4-7). Upon investigation, it was determined that the polygon had been excavated by Textron in 2002 as part of their crushed drum removal in support their decommissioning activities at the J-3 Range. The polygon was checked with magnetometers and no additional investigation was required.

In 2004, Textron removed the concrete Target Walls in the Demolition Area in order to facilitate a soil removal operation by the IAGWSP. UXO technicians used magnetometers to sweep the work area footprint prior to demolition of the walls.

In 2004, an intrusive investigation of three GPR anomalies was conducted in the Demolition Area near the Target Walls. The anomalies were elected based on an earlier GPR survey that was conducted as part of a technology demonstration. A small munitions debris burial pit was discovered consisting of remnants of 40mm projectiles and fuzes adjacent to a blast mat. A composite soil sample (SSJ340MMPIT) was collected from the base of excavation (2 to 2.5 feet bgs) as well as from the excavated soil stockpile and analyzed for explosives, metals, perchlorate, and SVOCs. No explosives or perchlorate were detected in either sample and the soil was backfilled in the original excavation. No other anomalies were discovered in the remaining two GPR locations.

In 2006, an area between the Minuteman Missile Shroud Test Pad and the Demolition Area was cleared of vegetation to support an EM-61 geophysical investigation. This North of the Demolition Area was surface cleared of metallic items before conducting a geophysical survey (Figure 4-7). One suspect 40mm grenade was discovered on the surface in Grid D5 and BIP (SSJ3D5001). Concentrations of perchlorate (14.9 µg/Kg), TNT (38 µg/Kg), 2,4-DNT (22 µg/Kg), and RDX (93 µg/Kg) were detected in the pre-BIP soil sample. Concentrations of perchlorate (3.3 µg/Kg) and RDX (40 µg/Kg) were detected in the post-BIP sample. The soil remains in place and is evaluated in the risk screening (Section 7.0). In addition, an empty crushed drum was discovered in Grid D5. A discrete soil sample was collected under the drum and analyzed for explosives and perchlorate. Neither of these analytes was detected in the sample.

Prior to intrusive investigation at the North of Demolition Area, six locations (SSJ3NDA01 through SSJ3NDA06) were sampled, representing dig locations 3, 7, 2, 6, 5, and 10, respectively.

No explosives or perchlorate was detected at any of the sample locations with the exception of SSJ3NDA02 at the 0.5 to 1 feet interval where TNT was detected at 670 µg/Kg. A fourth interval was collected from 1 to 1.5 feet bgs at this location for explosives. No explosives were detected and the soil associated with this location was excavated and disposed off-site at an approved facility.

Thirteen geophysical anomalies (Locations 1 through 13) at the North of Demolition Area were selected to be investigated based on geophysical signature response and spatial extent. One MEC burial pit (J3-D6-BLP-001) was discovered at Location 5 in Grid D6. One hundred eighty-five fuzes, 183 initiators, 78 0.50 caliber Ball cartridges, four blasting caps, 17 cartridges, and 79 fuze components were discovered in the burial pit, disposed in the CDC, and determined to contain small quantities of energetics. Five suspect M95 20mm projectiles and four M56A3/M56A4 20mm projectiles were encountered in the burial pit, disposed in the CDC, and were considered to contain high explosives. Lastly, one propellant cartridge for a 20mm projectile and five grains of rocket propellant were discovered as well, disposed in the CDC, and considered to contain propellant/energetics. A discrete soil sample (SSJ3D6004) was collected under the propellant and analyzed for explosives and perchlorate. Elevated concentrations of RDX (920 µg/Kg), HMX (350 µg/Kg), nitroglycerin (3200 µg/Kg) and perchlorate (0.64J µg/Kg) were detected. The soil associated with SSJ3D6004 was combined with the burial pit soils. A confirmatory composite soil sample (J3D6-BLP-001 (PE)) was collected from the base of the burial pit. No explosives or perchlorate were detected. A composite soil sample was collected from the stockpile (J3D6-BLP-001 (stp)) for disposal parameters. Concentrations of perchlorate (0.45J µg/Kg) and HMX (270 µg/Kg) were detected. Soil associated with the burial pit was transported off-site and disposed at an approved facility. One MEC item, a suspect M71 90mm projectile, was discovered at Location 9 and BIP (SSJ3D5002). The item contained high explosives based on demolition results. In addition, one suspect 81mm mortar, M43, was discovered in an access path cleared to gain access to the central portion of the investigation area. The mortar was BIP (SSJ3E6001) and determined to contain high explosives based on demolition results.

A detailed description of the items discovered during these geophysical investigations is in Appendix E.

In 2008, Textron removed the elevated concrete slab at the Minuteman Missile Shroud Test Pad as well as the Flightline, Instrument Trailer, Gas Gun, Explosive Storage Bunkers, and other concrete structures and utility corridors. UXO technicians used magnetometers to gain access to the structures during demolition activities. No MEC items were encountered during these field activities.

**Area 3 Other MEC Items Discovered**

In support of the various field investigations conducted in the J-3 Range, the range road was UXO cleared in 2003. Four MEC items, consisting of a 60mm mortar, a 20mm projectile, a 3-inch Stokes mortar, and a 2.36-inch rocket were discovered during the clearance. All of the items were transported to the CDC. The first two were determined to contain high explosives and the other two were inert. Additionally, two 81mm mortars, one 40mm practice grenade, and one 40mm HE grenade were discovered and BIP. All but the practice grenade were found to

contain high explosives. Munitions debris and range related debris were discovered during the clearance and re-grading of the range road within the limits of Area 3.

Several MEC items were discovered during UXO clearance of the sixteen 100-foot by 100-foot grids established in support of the soil removal operation conducted in 2004. The following items were found and are further discussed in Appendix E:

- In grid A5, one M49 60mm mortar was BIP and determined to contain high explosives;
- In grid B5, one 81mm mortar was BIP and determined to contain a small quantity of energetics;
- In grid B6, one M49 60mm mortar, HE was BIP and determined to contain high explosives;
- In grid B7, one M6 2.36-inch rocket, HEAT, was disposed in the CDC and determined to contain a small quantity of energetics, one 40mm rifle grenade, HE, was BIP and determined to contain high explosives, one M78 fuze was disposed in the CDC and determined to contain a small quantity energetics, and three M6 2.36-inch rockets, HEAT were BIP and determined to contain high explosives;
- In grid C5, one MK1 3-inch Stokes mortar was disposed in the CDC and determined to contain a small quantity of energetics;
- In grid C6, four M301 81mm mortars were disposed in the CDC and determined to contain small quantities of energetics;
- In grid C7, one M49 60mm mortar was disposed in the CDC and determined to contain high explosives and one M6 2.36-inch rocket warhead was disposed in the CDC and determined to contain a small quantity of energetics;
- In grid D6, a burial pit was discovered. 1,132 M56A3/M56A4 20mm projectiles were disposed in the CDC and determined to contain high explosives.

#### 4.2.3.3 Area 3 BIP-Related Sampling

A total of 158 samples were collected from 29 BIP locations associated with field investigations and soil removal actions between 2003 and 2007 in this portion of the J-3 Range. BIP sample locations, sample identification, collection date, sample depths and laboratory analyses associated with this subarea are identified in Table 4-7. There were no elevated concentrations of explosives or perchlorate at sample locations SS15096-A, SS15201-A, SS15204-A, SS15205-A, SS15214-A, and SS15215-A. Elevated concentrations of explosives and/or perchlorate were detected at BIP locations SS15094-A, SS15095-A, SS15206-A, SS338-A, and SSJ3C7003. The soils associated with these BIP locations were excavated under the BIP management program.

Concentrations of explosives below the BIP excavation criteria were detected at 10 BIP locations. TNT was detected in the pre- and post-BIP samples (39 µg/Kg and 180 µg/Kg, respectively) at location SS15098-A. 2-amino-4,6-DNT was detected in the pre- and post-BIP samples (15 µg/Kg and 15 µg/Kg, respectively) at location SS15202-A. At location SS15203-A, 2,4-DNT (31 µg/Kg) was detected in the pre-BIP sample while RDX (13 µg/Kg); 4-amino-2,6-

DNT (36 µg/Kg); 2-amino-4,6-DNT (40 µg/Kg); and TNT (32 µg/Kg) were detected in the post-BIP sample. TNT (14 µg/Kg) was detected in the post-BIP sample at location SS15207-A. Perchlorate (33 µg/Kg and 5.3 µg/Kg) was detected in the pre-BIP sample only at locations SS15213-A and SSJ3C7004 respectively. A concentration of tetryl (45 µg/Kg) was detected in the post-BIP sample at location SS15216-A. Concentrations of TNT (41 µg/Kg); 2,4-DNT (21 µg/Kg); 2-amino-4,6-DNT (37 µg/Kg); and 4-amino-2,6-DNT (34 µg/Kg) were detected in the post-BIP sample at location SSJ3E6001. Low concentrations of explosives were also detected in the supplemental BIP samples collected at locations SS15206-A and SSJ3E6001. The soils associated with these BIP samples were below the BIP excavation criteria and therefore remain in place (Figure 4-8). Table 4-9 summarizes the detections of explosives/perchlorate in soil that remain in place. Remaining detections are evaluated in the risk screening (Section 7.0).

#### 4.2.3.4 Area 3 Source Characterization Conclusions

A total of 1,085 cubic yards of soils was excavated from the Demolition Area during the 2004 soil RRA and thermally treated on-site. In addition, approximately 150 cubic yards of soil were removed during Textron's 2008 investigation activities at the Drum Disposal Area. There are low concentrations of explosives remaining on-site. These detections are further evaluated in the risk screening (Section 7.0).

The conceptual site model of munitions use in J-3 Range, Area 3 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site models is presented in Appendix E. The available information suggests that Area 3 is comprised of numerous testing areas for various munitions in support of defense contractor's activities. A significant reduction in overall MEC has been achieved through various intrusive investigation and soil removal actions. Some of the MEC items encountered could be attributable to training associated with Former H Range (located to the southeast of J-3 Range), which preceded contractor activities at the J-3 Range. The highest percentage of MEC items were located in burial pits, discovered during numerous investigations. Single MEC items were also discovered on the range between investigation areas. It is possible that fragmentation, metallic debris, or individual intact munitions, both inert and HE, remain as isolated occurrences in Area 3. Residual, single MEC items are likely to be 20mm projectiles, 40mm projectiles, 60mm mortars, 81mm mortars, 3-inch Stokes mortars, and/or 2.36-inch rockets.

### 4.2.4 Area 4 – Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area

The Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area, and Presumed M550 Berm Area are located in the central portion of the J-3 Range (Figure 4-9). The following specific site features are or were formerly located within Area 4:

- Ordnance Assembly/X-Ray Building
- Environmental Test/Assembly Building
- Gauntlet Area
- Presumed M550 Berm Area

In addition, eight MSP polygons were investigated in Area 4. The overall objective of the MSP Polygon investigation was to identify sites where munitions and other materials were disposed of through burial and other means.

Soil sampling was generally focused on the features listed above. A description of each of these features was previously presented in Section 2.2. The J-3 Range Area 4 soil data set represents site investigations conducted from June 2000 through September 2006. A total of 97 soil samples were collected from 32 locations within this portion of the range. In most cases, samples were collected from multiple depths at each location, resulting in a larger number of samples than actual sample locations. Additional details about soil samples collected around each feature within this subarea are discussed below and presented in Table 4-10. Table 4-11 summarizes analytical detections in soil that has already been excavated during various intrusive investigations, removal actions, or in conjunction with BIP activities. Table 4-12 summarizes analytical detections for all soil samples that represent current in-situ site conditions. Soil sample locations as well as locations and descriptions of MEC items identified in the field are depicted on Figure 4-9. Figure 4-10 depicts current site conditions, and includes chemical results boxes for samples with explosives or perchlorate detections. The complete analytical data set for all soil results is included in Appendix D.

#### 4.2.4.1 Area 4 Findings

**Ordnance Assembly/X-Ray Building**

The Ordnance Assembly/X-Ray Building is located in the southern portion of Area 4 (Figure 4-9). This building was constructed in 1983 and was used for assembling munitions and ordnance systems, x-ray inspection of ordnance components and systems, mass property measurements, and developing of x-rays (USACE 1999). The building had an above ground and underground storage tank that were removed in 1991. Wastewater from the building was discharged into a septic tank and leaching field. The building was demolished by Textron in 2008 as part of their decommissioning activities at the J-3 Range. No MEC items were found around the building footprint.

Two boreholes (BH-21 and BH-22) and one monitoring well (MW-125) were advanced downgradient (south) of the building. No explosives were detected in any of the intervals at any of the three locations. The remaining detections of the other analytes are evaluated in the risk screening (Section 7.0).

**Environmental Test/Assembly Building**

The Environmental Test/Assembly Building is located adjacent and northeast of the Ordnance Assembly/X-Ray Building in Area 4 (Figure 4-9). The building was used to conduct environmental testing of ammunition and ordnance devices, ballistic testing of 20mm, 30mm, and 40mm projectiles, temperature conditioning of ammunition, auxiliary ordnance assembly, and range support (USACE 1999). No MEC items were discovered within the footprint of the building.

In October 2000, three composite soil samples were collected at location SS102RA. In May 2001, a discrete sample (SS102S1) was collected at a small sand pile in the location of a former

ammunition capture box and analyzed for explosives, metals, SVOCs, VOCs, and herbicides/pesticides. In 2003, a composite soil sample was collected at SS1506-A and analyzed for perchlorate only. A discrete soil sample was also collected at SS15058-A at the same time and analyzed for perchlorate only. No explosives or perchlorate were detected in these samples. Remaining detections of the other analytes are evaluated in the risk screening (Section 7.0).

**Gauntlet Area**

The Gauntlet Area is located in the northern portion of Area 4 (Figure 4-9). The area was used for rocket and projectile ground launch tests, skeet launches from an 80-foot tower, captive flight tests, and altimeter tests (ASR, USACE 1999). No MEC items were discovered in this area.

In September 2000, 24 composite soil samples were collected at eight locations (SS102TA through SS102TH). A discrete soil sample was collected at each location and interval for VOC analysis. No explosives were detected at any of the locations and intervals. In January 2002, six composite soil samples were collected at two locations (SS102TI and SS102TJ) which corresponded with MSP III Polygons J3-P11 and J3-P12, respectively. No explosives were detected. In October 2003, composite soil samples were collected at five locations (SS15059-A through SS15062-A and SS15013-A). No explosives or perchlorate were detected at either location. Remaining detections of all other analytes from each location are evaluated in the risk screening (Section 7.0).

Three MSP III polygons (J3-P5, J3-P11, and J3-P12) were intrusively investigated in June 2002. No MEC items were discovered at these three locations. A description of the finds is detailed in Appendix E.

**Presumed M550 Berm Area**

The Presumed M550 Berm Area was reported to have been used as an impact area for 40mm projectiles. A total of nine M433 40mm projectiles with suspect fuzes were discovered in Polygons J3-P6 through J3-P10. The items were BIP and determined to contain a small quantity of energetics based on the demolition results. Discrete soil samples (SS102XA and SS102XB) were collected in May 2000. No explosives were detected at either location. Composite soil samples were collected at four locations (SS15053-A through SS15056-A). No explosives were detected at any location.

#### 4.2.4.2 Area 4 BIP-Related Sampling

A total of 17 samples were collected from three locations (SS15097-A, SS15127-A, SS15128-A) associated with BIP activities from field investigations between 2003 and 2006 in Area 4. BIP sample locations, sample identification, collection date, sample depths, and laboratory analyses associated with this subarea are identified in Table 4-10. Concentrations of explosives were detected at sample location SS15097-A where 2-amino-4,6-DNT and 4-amino-2,6-DNT were detected at 16 µg/Kg and 14 µg/Kg, respectively. These detections were below the BIP excavation criteria and remain in place. They are evaluated in the risk screening (Section 7.0). TNT was detected (200 µg/Kg) at BIP location SS15127-A. The soils associated with this BIP location were excavated under the BIP management program.

### Area 4 Source Characterization Conclusions

The conceptual site model of munitions use in J-3 Range, Area 4 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site model is presented in Appendix E. The available information suggests that Area 4 is comprised of numerous testing areas for various munitions in support of defense contractor's activities. The buildings once used for testing and analyzing munitions' response were demolished by Textron in 2008 as part of their decommissioning activities at the J-3 Range. The few MEC items encountered may be related to contractor testing activities or to training associated with the Former H Range (located to the southeast of J-3 Range) which predates contractor activities in J-3 Range. The M550 fuses were tested by Textron. Based on the results of the investigations and known past usage of this portion of the range, it is unlikely that significant additional MEC items would be found in Area 4.

## 4.2.5 Area 5 – Hillside Study Area

The Hillside Study Area is located in the southwestern portion of the J-3 Range (Figure 4-1). The area was reportedly used as part of a training range impact area and has been investigated since 2002.

The J-3 Range Area 5 soil data set represents site investigations conducted from September 2002 through August 2006. A total of 75 soil samples were collected from 21 locations within this portion of the range. In most cases, samples were collected from multiple depths at each location, resulting in a larger number of samples than actual sample locations. Additional details about soil samples collected around each feature within this subarea are discussed below and presented in Table 4-13. Table 4-14 summarizes analytical detections in soil that has already been excavated during various intrusive investigations, removal actions, or in conjunction with BIP activities. Table 4-15 summarizes analytical detections for all soil samples that represent current in-situ site conditions. Soil sample locations as well as locations and descriptions of MEC items identified in the field are depicted on Figure 4-11. Figure 4-12 depicts current site conditions, and includes chemical results boxes for samples with explosives or perchlorate detections. The complete analytical data set for all soil results collected through 2004 is included in Appendix D.

### 4.2.5.1 Area 5 Findings

Under the MSP III investigation, a magnetometer-assisted survey was conducted by UXO technicians in March and April 2003. Three MEC items (two suspect M21 hand grenades and one unfuzed MK1 3-inch Stokes mortar) were transported to the CDC and determined to contain a small quantity of energetics. Based on the results of the magnetometer survey, eleven 100-foot by 100-foot grids were selected for further investigation in August 2003. The grids were cleared of vegetation and a ground-based geophysical survey was conducted. Numerous suspect 3-inch Stokes mortars were discovered during the investigation and transported to the CDC. These items were determined to be inert based on the demolition results. Other MEC items included a suspect 40mm projectile (SSA08290202) and a 60mm mortar (SS339-A) discovered on access roads to the Hillside Study Area. These items were BIP and determined to contain high explosives. An M21 hand grenade and a 60mm mortar were found adjacent to

sample location SS198DG. Both items were disposed in the CDC and determined to contain a small quantity of energetics. Lastly, a monitoring well (MW-356) was installed in 2004 at the top of the Hillside Study Area within an existing jeep trail discovered during the magnetometer survey. No MEC items were discovered during UXO clearance in support of this well installation.

Composite soil samples (and discrete VOC samples) were collected in June 2003 at 19 locations (SS198DG, SS198EG, SS198EK, SS198FG, SS198FK, SS198GE, SS198GG, SS198GK, SS198GP, SS198HG, SS198HH, SS198HL, SS198HO, SS198IH, SS198II, SS198IJ, SS198JJ, SS198JK, and SS198JO). A discrete soil sample was also collected from SS198FF. Explosives were detected at three of the 20 locations. At location SS198GP, 1,3,5-trinitrobenzene was detected at 33 µg/Kg; at location SS198HG, 1,3,5- trinitrobenzene was detected in the first two intervals at 35 µg/Kg and 22J µg/Kg respectively; and at location SS198JO, 2,4-DNT was detected at 22J µg/Kg. The soils associated with these locations remain in place and are evaluated in the risk screening (Section 7.0).

One monitoring well (MW-365) was installed in November 2004 with soil boring samples collected in three intervals from 0 to 6 inches, 1.5 to 2 feet, and 10 to 12 feet bgs and analyzed for explosives, metals, perchlorate, and SVOCs. No explosives or perchlorate were detected in any of the boring samples. Detections of the other analytes are evaluated in the risk screening (Section 7.0).

#### 4.2.5.2 Area 5 BIP-Related Sampling

A total of 32 samples were collected from five BIP locations (SS335-A, SS339-A, SS71-A, SSA08290202, and SSA10230301) associated with field investigations in Area 5 between 2003 and 2006. BIP sample locations, sample identification, collection date, sample depths, and laboratory analyses associated with this subarea are identified in Table 4-13. Explosives were detected at sample location SS335-A where tetryl and 2-nitrotoluene were detected at 37 µg/Kg and 49J µg/Kg, respectively. Explosives were also detected in supplemental BIP samples at location SSA08290202, where 2,4-DNT and 2,6-DNT were detected at 27J µg/Kg and 14J µg/Kg respectively. These concentrations are below the BIP excavation criteria and remain in place. These detections are evaluated in the risk screening (Section 7.0). Various explosives were detected at BIP locations SS339-A and SSA08290202. Soils associated with these BIP locations were excavated under the BIP management program.

#### 4.2.5.3 Area 5 Source Characterization Conclusions

The conceptual site model of munitions use in J-3 Range, Area 5 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site models is presented in Appendix E. The available information suggests that Area 5 is comprised of a training range impact area. The principal MEC items discovered in Area 5 included 3-inch Stokes mortars as well as a few 60mm/81mm mortars. The location of the area and the types and ages of the munitions discovered suggest that use of the area likely pre-dates the development of the J-3 Range as a munitions testing range. The few MEC items encountered are likely attributable to training associated with Former H Range (located to the southeast of J-3 Range). Based on the results of the investigations and

known past usage of this portion of the range, it is unlikely that significant additional MEC items would be found in Area 5.

### 4.2.6 Area 6 – Barrage Rocket Study Area

The J-3 Range Barrage Rocket Study Area is located in the northern portion of the J-3 Range, south of Wheelock Road. The Barrage Rocket Study Area is an impact area for the 4.5-inch Barrage Rocket (northern portion) and the 81mm Mortar (southern portion). Extensive field investigation activities have been performed in the Barrage Rocket Study Area. These investigations included a comprehensive detector-aided reconnaissance, vegetation clearance of support areas, UXO surface clearance, ground-based geophysical surveys, 5-point composite sampling of surface soils, multiple increment grid sampling of surface soils, and intrusive investigations at select geophysical anomaly locations.

Soil sampling was primarily related to geophysical investigation finds, general site characterization activities and BIP activities conducted in the Barrage Rocket study area between 2002 and 2012. References for these investigations were previously presented in Section 4.1.2. The J-3 Range Area 6 soil data set represents site investigations conducted from February 1997 through March 2013. A total of 455 soil samples were collected from 135 locations within this portion of the range. In most cases, samples were collected from multiple depths at each location, resulting in a larger number of samples than actual sample locations. In addition, in 2012 multiple increment soil samples were collected from ten 100-foot by 100-foot grids located in areas exhibiting the greatest density of munitions during preceding geophysical investigations. Additional details about soil samples collected within this area are discussed below and presented in Table 4-16. Table 4-17A summarizes analytical detections in soil that has already been excavated during various intrusive investigations, removal actions, or in conjunction with BIP activities (Figure 4-13). Table 4-17B summarizes analytical detections for all soil samples that represent current in-situ site conditions. The complete database for all soil analytical results is included in Appendix D. Soil sample locations as well as locations and descriptions of MEC items identified in the field are depicted on Figure 4-13. Figure 4-14 depicts current site conditions including chemical results boxes for samples with remaining explosives or perchlorate detections.

#### 4.2.6.1 Area 6 Findings

Composite soil samples were initially collected from 28 locations (SS346-A through SS373-A) in the J-3 Range Barrage Rocket Study Area. Fifteen of these samples were non-detect for explosives and perchlorate. Perchlorate was detected at locations SS357-A (3.1J µg/Kg), SS361-A (4.0J µg/Kg and 510 µg/Kg), and SS371-A (3.6J µg/Kg). Barrage rockets did not contain RDX. TNT was identified at location SS362-A (290 µg/Kg by Method SW8330). 2-Amino-4,6-DNT was detected at SS358-A (190J µg/Kg) and SS362-A (180J µg/Kg). 2,4-DNT was detected at locations SS362-A (460 µg/Kg by Method SW8270C and 300 µg/Kg by Method SW8330), and SS368-A (190J µg/Kg). Concentrations of nitroglycerin ranged from 2,600 µg/Kg to 33,000 µg/Kg with the highest concentration found at location SS348-A. Ten multiple increment soil samples were collected in 2012 from grids in areas of the greatest munitions density (LOCIDs SSJ3BRSG01 through SSJ3BRSG10).The sample collected from soil grid SG-8 (SSJ3BRSG08), which encompassed the southern end of transect 9, detected tetryl (1190

µg/Kg), 2,4-DNT (1330 µg/Kg) and 2,6-DNT (100 µg/Kg). Perchlorate was also detected at trace levels in nine of the ten multiple increment samples but was detected at 7.79 µg/Kg in the sample from SG-8. Soils associated with these samples remain in place and are evaluated in the risk screening (Section 7.0).

#### 4.2.6.2 Area 6 Geophysical Investigations/Findings

Geophysical investigations within Area 6 included MSP I, MSP III, detailed reconnaissance, and geophysical surveys of transects and additional grids.

**MSP Phase I Investigation**

Ten 100-foot by 100-foot grids were selected for investigation to evaluate a clearing visible in a 1966 aerial photograph. These grids were brush cut and UXO technicians performed a surface sweep of the area prior to conducting a geophysical survey. MEC items consisting of suspect 4.5-inch barrage rockets and 81mm mortars were discovered. Fourteen barrage rockets were BIP, of which ten were determined to contain high explosives. Two 81mm mortars were also discovered and BIP. Both of the mortars was determined to be inert based on demolition results.

**MSP Phase III Reconnaissance Investigation**

Twenty-one transects were investigated in the Barrage Rocket Study Area using hand-held magnetometers. Numerous subsurface anomalies were identified and marked by UXO technicians during a detailed reconnaissance. The results of the initial survey are documented in the *MSP3 Final Geophysical Survey Report for the J3 Range Barrage Rocket Site* (TetraTech 2003d).

**Additional Site Investigations**

As a result of the MSP III reconnaissance, an EM-61 geophysical survey was performed in July 2003 within each transect in the J-3 Range Barrage Rocket Study Area. A total of eleven anomalies were selected for intrusive investigation. Four 4.5-inch Barrage Rockets, a 4.2-inch mortar, and an 81mm mortar were discovered and BIP. All items were determined to be inert. No MEC items were discovered and no evidence of disposal or burial activities was encountered.

In November 2003, additional detailed reconnaissance was conducted in four transect extension areas in an effort to identify any decrease in density of munitions finds. Anomalies were categorized by the size of the response as Type A through Type F. Type C and larger anomalies were intrusively investigated in the transect extension areas and a new “northwest transect,” located between transect #1 and Wheelock Road, in 2009. Sixteen 4.5-inch barrage rockets (nine inert, four HE) were found in transect extension 3. One inert 4.5-inch barrage rocket was found in the northwest transect. Only fragmentation was found in the other three transect extensions (Figure 4-13).

Also in 2009, 119 anomalies exhibiting an EM-61 signal threshold of 34mV or greater were intrusively investigated in the existing 21 transects, the ten MSP 1 grids (“Zone 3”) and an area adjacent to the southern edge of the Barrage Rocket transects (“Zone 2”). Munitions items found in the transects using this method included three inert 4.5-inch barrage rockets, three

81mm mortars (two HE, one white phosphorus) and one 4.2-inch mortar (white phosphorus). Only fragmentation was recovered in Zone 3 (MSP 1 grids). In Zone 2, 18 inert 81mm mortars and one 3.5-inch practice rocket were found.

In addition, an EM-61 geophysical survey was conducted in two 30 meter by 30 meter grids in the southern portion of the Barrage Rocket Study Area with anomalies exhibiting a 34mV or greater signal threshold selected for intrusive investigation.

The investigation in the two southern grids yielded numerous anomalies with a response greater than 34mV, however, no MEC items were encountered. UXO technicians subsequently investigated 12 Type C or greater size anomalies located in or near transects #1 through #3. Three MEC items, consisting of 4.5-inch Barrage Rockets, MK3, high explosives, were encountered. Munitions debris was also discovered during this investigation.

In May 2010, investigation of Type C or greater anomalies in transects #4 through #21 was conducted in accordance with the *Revised Draft J-3 Barrage Rocket Additional Characterization Investigation Project Note* (ECC 2009a). In conjunction with this effort similar investigations were also conducted in six new transects: one to the north of and parallel to Wheelock Road, and five perpendicular transects terminating at the northwest transect and Chadwick Road. In addition, a detailed reconnaissance was conducted in a newly cut firebreak that crosses the northern side of the Barrage Rocket area. MEC items consisting of 11 HE and six inert 4.5-inch Barrage Rockets, MK3; two M56 81mm HE mortars; and two 75mm Projectile, M310, HEAT were discovered. Munitions debris consisting of inert barrage rockets and fragmentation were also encountered. No Type C or greater anomalies were encountered within the firebreak. A summary of the items encountered in each phase of the site investigations is located in Appendix E.

No soil samples were collected during the geophysical site investigation phases of work except for pre- and post-BIP sampling as described below in Section 4.2.5.6.

Ten multiple increment samples were collected in 2012 in accordance with the *Final J-3 Range Barrage Rocket Area Sampling* project note (IAGWSP 2012). Ten 100-foot by 100-foot grids were selected for sampling in areas where the highest concentrations of HE munitions were discovered during previous geophysical investigations. Samples were collected and submitted for explosives and perchlorate analyses.

#### 4.2.6.3 Area 6 BIP Samples

Some suspect items discovered during intrusive field investigations and road and well pad clearance activities were BIP. A total of 101 samples were collected from 41 locations associated with BIP activities in the J-3 Range Area 6. BIP sample locations, sample identification, collection date, sample depths, and laboratory analyses associated with this subarea are identified in Table 4-16. The pre-BIP sample collected at SS15133-A had detections of TNT, 2-nitrotoluene, 3-nitrotoluene and nitrotoluene at 120 µg/Kg, 71 µg/Kg, 58 µg/Kg and 120 µg/Kg, respectively.

The post-BIP samples from SSJ3X03, SSJ3X04, SSJ3X05, SSJ3X17, SSJ3X20 all had detected concentrations of explosives (Figure 4-14). These soils were excavated.

Samples from BIP sample locations SSJ3X07, SSJ3X08, SSJ3X10, SSJ3X15, SSJ3X19, and SSJ3X26 all had detections of explosives that were below the BIP excavation criteria and therefore remain in place (Figure 4-14). As a note, the pre-BIP sample at SSJ3X06 had elevated levels of TNT and tetryl at 2,800 µg/Kg and 44 µg/Kg, respectively while the post-BIP sample only had a detection of TNT at 140 µg/Kg. Soils associated with these locations were evaluated as part of the risk screening section.

#### 4.2.6.4 Area 6 Characterization Conclusions

Soil at locations with elevated explosives or perchlorate concentrations, identified on Figure 4-13, remain in place and are evaluated in the risk screening (Section 7.0).

The conceptual site model of munitions used in J-3 Range Area 6 was developed from range characteristics, range records, review of aerial photographs, and intrusive investigation finds. The development of the conceptual site model is presented in Appendix E. The available information suggests that the Barrage Rocket Study Area is indicative of an impact area for rockets and mortars.

Though all anomalies indicative of a barrage rocket and 81mm mortar (i.e., anomalies with an EM-61 response value greater than 34mV or Type C or greater) have been investigated within the transects and established grids, there is evidence to support that barrage rockets and mortars still remain in uninvestigated areas. In addition, isolated medium- to small-sized geophysical anomalies still remain on the range and it is likely that they represent fragmentation, metallic debris, or individual munitions that could be either inert or HE. Items that could remain on the range containing HE or small quantity of energetic include MK3 4.5-inch Barrage Rocket, M43/M56 81mm mortars, M3 4.2-inch mortars, and M310 75mm projectiles.

# 5.0 RESPONSE ACTIONS

## 5.1 Source Removal

Soil sampling and geophysical investigations, and associated soil excavations were conducted from 1997 through 2010. These activities included the intrusive investigations at more than 130 geophysical anomaly locations. These investigations resulted in the excavation and off-site disposal or on-site thermal treatment of approximately 2,386 cubic yards of contaminated soil (Table 4-1) from 15 locations. In addition to the soil removals, these investigations removed MEC from 43 locations (Appendix E).

As previously discussed in Section 4.2, soil sampling results identified soils with elevated concentrations of explosives in the following areas of the range:

- Former Burn Box
- Area North of Target 2
- Area South of Target 2
- Detonation Pit
- Drum Disposal Area
- Area West of Detonation Pit
- Area South of Detonation Pit
- Septic Tank
- Suspected Wastewater Discharge
- Area West of Wastewater Holding Tank
- Melt/Pour Building
- Area East of Melt/Pour Building
- Area East of Septic Tank

Textron removed the septic tanks and drywells noted above, as well as additional decommissioning activities as documented in the Final Summary Report Melt-Pour and Explosive Storage Bunker Building Decontamination, Drywell and Septic Tank Removal, Soil Delineation, and Building Demolition, December 2004, and Final Summary Report Range Closure Activities J-3 Range Camp Edwards, Massachusetts January 2009.

With the exception of the Drum Disposal Area, which was remediated by Textron, soils from these locations were removed during the soils Rapid Response Action (RRA) between February 2004 and December 2004 (Figures 4-2 and 4-8). The objective of the RRA was to reduce or eliminate probable sources of groundwater contamination. Soils with explosives detections were excavated to depths ranging from of 1.25 to 6 feet bgs and mechanically screened to remove any remaining munitions. These soils were thermally treated on-site. Textron excavated the soils associated with the Drum Disposal Area in 2008, which were disposed off-site.

Approximately 2,386 cubic yards of contaminated soil was excavated (Table 4-1). Post-excavation, 5-point composite soil samples were collected in each of the excavation areas units from 0 to 3 inches below the excavation floor. All samples were analyzed for explosives by method SW 846/8330B and perchlorate by method E.314. Results from post-excavation sampling indicated no detections of explosives or perchlorate exceeding the action levels. The

results of this RRA are documented in the *Final J-3 Range Rapid Response Action Completion of Work Report* (ECC 2005b).

## 5.2 J-3 Groundwater RRA System

In 2006, a groundwater rapid response action (RRA) was initiated to mitigate further migration of the J-3 perchlorate and RDX plumes until a final remedy could be determined. At that time, two groundwater plumes had been identified at the J-3 Range, including perchlorate and RDX contamination that was already shown to extend from the source areas downgradient to Snake Pond (Figures 5-1 and 5-2) (IAGWSP 2005). The design of the J-3 extraction, treatment and reinjection system consisted of three extraction wells, oriented along the plume axis, operating at a combined flow of 175 gallons per minute (gpm) and a treatment system consisting of ion-exchange resin (IX) and granular activated carbon (GAC) to remove RDX and perchlorate from the groundwater. The treatment system is housed within the nearby FS-12 treatment building where the treated groundwater is fed into the FS-12 effluent system of reinjection wells (Figure 3-1). The J-3 ETR system began operation in August 2006. In September 2009 the pumping rate was increased from 175 gpm to 195 gpm. The *Final J-3 Range Groundwater Rapid Response Action Plan* (ECC 2005d) presents the assessment activities, modeling and wellfield design for the J-3 groundwater RRA ETR system. As of December 31, 2013, the J-3 RRA system has treated over 675 million gallons of contaminated groundwater and has removed more than 25 pounds of perchlorate and 4 pounds of RDX from the aquifer.

2014-O-JV11-0008

# 6.0 CONCEPTUAL SITE MODEL

The conceptual site model is the depiction of site conditions that relate to contaminant source, environmental pathways for contaminants, and potential for contact with human receptors.

## 6.1 Source

The J-3 Range has primarily been used as a defense contractor test range to develop and test military munitions and other devices. Activities conducted included loading, assembly, and explosive testing of developmental tactical ordnance items. Military activities at the range included mortar and rocket firing. Secondary sources could include target and firing points throughout the range. Disposal activities are also known to have occurred in the Demolition Area. Residues from the firing activities have been found to be concentrated around firing positions and target areas. Residues from munitions testing and disposal practices have been found at various locations on the range. Groundwater contaminated with perchlorate and/or RDX has been found in areas downgradient from the J-3 Range and appears to be associated primarily with the Demolition/Artillery Areas and the Melt Pour Building.

The conceptual site model (Figure 6-1) based on known activities and the presence of soil contaminants, recognized two major source components in the J-3 Range area: (1) Soil sample results in the vicinity of the Demolition and Artillery Areas show contaminants that are consistent with explosives and perchlorate found in downgradient groundwater. This disposal and testing area shows elevated levels of RDX and perchlorate that are consistent with the development of the downgradient RDX and perchlorate plume. It is, therefore, likely that particles dispersed through disposal and testing activities have accumulated in sufficient quantities to result in groundwater contamination; and (2) Explosives contamination from the Melt/Pour Building was deposited on both the soil surface and subsurface as a result of operations, maintenance and housekeeping activities, and as a constituent of wastewater deposited in dry wells and septic systems. This particulate depositional process was also conducive to relatively rapid leaching of contaminants through the vadose zone to the groundwater table.

## 6.2 Pathway

Following deposition onto the soil, precipitation will dissolve a fraction of the contaminant mass and then migrate toward the water table. Dissolution is a function of the temperature, intensity, and duration of the precipitation, soil characteristics, drainage patterns, solubility, surface area, and kinetics. Although dissolution of the solid compounds is relatively slow, once dissolved, compounds such as RDX, HMX, and perchlorate move through the soil column with minimal sorption to the soil surfaces. Other contaminants such as metals, pesticides, and PAHs move more slowly based on their chemical properties. It is, therefore, reasonable to assume that contaminants that are more easily mobilized, such as RDX and perchlorate, pose a more immediate threat to groundwater than many other potential COCs from the J-3 Range. However, all detected analytes were evaluated for their potential to leach to groundwater in the risk screening (Section 7.0).

Releases of explosive-related contaminants in the environment have occurred, ultimately causing infiltration of these contaminants to groundwater. All indications are that the primary

contaminants, perchlorate and RDX, entered the groundwater with little retardation, and migrated in the direction of groundwater flow. Flow trajectories are influenced by the position of the top of the groundwater mound that is located northwest of the J-3 Range. Based on the amount of recharge during a particular period, the groundwater mound can move and increase hydrodynamic dispersion (flow field tends to splay/disperse contaminants). In general, the flow trajectories are southerly in the area of the J-3 Range plume.

## 6.3 Receptors

Analysis of the potential for contaminants reaching receptors is based on hypothetical exposures to groundwater if it were drawn from monitoring wells downgradient of the J-3 Range. No one is using the groundwater in these areas and the areas downgradient are closely managed. There is, however, a public water supply well located on the south side of Weeks Pond approximately one half-mile south of the J-3 Range. Residences in the vicinity of the J-3 plume are connected to the municipal water system and all future residents are required to use the municipal system as well.

The well series 90PZ0201 to 90PZ0212 are considered historical wells originally installed to support the FS-12 investigation. Wells 90PZ0201 through 90PZ0208 were installed in a cluster approximately 150 feet from the northwestern shore of Snake Pond. Wells 90PZ0211 and 90PZ2012 are located approximately 300 feet north of this cluster and well 90PZ0209 is located between them. The depths of these wells range between 4 and 107 feet. Screen lengths vary between the wells from 5 to 30 feet. Well 90PZ0211, which is screened from -5.48 to -35.48 msl, was chosen to monitor the movement of the J-3 plume because it has the screen in the right vertical location. Well 90PZ0211 monitors the leading edge of the RDX and perchlorate plumes. Well 90PZ020, located to the south within the above-mentioned cluster, is screened from -5.38 to -10.38 feet msl. This well has the right screen elevation to monitor groundwater at the western boundary of the RDX plume and leading edge of the perchlorate plume.

Although residential use is not a likely future land use within JBCC, hypothetical residents are identified as potential receptors to determine the need for institutional controls and to provide information for evaluating all future-use options in the Feasibility Study (FS). Therefore, hypothetical residents (on- and off-site) were identified as future receptors and the use of groundwater from the J-3 Range as a source of potable water was considered a potential exposure pathway.

Soil removal actions at the J-3 Range have removed all significant explosives-contaminated soil and thereby eliminated the potential for contact with contaminated soils that exceed standards.

Contaminated groundwater from J-3 plume flows in a southerly direction and crosses the base boundary downgradient of Greenway Road into a residential neighborhood. The soil removal actions conducted during the RRA will reduce contaminant mass in the source areas.

# 7.0 RISK SCREENING

## 7.1 Introduction

Risk screening evaluations were conducted for J-3 Range. The objective of the risk screening was to identify any contaminants of concern (COCs) that were detected in the J-3 Range groundwater or soil that warrant further evaluation. The risk screening for soil included an evaluation of the potential for analytes detected in the soil to leach from the soil and migrate through the subsurface to the groundwater.

## 7.2 Groundwater Evaluation

The selection of the monitoring wells where the groundwater quality was evaluated in this groundwater risk screening considered the wells included in the 2009 J-3 Groundwater RI/FS Report, the more recently installed monitoring wells at J-3 Range, groundwater flow directions at these well locations, and other well-specific installation parameters. Extraction well sample results, profile, and drive-point sample results were omitted from the groundwater risk screening data set due to concerns that they were not representative of general groundwater conditions. A total of 112 monitoring wells (including nested wells drawing from different depths at the same location) were determined to be representative and indicative of the J-3 Range groundwater impacts. These wells are listed in numerical order in a footnote to Table 7-1, and their associated sampling events and analytical results are included in Appendices A and B, respectively. The risk screening groundwater data set includes analytical results for the samples collected from October 1997 to August 2013.

Table 7-1 presents the results of the risk screening evaluation that was performed on the J-3 Range groundwater data set. The maximum concentration of each detected constituent was compared to its federal and Massachusetts (where available) Maximum Contaminant Level (MCL or MMCL), EPA Drinking Water Health Advisory (HA), EPA Regional Screening Level (RSL) for Tapwater, and MCP Method 1 GW-1 Standard. Other factors that were considered in the risk screening to determine whether to further evaluate the detected constituent included whether the analyte was an essential human nutrient, its frequency of detection, any specific characteristics of the analyte, and if the analyte had a documented history of false positive analytical results at JBCC. The subsections that follow summarize the results of these comparisons and considerations for the groundwater associated with the J-3 Range by chemical group.

### 7.2.1 Explosives and Perchlorate

Nineteen explosives were analyzed for by Method 8330 in groundwater samples from 112 J-3 Range monitoring wells. Three additional explosives were occasionally included in the analytical program for 21 of the wells (i.e., hexahydro-1-mononitroso-3,5-dinitro-1,3,5-triazine (MNX), hexahydro-1,3-dinitroso-5-mononitro-1,3,5-triazine (DNX), and hexahydro-1,3,5-trinitroso-1,3,5-triazine (TNX)). Thirteen explosives were detected in at least one groundwater sample. Six explosives were detected in one, two, or three samples (i.e., 1,3-dinitrobenzene, 2,4-diamino-6-nitrotoluene, 2,4-DNT, 2-nitrotoluene (2-NT), 4-nitrotoluene (4-NT) and picric acid). As these detections were not repeated in subsequent sampling events at the same

locations, these explosives were not considered further in the groundwater risk screening evaluation. Of the eight explosives that were detected on more than three occasions, the noted groundwater screening criteria were exceeded only for 2,4,6-trinitrotoluene (TNT) and RDX.

Since 1997, exceedances of the most stringent screening criterion for TNT (the HA of 2 µg/L), have been observed at least once in only one well, MW-196S. During the most recent sampling event at this location (March 2, 2006), TNT was not detected. TNT has been detected once or twice in three other wells (i.e., MW-181S, MW-190M1, and MW-30), but at concentrations well below the most stringent screening criterion. TNT has not been detected at any of the groundwater monitoring wells since 2005 (some 354 samples from 79 groundwater monitoring wells at J-3 Range). Consequently, TNT was not retained for further evaluation.

Since 1997, exceedances of the most stringent screening criterion for RDX (the Tapwater RSL of 0.70 µg/L) have been observed at least once in 29 of the monitoring wells associated with the J-3 plume. Since 2009, exceedances of the RSL have been observed in only six of these monitoring wells (i.e., MW-163S, MW-193S, MW-197M3, MW-198M4, MW-227M2, and MW-250M2), and the maximum observed RDX concentration since 2009 was 20.7 µg/L. Since this maximum detected concentration exceeds the screening criterion, RDX was retained for further evaluation in the Feasibility Study.

Perchlorate was detected in approximately 43% of all J-3 groundwater samples analyzed and at 72 of the 112 monitoring wells. Since 1997, exceedances of the most stringent screening criterion for perchlorate (the MMCL and MCP GW-1 Standard of 2 µg/L) have been observed at least once in 30 of the monitoring wells associated with the J-3 plume. Since 2009, exceedances of perchlorate have been observed in only 13 of these monitoring wells (i.e., MW-142M2, MW-143M2, MW-143M3, MW-163S, MW-198M2, MW-198M3, MW-198M4, MW-227M2, MW-232M2, MW-250M2, MW-250M3, MW-343M1, and MW-343M2), and the maximum observed perchlorate concentration since 2009 was 25.4 µg/L. Consequently, perchlorate was retained for further evaluation in the Feasibility Study.

### 7.2.2 Metals and Inorganics

Samples from 111 of 112 monitoring wells used to construct the groundwater data set were analyzed for 30 metals and inorganics. Each of the 30 metals was detected in at least one sample. However, only arsenic, chromium (total), manganese, thallium, and nitrogen (as nitrate-nitrite) exceeded any of their respective screening criteria.

Arsenic was detected in 10 of the 178 samples included in the groundwater data set. The maximum detected concentration of arsenic in groundwater was 10.9 µg/L (MW-152M1), which exceeded the HA and RSL, but was only marginally above the MCL and MCP GW-1 Standard of 10 µg/L. Furthermore, many studies have been conducted to characterize the elevated levels of arsenic in groundwater throughout New England. Naturally occurring arsenic is common in alluvial aquifers of the United States (Korte 1991). Chromium (total) was detected in 22 of 178 samples. The maximum detected concentration of chromium was 10.2 µg/L (MW-13D). Chromium has only been sporadically detected in 13 different wells, typically only once per well during the timeframe defined for this risk screening. The maximum detected concentration of

chromium exceeded the RSL for hexavalent chromium in Tapwater, but was less than its MCL and the MCP GW-1 Standard.

There were only four detections of thallium out of 180 groundwater samples, with a maximum reported concentration of 6.2 µg/L, which exceeded the MCL and MCP GW-1 Standard of 2 µg/L and the RSL of 0.16 µg/L, but was less than the HA of 7 µg/L. Thallium has not been detected in the subsequent rounds of sampling conducted at any of these monitoring wells. The maximum detected concentration of nitrogen measured as nitrate-nitrite (9,900 µg/L) exceeded the MCL for nitrite (1,000 µg/L) and the RSL for nitrite (1,600 µg/L), but not the MCL for nitrate (10,000 µg/L) nor the RSL for nitrate (25,000 µg/L). The maximum detected concentration also did not exceed the HA for nitrate plus nitrite. Therefore, arsenic, chromium, manganese, thallium, and nitrogen as nitrate-nitrite in groundwater were not further evaluated.

Four of the detected inorganics had no published screening criteria from the established sources, but are considered to be essential human nutrients (i.e., calcium, magnesium, potassium, and sodium). As such, they were not considered for further evaluation. In summary, therefore, no metals or inorganics detected in J-3 Range groundwater were determined to warrant further evaluation.

### 7.2.3 Pesticides and Herbicides

Groundwater samples collected from 49 of the 112 monitoring wells used to construct the groundwater data set were analyzed for 21 pesticides and 18 herbicides. Eight pesticides and three herbicides were occasionally reported as detected in these groundwater samples, but the frequency of detection was less than 3% for all of these detected pesticide and herbicide compounds, except for chloramben. Only the maximum detected concentrations of five of these compounds (i.e., MCPP, pentachlorophenol, aldrin, alpha-BHC, and heptachlor) exceeded any of their respective screening criteria. MCPP, pentachlorophenol, and heptachlor were detected twice, and aldrin and alpha-BHC were detected only once in the groundwater samples included in the risk screening data set. Furthermore, the MCPP detections have been determined to be false positives that were obtained using an old analytical method that is no longer used (AMEC 2002c). The analyses for herbicides performed prior to 2001 were shown to have been affected by interferences that resulted in tentative identifications and estimated quantifications of MCPA and MCPP. In 2001, modifications were made to the analytical method for herbicides to minimize these interferences. As such, the analytical data for this compound obtained prior to 2001 likely represent false positive results. There have been no detections of MCPP since 2000, and no detections of any pesticide or herbicide compound in groundwater samples analyzed after 2002. Therefore, no pesticides or herbicides in the groundwater were determined to warrant further evaluation.

### 7.2.4 Polycyclic Aromatic Hydrocarbons (PAHs)

Groundwater samples from 86 of the 112 monitoring wells used to construct the groundwater data set were analyzed for 17 PAHs. Of these 17, only one, naphthalene, was detected. Three of the four reported detections for naphthalene were associated with samples from MW-152M2 and the fourth was associated with a sample from MW-190M1. Naphthalene has not been detected in either of these wells during subsequent sampling events. Naphthalene has not been

detected in any sample since July 2002 (some 144 samples from 55 different monitoring wells). Therefore, PAHs were not considered further in the groundwater screening evaluation.

### 7.2.5 VOCs/SVOCs

Groundwater samples from 86 of the 112 monitoring wells used to construct the groundwater data set were analyzed for 63 SVOCs. Of these, four phthalate esters (i.e., bis(2-ethylhexyl)phthalate, diethyl phthalate, di-n-butyl phthalate, and di-n-octyl phthalate), 4-methylphenol, 5-nitro-o-toluidine, and phenol were detected. Of these seven SVOCs, all but bis(2-ethylhexyl)phthalate were detected at frequencies below 3% and only the maximum detected concentrations of bis(2-ethylhexyl)phthalate and naphthalene (discussed in Section 7.2.4) exceeded any screening criteria. Bis(2-ethylhexyl)phthalate is a probable laboratory contaminant, as evidenced by its sporadic detection and the relatively high variability in measured concentrations. For example, the maximum detected concentration of bis(2-ethylhexyl)phthalate was 47 µg/L in 90WT0005 on January 13, 1998 but subsequent sampling results for this location were non-detect on January 21, 1999 and 2 µg/L on October 1, 1999. Bis(2-ethylhexyl)phthalate is not considered a component of the J-3 Range groundwater plume. None of the other phthalates exceeded any of their screening criteria.

Groundwater samples collected from 70 of the 112 monitoring wells used to construct the groundwater data set were analyzed for 45 VOCs. Of these, 12 of the compounds were detected in the groundwater and only three of these 12 (i.e., bromodichloromethane, chloroform and dibromochloromethane) exceeded at least one of their groundwater screening criteria. All three of these compounds are trihalomethanes and the maximum detected concentrations were below the MCL for total trihalomethanes (80 µg/L). Chloroform was detected in 54 wells, and its degradation product (chloromethane) also was detected in 3 wells. In all cases, the reported concentrations of chloroform exceeded the lowest of its groundwater screening criteria (i.e., the EPA RSL for Tapwater of 0.22 µg/L), but were below its MCL, HA, and MCP GW-1 Standard. In addition, chloroform appears to be ubiquitous within the portion of the aquifer being studied. Chloroform, which has not been identified as a compound associated with historical J-3 Range activities, has been widely observed in groundwater across the Upper Cape, and has been determined to be naturally present in much of the groundwater on Cape Cod (Earth Tech 2000). Therefore, VOCs were not considered further in the groundwater screening evaluation.

### 7.2.6 Polychlorinated Biphenyls

Groundwater samples collected from 49 of the monitoring wells used to construct the groundwater data set were analyzed for PCBs. Only one of the seven Aroclors (i.e., Aroclor 1260) was detected in one groundwater sample. Subsequent groundwater samples collected at this location were non-detect for all PCBs. Although the maximum detected concentration of Aroclor 1260 exceeded its HA and the RSL, it was less than the MCL and the MCP GW-1 Standard. Therefore, PCBs were not considered further in the groundwater screening evaluation.

### 7.2.7 Radionuclides

Gross alpha and beta activity were measured in samples collected from 47 groundwater monitoring wells associated with the J-3 Range. Gross alpha activity was below the MCL (15 pCi/L). The MCL for gross beta is 4 millirems per year, which is a dose-based standard and cannot be directly compared to an activity based measurement. In addition uranium-234, -235 and -238 activities were measured in two of these samples (both from MW-181S). Uranium-235 was not detected. Activity based screening criteria for uranium-234 and uranium-238 were calculated using default residential values for tap water (USEPA 2014). The detected concentrations were below the calculated RSLs.

### 7.2.8 Summary of Site-Wide Groundwater Screening

Groundwater data from monitoring wells associated with the J-3 Range were available for explosives, perchlorate, metals and inorganics, pesticides and herbicides, SVOCs, VOCs, and PCBs and selected radiological parameters. Of the 227 analytes reported for groundwater, 22 were detected at maximum concentrations that exceeded one or more groundwater screening criteria: 1,3-dinitrobenzene, TNT, 2-nitrotoluene, 2,4-DNT, RDX, perchlorate, arsenic, chromium, manganese, nitrogen (as nitrate-nitrite), thallium, MCPP, pentachlorophenol, aldrin, alpha BHC, heptachlor, bis(2-ethylhexyl)phthalate, naphthalene, bromodichloromethane, chloroform, dibromochloromethane and Aroclor 1260. Of the detected explosives exceeding of at least one screening criterion, only RDX continues to be detected at elevated concentrations and with a frequency of detection (FOD) that indicates a potential risk relative to groundwater use. TNT and 2,4-DNT were each only detected occasionally in almost 1,600 samples, and were not detected in the most recent samples from the same monitoring wells where exceedances of the established criteria had been previously reported. Perchlorate also was seen to be present at a concentration that could pose a potential threat to groundwater. Of the metals and inorganics reporting exceedances of screening criteria, the presence of arsenic is not indicated to be related to operations at the J-3 Range. Chromium has only been sporadically detected, and the maximum detected concentration of chromium (total) was less than its MCL and the MCP Method 1 GW-1 Standard. Manganese was widely detected, and results from 10 well locations exceeded the HA (300 µg/L) and RSL (430 µg/L). Of these 10 wells, only two wells have consistently had exceedances (MW-125S and MW-152M1). The maximum detected concentration of nitrogen (measured as nitrate-nitrite) (9,900 µg/L) exceeded the MCL for nitrite (1,000 µg/L), but not the MCL for nitrate (10,000 µg/L). The maximum detected concentration also did not exceed the HA for nitrate plus nitrite. Thallium was infrequently detected and was not detected in the subsequent rounds of sampling at the same sampling point where the exceedances of the MCL (2 µg/L) were measured. MCPP, pentachlorophenol, aldrin, alpha-BHC, and heptachlor were detected only once or twice, and were not detected in later sampling events at the same monitoring wells. In addition, the MCPP detections that exceeded its criteria are likely to be false positives due to the past application of an analytical method that is no longer used. Bis(2-ethylhexyl)phthalate detections are believed to have been a laboratory artifact and are not considered part of the J-3 groundwater plume. Three of the four reported detections for naphthalene were for samples from MW-152M2 and the fourth was from MW-190M1. Naphthalene was not detected in either of these two wells during subsequent sampling events. Chloroform is indicated to be present in groundwater due to natural sources,

and not related to activities at the J-3 Range. Although Aroclor 1260 was detected once, subsequent samples from the same location were non-detect for all analyzed PCBs. Although the maximum detected concentration of Aroclor 1260 exceeded its HA and RSL, it was less than the MCL and the MCP GW-1 Standard.

Based on the screening analysis performed for the J-3 Range groundwater, perchlorate and RDX were identified as the only COCs in the J-3 groundwater plume warranting further evaluation in the Feasibility Study.

## 7.3 Soil Screening

For purposes of the soil screening evaluation, the J-3 Range was divided into the following six discrete subareas:

- Area 1 - Melt/Pour Area
- Area 2 - 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area
- Area 3 - Artillery Range, Demolition Area and Explosive Storage Bunker
- Area 4 - Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area
- Area 5 - Hillside Study Area
- Area 6 - Barrage Rocket Study Area

As noted in Sections 4.0 and 5.0, soils contaminated with explosives and perchlorate have been treated on-site or taken off-site in a series of removal response actions. The analytical detections evaluated in the risk screen represent current site conditions. Accordingly, the risk screening data sets do not contain the sample results for soil that was subsequently removed. The data sets consisted of all validated soil sampling results from May 1999 to March 2013 from all depth intervals consistent with the “Current Conditions” tables provided in Section 4.0.

Tables 7-2 through 7-7 present comparisons of the maximum detection concentrations in remaining soil to a series of screening values for the J-3 Range soil subareas. The screening values for each analyte were (when available) its MCP Method 1 S-1/GW-1 Standard, its MassDEP strictly leaching soil concentration, its MMR SSL, its EPA risk-based SSL, and its MMR-specific outwash background soil concentration. It is noted that the MCP S-1/GW-1 Method 1 Standards were used as a screening criterion only for those compounds for which a value has been published in 310 CFR 40.0975(6)(a). An MCP Method 2 comparison value for nitroglycerin (4.4 mg/Kg) was developed and calculated using the provisional oral reference dose (1E-4 mg/Kg-day) and the default exposure parameters of the S-1 direct contact standards. Additional evaluation of exceedances of MCP S-1/GW-1 standards for soils is presented in Appendix G.

Other factors that were considered in determining whether to evaluate a compound further included whether the compound was an essential human nutrient, its frequency of detection within the sampled Area, whether the compound was detected in both soil and groundwater, any specific circumstances regarding the presence of the compound, and whether there were documented prior false positive analytical results associated with the analyte. The frequency of detection was not used as the sole criteria for the elimination of a compound from further

consideration. The subsections that follow summarize the results of these comparisons for each Area.

### 7.3.1 Area 1 - Melt/Pour Building

Table 7-2 presents the comparisons of the detected concentrations to the screening criteria for the Melt/Pour Area.

#### 7.3.1.1 Explosives and Perchlorate

Four explosives (i.e., 1,3-diethyl-1,3-diphenyl urea, 2,4-DNT, 2,6-DNT and 2-NT) were detected in Area 1 soils (Table 7-2). Of these only 2,4-DNT, 2,6-DNT and 2-NT were detected in groundwater. The following explosives related compounds and perchlorate exceeded at least one of their respective screening values:

- 2,4-DNT – the only detection (0.83 mg/Kg) in the 121 soil samples analyzed by Method 8330 (FOD = 1.2%) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. This sample (SS102VF 0-0.25 feet bgs) was a post-BIP confirmatory sample. The only detection (0.83 mg/Kg) in the 83 soil samples analyzed by Method 8270 (FOD = 1.2%) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. 2,4-DNT was detected in 2 of 1576 groundwater samples analyzed by Method 8330. 2,4-DNT was not detected in any of the 83 groundwater samples analyzed by Method 8270.
- 2,6-DNT – the only detection (0.17 mg/Kg) in the 83 soil samples analyzed by Method 8270 (FOD = 1.2%) exceeded the MMR SSL and the EPA risk-based SSL. 2,6-DNT was not detected in any of the 121 samples analyzed by Method 8330. 2-6-DNT was not detected in groundwater.
- 2-NT – the only detection (0.16 mg/Kg) in the 121 soil samples analyzed (FOD ≤ 1%) exceeded the MMR SSL and the EPA risk-based SSL. 2-NT was detected in 1 of 1,576 groundwater samples (FOD = 0.06%). It has not been detected in groundwater since 1997.

1,3-Diethyl-1,3-diphenyl urea was detected in the soil but had no screening values and it was not detected in the groundwater. Based on these findings, none of the explosives or perchlorate will be evaluated for Area 1 soils in the Feasibility Study.

#### 7.3.1.2 Metals and Inorganics

As presented on Table 7-2, a number of metals and inorganics were detected in the soil. The maximum detected concentrations of a number of metals exceeded at least one of their respective screening levels. However, the site concentrations for the majority of the metals were very similar to their outwash background levels. The exceptions to this were copper and lead which are discussed in more detail below.

- Copper – the maximum soil concentration (227 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. There is no MCP S-1/GW-1 Standard for copper. The Area 1 average concentration (11 mg/Kg) was less than the SSLs. Only 5 of the 52 detected

concentrations exceeded the MMR SSL and the EPA risk-based SSL. This indicates that copper is not present at elevated levels across the area.

- Lead – the maximum soil concentration (106 mg/Kg) exceeded the MMR SSL and the EPA SSL but not the MCP S-1/GW-1 Standard. The Area 1 average concentration (12.6 mg/Kg) was consistent with the background level (19 mg/Kg).

Although most metals were detected in J-3 Range groundwater monitoring wells, only arsenic and thallium were detected in groundwater at concentrations greater than MCLs or MCP GW-1 Standards. Arsenic and thallium were detected in Area 1 soils at concentrations exceeding SSLs, but the concentrations were consistent with background levels and below MCP S-1/GW-1 Standards. Based on these findings, none of the metals and inorganics will be evaluated in the Feasibility Study.

#### 7.3.1.3 PAHs

Several PAHs were detected in the soil. The PAHs were detected sporadically throughout the area. The FOD values ranged from 1.2% to 11%. The maximum detected concentrations of six PAHs exceeded at least one of their respective SSL screening values but were below their MCP S-1/GW-1 Standard. These six are benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and naphthalene. The detected concentrations of PAHs are consistent with background levels for natural soil (MassDEP 1992). Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.1.4 Pesticides and Herbicides

Beta-BHC was the only pesticide/herbicide detected in the soil. The single detected concentration exceeded the MMR SSL and the EPA risk-based SSL. The distribution and concentration of pesticides and herbicides in Area 1 soils are presumed to be consistent with application in accordance with manufacturer's guidelines. Based on these findings, pesticides and herbicides will not be evaluated in the Feasibility Study.

#### 7.3.1.5 VOCs and SVOCs

Several VOCs and SVOCs were detected in the soil (see Table 7-2). The analytes were detected sporadically throughout the site. N-nitrosodiphenylamine and TCE were the only analytes observed in the soil that exceeded at least one of their screening values. The single detection of n-nitrosodiphenylamine exceeded the MMR SSL and the EPA SSL. The single detection of TCE exceeded the MMR SSL and the EPA SSL. Neither compound was detected in J-3 groundwater monitoring wells. Based on these findings, VOCs and SVOCs will not be evaluated in the Feasibility Study.

#### 7.3.1.6 Radionuclides

Uranium-234, -235, and -238 were detected in the soil. Activity-based screening criteria for uranium-234, -235, and -238 were calculated using the default values for soil to groundwater developed for the EPA risk-based SSLs. The maximum detected concentrations were above the calculated risk-based SSLs. There are no MCP Method 1 S-1/GW-1 Standards or MMR SSLs for radionuclides. Both uranium-234 and -238 were detected in groundwater, but the maximum

detected concentrations were below calculated screening criteria for tapwater. Based on this, they will not be evaluated in the Feasibility Study.

### 7.3.2 Area 2 – 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area

Table 7-3 presents the comparisons to the screening criteria for the 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area.

#### 7.3.2.1 Explosives and Perchlorate

Seven explosives (2,4-DNT, 2-amino-4,6-DNT, 4-amino-2,6-DNT, RDX, nitroglycerin, HMX and tetryl) were detected in Area 2 soils (Table 7-3). The maximum detected concentrations for the each of these compounds except tetryl exceeded at least one screening value. There is no MCP S-1/GW-1 Standard for tetryl. The following explosives related compounds and perchlorate that were observed in the soil exceeded at least one of the screening values:

- 2,4-DNT – the maximum detected soil concentration (0.62 mg/Kg by Method 8330 and 0.47 mg/Kg by Method 8270) exceeded the MMR SSL, and the EPA risk-based SSL and the MassDEP leaching concentration. 2,4-DNT was detected in 2 of 1576 groundwater samples analyzed by Method 8330. 2,4-DNT was not detected in any of the 83 groundwater samples analyzed by Method 8270.
- 2-Amino-4,6-DNT – the maximum detected soil concentration (0.11 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 2 of 108 samples (FOD = 2%). It was detected in the groundwater but not at concentrations above screening levels.
- 4-Amino-2,6-DNT – the maximum detected soil concentration (0.081 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 2 of 108 samples (FOD = 2%). It was detected in the groundwater, but not at concentrations that exceeded its groundwater screening criteria.
- RDX – the single detection (0.017 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. It was detected in only 1 of 108 samples (FOD ≤ 1%). It was detected in the groundwater at concentrations that exceeded its groundwater screening criteria.
- Nitroglycerin – the maximum detected soil concentration (11 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 2 of 108 samples (FOD = 2%). The maximum detected concentration exceeded the calculated MCP Method 2 S-1 value (4.4 mg/Kg). Five other samples from this same location (SS102DA) were non-detect for nitroglycerin. It was not detected in the groundwater.
- HMX – the single detection (1.3 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL and the MassDEP leaching concentration. It was detected in 1 of 108 samples (FOD ≤ 1%). It was detected in the groundwater but at concentrations below its groundwater screening criteria.

Many of the sample locations with exceedances of the soil screening criteria are associated with BIP activities (i.e., location SSJ303) and were evaluated under the BIP program. One exception is the HMX detection of 1.3 mg/Kg at location SS102C1. This sample appears to have been

associated with sediment material located within the Drywell at the former Workshop Building. Textron documentation indicates that this sediment material was subsequently removed (MACTEC 2004).

As none of the detected explosives exceeded the MCP S-1/GW-1 Standard, they will not be further evaluated for Area 2 soils in the Feasibility Study.

#### 7.3.2.2 Metals and Inorganics

As presented in Table 7-3, a number of metals and inorganics were detected in Area 2 soil. The maximum detected concentrations of most of the metals exceeded at least one of their respective screening levels. However, the site concentrations for the majority of the metals were comparable to background levels. The exceptions to this were chromium, copper, iron, lead, manganese, molybdenum, nickel, silver and zinc (which are discussed in more detail below).

- Chromium – the maximum soil concentration (203 mg/Kg) exceeded the MCP S-1/GW-1 Standard and the MMR SSL, but was less than the EPA MCL-based SSL. The average concentration (15.9 mg/Kg) is consistent with background and below the MCP S-1/GW-1 Standard. Only the maximum detected concentration exceeded the MCP S-1/GW-1 Standard.
- Copper – the maximum soil concentration (775 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (19.3 mg/Kg) was less than the SSLs. Eleven of the 115 detected concentrations exceeded the SSLs. This indicates that copper is not present at elevated levels across the area. Copper was detected in groundwater, but at concentrations below screening levels.
- Iron – the maximum detected soil concentration (130,000 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration was 14,186 mg/Kg, which is consistent with background. Iron was detected in the groundwater, but at concentrations below its groundwater screening criteria.
- Lead – the maximum soil concentration (184 mg/Kg) exceeded the MMR SSL and the EPA MCL-based SSL. The average concentration was 22 mg/Kg. All of the detected concentrations exceeded the MMR SSL, but were below the S-1/GW-1 Standard. Lead was detected in the groundwater but at concentrations below its groundwater screening criteria.
- Manganese – the maximum soil concentration (1,570 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (151 mg/Kg) exceeded the SSLs and was slightly greater than the background level (134 mg/Kg). Only eight locations were inconsistent with background concentrations.
- Molybdenum – the maximum soil concentration (85.2 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. There is no MCP S-1/GW-1 Standard for molybdenum. The average concentration (1.9 mg/Kg) was slightly greater than the background level (1.2 mg/Kg) and was less than the EPA SSL.
- Nickel – the maximum soil concentration (964 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the EPA risk-based SSL. The average concentration (21 mg/Kg) was less than the SSLs and the MCP S-1/GW-1 Standard (600 mg/Kg). Only

the maximum detected concentration exceeded the MCP S-1/GW-1 Standard. This indicates that nickel is not present at elevated levels widely across the area.

- Silver – the maximum soil concentration (96.2 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL and was slightly below the MCP S-1/GW-1 Standard. Three of the four detections of silver were inconsistent with background (sample locations BH-40 4-5 feet bgs, BH-40 9-10 feet bgs, and SS102C1 0-0.5 feet bgs). Location SS102C1 was associated with sediment within the Drywell at the former Workshop Building. Textron documentation indicates that this material was removed (MACTEC 2004). Silver was detected in groundwater occasionally at concentrations below its groundwater screening criteria.
- Zinc – only the maximum soil concentration (493 mg/Kg) exceeded the EPA risk-based SSL but was below the MCP S-1/GW-1 Standard and the EPA risk-based SSL. This single exceedance was associated with BIP activities (SSJ303). Zinc was detected in groundwater at concentrations below its groundwater screening criteria.

Based on these findings, none of the metals and inorganics in Area 2 soils will be evaluated in the Feasibility Study.

#### 7.3.2.3 PAHs

Five PAHs were detected in the soil. The PAHs were detected sporadically throughout the area. The FOD values ranged from 1.0% to 2.1%. The maximum detected concentrations of two PAHs (i.e., benzo(a)anthracene and naphthalene) exceeded at least one of their respective screening values, but were below MCP S-1/GW-1 Standards. The detected concentrations of PAHs are consistent with background levels for natural soil (MassDEP 1992). Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.2.4 Pesticides and Herbicides

Several pesticides and herbicides were detected in the soil. The FOD values ranged from 2% to 8%. The distribution and concentration of pesticides and herbicides in Area 2 soils are presumed to be consistent with application in accordance with manufacturer's guidelines. The maximum detected concentrations for the pesticides and herbicides listed below exceeded at least one of their respective screening values.

- Acifluorfen – exceeded the MMR SSL. It was detected in 2 of 52 soil samples. It was not detected in the groundwater.
- Alpha-Chlordane – exceeded the MMR SSL but not the EPA risk-based SSL. It was detected in one of 65 soil samples. It was not detected in the groundwater. The single detection was below the MCP S-1/GW-1 Standard.
- Dieldrin – exceeded the MMR SSL and the EPA risk-based SSL. It was detected in one of 65 soil samples. The single detection was below the MCP S-1/GW-1 Standard. It was detected in one groundwater sample, but at a concentration below its groundwater screening criteria.
- Gamma-Chlordane – exceeded the MMR SSL. It was detected in one of 65 soil samples. The single detection was below the MCP S-1/GW-1 Standard and the EPA

risk-based SSL. It was detected in one groundwater sample, but at a concentration below its groundwater screening criteria.

- p,p'-DDD – exceeded the EPA risk-based SSL but was less than the MMR SSL and the MCP S-1/GW-1 Standard. It was not detected in groundwater.

Based on these findings, pesticides and herbicides will not be evaluated in the Feasibility Study.

#### 7.3.2.5 VOCs and SVOCs

Twenty-two VOCs and SVOCs were detected in the soil. The analytes were detected sporadically throughout the site. Of these 22, 10 (see Table 7-3) exceeded at least one of the screening values and are discussed below:

- Acetone – the maximum soil concentration exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Acetone was detected in 99% of samples, consistent with being a laboratory contaminant. It was detected in 5 of the 142 groundwater samples at concentrations below its screening levels.
- Benzene – the maximum soil concentration (0.003 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. It was detected in 5 of 68 samples. It was not detected in groundwater.
- Bromomethane – the maximum soil concentration (an estimated 0.005 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. It was detected in 4 of 69 samples. It was not detected in groundwater.
- Chloromethane – the maximum soil concentration (an estimated 0.011 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL. It was detected in 2 of 69 samples. It was detected in groundwater at concentrations below its screening levels.
- Di-n-butyl phthalate – the maximum soil concentration (4.0 mg/Kg) exceeded the EPA risk-based SSL but was less than the MMR SSL. There is no MCP S-1/GW-1 Standard for di-n-butyl phthalate. It was detected in 4 of 95 samples. It was detected in groundwater at concentrations below its screening levels.
- Ethylbenzene – only the maximum soil concentration (an estimated 0.002 mg/Kg) slightly exceeded the EPA risk-based SSL. Other sample results for this location (SS102EB 0-0.25 feet bgs) were non-detect for ethylbenzene. Ethylbenzene was not detected in groundwater.
- N-Nitrosodiphenylamine – the maximum soil concentration (1.2 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 3 of 95 samples. It was not detected in the groundwater.
- Phenol – the maximum soil concentration (2.4 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the MassDEP leaching standard. It was detected in 4 of 95 samples. It was not detected in groundwater.
- Total-1,2-dichloroethene – the maximum soil concentration (an estimated 2.3 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the EPA risk-based SSL, and the MassDEP leaching concentration. The average concentration was less than the screening criteria. It was detected in 2 of 66 samples. It was not detected in the groundwater.

- Vinyl chloride – exceeded the EPA risk-based SSL but was less than the MCP S-1/ GW-1 Standard. It was detected in 1 of 68 samples. It was not detected in the groundwater.

Based on these findings, VOCs and SVOCs will not be evaluated in the Feasibility Study.

#### 7.3.2.6 Polychlorinated Biphenyls

Only one of the seven Aroclors analyzed for (i.e., Aroclor 1260) was detected in one of 65 soil samples. This single detection exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Although the maximum detected concentration of Aroclor 1260 in groundwater exceeded its HA and the RSL, it was less than the MCL and the MCP GW-1 Standard. Therefore, PCBs will not be evaluated in the Feasibility Study.

### 7.3.3 Area 3 - Artillery Range, Demolition Area and Explosive Storage Bunker

Table 7-4 presents the comparisons to the screening criteria for the Artillery Range, Demolition Area, and Explosive Storage Bunker area.

#### 7.3.3.1 Explosives and Perchlorate

Ten explosives were detected by Method 8330 in at least one soil sample from Area 3. One additional explosive (2,6-DNT) was detected only by Method 8270. The following explosives related compounds and perchlorate that were observed in the soil exceeded at least one of the screening values:

- 2,4-DNT – the maximum detected soil concentration (0.4 mg/Kg by Method 8270 and 0.031 mg/Kg by Method 8330) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. 2-4-DNT was detected in less than 2% of all soil samples analyzed by either method. 2,4-DNT was detected in 2 of 1576 groundwater samples analyzed by Method 8330. 2,4-DNT was not detected in any of the 83 groundwater samples analyzed by Method 8270.
- TNT – the maximum detected soil concentration (0.18 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. However, it was below the calculated MCP Method 2 S-1 value for TNT. TNT was detected in less than 2% of all soil samples. TNT has not been detected in groundwater since 2005.
- 2-Amino-4,6-DNT – the maximum detected soil concentration (0.39 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL and the MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. It was detected in 5 of 379 samples (FOD = 1.3%). It was not detected in groundwater at concentrations above its groundwater screening criteria.
- 2,6-DNT – the single detected soil concentration (estimated 0.032 mg/Kg by Method 8270) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in one of 295 samples (FOD = 0.1%) by Method 8270 and was not detected in any of the 379 samples analyzed by Method 8330. It was not detected in the groundwater.

- 4-Amino-2,6-DNT – the maximum detected soil concentration (0.25 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 3 of 379 samples (FOD = 0.8%). It was not detected in the groundwater at concentrations above its screening criteria.
- RDX – the maximum detected soil concentration (0.34 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. It was detected in 4 of 379 samples (FOD = 1.1%). Three of these four samples were associated with BIP activities. It was detected in the groundwater at concentrations above its groundwater screening criteria.
- Nitroglycerin – the single tentatively identified detection (0.047 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. However, it is below the calculated MCP Method 2 S-1 value. Nitroglycerin has not been detected in groundwater.
- Perchlorate – the maximum detected soil concentration (0.033 mg/Kg) exceeded the MMR SSL and MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. The average concentration was less than the soil screening criteria. It was detected in 20 of 236 samples. Of the seven detected concentrations that exceeded the MassDEP leaching concentration, five were associated with BIP activities. Perchlorate has been detected in groundwater at concentrations above its groundwater screening criteria.
- HMX – the single detected soil concentration (25 mg/Kg at location SS15030-E 0-0.25 feet bgs) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. Two other samples from subsequent depth intervals were non-detect for HMX. The average concentration was less than the soil screening criteria. HMX was detected in 1 of 379 samples (FOD = 0.3%). It was detected in the groundwater, but at concentrations below its groundwater screening criteria.
- Tetryl – the maximum detected soil concentration (0.14 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL. It was detected in 2 of 378 samples (FOD = 0.5%). It was not detected in the groundwater.

Based on these findings, none of the explosives and perchlorate in Area 3 soil will be evaluated in the Feasibility Study.

#### 7.3.3.2 Metals and Inorganics

As presented on Table 7-4, a number of metals and inorganics were detected in the soil. The maximum detected concentrations of a number of metals exceeded at least one of their respective screening levels. However, the site concentrations for the majority of the metals were comparable to background levels. The exceptions to this were arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, molybdenum, nickel, and thallium which are discussed in more detail below. A total of 28 soil samples were collected from bore holes 19 and 20 and location SS102NB, and were analyzed for titanium. However, there are no screening values including background for titanium.

- Arsenic – the maximum soil concentration (47.5 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the EPA risk-based SSL. The average concentration (3.2 mg/Kg) was less than the MCP S-1/GW-1 Standard and was comparable to background.
- Boron – the maximum soil concentration (103 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (2.6 mg/Kg) was comparable to background. Boron has been detected in groundwater, but at concentrations below its screening criteria.
- Cadmium – the maximum soil concentration (117 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the EPA risk-based SSL. The average concentration (1.3 mg/Kg) was less than the MCP Standard and was consistent with background. Only 17 of the 316 samples exceeded the MCP S-1/GW-1 Standard, which is based on background. This indicates that cadmium is not present at elevated levels across Area 3.
- Chromium – the maximum soil concentration (157 mg/Kg) exceeded the MCP S-1/GW-1 Standard and the MMR SSL. The average concentration (15.2 mg/Kg) is consistent with background and below the MCP S-1/GW-1 Standard. Only 2 of the 316 samples exceeded the MCP S-1/GW-1 Standard. This indicates that chromium is not present at elevated levels across Area 3.
- Cobalt – the maximum soil concentration (32.6 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (3.7 mg/Kg) was comparable to background. Cobalt has been detected in groundwater, but at concentrations below its screening criteria.
- Copper – the maximum soil concentration (an estimated 2,080 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (46.8 mg/Kg) was slightly greater than the SSLs and the background concentration. Forty five of the 322 samples exceeded the lowest SSL, indicating that copper is not widely present at elevated levels across the area. Copper has been detected in groundwater, but at concentrations below its screening criteria.
- Iron – the maximum soil concentration (254,000 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (11,072 mg/Kg) was comparable to background. Iron was detected in the groundwater, but at concentrations below its screening criteria.
- Lead – the maximum soil concentration (204 mg/Kg) exceeded the MCP S-1/GW-1 Standard, MMR SSL and the EPA MCL-based SSL. The average concentration was 13.4 mg/Kg, which is consistent with background. Lead was detected in the groundwater, but at concentrations below its screening criteria.
- Molybdenum – the maximum soil concentration (24.9 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (0.72 mg/Kg) was comparable to background. It was detected in the groundwater, but at concentrations below its screening criteria.
- Nickel – the maximum soil concentration (226 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. The average concentration

(11 mg/Kg) was less than the screening criteria and consistent with background. This indicates that nickel is not present at elevated levels across the area.

- Thallium – the maximum soil concentration (15.3 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the EPA risk-based SSL. The average concentration (0.5 mg/Kg) is consistent with background and below the MCP S-1/GW-1 Standard and the MMR SSL. Only the maximum detected concentration exceeded the MCP S-1/GW-1 Standard. This indicates that thallium is not present at elevated levels across Area 3.

Based on these findings, none of the metals and inorganics will be evaluated in the Feasibility Study.

#### 7.3.3.3 PAHs

Several PAHs were detected in the soil. The PAHs were detected sporadically throughout the area. The FOD values ranged from 0.3% to 4%. The maximum detected concentrations of six PAHs exceeded at least one of their respective screening values but all were less than MCP S-1/GW-1 Standards. The detected concentrations of PAHs are consistent with background levels for natural soil (MassDEP 1992). Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.3.4 Pesticides and Herbicides

Several pesticides and herbicides were detected in the soil. The FOD values ranged from 0.7% to 11%. The distribution and concentration of pesticides and herbicides in Area 3 soils are presumed to be consistent with application in accordance with manufacturer's guidelines. The maximum detected concentrations for the pesticides and herbicides listed below exceeded at least one of their respective screening values.

- Beta BHC – the single detected soil concentration (0.001 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. Beta BHC was detected in groundwater at concentrations below its screening criteria.
- Dieldrin – the single detected soil concentration (estimated 0.0026 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. It was not detected in the groundwater.
- Gamma-Chlordane – the single detected soil concentration (estimated 0.0013 mg/Kg) exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. It was detected in groundwater at concentrations below its screening criteria.
- Heptachlor – the single detected soil concentration (estimated 0.0013 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard and the MMR SSL. Heptachlor was detected in 2 of 151 groundwater samples but was not detected in subsequent samples from the same monitoring wells.
- Heptachlor epoxide – the single detection (estimated 0.0012 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard and the MMR SSL. It was not detected in the groundwater.

- MCPP – the maximum detected soil concentration (an estimated 40 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in three of 140 samples (FOD = 2%). All three detections were observed in samples from locations SS102MA and were collected in October 2000. As discussed in Section 7.2.3, these results are likely to be false positives.

Based on these findings, pesticides and herbicides will not be evaluated in the Feasibility Study.

#### 7.3.3.5 VOCs and SVOCs

Several VOCs and SVOCs were detected in the soil. The analytes were detected sporadically throughout the area. The following analytes that were observed in the Area 3 soil (see Table 7-4) exceeded at least one of their respective screening values:

- Acetone – the maximum soil concentration (an estimated 0.43 mg/Kg) exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Acetone was detected in 89% of samples, consistent with being a laboratory contaminant. It was detected in groundwater at concentrations below its screening criteria.
- Benzene – the maximum soil concentration (an estimated 0.002 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. It was detected in 7 of 143 samples (FOD = 5%).
- Bis(2-ethylhexyl)phthalate – the maximum soil concentration (an estimated 8.6 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard and the MMR SSL. It was detected in 68 of 295 samples. Only three of the 68 detected concentrations exceeded the EPA risk-based SSL. The presence of BEHP appears to be an artifact of the investigation methods where it was introduced to the samples from plastic equipment used during collection and analysis.
- Bromomethane – the maximum soil concentration (0.02 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. It was detected in 19 of 141 samples. It was detected in the groundwater at concentrations below its screening criteria.
- Chloromethane – the maximum soil concentration (an estimated 0.004 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL. It was detected in 4 of 141 samples (FOD = 3%). It was detected in groundwater at concentrations below its screening criteria.
- Di-n-butyl phthalate – the maximum soil concentration (2.4 mg/Kg) exceeded the EPA risk-based SSL but was less than the MMR SSL. There is no MCP Method 1 S-1/GW-1 Standard for di-n-butyl phthalate. It was detected in 30 of 295 samples. It was detected in groundwater at concentrations below its screening criteria.
- Ethylbenzene – the single detection (estimated 0.0063 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard and the MMR SSL. It was detected in one of 143 samples (FOD = <1%). Ethylbenzene was not detected in groundwater.

- N-nitrosodiphenylamine – the maximum soil concentration (an estimated 0.25 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 8 of 295 samples (FOD = 3%). It was not detected in the groundwater.
- Pentachlorophenol – the maximum soil concentration (an estimated 0.092 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. It was detected in 5 of 353 samples (FOD = 1%). It was not detected in the groundwater.

Based on these findings, VOCs and SVOCs will not be evaluated in the Feasibility Study.

#### 7.3.3.6 Polychlorinated Biphenyls

Only two of the seven Aroclors analyzed for (i.e., Aroclors 1254 and 1260) were detected in the soil samples. Aroclor 1254 was detected in 1 of 148 samples, and Aroclor 1260 was detected in 2 of 148 soil samples. These detections exceeded their respective MMR SSLs and the EPA risk-based SSLs but were less than the MCP S-1/GW-1 Standard. Although the maximum detected concentration of Aroclor 1260 in groundwater exceeded its HA and the RSL, it was less than its MCL and the MCP GW-1 Standard. Aroclor 1254 was not detected in groundwater. Based on these findings, PCBs in Area 3 soils will not be evaluated in the Feasibility Study.

#### 7.3.3.7 Aliphatic and Aromatic Hydrocarbons

Aliphatic and aromatic hydrocarbons were detected in two samples collected from the area (the fraction C19-C36 aliphatic hydrocarbons in only one sample). The observed concentrations were less than their respective MCP S-1/GW-1 Standards. Based on these findings, hydrocarbons will not be evaluated in the Feasibility Study.

### 7.3.4 Area 4 - Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area

Table 7-5 presents the comparisons of the detected concentrations to the screening criteria for the Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area.

#### 7.3.4.1 Explosives and Perchlorate

2-Amino-4,6-DNT and 4-amino-2,6-DNT were the only explosives detected in the soil. They were detected in one of 163 samples (FOD = 0.6%). 2-Amino-4,6-DNT did not exceed any of its screening criteria. The concentration of 4-amino-2,6-DNT (0.014 mg/Kg) observed in this sample exceeded the MMR SSL, but it was not detected in the groundwater at concentrations that exceeded the groundwater screening criteria. Based on these findings, explosive compounds and perchlorate will not be evaluated in the Feasibility Study.

#### 7.3.4.2 Metals and Inorganics

As presented on Table 7-5, a number of metals and inorganics were detected in the soil. The maximum detected concentrations of a number of metals exceeded at least one of their respective screening levels. However, the average (and generally the maximum detected) site

concentrations for the all of the metals were consistent with background levels. The exceptions are discussed below.

- Chromium – the maximum detected soil concentration (55.8 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP Method 1 S-1/GW-1 Standard. The average concentration (10.4 mg/Kg) was less than the background concentration. This indicates that chromium is not widely present at elevated levels across the area.
- Copper – the maximum detected soil concentration (132 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (6.1 mg/Kg) was less than the SSLs and the background concentration. Two of the 191 samples exceeded the lowest SSL, indicating that copper is not widely present at elevated levels across the area. Copper has been detected in groundwater, but at concentrations below its screening criteria.
- Lead – the maximum soil concentration (153 mg/Kg) exceeded the MMR SSL and the EPA MCL-based SSL but was less than the MCP Method 1 S-1/GW-1 Standard. The average concentration was 7.4 mg/Kg, which is consistent with background. It was detected in the groundwater, but at concentrations below its screening criteria.
- Cyanide – the maximum detected soil concentration exceeded the MMR SSL and the EPA risk-based SSL but was below the MCP S-1/GW-1 Standard. Cyanide was not detected in groundwater.

Based on these findings, none of the metals and inorganics will be evaluated in the Feasibility Study.

#### 7.3.4.3 PAHs

Only one PAH (phenanthrene) was detected in the soil. It was detected in one sample. The observed concentration was less than its screening criteria. Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.4.4 Pesticides and Herbicides

Several pesticides and herbicides were detected in the soil. The FOD values ranged from 0.8% to 5%. The distribution and concentration of pesticides and herbicides in Area 4 soils are presumed to be consistent with application in accordance with manufacturer's guidelines. The maximum detected concentrations for the pesticides and herbicides listed below exceeded at least one of their respective screening values.

- Acifluorfen – the maximum detected soil concentration (estimated 0.011 mg/Kg) exceeded the MMR SSL. It was detected in 4 of 116 samples (FOD = 3%). It was not detected in the groundwater.
- Beta-BHC – the maximum detected soil concentration (estimated 0.0014 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in two of 123 samples (FOD = 2%). Beta BHC was detected in groundwater at concentrations below its screening criteria.

- MCPP – the single detected soil concentration exceeded the MMR SSL and the EPA risk-based SSL. As discussed in Section 7.2.3, this result is likely to be a false positive.

Based on these findings, pesticides and herbicides will not be evaluated in the Feasibility Study.

#### 7.3.4.5 VOCs and SVOCs

Several VOCs and SVOCs were detected in the soil. The analytes were detected sporadically throughout Area 4. The following VOCs and SVOCs that were observed in the soil exceeded at least one of the screening values:

- Acetone – the maximum soil concentration (an estimated 0.63 mg/Kg) exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Acetone was detected in 89% of samples, consistent with being a laboratory contaminant. It was detected in groundwater at concentrations below its screening criteria.
- Bis(2-ethylhexyl)phthalate – the maximum soil concentration (an estimated 2.6 mg/Kg) exceeded the EPA risk-based SSL. It was detected in 23 of 146 samples. Only one of the detected concentrations exceeded the SSL. The presence of BEHP appears to be an artifact of the investigation methods where it was introduced to the samples from plastic equipment used during collection and analysis.
- Bromoform – the maximum soil concentration (an estimated 0.005 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. Only 7 of the 122 samples exceeded the SSLs.
- Bromomethane – the maximum soil concentration (an estimated 0.003 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 3 of 122 samples (FOD = 2%).
- N-nitrosodiphenylamine – the single detected soil concentration (an estimated 0.28 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was not detected in the groundwater.
- Pentachlorophenol – the maximum detected soil concentration (an estimated 3.7 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. The average concentration was less than the MCP Standard. It was detected in 6 of 186 samples (FOD = 3%). Pentachlorophenol was not detected in groundwater.

Based on these findings, VOCs and SVOCs will not be evaluated in the Feasibility Study.

### 7.3.5 Area 5 - Hillside Study Area

Table 7-6 presents the comparisons of the detection concentrations to the screening values at the Hillside Study Area (Area 5).

#### 7.3.5.1 Explosive Compounds and Perchlorate

The following explosives related compounds that were observed in the soil exceeded at least one of their respective screening criteria:

- 2,4-DNT – the maximum detected soil concentration (an estimated 0.027 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL, but was below the MCP S-1/GW-1 Standard. It was detected in 2 of 110 samples (FOD = 1.8%) by Method 8330 and was not detected by in any of the 90 samples analyzed by Method 8270. 2,4-DNT was detected in 2 of 1576 groundwater samples analyzed by Method 8330. 2,4-DNT was not detected in any of the 83 groundwater samples analyzed by Method 8270.
- 2,6-DNT – the maximum detected soil concentration (an estimated 0.014 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 1 of 110 samples (FOD = 0.9%) by Method 8330 and was not detected in any of the 90 samples analyzed by Method 8270. 2,6-DNT was not detected in groundwater.
- 2-NT – the maximum detected soil concentration (0.049 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in only 1 of 110 samples (FOD = 0.9%). 2-NT was detected in 1 of 1,576 groundwater samples (FOD = 0.06%). It has not been detected in groundwater since 1997.

Based on these findings, explosives will not be evaluated in the Feasibility Study.

#### 7.3.5.2 Metals and Inorganics

As presented on Table 7-6, a number of metals and inorganics were detected in the soil. The maximum detected concentrations of a number of metals exceeded at least one of their respective screening criteria. However, the site concentrations for the majority of the metals were similar to background levels. The exceptions to this were copper, iron, and lead, which are discussed in more detail below.

- Copper – the maximum soil concentration (3,210 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (50.3 mg/Kg) was above the background level and the SSLs. Only 14 of the 101 samples exceeded the lowest of the SSLs. Copper was not detected in groundwater at concentrations above its screening criteria. This indicates that copper is not present at elevated levels across the area.
- Iron – the maximum soil concentration (123,000 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (12,350 mg/Kg) was consistent with background. Iron was not detected in groundwater at concentrations above its screening criteria.
- Lead – the maximum soil concentration (852 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL and the EPA MCL-based SSL. The average concentration (35 mg/Kg) was less than the MCP S-1/GW-1 Standard and comparable to background. Only three detected concentrations exceeded its MCP Standard.

Based on these findings, none of the metals and inorganics will be evaluated in the Feasibility Study.

#### 7.3.5.3 PAHs

Several PAHs were detected in the soil. The PAHs were detected sporadically throughout the area. The FOD values ranged from 1.1% to 20%. The maximum detected concentrations of four

PAHs exceeded the EPA risk-based SSLs but were less than the MCP S-1/GW-1 Standards. The FOD for these PAHs was 1.1% to 1.2% (each was detected in only one soil sample). The detected concentrations of PAHs are consistent with background levels for natural soil (MassDEP, 1992). Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.5.4 VOCs and SVOCs

Several VOCs and SVOCs were detected in the soil. The analytes were detected sporadically throughout the area. The following VOCs and SVOCs that were observed in the soil (see Table 7-6) exceeded at least one of the screening values:

- Acetone – the maximum soil concentration (an estimated 0.27 mg/Kg) exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Acetone was detected in 97% of samples, consistent with being a laboratory contaminant. It was detected in groundwater at concentrations below its screening criteria.
- Chloroform – the maximum soil concentration (an estimated 0.006 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. Chloroform was detected in groundwater at concentrations above screening levels, but as discussed in Section 7.2.5 it is ubiquitous in the groundwater as a result of natural conditions.
- N-nitrosodiphenylamine – the single detected soil concentration (an estimated 0.043 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL. It was not detected in the groundwater.

Based on these findings, VOCs and SVOCs will not be evaluated in the Feasibility Study.

### 7.3.6 Area 6 - Barrage Rocket Study Area

Table 7-7 presents the comparisons of the detection concentrations to the screening values at the Barrage Rocket Study Area (Area 6).

#### 7.3.6.1 Explosives and Perchlorate

The following explosives related compounds and perchlorate that were observed in the soil at a maximum concentration that exceeded at least one of their respective screening criteria:

- 2,4-DNT – the maximum detected soil concentration (0.46 mg/Kg by Method 8270 and estimated 1.33 mg/Kg by Method 8330 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration. The average concentration of 2,4-DNT in the soil of this area was less than the MCP Standard. 2,4-DNT was detected in 3 of 200 samples (FOD = 1.7%) by Method 8270 and 5 of 263 samples (FOD = 1.9%) by Method 8330. 2,4-DNT was detected in 2 of 1576 groundwater samples analyzed by Method 8330. 2,4-DNT was not detected in any of the 83 groundwater samples analyzed by Method 8270.
- 2-Amino-4,6-DNT – the maximum detected soil concentration (2.42 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, the EPA risk-based SSL and the

MassDEP leaching soil concentration. It was detected in 11 of 264 samples (FOD = 4%). It was not detected in groundwater at concentrations above its screening criteria.

- TNT – the maximum detected soil concentration (117 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. TNT does not have an MCP S-1/GW-1 Standard. The calculated MCP Method 2 S-1 value is 32 mg/Kg. The two highest results exceed this value but the average concentration is below the calculated MCP Method 2 S-1 value. It was detected in 23 of 267 samples (FOD = 9%). TNT has not been detected at any of the groundwater monitoring wells since 2005 (some 354 samples from 79 groundwater monitoring wells).
- 2,6-DNT – the maximum detected soil concentration (an estimated 0.1 mg/Kg by Method 8330) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 3 of 263 samples (FOD = 0.6%) by Method 8330 and was not detected in any of the 200 samples analyzed by Method 8270. 2,6-DNT was not detected in the groundwater.
- 2-NT – the maximum detected soil concentration (0.071 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 2 of 263 samples (FOD = 0.8%). 2-NT was detected in 1 of 1,576 groundwater samples (FOD = 0.06%). It has not been detected in the groundwater since 1997.
- 3-NT – the maximum (and only) detected soil concentration (0.058 mg/Kg) exceeded the EPA risk-based SSL. It was detected in 1 of 263 samples (FOD = <1%). It was not detected in the groundwater.
- 4-Amino-2,6-DNT – the maximum detected soil concentration (3.22 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. It was detected in 9 of 263 samples (FOD = 3%). It was not detected in the groundwater at concentrations above its screening criteria.
- RDX – the maximum detected soil concentration (0.026 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL, and the MassDEP leaching concentration but was less than the MCP S-1/GW-1 Standard. It was detected in 2 of 263 samples (FOD = 0.8%). It was detected in the groundwater at concentrations exceeding its groundwater screening criteria.
- Nitrobenzene – the maximum detected soil concentration (0.12 mg/Kg) exceeded the EPA risk-based SSL. It was detected in two of 263 samples (FOD = 0.4%) by Method 8330 and was not detected in any of the 200 samples analyzed by Method 8270. It was not detected in the groundwater.
- Nitroglycerin – the maximum detected soil concentration (33 mg/Kg) exceeded the MMR SSL, the EPA risk-based SSL and the calculated MCP Method 2 S-1 value. Three other samples from this same location (SS348-A) were non-detect for nitroglycerin. It was detected in 14 of 261 samples (FOD = 5%) but was not detected in the groundwater.
- Tetryl – the maximum detected soil concentration (2.62 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. There is no MCP Method 1 S-1/GW-1 Standard for tetryl. It was detected in 2 of 263 samples (FOD = 0.8%). It was not detected in the groundwater.
- Perchlorate – the maximum detected soil concentration (0.51 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the MassDEP leaching concentration. However,

the average perchlorate concentration (0.004 mg/Kg) was less than the MCP Standard. It was detected in 17 of 156 samples (FOD = 11%). Only the maximum detected concentration exceeded the MCP S-1/GW-1 Standard.

Given the low concentrations, low FOD, biodegradability and/or lack of groundwater detections, none of these explosives will be evaluated in the Feasibility Study.

#### 7.3.6.2 Metals and Inorganics

As presented on Table 7-7, a number of metals and inorganics were detected in the soil. The maximum detected concentrations of a number of metals exceeded at least one of their respective screening levels. However, the site concentrations for the majority of the metals were similar to background levels. The exceptions to this were cadmium, copper, lead, manganese, nickel, and cyanide which are discussed in more detail below.

- Cadmium – the maximum soil concentration (31.7 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. The average concentration (1.0 mg/Kg) was consistent with background. Most of the elevated cadmium results were associated with BIP samples.
- Copper – the maximum soil concentration (1,840 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (34 mg/Kg) also exceeded the EPA risk-based SSL. Only 38 of the 220 samples exceeded the SSLs. Most of the elevated copper results were associated with BIP samples.
- Lead – the maximum soil concentration (462 mg/Kg) exceeded the MCP S-1/GW-1 Standard, the MMR SSL, and the EPA MCL-based SSL. Only the maximum concentration exceeded the MCP S-1/GW-1 Standard and the average concentration (19 mg/Kg) was less than the MCP S-1/GW-1 Standard and equal to the background concentration.
- Manganese – the maximum soil concentration (1,460 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL. The average concentration (72 mg/Kg) was consistent with background. Most of the elevated manganese results were associated with BIP samples.
- Nickel – the maximum soil concentration (121 mg/Kg) exceeded the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard and the MMR SSL. The average concentration (7 mg/Kg) was consistent with background.
- Cyanide – the maximum detected concentration (5.3 mg/Kg) of cyanide exceeded the MMR SSL and the EPA risk-based SSL, but was below its MCP S-1/GW-1 Standard. Cyanide was not detected in groundwater.

Most of the locations with elevated metals results are associated with BIP activities and were evaluated under the BIP program. Based on these findings, none of the metals and inorganics will be evaluated in the Feasibility Study.

#### 7.3.6.3 PAHs

Several PAHs were detected in the soil. The PAHs were detected sporadically throughout the area. The FOD values ranged from 0.5% to 2%. The maximum detected concentrations of three PAHs exceeded at least one of their respective screening values (i.e., benzo(a)pyrene,

benzo(b)fluoranthene, and naphthalene). However, none of the maximum detected concentrations of these PAHs exceeded their respective MCP S-1/GW-1 Standards. Based on these findings, PAHs will not be evaluated in the Feasibility Study.

#### 7.3.6.4 Pesticides and Herbicides

A limited number of pesticides and herbicides were detected in the soil. The distribution and concentration of pesticides and herbicides in Area 6 soils are presumed to be consistent with application in accordance with manufacturer's guidelines. The detected concentrations for the pesticides and herbicides listed below exceeded at least one of their respective soil screening criteria.

- Acifluorfen – the single detected soil concentration exceeded the MMR SSL. Acifluorfen was not detected in the area groundwater.
- Bentazon – the single detected soil concentration exceeded the MMR SSL and the EPA risk-based SSL. Bentazon also was not detected in the area groundwater.
- Beta-BHC – the single detected soil concentration exceeded the MMR SSL and the EPA risk-based SSL. Beta BHC was detected in the area groundwater but at concentrations below its groundwater screening criteria.

Based on these findings, pesticides and herbicides will not be evaluated in the Feasibility Study.

#### 7.3.6.5 VOCs and SVOCs

Several VOCs and SVOCs were detected in the soil. The analytes were detected sporadically throughout the area. The following VOCs and SVOCs that were observed in the soil (see Table 7-7) exceeded at least one of their respective screening criteria:

- Acetone – the maximum soil concentration (an estimated 1.1 mg/Kg) exceeded the MMR SSL but was less than the MCP S-1/GW-1 Standard and the EPA risk-based SSL. Acetone was detected in 75% of samples, consistent with being a laboratory contaminant. It was detected in groundwater at concentrations below its screening criteria.
- Benzyl alcohol – the maximum soil concentration (0.69 mg/Kg) exceeded the EPA risk-based SSL. Benzyl alcohol was not detected in the J-3 Range groundwater.
- Chloroform – the maximum soil concentration (an estimated 0.0039 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. Chloroform is ubiquitous in the groundwater as a result of natural conditions.
- Hexachlorobenzene – the single detected soil concentration (an estimated 0.07 mg/Kg) exceeded the MMR SSL and the EPA risk-based SSL but was less than the MCP S-1/GW-1 Standard. Hexachlorobenzene was not detected in the groundwater.
- Hexachloroethane – the single detected soil concentration (an estimated 0.068 mg/Kg) exceeded the EPA risk-based SSL. Hexachloroethane was not detected in the groundwater.
- N-nitrosodiphenylamine – the single detected soil concentration (an estimated 0.043 mg/Kg) exceeded the MMR SSL but was less than the EPA risk-based SSL. It was not detected in groundwater.

Based on these findings, VOCs and SVOCs in Area 6 soil will not be evaluated in the Feasibility Study.

### 7.3.7 Soil Evaluation Summary

There were single detections of 2,4-DNT, 2,6-DNT and 2-NT in Area 1. The only exceedance of an MCP S-1/GW-1 Standard was of 2,4-DNT by Method 8330, which was associated with sample SS102VF.

The maximum detected concentration of nitroglycerin in Area 2 exceeded the calculated MCP Method 2 S-1 value. Five other samples from the same location (SS102DA) were non-detect for nitroglycerin. Only the maximum detected concentration of phenol exceeded the MCP Method 1 S-1/GW-1 Standard. The two highest TNT results (117 mg/Kg at location SSJ3B06 and 61 mg/Kg at location SS362-A) exceed the calculated MCP Method 2 S-1 value, but the average concentration is below this value. The two detections of 1,2-DCE exceeded the MCP S-1/GW-1 Standard. The average concentrations of both phenol and 1,2-DCE were below screening criteria. Only the maximum detected concentrations of chromium and nickel exceeded the MCP Method 1 S-1/GW-1 Standard. The average concentrations of chromium and nickel were comparable to background levels.

The single detected concentration of HMX (25 mg/Kg in sample SS15030-E) in Area 3 exceeded the MCP S-1/GW-1 Standard. Two other samples from subsequent depth intervals were non-detect for HMX and the average concentration was less than the soil screening criteria. The maximum concentrations of several metals (arsenic, cadmium, chromium, lead, and thallium) exceeded the MCP S-1/GW-1 Standard. The average concentrations of these metals were consistent with background.

The only exceedance of an MCP S-1/GW-1 Standard in Area 4 was for pentalchlorophenol. The maximum detected soil concentration (an estimated 3.7 mg/Kg) exceeded the MCP S-1/GW-1 Standard but the average concentration was less than the MCP Standard (3 mg/Kg).

Detections of lead in Area 5 exceeding the MCP S-1/GW-1 Standard (200 mg/Kg) were observed in three samples. The average concentration of lead (35 mg/Kg) was less than the MCP S-1/GW-1 Standard and comparable to background.

Only the maximum detected concentration of 2,4-DNT in Area 6 (estimated 1.33 mg/Kg by Method 8330 and 0.46 mg/Kg by Method 8270 in sample location SSJ3BRSG08) exceeded the MCP S-1/GW-1 standard (0.7 mg/Kg). The five highest concentrations of nitroglycerin exceeded the calculated MCP Method 2 S-1 value. In each of these five locations, the highest concentration of nitroglycerin was observed in the uppermost sample interval (0 to 3 inches) and nitroglycerin was not detected in the deepest sample interval (6 to 12 inches). Only the maximum detected concentration of perchlorate (0.51 mg/Kg in sample location SS361-A) exceeded the MCP Method 1 S-1/GW-1 Standard (0.1 mg/Kg). Only the maximum detected concentration of lead (462 mg/Kg at sample location SS10704-A) exceeded the MCP S-1/GW-1 Standard (200 mg/Kg). The area-wide average concentration was less than the MCP S-1/GW-1 Standard and comparable to background.

# 8.0 INVESTIGATION FINDINGS

The following presents the summary and findings of the J-3 Range remedial investigation.

## 8.1 Groundwater Contamination

This section summarizes recent results concerning the RDX and perchlorate plumes.

### RDX

The extent of the J-3 Range RDX plume, as defined by concentrations of RDX above 0.6 µg/L (3,400-feet long and 500-feet wide) (Figures 3-2, 3-3 and 3-4), does not extend as far downgradient and is not as wide as depicted prior to the startup of the GW RRA ETR system (4,800-feet long and 900-feet wide). The plume, as defined by RDX concentrations above the health advisory (HA) (2 µg/L), is approximately 2,500-feet long and 200-feet wide. The change in RDX extent is due to mass removal from the J-3 Range ETR system and natural attenuation. The most recent maximum RDX concentration is lower (7.5 µg/L, MW-198M4; 06 August 2013) than the maximum reported prior to the startup of the GW RRA ETR system (35 µg/L, MW-343M2, 2005). However, historic concentrations (37.6J µg/L) in this well indicate that the core of the RDX plume has migrated from MW-343 south to MW-227 and is currently downgradient of MW-227. This is also reflected in the increase in RDX concentrations in the two downgradient extraction wells (J3EW0032 and 90EW0001) (Table 3-1).

### Perchlorate

The extent of the J-3 Range perchlorate plume, as defined by concentrations of perchlorate above the Massachusetts maximum contaminant level (MMCL) of 2 µg/L (3,500-feet long and 450-feet wide) (Figures 3-5, 3-6 and 3-7), has become slightly shorter and more narrow since prior to the startup of the groundwater RRA ETR (3,700-feet long and 900-feet wide). The western boundary in the downgradient portion of the plume has moved to the east of extraction well J3EW0032 where concentrations are well below the 15 µg/L previously reported due to J3EW0032 mass removal. The area where concentrations exceed 15 µg/L is also narrower, likely due to mass removal by extraction well J3EWIP1. Concentrations above 200 µg/L are no longer observed in the monitoring well network, however concentrations as high as 350 µg/L were detected in drive point profile samples collected in 2012 downgradient of MW-198 and upgradient of J3EWIP1. The vertical extent of the plume, based on the 2 µg/L contour is comparable to the previous depictions; however, the major difference is the thinning of the higher concentration contours in the plume.

Through mass removal via the ETR system and natural attenuation, perchlorate concentrations have decreased throughout most of the plume (Figure 3-4). The location of the historic maximum plume concentration of 770 µg/L (MW-198M3, June 2005) has decreased most recently to a concentration of 2.7 µg/L (MW-198M3, 06 August 2013). Significant decreases have been observed in areas in proximity to extraction wells, specifically at locations MW-343, MW-142, and MW-247 (Figure 3-4). However, significantly higher perchlorate concentrations are currently observed in the influent to extraction well J3EWIP1 (i.e., 17.3 µg/L, July 2013), indicating the presence of much higher perchlorate concentrations within the J-3 plume than what is presently being detected by the chemical monitoring network. Perchlorate

concentrations in source area well MW-163S have declined from a maximum of 120 µg/L (June 2005) to 4.5 µg/L in the latest sampling event (30 July 2013).

**Conceptual Site Model and Risk Screening**

The Conceptual Site Model, based on known range use activities and the presence of soil contaminants, suggest testing and disposal activities at and in the vicinity of the Demolition Area and Artillery Range, and the Melt/Pour building, as the primary source of the J-3 Range perchlorate and RDX plume.

A human health risk screening was conducted for the J-3 Range groundwater (1997 to 2013 data). The objective of the risk screening was to identify any contaminant detected in the J-3 Range groundwater that requires further evaluation. The maximum detected concentration of each analyte was compared against its MCL, HA, RSL or GW-1 standard. The screening identified a widespread presence of RDX and perchlorate at concentrations exceeding the screening criteria. Therefore, RDX and perchlorate will be further evaluated in the Feasibility Study. Other compounds were identified at concentrations exceeding some risk screening criteria, but these compounds were detected infrequently, are associated with naturally occurring background conditions, or are laboratory-related contaminants and therefore were not carried forward to the feasibility study.

## 8.2 Source Characterization

During the period from 1997 through 2013, 1,700 soil samples were collected from 505 locations within the J-3 Range investigation area. In addition, numerous intrusive investigations of geophysical anomalies were conducted in the J-3 Range study area. Results of historical releases and soil investigations in the Demolition and Artillery Areas as well as the Melt Pour Area, show soil contamination that is consistent with explosives found in downgradient groundwater. These areas are located in Areas 1 and 3 and the extent of the groundwater plume is consistent with sources in these locations. Explosive and perchlorate soil contamination associated with these source areas has been removed as discussed in Section 5.0.

For the soil risk screening, J-3 Range soil data were divided into six discrete subareas, based on the conceptual site model for the different portions of the range. The risk screening identified concentrations of explosives (2,4-DNT, 2,6-DNT, 2-amino-4,6-DNT, 4A 2,6-DNT, 2-NT, tertyl, nitroglycerin, nitrobenzene, HMX, RDX, TNT and perchlorate) exceeding the screening criteria. However, the subareas averages did not exceed the S-1/GW-1 standards. In addition, many of these locations are associated with BIP activities and were allowed to remain in place under BIP protocols. Other contaminants were occasionally detected above screening levels but only at low frequencies. Based on the above findings, there is no further action warranted for soils at the J-3 Range.

The most widespread occurrence of HE projectiles found during intrusive investigations were associated with training activities. HE projectiles from training activities were discovered in each subarea investigated. Discoveries of HE projectiles associated with testing activities were primarily limited to Area 3, in which burial pits and a burn pit were identified, and Area 4. The

potential for residual MEC items, likely consisting of inert projectiles with live fuzes or isolated individual HE items remains.

The largest potential of HE items that could remain on the range would be associated with training activities. High explosives items that could remain on the range include the MK3 4.5-inch Barrage Rocket, M3 4.2-inch mortar, M56 and M43 81mm mortars, and the M49 60mm mortar. It is possible that additional M9 Rifle HEAT Grenades could be found in the southern portion of the J-3 Range. The M6 2.36-inch HEAT rockets that were associated with the testing may be found in the vicinity of the J-3 Range Demolition Area. However, extensive clearance work has been conducted in this area and the likelihood is very low of finding additional rockets. The M433 40mm HEDP grenades could be found around the presumed M550 berm area and contain live fuzing.

# 9.0 J-3 RANGE FEASIBILITY STUDY

The feasibility study portion of this report presents the evaluation of alternatives to remediate the RDX and perchlorate groundwater plumes at the J-3 Range. The sources of contamination have been removed during the investigation phase resulting in the removal and treatment approximately of 2,400 cubic yards of soil from 15 investigation areas.

The remedies evaluated in the J-3 Range groundwater feasibility study were monitored natural attenuation and focused extraction. These remedies include technologies implemented as part of the J-2 and J-3 rapid response actions (ECC 2005a, c), and evaluated in the feasibility study for Demolition Area 1 (AMEC 2004b). The technology selected for the active remediation alternatives comparison is groundwater extraction, treatment with granular activated carbon (GAC) (for RDX contaminated groundwater) and/or ion-exchange resin (IX) (for perchlorate-contaminated groundwater) and return of treated water back into the aquifer. With GAC adsorption process, groundwater contaminated with explosives is passed through a carbon medium and explosives are adsorbed onto the surface of, or partition into the carbon particles. GAC has also been shown to be an effective treatment for low levels of perchlorate (below 6 µg/L) (AMEC 2004b). Once the capacity of the GAC has been exhausted, the GAC requires regeneration or disposal. IX is a physical-chemical process by which ions, such as perchlorate, are transferred from the liquid phase to the solid phase. Similar to GAC treatment, treatment with IX resin occurs via flow through a porous media. The IX resin removes perchlorate ions from the water and exchanges it for chloride ions bound to the resin. Perchlorate is an anion, which is attracted to the positively charged surface of the IX resins.

The return of treated water back to the aquifer can be accomplished by various methods (e.g., reinjection wells, infiltration trenches, surface water discharge). For the feasibility study, reinjection wells were used conceptually to return water to the aquifer. The specific method will be determined during the well field review and design effort if the selected remedy involves additional treatment.

The following steps were taken to identify alternatives to address the contamination in the J-3 plumes: (1) response action objectives were developed; (2) alternatives were developed to address the objectives; and (3) alternatives were subjected to a detailed assessment based on nine criteria (protection of human health and the environment; compliance with regulations; long-term effectiveness and permanence; reduction of toxicity, mobility or volume; short-term effectiveness; implementability; cost; state acceptance and community acceptance).

# 10.0 DEVELOPMENT OF ALTERNATIVES

## 10.1 Response Action Objectives

This section describes the response action objectives and potential response actions for J-3 Range groundwater. Based on preliminary information relating to types of contaminants, environmental media of concern, and potential exposure pathways, response action objectives were developed to aid in the development and screening of alternatives. The response action objectives for the selected response action for the J-3 Range groundwater plume are to restore the useable groundwater to its beneficial use wherever practicable, within a timeframe that is reasonable given the particular circumstances of the site; to provide a level of protection in the aquifer that takes into account that the Cape Cod Aquifer, including the Sagamore Lens, is a sole source aquifer that is susceptible to contamination; and to prevent ingestion and inhalation of groundwater containing COCs (perchlorate and RDX), in excess of federal maximum contaminant levels (MCLs), Health Advisories, drinking water equivalent levels (DWELs), applicable State standards or an unacceptable excess lifetime cancer risk or non-cancer Hazard Index.

RDX concentrations in groundwater between 6 and 0.6 µg/L, are currently equivalent to the $10^{-5}$ to $10^{-6}$ risk based level. The NCP uses a risk range of $10^{-6}$ to $10^{-4}$ as a "target range" to manage cancer risks as part of a CERCLA cleanup. The $10^{-6}$ risk level serves as the point of departure for determining remediation goals for alternatives when Applicable or Relevant and Appropriate Requirements (ARARs) are not available. The EPA lifetime Health Advisory for RDX is 2 µg/L. The MCP GW-1 Standard for RDX is 1 µg/L. The perchlorate MMCL is 2 µg/L and the EPA Interim Lifetime Health Advisory for perchlorate is 15 µg/L.

## 10.2 Regulatory Considerations

Table 10-1 summarizes the federal and state regulatory considerations for the proposed J-3 Range groundwater remedial actions.

## 10.3 Remedial Alternatives

Remedial alternatives were developed that included:

- A no action alternative to serve as a baseline for alternative comparisons.
- An alternative that, throughout the entire groundwater plume, reduces the contaminant concentrations to background conditions.
- An alternative that, throughout the entire groundwater plume, reduces the contaminant concentrations to levels that meet or exceed the MCLs, health advisories, DWELs, other relevant standards, results in a Hazard Index of 1 or less, and a cumulative $10^{-6}$ excess cancer risk and non-cancer Hazard Risk of one as rapidly as possible and in less than 10 years and shall require no long-term maintenance.

A range of alternatives from no further action to focused extraction of the J-3 Range plume are considered in this is feasibility study. Contaminated soil has been removed and remediated;

therefore, the range of alternatives does not include any further source area remediation or control. The source area remediation can be considered a part of each alternative.

This section presents the remedial alternatives developed to address contamination at the J-3 Range. The groundwater alternatives are:

- Alternative 1 – No Further Action;
- Alternative 2 – Monitored Natural Attenuation and Land Use Controls;
- Alternative 3 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land Use Controls (continued operation of current system);
- Alternative 4 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land Use Controls (optimization of current system);
- Alternative 4A – Focused Extraction with Four Wells, Monitored Natural Attenuation and Land Use Controls; and
- Alternative 5 – Focused Extraction with Six Wells, Monitored Natural Attenuation and Land Use Controls.

Alternative 1 only includes well abandonment and site closeout.

Monitoring and land-use controls are components of Alternatives 2 through 5. Land Use controls consist of measures that would prevent human exposure to plume contaminants or interference with monitoring and/or treatment systems. Land Use controls can be considered in three categories: (i) those that relate to the property that is under the control of the Army through the existing lease between the Commonwealth of Massachusetts and the US Army (i.e. on-post administrative controls), (ii) those that relate to property that is not under the control of the Army (i.e. off-post institutional controls), and (iii) those that relate to the Post after the lease with the Army has expired (i.e. post-lease institutional controls). On-post land-use controls would be established by the Army, Massachusetts National Guard, and any other entity in control of the on-post areas. The program would include monitoring the effectiveness of the institutional controls.

For off-post land-use controls, the Town of Sandwich has established regulations to protect human health. The Town of Sandwich Board of Health amended its private well regulations on 11 April 2005 to prohibit the construction of potable water supply wells for new buildings located in known and documented areas of groundwater contamination if the Sandwich Water District Service is available. For existing buildings, the Board of Health will not approve any new well to be used for human consumption until its water has been tested and the Board of Health has determined that the water is potable. Additional water testing and special standards may be required by the Board of Health if the well is located in an area of potential contamination.

In addition to the Town of Sandwich Board of Health well regulations, the Army will also assess all private wells relative to potential exposure to the J-3 Range groundwater plume. If a potential exposure is identified, the Army will take action to ensure protectiveness. The actions may include well decommissioning, health warnings, supplemental water supply, or treatment. Monitoring of these restrictions and controls will be conducted annually.

If cleanup levels are not attained by the end of the lease with the selected alternative, the Army would develop Land Use controls that would be implemented after the expiration of the Army's lease.

Monitoring would involve periodic analysis of groundwater for RDX and perchlorate to measure the attenuation of the contaminated groundwater, and to confirm that concentrations have decreased below risk-based concentrations. Prior to the termination of the proposed activities, a residual risk-assessment will be conducted pursuant to a work plan approved by EPA, in consultation with MassDEP, to determine if RDX and perchlorate concentrations remaining in the aquifer pose unacceptable human health risks.

The extraction alternatives (Figures 10-1 to 10-4) consist of extraction of groundwater through extraction well(s); (2) treatment of the groundwater through a treatment unit [the treatment unit uses IX to remove perchlorate from the groundwater and GAC to remove explosives from the groundwater]; and (3) infiltration of treated water to the aquifer via reinjection wells.

Each of the alternatives reduces contaminant concentrations to background conditions. In addition, Alternative 5 was designed to reduce the contaminant concentration to levels that meet regulatory and risk-based standards in less than 10 years after the start of treatment.

# 11.0 DETAILED ANALYSIS OF ALTERNATIVES

## 11.1 Introduction

The following subsections describe the conceptual design criteria for detailed analysis of each alternative. This section provides a description of the criteria for detailed analysis, groundwater modeling results, and the detailed analysis of the groundwater alternatives. Each alternative is evaluated against the same criteria established by the EPA and discussed below.

## 11.2 Criteria for Detailed Evaluation

Relative performance of each alternative is evaluated using the following nine criteria:

1. Overall protection of human health and the environment; this shall include prevention of the movement of contaminants into the aquifer and its preservation as a public drinking water supply.
2. Compliance with regulations, including:
    - Federal regulations; and
    - State regulations

3. Long-term effectiveness and permanence, considering:
    - The risks remaining after completion of the remedial action;
    - The adequacy and suitability of controls, if any, that are used to manage untreated contaminants remaining at the site.

4. Reduction of toxicity, mobility, and volume through treatment, including:
    - The expected reduction in toxicity, mobility or volume measured as a percentage or order of magnitude; and
    - The type and quantity of treatment residuals that will remain following treatment.

5. Short-term effectiveness, including:
    - Protection of the community during the remedial action;
    - Protection of workers during the remedial action;
    - Environmental impacts to natural resources; and
    - Time until remedial response objectives are achieved.

6. Implementability, considering:
    - Technical feasibility, including:
        - Construction and operation;
        - Reliability of technology;
        - Ease of undertaking additional remediation, if necessary; and
        - Monitoring considerations, addressing the ability to monitor adequately the effectiveness of the remedy and the risks should monitoring be insufficient to detect a system failure.
    - Administrative feasibility:
    - Availability of services and materials, including:
        - Availability of adequate off-site treatment, storage capacity, and disposal services;

- Availability of necessary equipment and specialists, and any other necessary resources;
- The potential for obtaining competitive bids (especially for innovative technologies); and
- Availability of prospective technologies.

7. Cost, considering:
   - Source removal costs
   - Capital costs, both direct and indirect;
   - Annual O&M costs; and
   - Present worth analysis (or net present value) of costs.

   The cost estimates for the alternatives include capital, annual and periodic costs associated with the anticipated scope of the alternative. These generally include construction costs, operations and maintenance (O&M) costs, system monitoring costs, and reporting costs. When possible, costs were based on actual costs for similar activities performed previously at the JBCC. The general assumptions made for the present value calculations are that costs based on current year (present day) information will escalate at a rate of 5% per year until year zero. After year zero, costs were discounted at a rate dependent on the length of the alternative (2013 Discount rates for OMB Circular No. A-94). A detailed presentation of the cost estimates and present value calculations are provided in Appendix F.

8. State Acceptance, considering the issues and concerns that the State may have regarding each alternative. This criterion will be evaluated throughout the development, screening and evaluation of alternatives based on comments and input received from MassDEP.
9. Community Acceptance which entails an evaluation of issues and concerns the public may have regarding each alternative. This criterion will be evaluated throughout the development, screening and evaluation of alternatives based on comments and input received from the JBCC Cleanup Team (JBCCCT) and public.

## 11.3 Feasibility Study Groundwater Modeling

Estimates of the J-3 Range groundwater performance of alternatives were developed based on a review of various data and groundwater modeling results. Treatment plant influent results from October 2006 through 2013 were used to calculate the amount of mass that has been removed by the treatment system and to provide a point of comparison to model-predicted mass removal.

The depiction of the perchlorate and RDX plumes at the J-3 Range were revised leading up to the development of this Feasibility Study, using historic groundwater profile and monitoring well data available through 2013 and according to the method outlined in Appendix H. In brief, the existing groundwater flow model for the J-3 Range was used to forward-migrate historic concentrations to their simulated current locations. The forward-migrated concentrations were then used to develop the spatial distribution of the plumes as they might exist at the end of 2013.

To account for the relative lack of historic perchlorate and RDX data within the plume core and around the plume edges, likely boundaries were drawn as lines of control points. These lines of

points were drawn using the simulated locations of contaminant concentrations, along with other factors, including the locations of groundwater sources and sinks and predicted extraction well reverse-particle paths, as a guide. The control points together with a conservatively selected subset of migrated points were then contoured in three dimensions to develop the initial conditions applied to all of the cleanup alternatives. Once the perchlorate and RDX plumes were satisfactorily developed they were mapped to the existing groundwater fate and transport model and used as starting conditions for each of the five cleanup alternatives.

The only modification to the mapped perchlorate and RDX plumes was that contamination mapped to low hydraulic conductivity zones (K ≤ 5 ft/day) was not considered realistic and was therefore removed from the fate and transport model prior to all simulations. The removal of this contamination was justified since the placement of low conductivity zones in the existing flow model was done during model calibration and in reality may not exist. Also, the mass reduction by taking this approach was minimal in that perchlorate from low conductivity zones only amounted to 0.36 lbs (3.2%) of the initially mapped perchlorate and 0.04 lbs (1.5%) of the initially mapped RDX from low conductivity zones.

While contamination was not mapped to the low conductivity layers, contaminated groundwater was still able to migrate into downgradient, low hydraulic conductivity zones. Therefore, throughout the simulation contamination was predicted to migrate toward and be captured by extraction wells but was also able to enter into, and be significantly slowed by, the low conductivity layers. Given that the cleanup alternatives are intended to demonstrate cleanup of the “productive” portion of the aquifers, the simulation results were reviewed to determine the point at which lingering contamination only remained in the low conductivity (K ≤ 5 ft/day) zones. The determination was confirmed by reviewing model predictions and corresponding hydraulic conductivity values in each model layer to insure that contamination was indeed remaining entirely in low conductivity zones, with the only exception being a very small front of contamination leaving the downgrading edges of the low conductivity zones.

The simulation of cleanup alternatives included a 10-month simulation using the current extraction rates, representing the period from 01 January 2014 through 31 September 2014, immediately followed by a 100-year simulation from 01 October 2014 through 31 September 2114, using the alternative revised extraction rates. It should be noted that inconsistencies in plume mass exist because of the irregular spatial and temporal distribution of the contamination, but the extent of contamination is believed to be more reliably understood. Groundwater with a concentration greater than a low-level threshold is going to occupy a much smaller volume in the model than groundwater with a concentration greater than zero. As such, an extraction well with a capture zone extending beyond the low-level threshold concentration is going to remove mass that was not accounted for in the original calculation. Therefore, the potential exists for more mass to be removed by an extraction well than was estimated as being above the low-level threshold concentration.

## 11.4 Detailed Analysis of Alternatives

This section provides the detailed description and analysis of the remedial alternatives. Each alternative description includes assumptions made for planning and cost-estimating purposes.

### 11.4.1 Alternative 1 – No Further Action

Under the no further action alternative, treatment and/or monitoring would not be conducted and the treatment system and monitoring wells associated with the J-3 Range plume would be abandoned. This alternative serves as a baseline for alternative comparisons.

Overall Protection of Human Health and the Environment

Alternative 1 would not prevent the migration of the plume or protect human health or the environment from the existing contamination. Although there is currently no exposure to the J-3 Range plume, Alternative 1 offers no monitoring or confirmation of existing land-use controls to ensure that future exposures do not occur. Perchlorate concentrations are predicted to decrease, through natural attenuation processes, below 15 µg/L by 2034, below 2 µg/L by approximately 2079 and background concentrations (0.35 µg/L) could be achieved after year 2114. RDX concentrations are predicted to decrease, through natural attenuation processes, below the $10^{-5}$ risk-based level of 6 µg/L by approximately 2014, below the HA of 2 µg/L by approximately 2018, below the $10^{-6}$ risk-based level of 0.6 µg/L by 2043, and background concentrations (0.25 µg/L) could be achieved after 2114 (Table 10-1). However, without monitoring or land-use controls, Alternative 1 would not ensure protectiveness or verify that cleanup levels were met.

Compliance with Applicable Regulations

Alternative 1 allows for continued migration of the plume. Because no action is taken, chemical-specific regulations would be met only if, and when, contaminant concentrations decreased below the cleanup standards by natural attenuation. Based on model predictions, Alternative 1 would be compliant with chemical-specific regulations across the entire plume by approximately 2114. Because the alternative takes no action, there are no location-specific or action-specific regulations to be met.

Long-term Effectiveness and Permanence

In this Alternative, perchlorate and RDX concentrations in the plume are expected to permanently decrease to below 2 µg/L and 0.6 µg/L through natural attenuation processes by 2079 and 2043, respectively. However, as noted above, any natural attenuation that occurred under Alternative 1 would not be monitored or verified, and thus the degree of certainty that the natural attenuation would attain cleanup goals would be low. Since Alternative 1 does not include land-use controls to prevent exposure, there is a potential threat to human health and the environment if the natural attenuation does not occur as predicted.

The source response actions already taken addressed the majority of source material, including unexploded ordnance that may be acting as a current source. However, because not all potential source material has been removed from the site, there may be a potential for further groundwater contamination. This alternative does not include long-term groundwater monitoring to verify that any possible remaining sources will not pose a threat to groundwater. Therefore, this alternative is not expected to be effective over the long-term.

Reduction of Toxicity, Mobility, or Volume through Treatment

No further treatment would occur; therefore, no reduction in toxicity, mobility, or volume would occur through treatment. However, the toxicity and volume of the contaminated groundwater would be reduced through natural processes.

Short-term Effectiveness

There would be little to no effect on the community or natural resources from implementing Alternative 1 because no construction work would be involved other than treatment system and well abandonment. There are risks to workers from unexploded ordnance. A site-specific Health and Safety Plan (HASP) would be followed during well abandonment.

Implementability

Alternative 1 would require no technical implementation other than well abandonment, which has been done successfully many times at JBCC. Administratively, this alternative is feasible.

Cost

The costs are estimated for Alternative 1 as follows:

- Capital Cost: $146,000
- O&M: $ 0
- Site closeout documentation: $ 82,000
- Total present worth: $228,000

Appendix F provides detailed calculations of the cost of Alternative 1.

State Acceptance

This criterion will be evaluated throughout the development, screening and analysis of alternatives based on comments and input received from MassDEP.

Community Acceptance

This criterion will be evaluated throughout the development, screening, and analysis of alternatives based on comments and input received from the JBCCCT and the public.

### 11.4.2 Alternative 2 – Monitored Natural Attenuation and Land Use Controls

No further extraction and treatment would occur with this alternative. This alternative would provide for long-term monitoring of the J-3 Range groundwater to ensure that natural attenuation was progressing towards cleanup levels and for land-use controls to prevent human exposure to contaminated groundwater.

On-base land-use controls would prevent exposure to contaminated groundwater or soil disturbance activities that might interfere with the remedy. The land-use controls would remain in place, and be monitored for compliance, until the concentration of COCs in the groundwater attains cleanup levels.

Monitored natural attenuation would involve periodic analysis of groundwater for perchlorate and explosives to measure the natural attenuation of the contaminated groundwater, determining when concentrations have decreased below risk-based concentrations. Additional groundwater monitoring wells may be necessary to adequately monitor the plume as it migrates down gradient of the current plume footprint into areas where there has been less monitoring well coverage. Groundwater monitoring would continue after cleanup objectives are met for two additional years to ensure that plume concentrations remain below those levels. The current active treatment system would be discontinued and infrastructure would be abandoned at the end of the project. A residual risk assessment would be performed, if necessary, and may include additional data collection and analysis

Overall Protection of Human Health and the Environment

Alternative 2 would not prevent the migration of the plume. Monitoring and land-use controls would be implemented to prevent exposure to contamination. Perchlorate concentrations are predicted to decrease, through natural attenuation processes, below 15 µg/L by 2034, 2 µg/L by approximately 2079 and background concentrations (0.35 µg/L) after year 2114. RDX concentrations are predicted to decrease, through natural attenuation processes, below the $10^{-5}$ risk-based level of 6 µg/L by approximately 2014, the HA of 2 µg/L by approximately 2018, the $10^{-6}$ risk-based level of 0.6 µg/L by 2043, and background concentrations (0.25 µg/L) after 2114 (Table 11-1).

Compliance with Applicable Regulations

Alternative 2 would comply with applicable regulations. Because the plume is expected to naturally attenuate below cleanup levels, Alternative 2 would eventually be expected to meet the response action objectives, including regulatory standards for COCs.

Long-term Effectiveness and Permanence

In this Alternative, perchlorate and RDX concentrations are expected to decrease to risk-based concentrations through natural processes (dilution, dispersion, and sorption). Monitoring of the plume would continue for several years after the plume attenuates to ensure that all areas remain below remedial goals. In the meantime, the land-use controls would ensure that no use of the contaminated water occurs.

The source response actions already taken addressed the majority of source material, including unexploded ordnance that may be acting as a current source. However, because not all potential source material has been removed from the site, there may be a potential for further groundwater contamination. This alternative includes land-use controls, which would minimize further exposure. It also includes long-term groundwater monitoring to verify that any possible remaining sources will not pose a threat to groundwater. Therefore, this alternative is expected to be effective over the long-term.

Reduction of Toxicity, Mobility, or Volume through Treatment

No further treatment would occur; therefore, no reduction in toxicity, mobility, or volume would occur through treatment. However, the toxicity and volume of the contaminated groundwater would be reduced through natural processes.

Short-term Effectiveness

There would be minor impacts to the community through off-base groundwater monitoring activities. There would be some effect on the workers during monitoring well construction, sampling and well abandonment. A HASP would be followed during construction and long-term groundwater monitoring. To date, health and safety precautions for unexploded ordnance clearance, groundwater sampling, and drilling have been adequate to protect workers.

To the extent feasible, previously disturbed areas would be utilized for the installation of wells to minimize impact on cultural and natural resources. However, some disturbance of natural resources may be necessary to complete this alternative.

Implementability

Groundwater monitoring associated with the J-3 Range plume would continue, subject to periodic optimization, using the same sampling and analytical protocols currently in use. Administratively, this alternative is feasible. There are no implementability concerns anticipated with obtaining access for additional monitoring well installation assuming the locations would be on-post. However, access agreements with the Town of Sandwich and private landowners may be necessary for future monitoring well installation and sampling if off-base monitoring wells are required. There is a potential administrative implementability concern for monitoring well sampling and installation after the military's lease expires, because it is unknown what the administrative requirements will be necessary to perform those tasks.

Cost

The present worth costs were estimated for Alternative 2 as follows:

- Capital Cost: $ 225,000
- O&M: $1,544,000
- Site closeout documentation: $ 23,000
- Total present worth: $1,792,000

Appendix F provides detailed calculations of the cost of Alternative 2.

State Acceptance

This criterion will be evaluated throughout the development, screening and analysis of alternatives based on comments and input received from MassDEP.

Community Acceptance

This criterion will be evaluated throughout the development, screening, and analysis of alternatives based on comments and input received from the JBCCCT and the public.

### 11.4.3 Alternative 3 – Focused Extraction with 3 wells Monitored Natural Attenuation and Land-Use Controls (Continued Operation of Current System)

Alternative 3 would provide for the continued long-term operation of the current J-3 Range groundwater plume ETR system (Figure 10-1); however, capture of source area contamination

would not be entirely achieved by the upgradient extraction well (Figure 11-1). The J-3 Range groundwater plume ETR system consists of three axial extraction wells pumping at a combined rate of 195 gpm and four reinjection wells located to the southeast of the J-3 plume. Figure 11-2 illustrates the predicted perchlorate concentrations and mass extracted at each Alternative 3 well and Figure 11-3 illustrates the Alternative 3 predicted perchlorate plume volume. Figure 11-4 illustrates the predicted RDX concentrations and mass extracted at each Alternative 3 well and Figure 11-5 illustrates the Alternative 3 predicted RDX plume volume. Active treatment of the plume removes perchlorate and RDX from the extracted groundwater and returns the treated water to the aquifer. This alternative includes the option of modifying the system to optimize the system performance.

This alternative would include for chemical and hydraulic monitoring of the plume and treatment system as long as active remediation continues, and chemical monitoring of the aquifer after the system is turned off, to ensure that perchlorate and RDX concentrations have decreased below risk-based concentrations. Land-use controls would minimize potential further exposure. Groundwater monitoring would continue for two years after risk-based concentrations were achieved to ensure that concentrations remain below risk-based levels. The monitoring wells and other infrastructure would be abandoned when no longer needed. A residual risk assessment would be performed, if necessary, and may include additional data collection and analysis.

Overall Protection of Human Health and the Environment

The groundwater model indicates that perchlorate concentrations are expected to decrease below 15 µg/L by 2025, 2 µg/L by approximately 2052 and background concentrations (0.35 µg/L) could be achieved after 2114. RDX concentrations are expected to decrease below the $10^{-5}$ risk-based level of 6 µg/L by approximately 2014 the HA of 2 µg/L by approximately 2016, below the $10^{-6}$ risk-based level of 0.6 µg/L by 2032, and background concentrations (0.25 µg/L) could be achieved after 2086 (Table 11-1).

Compliance with Applicable Regulations

Alternative 3 would comply with applicable regulations.

Long-term Effectiveness and Permanence

Both active treatment and natural attenuation components of the alternative would be permanent. Groundwater extraction and treatment would permanently remove some of the perchlorate and RDX from groundwater. The remaining contamination would continue to degrade due to natural attenuation processes, some of which would also be irreversible.

The source response actions already taken addressed the majority of source material, including unexploded ordnance that may be acting as a current source. However, because not all potential source material has been removed, there may be a potential for further groundwater contamination. This alternative includes long-term groundwater monitoring to verify that any possible remaining source will not pose a threat to groundwater. Therefore, this alternative is expected to be effective over the long-term.

Reduction of Toxicity, Mobility, or Volume through Treatment

Extraction and treatment of groundwater would reduce the toxicity, mobility and volume of perchlorate and RDX. At the start of the Alternative 3 simulation, the total perchlorate mass simulated within the model is 9.5 lbs (3.59 Kg) at a concentration greater than 0.35 µg/L and the total RDX mass simulated in the model is 1.7 lbs (0.77 Kg) at a concentration greater than 0.25 µg/L. Model-predicted mass capture for Alternative 3 is approximately 10.9 pounds of perchlorate and 1.5 pounds of RDX.

Short-term Effectiveness

There would be little effect on the community because most activity is on-post. There would be some effect on the workers during monitoring, well construction, sampling and decommissioning.

A site specific HASP would be followed during system operation and monitoring where engineering controls and Personal Protective Equipment would be used as necessary to limit potential exposure to COCs. To date, health and safety precautions for unexploded ordnance clearance, construction activities, groundwater sampling and drilling have been adequate to protect workers.

Implementability

Administratively, this alternative would be feasible. IX has been shown to be effective in treating perchlorate. GAC has been shown to be effective in treating RDX. The treatment system would require regular maintenance and monitoring. Experience at other sites suggests that the components would be reliable.

Cost

The present worth costs were estimated for Alternative 3 as follows:

- Capital Cost: $ 410,000
- O&M: $7,427,000
- Site closeout documentation: $ 39,000
- Total present worth: $7,876,000

Appendix F provides detailed calculations of the cost of Alternative 3.

State Acceptance

This criterion will be evaluated throughout the development, screening and analysis of alternatives based on comments and input received from MassDEP.

Community Acceptance

This criterion will be evaluated throughout the development, screening, and analysis of alternatives based on comments and input received from the JBCCCT and the public

### 11.4.4 Alternative 4 – Focused Extraction with 3 wells, Monitored Natural Attenuation and Land-Use Controls (Optimization of Current System)

Alternative 4 would provide for pumping and treatment of the J-3 Range groundwater plume, monitoring, and maintaining land-use controls. The conceptual design for Alternative 4 involves optimizing the pumping within the existing capacity of the J-3 Range groundwater ETR system. The conceptual design includes a flow rate at J3EWIP1 of 150 gpm, a flow rate at 90EW0001 of 50 gpm and a flow rate at J3EW0032 of 65 gpm for a total combined pumping rate of 265 gpm (Figure 10-2). The capture zone achieved by the Alternative 4 extraction rate scenario would completely contain source area contamination upgradient of the existing in-plume well (Figure 11-6). Figure 11-7 illustrates the predicted perchlorate concentrations and mass extracted at each Alternative 4 well and Figure 11-8 illustrates the Alternative 4 predicted perchlorate plume volume. Figure 11-9 illustrates the predicted RDX concentrations and mass extracted at each Alternative 4 well and Figure 11-10 illustrates the Alternative 4 predicted RDX plume volume. The effluent would be returned to the aquifer through the existing reinjection wells. The existing treatment system has adequate capacity for 265 gpm flow.

This alternative would include chemical and hydraulic monitoring of the plume and treatment system as long as active remediation continues, and chemical monitoring of the aquifer after the system is turned off, to ensure that perchlorate and RDX concentrations have decreased below risk-based concentrations. Land-use controls would minimize potential further exposure. Groundwater monitoring would continue for two years after risk-based concentrations were achieved to ensure that concentrations remain below risk-based levels. The monitoring wells and other infrastructure would be abandoned when no longer needed. A residual risk assessment would be performed, if necessary, and may include additional data collection and analysis.

Overall Protection of Human Health and the Environment

The groundwater model indicates that perchlorate concentrations are expected to decrease below 15 µg/L by 2025, 2 µg/L by approximately 2039 and background concentrations (0.35 µg/L) could be achieved by approximately 2114. RDX concentrations are expected to decrease below the $10^{-5}$ risk-based level of 6 µg/L by 2014, the HA of 2 µg/L by approximately 2016, below the $10^{-6}$ risk-based level of 0.6 µg/L by 2031, and background concentrations (0.25 µg/L) could be achieved after 2076 (Table 11-1).

Compliance with Applicable Regulations

Alternative 4 would comply with applicable regulations.

Long-term Effectiveness and Permanence

Both active treatment and natural attenuation components of the alternative would be permanent. Groundwater extraction and treatment would permanently remove some of the perchlorate and RDX from groundwater. The remaining contamination would continue to degrade due to natural attenuation processes, which would also be irreversible.

The source response actions already taken addressed the majority of source material, including unexploded ordnance that may be acting as a current source. However, because not all

potential source material has been removed, there may be a potential for further groundwater contamination. This alternative includes long-term groundwater monitoring to verify that any possible remaining source will not pose a threat to groundwater. Therefore, this alternative is expected to be effective over the long-term.

Reduction of Toxicity, Mobility, or Volume through Treatment

Extraction and treatment of groundwater would reduce the toxicity, mobility and volume of perchlorate and RDX. At the start of the Alternative 4 simulation, the total perchlorate mass simulated within the model is 9.5 lbs (3.59 Kg) at a concentration greater than 0.35 µg/L and the total RDX mass simulated in the model is 1.7 lbs (0.77 Kg) at a concentration greater than 0.25 µg/L. Model-predicted mass capture for Alternative 4 is approximately 12.5 pounds of perchlorate and 1.7 pounds of RDX.

Short-term Effectiveness

There would be little effect on the community because most activity is on-post. There would be some effect on the workers during monitoring, well construction, sampling and decommissioning.

A site specific HASP would be followed during system operation and monitoring where engineering controls and Personal Protective Equipment would be used as necessary. To date, health and safety precautions for unexploded ordnance clearance, groundwater sampling and drilling have been adequate to protect workers.

Implementability

Administratively, this alternative would be feasible. IX has been shown to be effective in treating perchlorate. GAC has been shown to be effective in treating RDX. The treatment system would require regular maintenance and monitoring. Experience at other sites suggests that the components would be reliable.

Cost

The present worth costs were estimated for Alternative 4 as follows:

- Capital Cost: $ 433,000
- O&M: $7,300,000
- Site closeout documentation: $ 52,000
- Total present worth: $7,785,000

Appendix F provides detailed calculations of the cost of Alternative 4.

State Acceptance

This criterion will be evaluated throughout the development, screening and analysis of alternatives based on comments and input received from MassDEP.

Community Acceptance

This criterion will be evaluated throughout the development, screening, and analysis of alternatives based on comments and input received from the JBCCCT and the public.

### 11.4.5 Alternative 4A – Focused Extraction with Four Wells, Monitored Natural Attenuation and Land Use Controls

Alternative 4A would provide for pumping and treatment of the J-3 Range groundwater plume, monitoring, and maintaining land-use controls. The conceptual design for Alternative 4A involves the optimization of the pumping rates within the existing capacity of the J-3 Range groundwater ETR system and installation of one new extraction well. The conceptual design involves a flow rate at J3EWIP1 of 90 gpm, a flow rate at 90EW0001 of 50 gpm, a flow rate at J3EW0032 of 65 gpm and installation of one new extraction well upgradient of J3EWIP1 at a flow rate of 60 gpm, for a total combined pumping rate of 265 gpm (Figure 10-3). The Alternative 4A extraction rate scenario would result in the complete capture of source area contamination by the upgradient extraction well (Figure 11-11). Figure 11-12 illustrates the predicted perchlorate concentrations and mass extracted at each Alternative 4A well and Figure 11-13 illustrates the Alternative 4A predicted perchlorate plume volume. Figure 11-14 illustrates the predicted RDX concentrations and mass extracted at each Alternative 4A well and Figure 11-15 illustrates the Alternative 4A predicted RDX plume volume. The effluent would be returned to the aquifer through the existing reinjection wells.

This alternative would include chemical and hydraulic monitoring of the plume and treatment system as long as active remediation continues, and chemical monitoring of the aquifer after the system is turned off, to ensure that perchlorate and RDX concentrations have decreased below risk-based concentrations. Land-use controls would minimize potential further exposure. Groundwater monitoring would continue for two years after risk-based concentrations were achieved to ensure that concentrations remain below risk-based levels. The monitoring wells and other infrastructure would be abandoned when no longer needed. A residual risk assessment would be performed, if necessary, and may include additional data collection and analysis.

Overall Protection of Human Health and the Environment

The groundwater model indicates that perchlorate concentrations are expected to decrease below 15 µg/L by 2017, 2 µg/L by approximately 2022 and background concentrations (0.35 µg/L) could be achieved sometime after approximately 2114. RDX concentrations are expected to decrease below the 10-5 risk-based level of 6 µg/L by 2014, the HA of 2 µg/L by approximately 2015, below the 10-6 risk-based level of 0.6 µg/L by 2021, and background concentrations (0.25 µg/L) could be achieved sometime after approximately 2071 (Table 11-1).

Reduction of Toxicity, Mobility, or Volume through Treatment

Extraction and treatment of groundwater would reduce the toxicity, mobility and volume of perchlorate and RDX. At the start of the Alternative 4A simulation, the total perchlorate mass simulated within the model is 9.5 lbs (3.59 Kg) at a concentration greater than 0.35 µg/L and the total RDX mass simulated in the model is 1.7 lbs (0.77 Kg) at a concentration greater than

0.25 µg/L. Model-predicted mass capture for Alternative 4A is approximately 13.1 pounds of perchlorate and 1.8 pounds of RDX.

Short-term Effectiveness

There would be little effect on the community because most activity is on-post. There would be some effect on the workers during monitoring, well construction, sampling and decommissioning.

A site specific HASP would be followed during system operation and monitoring where engineering controls and Personal Protective Equipment would be used as necessary. To date, health and safety precautions for unexploded ordnance clearance, groundwater sampling and drilling have been adequate to protect workers.

Implementability

Administratively, this alternative would be feasible. IX has been shown to be effective in treating perchlorate. GAC has been shown to be effective in treating RDX. The treatment system would require regular maintenance and monitoring. Experience at other sites suggests that the components would be reliable.

Cost

The present worth costs were estimated for Alternative 4A as follows:

- Capital Cost: $1,416,000
- O&M: $3,399,000
- Site closeout documentation: $ 69,000
- Total present worth: $4,884,000

Appendix F provides detailed calculations of the cost of Alternative 4A.

### 11.4.6 Alternative 5 – Focused Extraction with Six wells, Monitored Natural Attenuation and Land-Use Controls

Alternative 5 would provide for pumping and treatment of the J-3 Range groundwater plume, monitoring, and maintaining land-use controls. The conceptual design for Alternative 5 involves the optimization of the pumping rates within the existing J-3 Range groundwater ETR system and installation of three new extraction wells. The conceptual design involves a flow rate at J3EWIP1 of 140 gpm, a flow rate at 90EW0001 of 40 gpm, a flow rate at J3EW0032 of 40 gpm and installation of three new extraction wells (one upgradient of J3EWIP1 and two upgradient of 90EW0001) for a total combined pumping rate of 315 gpm (Figure 10-4). The Alternative 5 extraction rate scenario would result in the complete capture of source area contamination by the upgradient extraction well (Figure 11-16). Figure 11-17 illustrates the predicted perchlorate concentrations and mass extracted at each Alternative 5 well and Figure 11-18 illustrates the Alternative 5 predicted perchlorate plume volume. Figure 11-19 illustrates the predicted RDX concentrations and mass extracted at each Alternative 5 well and Figure 11-20 illustrates the Alternative 5 predicted RDX plume volume. The effluent would be returned to the aquifer through the existing reinjection wells. The existing ETR system will be expanded through

installation of an additional mobile treatment unit (MTU) to handle increased capacity from the proposed extraction wells.

This alternative would include chemical and hydraulic monitoring of the plume and treatment system as long as active remediation continues, and chemical monitoring of the aquifer after the system is turned off, to ensure that perchlorate and RDX concentrations have decreased below risk-based concentrations. Land-use controls would minimize potential further exposure. Groundwater monitoring would continue for two years after risk-based concentrations were achieved to ensure that concentrations remain below risk-based levels. The monitoring wells and other infrastructure would be abandoned when no longer needed. A residual risk assessment would be performed, if necessary, and may include additional data collection and analysis.

Overall Protection of Human Health and the Environment

The groundwater model indicates that perchlorate concentrations are expected to decrease below 15 µg/L by 2018, 2 µg/L by approximately 2024 and background concentrations (0.35 µg/L) could be achieved by approximately 2110. RDX concentrations are expected to decrease below the $10^{-5}$ risk-based level of 6 µg/L by 2014, the HA of 2 µg/L by approximately 2015, below the $10^{-6}$ risk-based level of 0.6 µg/L by 2024, and background concentrations (0.25 µg/L) could be achieved after 2065 (Table 11-1).

Compliance with Applicable Regulations

Alternative 5 would comply with applicable regulations.

Long-term Effectiveness and Permanence

Both active treatment and natural attenuation components of the alternative would be permanent. Groundwater extraction and treatment would permanently remove some of the perchlorate and RDX from groundwater. The remaining contamination would continue to degrade due to natural attenuation processes, which would also be irreversible.

The source response actions already taken addressed the majority of source material, including unexploded ordnance that may be acting as a current source. However, because not all potential source material has been removed, there may be a potential for further groundwater contamination. This alternative includes long-term groundwater monitoring to verify that any possible remaining source will not pose a threat to groundwater. Therefore, this alternative is expected to be effective over the long-term.

Reduction of Toxicity, Mobility, or Volume through Treatment

Extraction and treatment of groundwater would reduce the toxicity, mobility and volume of perchlorate and RDX. At the start of the Alternative 5 simulation, the total perchlorate mass simulated within the model is 9.5 lbs (3.59 Kg) at a concentration greater than 0.35 µg/L and the total RDX mass simulated in the model is 1.7 lbs (0.77 Kg) at a concentration greater than 0.25 µg/L. Model-predicted mass capture for Alternative 5 is approximately 14.8 pounds of perchlorate and 2.4 pounds of RDX.

Short-term Effectiveness

There would be some effect on the community and workers from implementing Alternative 5 since construction would occur within a residential neighborhood. There would be short-term impacts during installation of the extraction wells and piping. There will be long-term impacts from operation and maintenance of the system, and monitoring well sampling activities. Care will be taken to ensure safe operation particularly as it pertains to school bus routes and neighborhood children.

A site specific HASP would be followed during system operation and monitoring where engineering controls and Personal Protective Equipment would be used as necessary. To date, health and safety precautions for unexploded ordnance clearance, groundwater sampling and drilling have been adequate to protect workers.

Implementability

Administratively, this alternative would be feasible. IX has been shown to be effective in treating perchlorate. GAC has been shown to be effective in treating RDX. The treatment system would require regular maintenance and monitoring. Experience at other sites suggests that the components would be reliable. Due to the addition of three new extraction wells and the increased pumping rate, the treatment plant would need to be expanded. This expansion would probably involve the addition of an MTU.

Cost

The present worth costs were estimated for Alternative 5 as follows:

- Capital Cost: $3,723,000
- O&M: $4,535,000
- Site closeout documentation: $ 73,000
- Total present worth: $8,331,000

Appendix F provides detailed calculations of the cost of Alternative 5.

State Acceptance

This criterion will be evaluated throughout the development, screening and analysis of alternatives based on comments and input received from MassDEP.

Community Acceptance

This criterion will be evaluated throughout the development, screening, and analysis of alternatives based on comments and input received from the JBCCCT and the public.

# 12.0 COMPARISON OF ALTERNATIVES

A comparative analysis was conducted to evaluate the relative performance of each alternative in relation to each criterion. The presentation of the comparative analysis refers to each alternative by its number.

For reference, a brief description of each alternative follows:

Alternative 1 – No Further Action. Monitoring wells and the existing treatment system would be abandoned and site-closeout documentation would be completed.

Alternative 2 – Monitored Natural Attenuation with Land-Use Controls. Alternative 2 includes long-term groundwater monitoring until COC concentrations attain cleanup levels and land-use controls.

Alternative 3 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land-Use Controls (current system). Alternative 3 includes the continued operation of the current J-3 Range groundwater plume ETR system. The J-3 Range groundwater plume ETR system consists of three axial extraction wells pumping at a combined rate of 195 gpm and reinjection wells located to the southeast of the J-3 plume.

Alternative 4 – Focused Extraction with Three Wells, Monitored Natural Attenuation and Land-Use controls (optimized). Alternative 4 includes the continued operation of the current J-3 Range groundwater plume ETR system with optimization of the pumping rates within the existing capacity for a total combined pumping rate of 265 gpm.

Alternative 4A – Focused Extraction with Four Wells, Monitored Natural Attenuation and Land-Use controls (optimized). Alternative 4A includes the continued operation of the current J-3 Range groundwater plume ETR system with optimization of the pumping rates within the existing capacity and the installation of one new extraction well for a total combined pumping rate of 265 gpm. This extraction rate scenario would result in the complete capture of source area contamination by the upgradient extraction well.

Alternative 5 - Focused Extraction with Six Wells, Monitored Natural Attenuation and Land-Use Controls (10-year). Alternative 5 includes the continued operation of the current J-3 Range groundwater plume ETR system with three new extraction wells: one upgradient of J2EWIP001, one between J3EWIP001 and J3EWIP0032, and one downgradient of 90EW0001. The remaining existing ETR system wells would operate at optimized flow rates for a total combined pumping rate of 315 gpm. An MTU will be required to handle the expanded pumping rate.

The strengths and weaknesses of each alternative are presented in a narrative that addresses each criterion.

## 12.1 Overall Protection of Human Health and the Environment

Alternatives 2 through 5 would be protective of human health and the environment. Alternative 1, however, offers no monitoring or confirmation of existing land-use controls to ensure that future exposures do not occur. Alternative 2 adds provisions for plume monitoring

and land-use controls to help prevent future exposure to contaminated groundwater. Alternatives 3, 4, 4A and 5 add extraction and treatment components and achieve risk-based concentrations earlier than Alternatives 1 and 2.

| Alternative | Estimated Year for RDX Cleanup Times (year) | | | Perchlorate Cleanup Times | |
|---|---|---|---|---|---|
| | 6 µg/L | 2 µg/L | 0.6 µg/L | 15 µg/L | 2 µg/L |
| 1 | 2014 | 2018 | 2043 | 2034 | 2079 |
| 2 | 2014 | 2018 | 2043 | 2034 | 2079 |
| 3 | 2014 | 2016 | 2032 | 2025 | 2052 |
| 4 | 2014 | 2016 | 2031 | 2025 | 2039 |
| 4A | 2014 | 2015 | 2021 | 2017 | 2022 |
| 5 | 2014 | 2015 | 2024 | 2018 | 2024 |

## 12.2 Compliance with Regulators

All alternatives are expected to eventually result in compliance with applicable regulations. Alternatives 1 and 2 allow for continued migration of the plume. Because those alternatives involve no active remediation, chemical-specific regulations would be met only when contaminant concentrations decrease below cleanup standards by natural attenuation. Alternative 2 includes monitoring to confirm this occurs, Alternative 1 does not. Alternatives 3 through 5 include active treatment to ensure that applicable standards are met.

## 12.3 Long-Term Effectiveness and Permanence

The source area has been removed so residual soil contamination is unlikely to compromise the permanence of the remedial alternatives once completed. All of the alternatives would permanently achieve the cleanup goals; however, time to cleanup would vary. Moreover, Alternatives 3, 4, 4A and 5, which include active treatment of the plume, may result in fewer uncertainties over the long term regarding the fate and transport of the plume.

## 12.4 Reduction of Toxicity, Mobility or Volume Through Treatment

Alternatives 3, 4, 4A and 5 reduce the toxicity, mobility and volume of contaminated groundwater through treatment. Alternatives 3, 4, 4A and 5 would extract 10.9, 12.4, 13.1 and 14.8 pounds of perchlorate and 1.5, 1.7, 1.8 and 2.4 pounds of RDX, respectively.

## 12.5 Short-Term Effectiveness

Alternative 1 would have the least impact on workers because construction is minimal. Alternative 5 would have the greatest impact to the environment, community and workers because it includes the installation of three extraction wells. Alternatives 2, 3 and 4 have the least impact on workers, the community, and the environment since they do not require any new construction activities. In addition, all alternatives would eventually involve construction to decommission the wells and treatment facilities.

## 12.6 Implementability

None of the alternatives are limited by administrative feasibility. Alternative 1 is the most easily implemented alternative because it requires no further action other than abandoning system infrastructure, groundwater monitoring wells and preparing close out documentation. Alternatives 2, 3 and 4 are the next most easily implemented alternatives with groundwater monitoring, O&M of the existing ETR system (for Alternative 3 and 4) and land-use controls. Alternative 4A would require the installation of one new extraction well. Alternative 5 would require installation of three new extraction wells, two of which would be located off-base.

## 12.7 Cost

The total present worth costs of the alternatives generally increase as the amount of treatment increases.

Alternative 1 – total estimated cost of $ 228,000
Alternative 2 – total estimated cost of $1,792,000
Alternative 3 – total estimated cost of $7,876,000
Alternative 4 – total estimated cost of $7,785,000
Alternative 4A – total estimated cost of $4,884,000
Alternative 5 – total estimated cost of $8,331,000

## 12.8 State Acceptance

This criterion will be addressed in detail following comments received on the Remedy Selection Plan.

## 12.9 Community Acceptance

This criterion will be addressed in detail following comments on the Remedy Selection Plan.

## TABLE 4-1
## Summary of Soil/Intrusive Investigations and Removal Actions

| Grid/ Location | Figure | Study Area | | | | | | MD | RRD | Munitions | Soil Quantity Removed (cy) | Soil Samples Collected (Excl. BIPs) | Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Area 1 | Area 2 | Area 3 | Area 4 | Area 5 | Area 6 | | | | | | |
| ***Significant Pre-Investigation Findings*** | | | | | | | | | | | | | |
| Textron Drum Removal Operation | | | | X | | | | | X | | 3 | Yes | Harding ESE, Inc Report 2002- 18 crushed drums and steel target plate removed. Wipe samples collected. Soil disposed of offsite. |
| Textron Target Wall and Block Removal | | | | X | | | | | | | | Yes | MACTEC Report 2004. Also Minuteman 1 Test Area investigated and sampled. |
| GPR Investigation | | | | X | | | | X | X | | | Yes | Two trenches and one location investigated. Small MD burial was discoved at single GPR location in Grid D6. Sample collected from base and spoils pile. |
| MSP Phase I (Barrage Rocket Area) | | | | | | | X | X | X | X | | No | Ten 30m x 30m grids investigated. Eight 4.5" Barrage Rockets HE and one 81mm HE discovered. |
| Road Clearance | | X | X | X | X | X | X | X | X | X | | No | |
