# 1.0 INTRODUCTION

This J-3 Range Munitions Source Assessment examines the potential for any remaining unexploded ordnance (UXO) at the J-3 Range to act as a source of groundwater contamination. This analysis is based on lines of evidence collected from literature searches, aerial photographs, range records, investigation findings and munitions clearance activities conducted at the J-3 Range Study Areas.

## 1.1 Background/Purpose of Report

Historical use of the J-3 Range for various military training activities, munitions disposal, and ordnance testing by Defense Contractors has resulted in the deposition of significant quantities of munitions, including UXO, on the ground surface and within shallow subsurface areas of the range. These items have the potential to cause environmental contamination resulting from the release of munitions constituent compounds to soil and groundwater. The purpose of this report is to provide a summary of munitions investigations and clearance related activities conducted at the J-3 Range and to evaluate the likelihood for any residual munitions and/or unexploded ordnance on the range to cause groundwater contamination in the future.

## 1.2 Report Organization

The report includes a brief summary of results of previous munitions investigations, and remedial activities. Section 1.0 of this report describes the J-3 Range site background, including a brief history of past military activities conducted at the range. Section 2.0 presents the J-3 Range conceptual site model (CSM), including the basis of the site model; the results of munitions investigations; and a discussion of the potential for residual munitions on the range. Section 3.0 provides the report findings.

## 1.3 Site Description/History

The J-3 Range is located adjacent to the Camp Edwards Impact Area and is approximately 1,280 meters long and between 240 and 490 meters wide (Figure 1). The range is oriented southeast to northwest, with the southeastern end near Greenway Road and the northwestern portion of the range extending beyond Chadwick Road. A dirt road runs along the entire length of the range. The terrain is undulating with natural and man-made depressions but no surface water bodies of any kind. Access to the J-3 Range is currently restricted by a locked gate located at the Greenway Road entrance to the range. The current layout and features of the J-3 Range and investigation findings are depicted on Figure 1 and Figure 9.

Areas adjacent to Greenway Road were originally developed between 1935 and 1941 under the designation H Range. The former H Range was used into the 1950s as a mortar and rocket range. In 1968, the J-3 Range was leased to AVCO, Inc. to be developed as a Department of Defense contractor test range In 1985 AVCO was purchased by Textron Services Corporation (Textron). AVCO/Textron used the J-3 Range until 1997 to develop and test tactical weapon systems under contract to the U.S. Army and U.S. Air Force. The majority of the activity that occurred at the range included shaping and loading ordnance, ordnance assembly, and

ordnance testing. Numerous buildings, bunkers, and associated infrastructure were constructed to support the weapons development and testing activities. In addition, target walls and weaponry support foundations were also constructed. These features associated with the contractor testing were demolished and removed by Textron between 2003 and 2009.

Contractor facilities at the J-3 Range fell into four general categories: melt-pour facilities, contractor test ranges, disposal areas and impact areas lying adjacent to, and which predate, the development of the J-3 Range proper.

These four categories are further divided into six study areas for data presentations, based on geographical area and range use. The following six study areas as described in the *Final J-3 Range Supplemental Soil Work Plan* (AMEC 2004) were investigated:

- Area 1: Melt/Pour Area
- Area 2: 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area
- Area 3: Artillery Range, Demolition Area and Explosive Storage Bunker
- Area 4: Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area, Presumed M550 Berm Area
- Area 5: Hillside Study Area
- Area 6: Barrage Rocket Study Area

The locations of the six study areas within the J-3 Range are shown on Figure 1

Munitions investigations were conducted in several areas within the J-3 Range, based on historical information and findings from various prior investigations. To aid the execution of field work and documentation of findings, some investigation areas were marked using various grids and transects. Grids typically measured 30 meters by 30 meters and transects measured two meters wide and varied in length.

Limited information is available in the *Archive Search Report* (ASR) (USACE 1999) regarding the type of munitions used up until the time the range transitioned from training to a contractor testing range. Contractor testing on the range from the late 1960s through the late 1990s involved 2.36-inch rockets, 3.5-inch rockets, 40 mm, 30 mm, and 20 mm projectiles, fuzing, cartridge actuated devices and small arms munitions.

The ages of the munitions items found during investigations played a key role in determining their attribution to training-related or contractor-related activity at the J-3 Range. The MK3 4.5-inch Barrage rocket, M43 and M56 81mm mortar, 3-inch Stokes mortar and M49 60mm mortars were likely associated with training. Additional details concerning specific items tested at the J-3 Range are further discussed in the History of Site Operations report developed by Textron.

A detailed description of military and contractor activities and munitions used during the evolution of the J-3 Range can be found in the main body of the *J-3 Range Remedial Investigation/Feasibility Study Report* (J-3 RI/FS, 2014 pending) and the ASR. More recent investigative activities on the range including intrusive munitions investigations, geophysical surveys, and detailed reconnaissance, are discussed in Section 2.0.

## 2.0 RANGE CONCEPTUAL SITE MODEL

The range conceptual site model is a summary of what is known about the natural conditions, range characteristics, munitions use and disposition, and contamination at a site. The conceptual site model integrates the results of available records and investigations and is used to identify potential contaminant sources, to assist in understanding contaminant fate and transport, and support the evaluation of potential risk of harm to human health and the environment. The conceptual site model of soil contamination on the range is presented in Section 4 of the J-3 Range RI/FS. The conceptual site model developed here focuses on activities conducted on the range that involved munitions. Specific findings for disposal, testing, and training activities are supported by evaluation of finds and features identified on the range. Range activity-specific conceptual site models are presented in Section 2.3, after a discussion of investigation findings. The investigation findings are synthesized in the development of the CSMs.

J-3 Range is a multi-use range where military training, munitions testing, and munitions disposal occurred. Military training pre-dated contractor activities and occurred over a wide area including the area that later became the J-3 Range. Training conducted at the Former H Range, which lies to the south of the J-3 Range, is thought to be the source of most of the individual munitions items found during investigations at the J-3 Range. Additional historical information suggests that firing points were also located along Greenway Road and possibly within Areas 1 and 2. Although available information suggests that a significant fraction (approximately half) of the items fired during training activities were likely inert practice/test rounds, some of the 60mm and 81mm mortars, 2.36-inch rockets, and 4.5-inch Barrage rockets were observed to contain high explosives. This conceptualization is supported by records detailed and summarized in the ASR and numerous intrusive investigations conducted in the range, as described below.

Munitions testing activities on the range included direct fired projectiles (rounds aimed and fired directly at a visible target), as well as indirect firing (e.g., mortar fire) which was done primarily to evaluate fuze function. The principal projectiles tested were the MK6 2.36-inch rocket, M29 3.5-inch rocket, M433 40mm projectile, and M56A3/M56A4 20mm projectile. Site records suggest that contractors routinely collected fired projectiles from the floor of the range after firing for evaluation and/or re-use. For presentation in this report, munitions items are categorized based on their explosive characteristics. The categories developed include high explosive (HE), possible HE, Propellant/Energetic, Small Quantity Energetic, and Inert. Munitions items that are classified as HE had positive identification for their main charges, (e.g., lot number or post-blow in place (BIP) results indicative of High Explosives). Items that were classified as “possible HE” were munitions items that were assumed to contain HE on initial discovery and were either transported to the contained detonation chamber (CDC) for detonation or BIP, where the actual presence of the HE was not conclusively established or was not recorded. Items classified as Propellant/Energetic include raw propellant, chunk explosives or bulk explosives. Items classified as Small Quantity Energetic were munitions and explosives of concern (MEC) items that contained small amounts of energetic materials in one or more components (fuzes, detonator-spotting charges). Items classified as inert were munitions items that were initially

considered to be HE as a safety precaution but post-BIP or CDC results indicated that the item was inert.

## 2.1 Basis of the Site Model

The initial general range use conceptual site model was developed based on available data sources including: (1) aerial photographs; (2) range records; (3) field observations; and (4) munition characteristics. Insights gained from these data sources are discussed briefly below.

In all aerial photo years, the predominant vegetation clearance occurred within the current range footprint, consistent with descriptions of range boundaries and use as described in the ASR.

Investigation results indicated that training activities were conducted in the vicinity of the J-3 Range. Firing points were located at the Former H-Range and along Greenway Road. Munitions associated with these firing positions were found mid-range (Area 3 and Area 4) and extended further down range (Area 6) to Chadwick Road. The 4.5-inch MK3 Barrage rocket, 81mm M43 and M56 series mortars, and the 60mm M49 mortar were used during training. Inert 3-Inch Stokes mortars were also discovered along the Hillside Area (Area 5).

Investigation results indicate that Munitions Testing and MEC disposal activities occurred in Area 3 of the J-3 Range (Artillery Range, Demolition Area and Explosives Storage Bunker), but mostly within the Demolition Area. Predominant items found in the Demolition Area were 20mm projectiles, some 40mm projectiles, cartridge actuated devices and fuze components. Area 1 and Area 2 of the J-3 Range (Melt/Pour Area and the 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area respectively) contained a contractor test area and administrative area with associated buildings. The testing of M433 40mm projectiles was also conducted from firing points in the Demolition Area and impacted into the M550 Berm within Area 4. Based on the investigation finds, the southwest portion of the Hillside Area (Area 5) was considered a military maneuver areas; inert munitions area were discovered along the northeast hillside. Investigation results indicate that Area 6 was an impact area for the 4.5-inch barrage rocket (northern area) and also for 81mm mortars (southern portion).

The investigation findings described below (Figures 9 and 11 thru 16) provide a more thorough understanding of range use and munitions characteristics and distribution and are the basis for assessment of potential residual UXO as presented in Section 2.4. Where appropriate, key findings described in Section 2.2 are used to support range use descriptions and are summarized in Section 2.3. The range activity-specific CSMs are described in Section 2.3.

## 2.2 Munitions Investigations

Intrusive munitions investigations at the J-3 Range have occurred since 2000. Munitions investigations were conducted in several areas based on historical information and findings from various prior investigations. To aid the execution of field work and documentation of findings, some investigated areas were marked using various grids and transects. Grids typically measured 30 meters by 30 meters and transects measured two meters wide and varied in length. A summary of the munitions investigations in chronological order are briefly described

below. A chronological list of general investigation finds is provided in Table 1. It is noted that Table 1 does not include incidental munitions recovered during surface clearances, road or well pad clearances. For a complete list of all MEC and inert post-BIP/CDC determinations for items found on the range, see Table 2. Table 3 lists the round type and quantity of items found per area. Table 4 provides the weights of explosives in filler materials.

### 2.2.1 Munitions Survey Program

The Munitions Survey Program (MSP) was conducted in three phases between 1999 and 2002. MSP Phases I and III involved investigations at the J-3 Range. The overall objective of the MSP was to identify sites where munitions and other materials were disposed of, through burial and other means, which may present a threat to human health because of their potential to contaminate groundwater.

The MSP Phase I used airborne magnetometer (AIRMAG) and ground-based geophysical surveys to detect and map various sized surface and subsurface anomalies. The results of the AIRMAG surveys are presented in the *Draft AIRMAG Technology Evaluation Report* (Tetra Tech 2002). While the overall conditions at Massachusetts Military Reservation were not optimal for the detection of ordnance with AIRMAG technology, the surveys did provide valuable information to focus follow-on ground-based studies and were effective in identifying some areas of interest (potential disposal pits or trenches, and potential UXO items) that were later addressed through follow-on investigations.

A brief summary of the MEC items discovered during the MSP Phase I Investigation are provided below.

- One MK137 4.5-inch barrage rocket which was determined to contain high explosives;
- One 81mm M43 mortar determined to contain high explosives;
- One 40mm inert grenade; and
- One 4.5-inch MK137 inert barrage rocket.

Ground-based geophysical surveys were conducted, in February and March of 2001, using time-domain electromagnetic metal detection technology (EM-61). The geophysical data collected in MSP Phase I investigation was then evaluated to identify anomalous areas. From this interpretation, geophysicists encircled groupings of large anomalies and designated these as “polygons”.

Twelve polygons were intrusively investigated at the J-3 Range as part of the MSP Phase III field program with the results of these investigations documented in the *Draft J-3 Range Polygon Investigation Report, Munition Survey Project Phase 3 (MSP3)* (Tetra Tech 2003). Polygons 1, 2, and 3 were identified in the southwest portion of the J-3 Range Area 2 (Figure 3). Polygon 4 was located within Area 3 (Figure 4) adjacent to the Demolition Area. Polygon 5 was located within J-3 Gauntlet Area (Area 4) (Figure 5). Polygons 6, 7, 8, 9 and 10 were co-located to each other within the J-3 Presumed M550 Berm Area (Figure 5). Polygons 11 and 12 were located northwest of the Ordnance Assembly Area (Figure 5).

A brief summary describing only the MEC items discovered during the polygon investigation are provided below.

- During vegetation clearance: Three MK3 4.5-inch barrage rockets with high explosives and one MK3 4.5-inch barrage rocket;
- Polygon-6: Four M433 40mm inert projectiles with live fuzes;
- Polygon-8: Two M433 40mm inert projectiles with live fuzes;
- Polygon-10: Three M433 40mm inert projectiles with live fuzes; and
- One inert M29 3.5-inch rocket.

No burial areas were encountered during MSP III investigations at the J-3 Range. A detailed list of items found is presented in Table 1 and Table 2. A detailed description of these items can also be found in the *Draft J-3 Range Polygon Investigation Report, Munition Survey Project Phase 3 (MSP3)* (Tetra Tech 2003).

### 2.2.2 Initial J-3 Range Hillside Study Area and Barrage Rocket Study Area Investigation

In early 2003, a magnetometer-assisted reconnaissance was performed in the Hillside Study Area. UXO technicians walked a majority of the area in a meandering path fashion collecting coordinates and noting descriptions for each find. During the reconnaissance, munitions debris and other debris were left in place. MEC finds consisted of two M21 hand grenades and one 3-inch Stokes mortar, MK1 that were determined to contain small quantities of energetics. Numerous suspect 3-inch Stokes mortars and 81mm illumination canisters were also encountered during this initial investigation in the Hillside Study Area. Based on demolition observations, it was determined that all 3-inch Stokes mortars and all 81mm canisters were inert.

Based on the results of the initial reconnaissance, portions of the Hillside Study Area as well as the Barrage Rocket Study Area were selected in late 2003 to be further investigated. Areas at both sites were cleared of vegetation and a geophysical survey was conducted (ECC 2003). Ten 30 by 30 meter grids were investigated in the Hillside Study Area (Figure 6) and 21 transects were investigated in the Barrage Rocket Study Area (Figure 7). Munitions debris and other debris were encountered. MEC items discovered in the Hillside Study Area included 14 3-inch Stokes mortars. MEC items discovered in the Barrage Rocket Study Areas included five 4.5-inch MK3 barrage rockets. All MEC items were determined to be inert. A list of items recovered is provided in Tables 1 and 2.

### 2.2.3 J-3 Range Access Road Clearance

In 2003, the J-3 Range access road was UXO cleared in order to support activities associated with the rapid response soil removal action that was accomplished in early 2004. UXO technicians used magnetometers to sweep the roads and excavated all anomalies. The following MEC items were discovered:

- One M49 60mm mortar and seven M56A3/M56A4 20mm projectiles were determined to contain high explosives;

- Four M43 81mm mortars and one M56 81mm mortar were determined to contain high explosives;
- One M433 40mm dual purpose mortar was determined to contain high explosives;
- One practice M918 40mm mortar was determined to be inert; and
- One 3-inch Stokes mortar was determined to be inert.

Munitions debris was also encountered during the clearance activities. A list of the finds is provided in Tables 1 and 2.

### 2.2.4 J-3 Range Soil Rapid Response Action

In 2004, soil removal actions were conducted at the Melt/Pour Facility and the Demolition Area of the J-3 Range. A total of 2,231 cubic yards of soil were excavated and thermally treated on site (ECC 2005). UXO technicians cleared the excavation footprint and support areas to allow the use of mechanical equipment. MEC items discovered during the J-3 Range soil removal included the following:

- Eleven 2.36-inch M6 HEAT rockets. Nine 2.36-inch M6 HEAT rockets were BIP and two more were taken to the CDC. Two were found to contain high explosives and nine were inert;
- One HE M43 81mm mortar, four inert M301 81mm mortars, and one M57 81mm mortar with small quantities of energetics;
- One HEDP M433 40mm HE projectile;
- Four HE M49 60mm mortars;
- One HE M78 fuze;
- 1,132 HE M56A3/M56A4 20mm projectiles;
- Seven M2 0.30 caliber cartridges were determined to contain small quantities of energetics;
- Two inert M9 HEAT rifle grenades;
- One inert MK1 3-inch Stokes mortar;
- One inert unknown rocket; and
- 37 HE rocket motors.

Munitions debris and/or other debris were also discovered during the UXO clearance activities. The findings during the soil removal operation are detailed in Tables 1 and 2.

### 2.2.5 J-3 Range North of Demolition Area Investigation

In 2006, an area “North of the Demolition Area” was intrusively investigated (Figure 4). The area between the Minuteman Missile Shroud Test Pad and the Demolition Area was cleared of vegetation to support a geophysical survey. A UXO surface clearance was conducted and one MEC item, an inert 40mm grenade, was discovered and determined to contain a small quantity of energetics. Thirteen geophysical anomalies (Locations 1 through 13) were also selected to be intrusively investigated based on geophysical signature responses and spatial extent of the anomaly.

The results of the investigation of these locations are documented in the *Final J-3 Range North of Demolition Area Geophysical Investigation Map and Location of Intrusive Investigation Project Note* (ECC 2006*)*. Descriptions of MEC items found are summarized below. All finds at each location are provided in Tables 1 and 2:

- Location 5: A MEC burial pit (J3-D6-BLP-001) was discovered at this location. The following MEC items were determined to contain small quantities of energetics: 185 M505A3 point detonating fuzes; 183 squib initiators; 78 M8 0.50 cal armor piercing incendiary ball; four M6 blasting caps; 12 impulse cartridges; five 20mm cartridges with live primer; and 79 various fuze components. Five M95 20mm projectiles and four M56A3/M56A4 20mm projectiles were determined to contain high explosives. One propellant cartridge and five pieces of rocket propellant were also discovered;
- Location 9: One M71 90mm HE projectile was discovered and BIP; and
- Access Path: One M43 81 mm HE mortar was discovered and BIP.

Munitions debris and other debris were also discovered at each of the locations. One thermal battery was also found at Location 6 and disposed of separately at an approved off-site facility.

### 2.2.6 J-3 Range Aerial Photo Assessment Investigations

As part of the assessment of possible sources of contamination at the J-3 Range, historical aerial photographs were evaluated. Locations for additional investigations were selected based on ground disturbances identified in the aerial photos, range history information (including review of the ASRs), findings from previous investigations, and general site knowledge. Four locations in Area 1 were selected for further intrusive investigation (ECC 2009). Three MEC items were discovered during the investigation. Two items, one M9 HEAT rifle grenade and one 4.5-inch MK3 barrage rocket, were discovered at the J-3 Type “E” location. The items were BIP and the grenade was determined to contain high explosives and the rocket was inert. The third item, another M9 HEAT rifle grenade was found in the J-3 Mound Access Rd, BIP, and determined to contain a small quantity of energetics. Munitions debris and/or other debris were discovered at each of the locations. The findings of these intrusive investigations are listed in Tables 1 and 2.

### 2.2.7 J-3 Range Barrage Rocket Area Investigation

Geophysical survey of two 30 by 30 meter grids and multiple intrusive investigations were performed in the J-3 Range Barrage rocket area (ECC 2009). The grids were cleared of vegetation and a geophysical survey was conducted and anomalies greater than 34mV were intrusively investigated. In addition, 12 smaller anomalies that fell below the 34mV threshold were investigated. Lastly, intrusive investigations of Type C or greater anomalies were performed in the transect extensions as well as transects 1 to 3. Using previously established prove-out information and detailed reconnaissance data, Type C anomalies (linear magnetometer response of one-foot to three-feet in length) could be indicative of a 4.5-inch Barrage rocket or an 81mm mortar. The following MEC items were discovered:

- Transect 1: four MK3 4.5-inch Barrage rockets were BIP. Two were determined to contain high explosives and two were inert. One 4.2-inch M3 mortar was BIP and determined to contain high explosives;
- Transect 2: three MK3 4.5-inch Barrage rockets were BIP and determined to be inert;
- Transect 3: six MK3 4.5-inch Barrage rocket and one M43 81mm mortar were BIP. One was determined to contain high explosives and the other five were inert;
- Transect Extension 3: three MK3 4.5-inch Barrage rockets were BIP. One was determined to contain high explosives and the other two were inert;
- Transect 10: one MK3 4.5-inch Barrage rockets were BIP and determined to be inert;
- Transect 17: one M57 81mm mortar was BIP and determined to contain white phosphorous;
- Transect 18: one M3 4.2-inch mortar was BIP and determined to contain white phosphorous;
- Transect 19: one M56 81mm mortar was BIP and determined to contain high explosives; and
- Northern Transect: Four 4.5-inch barrage rockets were BIP and determined to be inert.

Munitions debris and other debris were also discovered during the investigation activities. The results of these investigations are detailed in Tables 1 and 2.

### 2.2.8 J-3 Range Additional Barrage Rocket Transect Characterization

Additional detailed reconnaissance and intrusive investigations of Type C or greater sized anomalies in transects 4 through 21 was conducted in May 2010 (ECC 2009). In addition, several Type B (0.5- feet to 1- foot) anomalies were investigated in these transects. Lastly, a detailed reconnaissance and intrusive investigations of Type C or greater anomalies in six additional transects and one firebreak were conducted. The following MEC items were discovered:

- Transect 4: one MK3 4.5-inch Barrage rocket was BIP and inert;
- Transect 5: one MK3 4.5-inch Barrage rocket was BIP and determined to contain high explosives;
- Transect 6: two MK3 4.5-inch Barrage rockets were BIP and determined to contain high explosives;
- Transect 7: two MK3 4.5-inch Barrage rockets and one M56 81mm mortar were BIP. One 4.5-inch rocket and the mortar were determined to contain high explosives and one 4.5-inch rocket was inert;
- Transect 8: two MK3 4.5-inch Barrage rockets were BIP and determined to contain high explosives;
- Transect 9: one M56 81mm mortar was BIP and determined to contain high explosives;

- Transect 10: two MK3 4.5-inch Barrage rockets were BIP and determined to contain high explosives;
- Transect 12: one MK3 4.5-inch Barrage rocket was BIP and determined to contain high explosives;
- Transect 13: one MK3 4.5-inch Barrage rocket was BIP and determined to contain high explosives;
- Transect 17: one M43 81mm mortar was BIP and inert;
- Transect 25: one MK3 4.5-inch Barrage rocket and one HEAT 75mm projectile were BIP. The 75mm projectile was determined to contain high explosives and the rocket was inert;
- Transect 28: one MK3 4.5-inch Barrage rocket was BIP and inert; and
- Transect 29: three MK3 4.5-inch Barrage rockets and one M310 HEAT 75mm projectile were BIP. One rocket and the projectile were determined to contain high explosives and two rockets were inert.

Munitions debris and other debris were also encountered during the investigation. The results of the investigation are summarized in Table 1 and Table 2.

### 2.2.9 J-3 Range Barrage Rocket Area Follow-up Intrusive Investigation

In order to complete the investigation of the Barrage Rocket Area additional intrusive investigations were performed over 100 percent of an area spanning transects 3 to 8, where highest density of UXO was observed during previous investigations. All work was performed in 2011 in accordance with the *Draft J-3 Barrage Rocket Follow-up Investigation Project Note* (IAGWSP 2011). This area is depicted on Figure 1.

Prior to commencing intrusive investigations, vegetation in the entire area was cut. UXO Technicians then used hand-held magnetometers to intrusively investigate all remaining Type B anomalies (0.5 feet) or larger in size. The following items classified as MEC at the time of discovery were uncovered:

- Lane 3: two MK3 4.5-inch Barrage rockets were BIP and determined to be inert;
- Lane 4: three MK3 4.5-inch Barrage rockets and one M43 81mm mortar were discovered. Two rockets and the mortar were BIP. One rocket and the mortar were determined to contain high explosives and one rocket was inert. The fourth rocket is awaiting destruction in the CDC;
- Lane 5: one M43 81mm mortar were BIP and determined to contain high explosives and four MK3 4.5-inch Barrage rockets were BIP and inert;
- Lane 6: one M306 57mm projectile was BIP and determined to contain high explosives and three MK3 4.5-inch Barrage rockets were BIP and determined to be inert;
- Lane 7: two MK3 4.5-inch Barrage rockets were BIP and determined to contain high explosives; and

- Lane 8: two MK3 4.5-inch Barrage rockets were BIP. One was determined to contain high explosives and one was inert. Munitions debris and other debris were also found during the investigations. The complete findings from these investigations are provided in Tables 1 and 2.

### 2.2.10 J-3 Range Groundwater Investigation Area

In 2012, UXO technicians supporting a drive-point groundwater investigation in an area immediately east of J3EWIP0001 discovered five 2.36-inch HEAT rockets. All five items were BIP and determined to be HE. No additional MEC items were found during the 2012 drive point investigation or follow up drilling conducted in 2014.

## 2.3 Activity-Specific Conceptual Site Models

The findings from the munitions investigations summarized above, site background information on range use presented in the ASR and range records, aerial photographs, munitions characteristics, and comparison of finds to ground-based geophysics and ground features were used to develop activity-specific conceptual site models for the J-3 Range. These conceptual models reflect the general use patterns and characteristics of the range and locations where munitions were discovered. Field observations detailing munitions characteristics and spatial distribution of HE finds, and in consideration of published munitions use and ballistics information, provide insight on likely areas on the range that may have the potential for residual unexploded ordnance. It is noted that all munitions discussed in the following sections have been removed from the range.

The mapping of the munitions finds areas and formulation of the CSMs was an iterative process. To help conceptualize the CSMs, areas where munitions were identified were delineated (Figures 8 and 9). This delineation was based on the spatial mapping of inert and HE projectiles, qualitative assessment of the distribution and spatial relationship of munitions debris to munitions finds, and comparison of finds to ground-based geophysics and range features. Aerial photographs also helped conceptualize range use areas and relate period land use with the production time frame for specific munitions. The extent and findings of intrusive investigations and their juxtaposition with those areas investigated less extensively, specifically the geophysical signal data in these areas, was considered to help assess the likelihood for additional rounds outside the mapped munitions use area. The extent of investigation-related UXO clearance on the range is shown in Figure 10.

The CSMs were principally constrained by records of site physical activity (e.g., berms, firing point locations, etc.), interpretation of cleared areas in period aerial photographs (e.g., testing activities would only be reflected on 1968 and later aerial photos), and corresponding munitions finds (Figures 9 and 11 through 16). The munitions use areas within the CSMs are delineated as polygons or ellipses (Figure 8). The shape of the polygons and orientation of the ellipses is principally controlled by: the pattern of detected munitions and observations on munitions debris distribution; assumptions about target location and munitions firing trajectory (e.g., predominantly distributed along the long axis of the range); munitions disposal patterns (burial

pit distribution); geophysical results; aerial photograph interpretation of areas cleared of vegetation; and ground features. The J-3 Range contained many munitions types that were either indirect or directly fired at berms and/or downrange areas. As such, general CSMs annotating MEC target areas, Testing Areas, and General Disposal Areas were mapped.

The conceptual site model for munitions is based on the concept of three general activities being performed within the J-3 Range boundaries: military training, munitions disposal, and munitions testing. Military training in the J-3 Range area occurred from the mid-1930s to the 1960s. This training consisted of practice firing, distribution and firepower control, estimating distances, tracking and leading targets at simulated distances (USACE 1999). Firing points for the J-3 Range training were located within the Former H-Range, along Greenway Road. The Impact Area boundary is located north of J-3 Range along Chadwick Road.

Contractor munitions testing occurred from the late 1960s to the 1990s. These areas are located in the up-range and mid-range areas within the J-3 Range. The majority of the munitions testing occurred in Area 4, Area 5, and Area 6. Testing was performed to evaluate munitions dispersions at various distances, heat tolerance, fuze functioning and warhead performance, and interior ballistics and velocity of projectiles (ASR, USACE 1999).

Disposal activities occurred in Area 3 within the northern portion of the J-3 Range Demolition Area. Disposal occurred through burning or burial of excess explosives and munitions propellants, (HE and inert), munitions debris, and other debris. It is likely that the disposal pits contained munitions that were associated with testing activities.

Based on the investigations to date, historical data, and aerial photograph interpretations, training and testing activities occurred throughout the J-3 Range. Training occurred from mid-1930s to the 1960s and testing activities occurred late 1960s to the 1990s. Area 1 and Area 2 were associated with Contractor Testing facilities and firing points for 20mm/30mm projectiles. Testing was also conducted in Area 4 at the J-3 Presumed M550 Berm and J-3 Ordnance Assembly Area and J-3 Range Gauntlet Area. The upper portion of the Hillside Study Area (southwest) was mainly used for military maneuvers as evident from cultural debris and topographic features. The lower portion of the Hillside Area (northeast) was also used as a backstop for the testing of 3.5-inch rockets. Area 6 was exclusively used for munitions training as evident from findings.

### 2.3.1 Munitions Disposal CSM

Munitions disposal activities within the J-3 Range were confined to the northern portion of the J-3 Range Demolition Area (Area 3). The MEC disposal area is described by several burial pits containing significant quantities of MEC items. The burial pits were found to contain 20mm HEI projectiles, fuze components, cartridge actuated devices, and small arms rounds.

The mapped CSM is enveloped within the testing activities that were conducted within the same area and time frame. It is likely that the MEC disposal was a subsequent activity to the testing, where spent items were gathered and either buried or burned. The CSM for MEC Testing and MEC Disposal Area were developed from these findings.

Although surface debris and metallic debris has been identified in an around all of the J-3 Range sub areas, this debris is likely associated with the former contractor testing or military training activities and does not support a MEC disposal CSM.

#### 2.3.1.1 Melt Pour Area (Area 1)

Area 1 contained the Melt/Pour facility and was used principally to support munitions testing (Figures 2 and 11). No munitions disposal activities were identified within this area. The Melt/Pour facility was demolished and disposed offsite in October 2003. No munitions disposal CSM was developed for Area 1.

#### 2.3.1.2 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area (Area 2)

Area 2 was also used to support contractor testing activities (Figure 12), however, there were no MEC disposals identified during the investigations in this area. Three MSP III polygons were investigated in this area and only munitions debris and other debris were encountered. No disposal CSM was developed for Area 2.

#### 2.3.1.3 Artillery Range, Demolition Area and Explosive Storage Bunker (Area 3)

Area 3 was used almost entirely for munitions testing activities (Figure 13). It is likely that surplus items associated with the testing activities were occasionally gathered and disposed of by burial/burning. Both burial pits and burn pits were discovered during the investigations within this area. Two disposal pits were discovered in close proximity to each other in the northern portion of the J-3 Range Demolition Area. The predominant munitions found in the burials were 20mm and 40mm projectiles. A significant quantity of cartridge actuated devices and other small energetic items were also discovered. General debris was also found in this area.

The MEC Disposal Area in Area 3 was conservatively mapped along with the munitions testing that occurred in this area. The mapping was conducted using historical descriptions, geophysical data and encompassing all munitions burials and burn areas within this portion of the range. The predominant items found in the disposal area were the 20mm and 40mm projectiles/fuzes, fuze components, initiators, and cartridge actuated devices.

#### 2.3.1.4 Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area (Area 4)

Area 4 contained a number of the testing facilities including the Ordnance Assembly/X-Ray Building, Environmental Test Building, Gauntlet Area, and Presumed M550 Berm Area (Figure 14). Few ordnance items were discovered in this general area with the exception of the Presumed M550 Berm Area where impacted 40mm projectiles were encountered. No disposal areas were discovered during any of the investigations in Area 4 and therefore no munitions disposal CSM was developed for Area 4.

#### 2.3.1.5 Hillside Study Area (Area 5)

Area 5 can be described as a military maneuvers area and impact berm for inert munitions based on the findings (Figure 15). General debris related to the military maneuvers has been identified in the southwest portion of this area. No disposal areas were discovered during any of the investigations and therefore no CSM for munitions disposal was developed for Area 5.

#### 2.3.1.6 Barrage Rocket Study Area (Area 6)

Area 6 was used exclusively for training and is considered an impact area based on investigation findings (Figure 16). No disposal areas were discovered during any of the investigations and therefore no CSM for munitions disposal was developed for Area 6.

### 2.3.2 Munitions Testing CSM

The munitions testing CSMs were developed to indicate specific areas within the J-3 Range where munitions testing is known to have occurred and where munitions items or debris associated with testing has been found. Testing activities that involved firing of munitions were generally conducted from a static platform as was the case of testing various projectile types. A key characteristic of controlled testing activities is a tighter grouping of impacted munitions as compared to training activities. This also simplified the imaging and retrieval of fired projectiles for evaluation. Since munitions were being tested for fuze function, ballistics and other characteristics, test-fired projectiles were often collected for further evaluations. Direct-fired projectiles can also be found scattered throughout the J-3 Range as a result of overshot or undershot. Testing of munitions was conducted in Area 1, Area 2, Area 3, and Area 4 (Figure 1). Although records indicate that specific testing occurred at various facilities (Figure 1), residual munition items associated with that testing were not always found. CSMs that were developed have been focused on mapping areas where munitions testing occurred and evidence of residual munitions items was found. Multiple munition testing support facilities were located within the J-3 Range but were not included in the munitions testing CSM due to a lack of MEC finds. The primary firing point associated with the munitions testing CSM was located within the J-3 Range Demolition Area and extended north to the M550 berm, where M433 40mm projectiles with live fuzing were fired.

#### 2.3.2.1 Melt/Pour Area (Area 1)

The Melt/Pour Building was a support facility within Area 1 that housed explosives mixing and loading equipment. No munition items were found discarded in Area 1 and therefore no Munitions testing CSM was developed for this area.

#### 2.3.2.2 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area (Area 2)

Area 2 was used for the testing of munitions using fixed facilities. Only munitions debris and other debris in the form of 20mm cartridge casings were found within this area. One M6 2.36-inch HEAT rocket and one 60mm HE mortar were discovered in this area (inert with live fuzing). Based on the results of the investigations, no munitions testing CSM was developed for this area.

#### 2.3.2.3 Artillery Range Area and Demolition Area (Area 3)

Area 3 was used for testing of the M6 2.36-inch HEAT rocket, 20mm projectiles, and 40mm projectiles. Other munitions are likely to have been tested, but no high explosive versions have been found. This area contained two former concrete target walls that were used as a backstop for the munitions testing. A CSM for munitions testing was developed for this expanse based on the concentration of M6 2.36-inch rockets and former fixed testing structures as shown on Figure 13. Disposal activities that occurred in this area are further discussed in the munitions disposal CSM section.

Firing points for 40mm projectiles were located in this area. M433 40mm projectiles with live fuzing were fired into the presumed M550 berm. Two 40mm projectiles with high explosives were also discovered and BIP. A CSM was developed for this firing pattern that extended from Area 3 north into Area 4. This CSM is shown on Figure 13 and Figure 14.

#### 2.3.2.4 Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area (Area 4)

Area 4 included the Ordnance Assembly/X-Ray Building and Environmental Test Building which were fixed structures where testing occurred inside the facilities. The Gauntlet Area was an outdoor test facility where development and testing of inert munitions was conducted. No discarded munitions or disposal activities were identified in this area and therefore they were not included in the munitions testing CSM for this sub-area. As previously discussed, the Presumed M550 Berm Area was an impact berm for the test firing of the M433 40mm grenades. These items were inert with live fuzing though two of the projectiles were reported as HE. A MEC Testing CSM was developed for this part of Area 4 (Figure 14).

#### 2.3.2.5 Hillside Study Area (Area 5)

Area 5 contained some testing of inert 3.5-inch rockets that were fired into the Hillside Study Area as an impact berm. Due to the fact items unrelated to testing were found during investigations, no munitions testing CSM was developed for this area.

#### 2.3.2.6 Barrage Rocket Study Area (Area 6)

The J-3 Range Barrage Rocket Study area was used exclusively for training purposes and no contractor testing activity was conducted. This has also been determined from the types of munitions found during the investigation. No contractor testing occurred in Area 6 and therefore no munitions testing CSM was developed for this area.

### 2.3.3 Munitions Training CSM

An extensive amount of military training was conducted in the vicinity prior to the establishment of the J-3 Range. The determination of training related residues is made primarily by considering the age of the munitions items found and historical firing points. A historical training range (Former H-Range) was located southeast of the J-3 Range and was used as a mortar firing point. Firing points were also likely located along Greenway Road and further north.

However, in many cases the firing point for a specific munition found during investigations cannot be conclusively determined. Munitions used during training were the inert and HE versions of the M49 60mm mortar, inert and HE versions of the M43 81mm HE mortar, M56 81mm HE mortar, inert 3-inch stokes mortars, inert and HE versions of the 4.5-inch Barrage rocket and the inert and HE versions of the M9 rifle HEAT grenade.

While some munitions associated with training were found during investigations conducted within the J-3 Range, similar items were also found in surrounding areas, as single items or small clusters, at similar frequencies (Figure 8). It is likely that some residues from previous training activities within the central portion of the J-3 Range were disturbed during construction of the J-3 testing facilities.

#### 2.3.3.1 Melt/Pour Area (Area 1)

Training related munitions items found in the J-3 Range Melt/Pour (Area 1) included four M9 Rifle HEAT Grenades (3 inert, 1 HE), one M49 60mm HE Mortar and one inert MK3 4.5 inch barrage rocket. Five 2.36-inch barrage rockets were also found outside of Area 1 but along Greenway Road The items were likely associated with training that occurred at the Former H Range and/or along Greenway Road and extended into the J-3 Range and were incorporated into the J-3 Range munitions training CSM as shown on Figure 11. It is possible that additional training-related munitions items may remain within this area at low frequencies.

#### 2.3.3.2 20mm/30mm Range and Workshop Building, Burn Kettle/Conex Area (Area 2)

Area 2 is considered a flyover area associated with military training (Figure 12). One M49 60mm HE mortar, one inert M28 3.5-inch rocket, and one inert M6 2.36-inch rocket was identified in this area which likely originated from the Former H-Range located to the southeast of the J-3 Range. This item was likely associated with training that occurred at the Former H Range and/or along Greenway Road and extended into the J-3 Range and is incorporated into the J-3 Range munitions training CSM as shown on Figure 12. It is possible that additional 60mm projectiles and rockets could remain within this area at low frequencies. Higher concentrations of these mortars were identified further north.

#### 2.3.3.3 Artillery Range, Demolition Area and Explosive Storage Bunker (Area 3)

The J-3 Artillery Range and Demolition Areas of Area 3 were used extensively for munitions testing and disposal. Despite the level and nature of contractor activity a number of M43 81mm HE and M49 60mm HE mortars and 2.36-inch HE rockets were found during investigations in this area (Figure 13). These items likely originated from the former H-Range or firing points along Greenway Road and were likely disturbed during construction of the contractor testing infrastructure. One 90mm HE projectile and a small number of 40mm grenades were also found though their origins are unknown. The 81mm and 60mm mortars and 2.36-inch rockets were incorporated into the J-3 Range munitions training CSM. Although heavily disturbed during the construction and operation of the J-3 testing facilities as well as during investigation and remediation activities, it is possible that additional 81mm HE mortars, 60mm HE mortars and 2.36-inch HE rockets may remain within this area at low frequencies.

#### 2.3.3.4 Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area and Presumed M550 Berm Area (Area 4)

Several individual M56 81mm HE mortars were found during investigations conducted in the Ordnance Assembly/X-Ray Building and Environmental Test Building, Gauntlet Area (Figure 14) (Gauntlet area not labeled/depicted on Figure 14). It is likely that these mortars originated from firing points located along Greenway Road. The M550 Berm area (not labeled/depicted on Figure 14) was used exclusively for contractor testing activities associated with M433 40mm projectiles and therefore the numerous investigative finds of these items likely are not training related. One inert 2.36-inch M6 HEAT rocket and one inert 3.5-inch M29 practice rocket were discovered in Area 4 but their origins are unknown. Based on investigation findings, the M56 81mm HE mortars were incorporated in the J-3 Range munitions training CSM. It is possible that additional inert bodied M433 40mm projectiles with live fuzing may remain within the M550 berm area. Individual M43 and M56 81mm HE mortars may also remain within this area at low frequency.

#### 2.3.3.5 Hillside Study Area (Area 5)

The Hillside Study Area (Area 5) includes several overlapping former training areas adjacent to the northeast of the J-3 Range (Figure 15). Possible items in this area could include the M49 60mm HE mortar and the M43 81mm HE mortar. Inert 3-inch stokes mortars were found along the northeast boundary of Area 5. One HE MK11/MK27 40mm grenade was discovered but its origins are unknown. Site findings indicated that the area to the southwest was a military maneuver area, evident from the jeep trails and barbwire. The Hillside Study Area was located on the southwestern boundary of the J-3 Range Munitions Training CSM. It is possible that additional M49 60mm HE mortars and M43 81mm HE mortars could remain on the north eastern side of this area at low frequency.

#### 2.3.3.6 Barrage Rocket Study Area (Area 6)

The J-3 Barrage Rocket Study Area (Area 6) was the site of significant training activities (Figure 16). Dozens of MK3 4.5-inch HE Barrage rockets and, to a lesser extent, M56 81mm HE mortars were found in this area. Inert M43 81mm mortars and inert M49 60mm mortars were also found in this area. Three 4.2-inch mortars were found, but it is likely that they overshot the adjacent Camp Edwards Impact Area. In addition, two 75mm HEAT projectiles were found and were likely associated with impact area training. The MK3 4.5-inch HE Barrage rockets were identified further down-range from the M56 81mm HE mortars. It is likely that these items originated from firing points along Greenway Road. These projectiles are incorporated into the J-3 Range munitions training CSM. It is possible that MK3 4.5-inch HE Barrage rockets, M56 81mm HE mortars and 4.2-inch mortars may remain in this area at low frequency.

## 2.4 Residual Unexploded Ordnance

A significant amount of munitions clearance occurred within and around the J-3 Range in support of the various investigations described in Section 2.2. The investigation of suspected burials, various geophysical anomalies, soil removal actions, and investigation and clearance of

areas of concern noted in the ASR and during site reconnaissance suggest that the area is well characterized in those areas. All munitions items encountered during investigative activities were removed. In addition, contractor testing facilities and target structures were removed by the former testing contractor. As indicated above, a large percentage of HE projectiles found in the J-3 Range area were associated with past training activities. Many testing activities that were conducted used inert projectiles with possible live fuzing. Certain types of testing (e.g., ballistic and fuse testing) are believed to have primarily used inert munitions. However, warhead testing would have likely used HE munitions.

The three burial pits found during the geophysical investigations were concentrated in one area and were associated with the contractor's disposal practices. Based upon the overall investigation results, the likelihood of additional burial pits remaining at the range appears to be low.

The greatest potential exists for HE items associated with historic training activities to remain on the J-3 Range. Individual high explosives items that could remain on the range include the MK3 4.5-inch Barrage rocket, M3 4.2-inch mortar, M56 and M43 81mm mortars, and the M49 60mm mortar. It is possible that additional M9 HEAT rifle grenades could be found in the southern portion of the J-3 Range. The M6 2.36-inch HEAT rockets that were associated with the testing maybe found in the vicinity of the J-3 Range Demolition Area. However, extensive clearance work has been conducted in this area and the likelihood is very low of finding additional rockets. The M433 40mm HEDP grenades containing live fuzing may remain around the presumed M550 berm area.

## 3.0 FINDINGS

Site background documentation and field clearance activities indicate that the J-3 Range was used for training and testing activities. The disposal activities were associated and concurrent with the testing activities that occurred. The training activities that occurred from the 1930s to the 1960s, account for the most widespread distribution of UXO found on the J-3 Range. The MK3 4.5-inch HE Barrage rocket, M56 and M43 81mm HE mortars, and M49 60mm HE mortar account for the most common high explosive items used in the training.

The types of munitions reportedly tested and identified in the field include many direct fire rounds including 2.36-inch rocket, and 20mm and 40mm projectiles. Other types of inert munitions were tested by the defense contractor at the J-3 Range. The most frequently encountered HE projectile that was used in testing was the 2.36-inch HEAT rocket. Testing activities focused on fuze testing, projectile testing, perforation assessment, spotting charge evaluation and several static tests such as determining the detonation temperatures of various rounds.

Investigation and remediation of the range has been ongoing since 1999 and has resulted in a good understanding of munitions use at the range. The investigations cleared munition burial areas, addressed burn and testing locations, and investigated areas of interest identified in the ASR as well as during numerous site reconnaissance efforts. The investigation activities led to the identification and removal of sources of groundwater contamination through soil removal actions and munition clearances.

Even though the range was rigorously investigated based on multiple lines of evidence there will always be some uncertainty, as is typical with environmental investigations. It is noted however, that all potential burials identified using geophysical signature responses analyses were investigated and the contents removed and appropriately managed.

Numerous investigations were conducted in the southern portion of the range in Areas 1 and 2. These areas were used to support testing and no disposal pits were encountered. Several M9 HEAT rifle grenades were found in this area and others may still be present.

A large number of geophysical anomalies detected in the mid-portion of the J-3 Range in Areas 3 and 4 have been investigated. Extensive clearance and soil removal has been conducted in the J-3 Demolition Area. The former testing contractor has removed fixed facilities and all concrete structures. Complete geophysical coverage, however, was not conducted at the J-3 Range. Based on the site findings, it is possible that M43 81mm HE mortars and M49 60mm HE mortars that were associated with the training could be found in this area. In addition, contractor testing residues including the 2.36-inch HEAT rocket and the M433 40mm projectile with live fuzing could still remain.

The southwest portion of the J-3 Range in Area 5 was used for inert training and testing of inert munitions. The upper portion of this area was used as a military maneuver area. Trails and barbwire fencing have been found in this area during investigations. The northwest side was used as an impact berm for the testing of inert 3.5-inch rockets. Inert 3-inch stokes mortars have

also been found in this portion of the Hillside Study Area. Due to the potential for overlapping training areas within the Hillside Study Area, M43 81mm HE mortars and M49 60mm HE mortars may also be encountered on the northeast side of his area.

In the northern portion of the range, Area 6 has had multiple geophysical investigations that encountered MK3 4.5-inch HE Barrage rockets and M56 81mm HE mortars. Although many of these items have been recovered and disposed of, others potentially remain onsite. Inert versions of the MK3 4.5-inch Barrage rocket have also been identified in this area. The highest concentration of the HE versions were located around Transects 6, 7, and 8. Individual M56 81mm HE mortars have been discovered within the southeast portion of the Barrage Rocket Study Area. No disposal activities were found during investigations in Area 6.

In summary, munitions occurrence at the J-3 Range has been adequately characterized although it is possible that individual UXO may remain at low frequencies in uninvestigated areas. The J-3 Range has been evaluated and investigated under the auspices of several iteratively scoped investigation programs. The investigated areas were strongly biased based on archive search findings, aerial photo assessments, site reconnaissance and geophysical data. The investigations resulted in the removal of all munition items encountered on the range.

**NOTES:**

BIP = Blow In Place
CDC = Contained Detonation Chamber
HE = High Explosive
HTRW = Hazardous, Toxic, and Radioactive Waste
LIP = Left in Place
MD = Munitions Debris
MEC = Munitions and Explosives of Concern
mm = millimeter
N/A = Information not available
RRA = Rapid Response Action
RRD = Range Related Debris
SCP = Scrap

# Information for MassDEP

# Appendix G
# Information for MassDEP

As discussed in the main body of the report, none of the soil analytes detected at the J-3 Range was determined to be a threat to groundwater. However, 12 analytes (i.e., 2,4-DNT, HMX, perchlorate, arsenic, cadmium, chromium (total), lead, nickel, thallium, phenol, pentachlorophenol, and 1,2-DCE (total)) were detected in soil at one or more of the six Areas of Interest at concentrations exceeding MCP Method 1 S-1/GW-1 Standards (see Tables 7-2 to 7-7 of the main Investigation Report). Nitroglycerin was detected at two of these areas at concentrations exceeding the calculated MCP Method 2 S-1 value. A summary of these exceedances, including the Area of Interest, the analyte exhibiting the exceedance of its criterion, a descriptor for the averaging area, the sample type, the analyte's frequency of detection, the number of exceedances of its criterion, its maximum detected concentration, and its average concentration within that averaging area, is provided in Table G.1. The MCP Method 1 S-1/GW-1 Standard (or its specifically noted alternative) and the MCP Method 2 S-1 Standard (for direct contact exposure only) also are shown in Table G.1. Note that TNT has not been included in Table G.1 since there is no MCP Method 1 S-1/GW-1 Standard for this compound.

The summary statistics provided in Table G.1 were calculated using data from all investigations conducted at the respective Areas of Interest. Various sampling methodologies were used during these investigations, including discrete samples; 5-point and 9-point composite samples; and multiple increment samples. Separate averages were computed for the identified averaging areas within each Area of Interest using the combined discrete and composite sampling results and using the available multiple increment sampling results. Only those samples that were collected from within 3 feet of the ground surface (i.e., MCP "accessible" soil) were included in the averages.

The average concentration for each analyte provided in Table G.1 is area-specific and was calculated using all sample results (including the reported non-detections). Each Area of Interest exhibiting an exceedance of its MCP Method 1 S-1/GW-1 Standard (or its specifically noted constituent-specific alternative comparison criterion) was subdivided into contiguous areas of approximately 10,000 square feet (or less) for the averaging. The previously identified site features of Area 1 (see Figure 4-2), Area 2 (see Figure 4-5), and Area 4 (see Figure 4-9) were used to form subareas for these three Areas of Interest. The existing grids for Area 3 (see Figure 4-7) and Area 5 (see Figure 4-11) were used to form subareas for these two Areas of Interest. For Area 6, subareas were formed using the coordinates of the sample with the exceedance and then selecting all samples within ± 15 meters easting / northing. The multiple increment sample footprints that were previously defined within these Areas of Interest were approximately 10,000 square feet or less (typically 50 feet by 50 feet). At locations where replicate multiple increment samples were collected (i.e., the 2012 Barrage Rocket Investigation in Area 6), each of the replicate results was used in the calculation of the average concentration. If an analyte was not detected in a sample being used to calculate an average, it was conservatively assumed that the analyte was present in that sample at ½ the sample-specific reporting limit. 2,4-DNT was detected in area soils using both the SVOC (Methods 8270

and 8270C) and explosives (Method 8330) analytical methods. All of these methods are considered to be valid and each result was counted as a unique sample for this assessment. Results for the SVOC and explosives methods were tabulated separately.

At those locations where maintenance or response actions involving soil excavation and removal have been performed, only post-removal soil sampling results were utilized in the calculation of the averages to ensure that the contaminated soil that has already been removed from a range does not bias the assessment of the current conditions for that Area of Interest.

As seen in Table G.1, in general, subarea average concentrations do not exceed the MCP Method 1 S-1/GW-1 or the Method 2 S-1 Standards (i.e., there are few yellow highlighted listed average concentrations). There is one exceedance each for 2,4-DNT and nitroglycerin, and two for lead. These exceedances are discussed below by Area of Interest, averaging subarea, and sample type.

- Area 1 – Melt / Pour Area - The maximum detected concentration of 2,4-DNT (SS102VF 0-0.25 feet bgs 0.83 mg/Kg by Method 8270; it was not detected by Method 8330) exceed the MCP Method 1 S-1/GW-1 Standard but is less than the MCP Method 2 S-1 Standard. 2,4-DNT was not detected in any of the 23 other samples collected from the surrounding area (subarea 102VF). The subarea average concentration of 2,4-DNT is below both the Method 1 and Method 2 Standards. No other analytes of interest were detected at concentrations exceeding MCP Method 1 S-1/GW-1 Standards.

- Area 2 – 20mm / 30 mm Range and Workshop Building, Burn Kettle / Conex Area - The maximum detected concentrations of chromium, nickel, nitroglycerin, phenol, and 1,2-DCE (total) exceed their respective MCP Method 1 S-1/GW-1 Standards. When averaged with the surrounding subarea samples, all were below their respective MCP Method 1 S-1/GW-1 Standards.

- Area 3 – Artillery Range, Demolition Area and Explosive Storage Bunker - The maximum detected concentrations of arsenic, cadmium, chromium (total), HMX, and thallium exceed their respective MCP Method 1 S-1/GW-1 Standards. When averaged with the surrounding subarea samples, all were below their respective MCP Method 1 S-1/GW-1 Standards.

- Area 4 – Ordnance Assembly/X-Ray Building, Environmental Test Building, Gauntlet Area, Presumed M550 Berm Area - The maximum detected concentration of pentachlorophenol exceeds the respective MCP Method 1 S-1/GW-1 Standards. When averaged with surrounding subarea samples, the average concentration was below its respective MCP Method 1 S-1/GW-1 Standard.

- Area 5 – Hillside Study Area - The maximum detected concentration of lead exceeds the MCP Method 1 S-1/GW-1 Standard. When averaged with surrounding subarea samples, the average concentration of the three discrete/composite samples collected from Grid I10 exceeded the respective MCP Method 1 S-1/GW-1 Standard.

- Area 6 – Barrage Rocket Study Area - The maximum detected concentrations of 2,4-DNT, lead, and perchlorate exceed their respective MCP Method 1 S-1/GW-1 Standards. The maximum detected concentration of nitroglycerin exceeds the calculated MCP Method 2 S-1 value. When averaged with surrounding subarea samples, the average concentration of perchlorate is below the MCP Method 1 S-1/GW-1 Standards for all subareas. For 2,4-DNT, only the maximum detected concentration (multiple increment sample SSJ3BRGS08 1.33 mg/Kg by Method 8330) exceeds the MCP Method 1 S-1/GW-1 Standard (0.7 mg/Kg). The maximum and average concentrations of the three discrete/composite samples from the surrounding area, are below the MCP Method 1 S-1/GW-1 Standard. For lead, only the maximum detected concentration (462 mg/kg in discrete/composite sample SS10704-A) exceeds the MCP Method 1 S-1/GW-1 Standard (200 mg/kg). The other paired discrete/composite sample from this same location (39.6 mg/kg also from location SS10704-A) was below the MCP Method 1 S-1/GW-1 Standard but the average of the two results was above the MCP Method 1 S-1/GW-1 Standard. None of the other 184 samples collected from Area 6 exceed the Method 1 S-1/GW-1 Standard for lead. For nitroglycerin, five of 258 samples exceed the calculated Method 2 S-1 Standard (4.4 mg/Kg). When averaged with samples from the surrounding area, only subarea 348/15131 has an average concentration that exceeds the calculated Method 2 S-1 Standard. This subarea included the site-wide maximum concentration for nitroglycerin (estimated 33 mg/Kg in field duplicate sample SS348-A 0-0.25 feet bgs). The original sample from this location as well as two samples from successive depth intervals were non-detect for nitroglycerin. Subsequent pre- and post-BIP samples (SS15131-A) from the same location as SS348-A also were non-detect for nitroglycerin.

The J-3 Range site-wide maximum detected concentration of arsenic (47.5 mg/Kg in Area 3) is below the arsenic MCP Upper Concentration Limit (UCL) (500 mg/Kg). The maximum detected concentration of cadmium (117 mg/Kg in Area 3) is below the cadmium UCL (1,000 mg/Kg). The maximum detected concentration of chromium (total) (203 mg/Kg in Area 2) is below the chromium UCL (2,000 mg/Kg). The maximum detected concentration of lead (852 mg/Kg in Area 5) is below the lead UCL (6,000 mg/Kg). The maximum detected concentrations of nickel (964 mg/Kg in Area 2) is below the nickel UCL (10,000 mg/Kg). The maximum detected concentrations of thallium (15.3 mg/Kg in Area 3) is below the thallium UCL (800 mg/Kg). The maximum detected concentration of 2,4-DNT (1.33 mg/Kg in Area 6) is below its UCL value of 800 mg/Kg. The maximum detected concentration of HMX (25 mg/Kg in Area 3) is below its UCL value of 10,000 mg/Kg. The maximum detected concentration of perchlorate (0.51 mg/Kg in Area 6) is below its UCL value of 50 mg/Kg. The maximum detected concentration of 1,2-DCE (total) (2.3 mg/Kg in Area 2) is below the cis-1,2-DCE UCL value of 5,000 mg/Kg and the trans-1,2-DCE value of 10,000 mg/Kg. The maximum detected concentration of pentachlorophenol (3.7 mg/Kg in Area 4) is below its UCL value of 700 mg/Kg. The maximum detected concentration of phenol (2.4 mg/Kg in Area 2) is below its UCL value of 10,000 mg/Kg. There is no published MCP UCL for nitroglycerin.

NOTES:

**Calculated average concentrations exceeding the applicable screening criterion are bolded and highlighted in yellow.**

**Maximum concentrations exceeding the applicable screening criterion are bolded.**

* A calculated MCP Method 2 Standard was used to screen the sampling results for nitroglycerin.

The average was calculated using all detections and non-detections at 1/2 the sample-specific reporting limit.

The value shown for MCP Method 2 S-1 standard for nitroglycerin is a calculated value using the provisional oral reference dose (1E-4 mg/kg-day) and the default exposure parameters of the S-1 direct contact standards.

Average concentrations were not calculated for the "Rest of Area" sub-areas because the "Rest of Area" is larger than 10,000 square feet.

# 1.0 INTRODUCTION

Existing J-3 Range plume shells have more recently been demonstrated to be outdated and unreliable for the prediction of the distribution and magnitude of perchlorate and RDX concentrations throughout the respective plumes (USACE 2012). Plume shells representing current levels of groundwater contamination at the J-3 Range area were redeveloped to facilitate a more reliable prediction of groundwater perchlorate and RDX concentrations for use in evaluating long-term remediation alternatives. Plume shell development utilized all the historic and recent perchlorate and RDX data available for the J-3 Range from both monitoring wells and aquifer profiles. In an effort to develop the most reliable plume shell possible, given the data collected, the existing groundwater flow models for the J-3 Range was used to forward-migrate all previously measured concentrations to insure the most complete use of the data available. The following text summarizes the objectives of the plume shell development and the steps involved, and presents the revised plume shells and comparisons of measured and predicted contaminant concentrations.

## 1.1 Objectives

The goal of plume shell development for the J-3 Range is to derive a reliable estimate of the magnitude and distribution of perchlorate and RDX concentrations, using all existing monitoring well and profile data, for use in simulating future conditions. This objective has been met by using a flow model to migrate available historic groundwater concentrations of perchlorate and RDX down gradient through the respective aquifer systems and then contouring the migrated concentrations to develop three-dimensional depictions of contamination. The reliability of the newly developed plume shell was evaluated by comparing measured and predicted contamination at each of the existing extraction wells and adjusting in-plume concentrations where necessary.

## 2.0 METHODS

The plume shell development, as presented here, is the process of using existing historic groundwater quality data to depict the current distribution and magnitude of known perchlorate and RDX plumes. There are generally three distinctly different approaches to determining initial concentrations in a groundwater quality model including 1) applying a source of contamination to a fate and transport model and predicting current conditions that can be compared with recent concentration measurements, 2) using a snapshot of groundwater contamination data to develop a contoured three-dimensional plume and 3) using all historic chemical data and a reliable flow model to determine the current locations of all historic data points for use in developing a contoured three-dimensional plume.

If detailed mass and duration information about a contaminant release is available then simulating a developing plume is a reasonable option but the level of information necessary to develop a reliable plume shell is often not available, as is the case at the J-3 Range. Using a snapshot of chemical data to develop a plume shell is also a straight-forward option, but it is limited in that relatively little data is used and also the contoured plume is independent of any actual or model predicted hydraulics. The option of using forward migrated historic data is considered a superior method for plume shell development and for initiating a chemical concentration field in a groundwater model because it takes advantage of all available data and is developed using realistic hydraulic conditions. While the steps involved in developing a plume shell using forward-migrated data are relatively complex and require the sequential use of multiple software packages, this approach was considered to be the most reliable for use at the nearby J-2 Range Eastern and Northern plumes and was also selected for use at the J-3 Range site.

Determining the current location of historically measured perchlorate and RDX contamination is a key component and complicating factor in the plume shell development process. To achieve the goal of plume shell development, the previously developed groundwater flow model (USACE 2012) was used to distribute historic perchlorate and RDX data points, which were then coupled with a set of boundary data points and contoured in three dimensions. Reliability of the developed plume shell was evaluated by comparing measured and predicted extraction and monitoring well concentrations. In cases where the comparison was favorable, the derived plume shell was used as developed and in cases where the comparison was poor, the estimated contaminated concentrations within the plume shell were conservatively adjusted by applying a multiplication factor to 1) increase concentrations and consequently mass throughout the plume, and 2) facilitate a more reliable agreement between measured and predicted extraction well contaminant concentrations. The newly developed plume shells were then used for all simulations associated with the various cleanup alternatives already presented.

The following text and associated figures and table present a detailed explanation of the plume shell development process and the results of the plume shell development for the J-3 Range (perchlorate and RDX).

## 2.1 Data Query (MS Access)

Perchlorate and RDX concentrations for J-3 Range groundwater were queried from the EDMS database, including all historic monitoring well data, which was applied to the mid-screen elevations, and profile data, which was applied to point locations. The locations and times that samples were collected were used to identify where and when particles were released throughout the flow model simulation prior to the prediction of particle and associated contaminant migration. Chemical data reported in EDMS was qualified as being "Normal", "Estimated", "Rejected" or "Not-Detected" where "Normal" and "Estimated" values were used as reported, "Rejected" values were dismissed, and "Not-Detected" values were assumed to be 0.35 µg/L for perchlorate and 0.25 µg/L for RDX. The perchlorate data for the J-3 plume extends from 09 August 2000 through 12 December 2013 and the RDX data for the J-3 plume extends from 28 October 1997 through 12 December 2013.

## 2.2 Transient Groundwater Flow Simulation (Vista-MODFLOW)

The previously developed MODFLOW groundwater flow model for the J-3 Range plumes was used to simulate hydrologic conditions throughout a time period extending from the earliest water quality measurement to the most recent. All boundary conditions, with the exception of well extraction rates, were held constant throughout the transient simulation. Groundwater extraction rates varied according to the actual measured rates from wells within each respective model domain. The initial head conditions applied to the model were predicted from an initial steady-state simulation representative of the first transient model time-step.

## 2.3 Particle Migration (Vista-MODPATH)

The development of transient groundwater flow conditions over the time period coincident with the earliest and most recent perchlorate and RDX data points was followed by a particle tracking simulation using the MODPATH particle tracking program. Particle simulations were conducted to determine the recent location of perchlorate and RDX concentrations that were historically measured at various monitoring wells and profile locations. The starting locations and times for the particle simulations were derived from information acquired through EDMS and predicted particle locations were determined for the end of the simulation so that the most recent particle locations and concentrations are known (x, y, z and c). Migrated particle locations and initial concentrations are all presented in the respective Table sections included within this appendix.

## 2.4 2-D Contouring in GIS (ArcView)

The predicted location and measured concentration data (x, y, z and c) was imported into the ArcView GIS platform and concentrations at 10-foot vertical intervals were queried to isolate specific layers of forward migrated perchlorate and RDX concentrations. Concentration contours for each vertical interval were then drawn using 1) the forward-migrated historical concentrations, 2) a map of the suspected source areas, and 3) the previously drawn plumes, as a guide. Contours for perchlorate included 0.35 µg/L, 2 µg/L and 15 µg/L and contours for RDX included 0.25 µg/L, 0.6 µg /L, 2 µg /L and 6 µg /L. The concentration contours were developed to constrain the perchlorate and RDX plume shell boundaries and to offer some

control on the distribution and magnitude of the plume shells. Migrated concentrations outside of the drawn contours were very low or non-detect and were removed from the dataset. The final step in 2D contouring was to transform each of the contours into sets of equally spaced points (x, y, z and c). Migrated particle locations and initial concentrations (perchlorate) or decayed concentrations (RDX), along with contours developed using this information, are all illustrated in the respective Table sections included within this appendix.

## 2.5 3D Contouring (GMS)

The significant effort completed to this point resulted in a lengthy set of data points (x, y, z and c) representing both the forward-migrated measured data and a much larger set of boundary contour points. A composite of this set of points was imported into the GMS groundwater modeling software package as a set of “scatter points” and then contoured using the inverse distance weighted (IDW) option and the Quadratic Method, all points for the computation of nodal function coefficients, the nearest 16 points for the computation of interpolation weights, and a relatively small vertical anisotropy ratio of 3.5%. This 3D contouring resulted in a dense network of plume concentrations that were all assigned to the mid-points of GMS grid cells that were developed to be marginally smaller than the grid cells used in the existing Groundwater Vistas flow model. These contoured contaminant concentrations, within the footprint of the outermost concentration contour, were then ultimately exported as a set of points (x, y, z and c) for import to the Groundwater Vistas modeling package.

## 2.6 Import to Groundwater Vistas Simulation

Grid centered points (x, y, z and c) exported from the GMS groundwater modeling software were imported to Groundwater Vistas to provide the starting perchlorate and RDX concentrations to the model for simulation using MODFLOW-Surfact. The Groundwater Vistas model was then used to simulate perchlorate and RDX concentrations throughout the model domain for a period extending from the respective plume shell dates through September 2014 under current conditions and continuing for a 100-year period from October 2014 through September 2114 under a variety of alternative cleanup conditions. The perchlorate and RDX plume shell for the J-3 Range represents conditions on 01 January 2014.

## 2.7 Comparison with Measured Concentrations and Calibration

The reliability of the newly developed plume shells was evaluated by comparing recently measured and predicted perchlorate and RDX concentrations at respective extraction wells. This comparison was completed as a means of averaging out all the measured and often contradictory perchlorate and RDX concentrations and to account for elevated concentrations in areas without direct measurements. The extraction well concentrations represent an average of all incoming contaminant diluted by the groundwater extraction rate and while these concentrations cannot directly be used to determine the reliability of point-by-point concentrations within the plume, they can be used to quantify whether the concentrations in the immediate vicinity of the extraction wells are reliable. This approach was taken because the distributed sources and the episodic nature of contaminant releases had produced a very heterogeneous sequence of intermingled plumes rather than a larger cohesive plume and, given

the relatively small number of in-plume wells in the monitoring network, the general distribution of contamination is far better understood than the magnitude of contamination. Furthermore, it is presumed that if the concentrations in the immediate vicinity of the extraction wells are reliable, then the concentrations within the other measured portions of the plume are also reliable. This is believed to be true whether or not the point-by-point concentrations are in close agreement particularly, since there are relatively few points within the plumes to compare.

## 3.0 RESULTS

Historical water quality data was used to develop updated perchlorate and RDX plume shells at the J-3 Range for use in simulating groundwater cleanup options. The existing groundwater flow models for the J-3 areas were used to spatially and temporally migrate historical concentrations forward to facilitate the development of concentration contours that were ultimately used to develop the respective three-dimensional plume shells. Measured concentration data from the three extraction wells in the J-3 (J2EWIP1, J3EW0032, and 90EW0001) plumes were compared with predicted concentrations to determine the reliability of the plume shell at representing concentrations within the model domain.

### 3.1 J-3 Plume (Perchlorate)

The perchlorate plume developed for the J-3 Range is segmented into two separate lobes including one lobe upgradient of extraction well J2EWIP1 and another lobe upgradient of extraction wells J3EW0032 and 90EW0001. The overall centerline length of the perchlorate plume, as define by the 2 µg/L contour, is approximately 3,500 feet, extending from the source area downgradient to immediately downgradient of extraction well 90EW0001 and the plume is approximately 450 feet at its widest point. The areal extent of contamination is determined to be 52.0 acres at a concentration greater than 0.35 µg/L, 28.0 acres at a concentration greater than 2 µg/L, and 7.8 acres at a concentration greater than 15 µg/L.

The predicted initial mass of the perchlorate in the plume shell is determined to be 10.8 lbs at a concentration greater than 0.35 µg/L and 9.2 lbs at a concentration greater than 2 µg/L. The uppermost elevation of the perchlorate plume is approximately 55 feet msl just downgradient of the source area and the lowest elevation is approximately -85 feet msl upgradient in the immediate vicinity of extraction well J3EWIP1 and downgradient in the immediate vicinity of extraction wells J3EW0032 and 90EW0001. Predicted extraction well perchlorate concentrations at the J-3 Range indicated that the plume shell was able to reliably replicate measured concentrations and no calibration of the plume shell was required.

### 3.2 J-3 Plume (RDX)

The RDX plume developed for the J-3 Range is segmented into two separate lobes including one lobe upgradient of extraction well J3EWIP1 and another lobe upgradient of extraction wells J3EW0032 and 90EW0001. The overall centerline length of the RDX plume, as define by the 0.60 µg/L contour, is approximately 3,400 feet, extending from the source area downgradient to immediately downgradient of extraction well 90EW0001 and the plume is approximately 500 feet at its widest point. The areal extent of contamination is determined to be 45.2 acres at a concentration greater than 0.25 µg/L, 28.5 acres at a concentration greater than 0.6 µg/L, 5.5 acres at a concentration greater than 2 µg/L, and 0.9 acres at a concentration greater than 6 µg/L.

The predicted initial mass of the RDX in the plume shell is determined to be 2.5 lbs at a concentration greater than 0.25 µg/L and 1.6 lbs at a concentration greater than 0.6 µg/L. The uppermost elevation of the RDX plume is approximately 55 feet msl just downgradient of the source area and the lowest elevation is approximately -105 feet msl at a location east of the

downgradient plume. Predicted extraction well RDX concentrations at the J-3 Range indicated that the plume shell was able to reliably replicate measured concentrations and no calibration of the plume shell was required.

## 3.3 Development of Cleanup Alternatives

Five simulations were developed for each plume shell to provide information necessary to evaluate and select a reliable, cost-effective cleanup alternative. The primary difference from one simulation to the next was the extraction rate at the existing wells through the 100-year simulation. In the case of the 10-year scenarios, additional extraction wells were added to the simulation to reduce concentrations in the core of the plume(s) more rapidly. The following five alternatives were simulated and results summarized in a comparison table.

- Alternative 1 – No Further Action
- Alternative 2 – Monitored Natural Attenuation
- Alternative 3 – Current Extraction Rate Conditions
- Alternative 4 – Optimized Extraction Rate Conditions
- Alternative 5 – 10 Year Cleanup Extraction Rate Conditions

The previously described perchlorate and RDX plume shells were applied by initiating simulations starting on 01 January 2014. Each of the five alternative cleanup simulations was run from the starting point of the representative plume shell to 30 September 2014, using current extraction rates, and from that point forward for a period of 100 years using modified extraction rates.

## 4.0 CONCLUSIONS

The plume shell development process presented in this appendix is considered to be a reliable means of determining the lateral and vertical extents, and to a lesser extent the magnitude of concentrations, throughout the respective plumes. The existing flow model used to forward-migrate the existing perchlorate and RDX data through the aquifer has been shown to effectively predict average hydraulic conditions and the process of migrating historic perchlorate and RDX data to facilitate a layer-by-layer contouring of data made the best use of existing information. While the plume-wide distribution of profile and monitoring well data tends to better define the extent of contamination, rather than the magnitude of contamination, the plume shells developed and presented here are considered to be reasonable depictions of the respective plumes and, in spite of the relatively limited data available to characterize the magnitude of concentrations throughout the heterogeneous plumes, are believed to be suitable for use in evaluating cleanup alternatives.

US Army Corps of Engineers

J-3 Range 2013
Perchlorate Plume Shell

Migrated Concentration Data
and Associated Contours

Elevation Range: -70 to -60 feet msl

Red labels are migrated samples collected since 01 Jan 2012.

Notes:

U = non-detect
J = estimated
N/A = not applicable

Used = point used to develop plume shell
Deleted = point not used to develop plume shell
Predicted Extracted/Removed = predicted to have been extracted/removed
Not Within Model Domain = outside of model domain and not simulated

Concentrations reduced by 22% after 1 year, 38% after 2 years,
48% after 3 years, 54% after 4 years and 55% after 5 years.
