

US EPA ARCHIVE DOCUMENT

Use of a Watershed Model to Characterize and Prioritize Bacteria Sources for Mitigation in New Hampshire Coastal Beach Watersheds.

Jessica Devoid & Ken Hickey

NHDES Beach Inspection Program

- Monitoring NH beaches for >20 yr
 - ▣ Marine & Fresh
- Public Health is our Concern
 - ▣ Prevent the spread of water-borne illness
 - ▣ Pathogens (indicator organisms) & Toxic algae
- Hampton Beach, NH
 - ▣ Awarded 5 stars for water quality by the NRDC in 2008

Responsibilities of the Beach Program

- Assigning each beach a “Tier” status
- Monitoring water quality
 - ▣ λ appropriate to tier status
- Posting Advisories & Warnings
- Inspecting each beach
 - ▣ Facilities, waste receptacles, animal presence, signs, emergency equipment
- Report our findings annually
 - ▣ General public, Local Beach Managers & EPA

NH Coastal Region

- 16 Coastal Beaches in 2008
- Watersheds outlined in white
- Extending from New Castle Town Beach to Seabrook Town Beach
- Isle of Shoals
 - Star Island Beach 2009

Sampling Protocol

- 3 Beaches shown here
- Purple Dots indicate Beach Sampling Stations
 - Wade out to knee depth
 - Collect water
 - 8 hr holding time
- We've been doing this since 1989...

Overview of bacteria data 2004-2007

		Geomean Standard of		Single Sample Standard of		
		35 col/ 100 ml		105 col/100 ml		Adjacent Creeks
Beach	n	n above	% above	n above	% above	or Outfalls
New Castle Town	273	42	15%	13	5%	Pipe
Pirates Cove	172	12	7%	5	3%	Parsons Creek
Wallis Sands	173	6	3%	0	0%	Parsons Creek
Foss	108	2	2%	1	1%	Parsons Creek
Jenness	174	12	7%	3	2%	
Cable	249	10	4%	4	2%	
Sawyer	246	20	8%	8	3%	Eel Pond
Bass	225	15	7%	4	2%	Chapel Brook
Northside Park	147	4	3%	2	1%	Little River
State	255	31	12%	10	4%	Little River
North	276	5	2%	0	0%	

Bacterial Source Identification

- Develop a better understanding
- To identify and prioritize bacteria sources for mitigation
- To create a modeling tool that can be used over time to simulate sources & support removal of bacteria sources Prioritize remediation efforts

Overview: What is a watershed model?

A simplified mathematical representation of a complex, real watershed system.

Three primary components:

- Physical characteristics
- Hydrologic budget
- Pollutant transport

AVGWLF – Arc View Generalized Watershed Loading Function

- Screening level watershed loading model
- Applied in New England as part of NEIWPCC project
- Simulates water and pollutant loading from a watershed
- Monthly time scale
- No in-stream dynamics
- Established for nutrient and suspended solids simulation
- Recently added bacteria simulation

Beach Bacteria Source Investigation

Obtain data and set up model

- Collaborate with diverse group of investigators
 - NHDES Beach Program, Shellfish Program, Subsurface Section, IDDE, NPDES and TMDL programs
- Conduct field reconnaissance surveys
 - ID sources,
 - refine land cover
- Conduct targeted bacteria sampling
- Review and select optimal parameter values

Purpose of Modeling Application

- Estimate bacteria loads by source in each watershed.
- Develop watershed based plans
- Prioritize and mitigate bacteria sources

Insights from Collaboration

- Bacteria data
- Incident reports
- Illicit discharges
- Septic failures
- MST survey results
- Problematic storm drains
- Boat discharges

An aerial photograph of a coastal watershed. A yellow line outlines the boundary of the watershed, which includes a mix of forested areas, fields, and some developed land. The watershed flows towards a beach and the ocean on the right side of the image.

Watershed Reconnaissance Surveys – Focus Areas

- Land Cover Validation and Change Identification
- New development
- Buffer areas
- Storm drains
- Directly connected IC
- Livestock, bird, and pet

Adapted
Center for Watershed Protection's
Reconnaissance Manual

Legend

-  Watershed

Watershed Bacteria Model Setup

Specifying Key Parameter Values

Bacteria source loading rates by type

- Urban runoff
- Failing Septic systems
- WWTP and other PS
- Livestock
- Wildlife

Other Pathogen Related Data	
Wildlife loading rate (org/animal/per day)	5.00E+08
Wildlife density (animals/square mile)	25
Wildlife/Urban die-off rate	0.9
Urban EMC (org/100ml)	7.00E+03
Septic loading rate (org/person per day)	2.00E+09
Malfunctioning system rate	0
WWTP loading rate (cfu/100ml)	200
In-stream die-off rate	0.5

Bacteria fate and transport terms

- Overland die off rate
- In-stream die off rate

Simulating Urban Runoff

Steps:

1. Specify land cover type
2. Assign Event Mean Concentration (EMC) value
3. Bacteria load is a product of EMC and flow volume

$$\begin{aligned}\text{Urban runoff} &= \text{EMC (org/100ml)} \times \text{Volumetric flow rate(volume/day)} \\ \text{bacteria load} &= (\text{bacterial organisms})/\text{day}\end{aligned}$$

Urban Runoff

Urban Event Mean Concentration

Other Pathogen Related Data

Wildlife loading rate (org/animal/per day)	5.00E+08
Wildlife density (animals/square mile)	25
Wildlife/Urban die-off rate	0.9
Urban EMC (org/100ml)	7.00E+03
Septic loading rate (org/person per day)	2.00E+09
Malfunctioning system rate	0
WWTP loading rate (cfu/100ml)	200
In-stream die-off rate	0.5

Table B.4: Summary of Pollutant EMCs in Stormwater Runoff

	All Data	Residential	Commercial	Industrial	Freeways	Open Space
# of Storms Sampled	3,765	1,042	527	566	185	49
Median Event Mean Concentrations (mg/L or ppm, except where noted)						
TDS	80	72	72	86	77.5	125
TSS	59	49	43	81	99	48.5
BOD ₅	8.6	9.0	11.0	9.0	8.0	5.4
COD	53	54.5	58	58.6	100	42.1
Fecal Coliform ¹	5,091	7,000	4,600	2,400	1,700	7,200
NO ₂ + NO ₃	0.60	0.60	0.6	0.69	0.28	0.59
TKN	1.4	1.5	1.5	1.4	2.0	0.74
Total N	2.0	2.1	2.1	2.09	2.28	1.33
Dissolved P	0.13	0.18	0.11	0.10	0.20	0.13
Total P	0.27	0.31	0.22	0.25	0.25	0.31
Dissolved Cu ²	8.0	7.0	7.57	8.0	10.9	--
Total Cu ²	16	12	17	20.8	34.7	10
Dissolved Zn ²	52	31.5	59	112	51	--
Total Zn ²	116	73	150	199	200	40

Source: Pitt *et al.*, 2004.

¹ MPN/100 mL, which represents the most probable number (MPN) of bacteria that would be found in 100 mL of water

² Cu and Zn values are shown in µg/l

CENTER FOR
WATERSHED
PROTECTION
Manual 3

Septic systems

Parcels noted as having past septic issues

Septic system failure rate

Other Pathogen Related Data

Wildlife loading rate (org/animal/per day)	5.00E+08
Wildlife densitiy (animals/square mile)	25
Wildlife/Urban die-off rate	0.9
Urban EMC (org/100ml)	7.00E+03
Septic loading rate (org/person per day)	2.00E+09
Malfunctioning system rate	0
WWTP loading rate (cfu/100ml)	200
In-stream die-off rate	0.5

Simulating Failing Septic Systems

Failing septic system bacteria load =

= (# of failing systems) x (# people/system) x (bacteria load/person)

Assumptions:

1. Assume all parcels >30 m from sewer are on septic
2. 1 structure/parcel and 2 people/structure
3. 1% of septic systems are failing

Bacteria load/person/day obtained
from available literature

Selecting and adding septic systems data

Septic Loading Rate

Lowe, K.S., N. Rothe, J. Tomaras, K. DeJong, M. Tucholke, J. Drewes, J. McCray, and J. Munakata-Marr. 2007. Influent Constituent Characteristics of the Modern Waste Stream from Single Sources: Literature Review. Water Environment Research Foundation.

Other Pathogen Related Data

Wildlife loading rate (org/animal/per day)	5.00E+08
Wildlife density (animals/square mile)	25
Wildlife/Urban die-off rate	0.9
Urban EMC (org/100ml)	7.00E+03
Septic loading rate (org/person per day)	2.00E+09
Malfunctioning system rate	0
WWTP loading rate (cfu/100ml)	200
	1.5

Table 3-8. Literature Values for Concentration of Select Microorganisms Found in STE.

Organism/Organism Type	Mean cfu ¹ /100ml or pfu ² /100ml
Fecal Coliforms	1.1×10^6 (Brown <i>et al.</i> , 1980) 4.2×10^5 (Ziebell <i>et al.</i> , 1977) 1.9×10^6 (Ziebell <i>et al.</i> , 1977) 4.2×10^5 (McCoy and Ziebell, 1975)
Coliphages/Viruses	6.4×10^4 (Brown, <i>et al.</i> , 1980)
Total Coliforms	3.4×10^6 (Ziebell <i>et al.</i> , 1977) 5.7×10^6 (Ziebell <i>et al.</i> , 1977)
Fecal Streptococci	3.8×10^3 (Ziebell <i>et al.</i> , 1977) 1.6×10^5 (Ziebell <i>et al.</i> , 1977) 3.8×10^3 (McCoy and Ziebell, 1975)
Total Bacteria	3.4×10^6 (Ziebell <i>et al.</i> , 1977) 3.0×10^7 (Ziebell <i>et al.</i> , 1977) 3.4×10^8 (McCoy and Ziebell, 1975)

¹ cfu, colony forming units; refers to bacterial counts

² pfu, plaque forming units; refers to viral counts

Watershed Modeling Workshops

- Shared decision making
- Collaboration in setting up the model
- Training to enable DES staff to model independently
- Identify and address challenges early on

Editing Nutrient File: nutrient5

Watershed Based Plans

Characterization and analysis of watersheds supports development of Watershed Plans and implementation of mitigative actions.

Source: U.S. EPA. 2008. Handbook for Developing Watershed Based Plans to Restore and Protect our Waters.

Project Accomplishments

- Project Goals
 - ▣ ID greatest contributing watersheds
 - ▣ Propose watershed restoration based on modeling
- Created Framework for watershed based planning
 - ▣ Includes septic system management plans
 - ▣ Set-up to apply for 319 Funds
- Blazing a trail with AVGWLF-E

Project Team

thank you to...

- Sonya Carlson, Teresa Ptak, and others, NHDES Beach Program
- Jody Connor, NHDES Limnology Section
- Chris Nash and Matt Wood, NHDES Shellfish Program
- Andy Chapman, NHDES Watershed Program
- Rob Livingston, NHDES IDDE Investigator
- Jay Baas, NHDES Subsurface Section
- Andrew Cornwell, NHDES Database Manager
- Dr. Steve Jones, UNH Microbial Source Tracking Investigator
- Dr. Pete Shanahan, Senior Modeling Advisor
- Dr. Barry Evans, AVGWLF developer and advisor
- Cayce Dalton, Lead modeler

And, Thank You all for Coming.

Questions anyone?
