

US EPA ARCHIVE DOCUMENT

Selective Control of Eurasian Watermilfoil (*Myriophyllum spicatum*) Using Three Aquatic Herbicides

Marc Bellaud, ACT Senior Biologist – Presenter

Gerald Smith, ACT President / Aquatic Biologist

AQUATIC CONTROL TECHNOLOGY, INC.

POND AND LAKE MANAGEMENT SPECIALISTS

Aquatic Herbicides

- Risk = Toxicity x Exposure
- Products re-registered by EPA under FIFRA, also registered in each State
- 20 active ingredients for aquatics in 1976 – now only 8 in US
- Many target proteins or photosynthetic pathways
- No aquatic herbicides have a swimming restriction on the label

USEPA Herbicide Registration – what's involved?

- 120 toxicity tests required in every category minimum
- 8-13 years typically required from when a new compound is introduced to when it is registered
- \$50-\$80 million (or more) to register a product in aquatics

POND AND LAKE MANAGEMENT SPECIALISTS

Registered Aquatic Herbicides

Compound	Year Registered	Mode of Action
2,4-D Ester	1959	Auxin – Systemic
2,4-D Amine	1976	
Copper	1950's	Contact – phs – membrane
Diquat	1962	Contact – PSII – membrane
Endothall	1960	Contact – Resp. – membrane
Glyphosate	1982	Growth – protein synthesis
Fluridone	1986	Growth – Enzyme inhibitor
Triclopyr	2002	Auxin Systemic
Imazapyr	2003	Growth – AHAS inhibitor
Carfentrazone	2004	Contact – Enzyme- membrane

New Aquatic Herbicides...

Registration Pending or issued EUP

<u>Compound</u>	<u>Company</u>	<u>Mode of Action</u>
Penoxsulam	SePRO	Growth – ALS enzyme inhib.
Imazamox	BASF	Growth – AHAS enzyme inhib.
Flumioxazin	Valent	Contact- Protox Enzyme
Bis-pyrobac	Valent	Growth – ALS enzyme inhib.

Eurasian watermilfoil

- Perennial dicot
- Vegetative fragmentation and seeds
- Tolerates wide range of water quality
- Canopy forming
- Rapid growth
- Susceptible to several aquatic herbicides

Factors for herbicide selection

- Target species
- Non-target species trying to protect
- Size and configuration of treatment area – potential for dilution
- Water flow
- Concentration Exposure Time (CET)
- Water uses

Reward (Diquat)

- Formulation: Liquid
- Mode of Action: Contact – interferes with photosynthesis
- Environmental Fate: Sediment absorption, photolysis
- Water Use Restrictions: Drinking 1-3 days, Irrigation 1-5 days, Watering Livestock 1 day
- Advantages: Rapid action effective for partial lake or shoreline treatments
- Limitations: Annual control does not kill roots
- Plants Controlled: Milfoil, Curlyleaf Pondweed, Elodea, Hydrilla, Coontail, Pondweeds, Naiad, Duckweed, Bladderwort, Algae

Sonar (Fluridone)

- Formulation: Liquid (AS) and Pellet (SRP, PR, Q, One)
- Mode of Action: Systemic – inhibits carotenoid synthesis
- Environmental Fate: phytolysis
- Water Use Restrictions: Irrigation 7-30 days or until <5-10 ppb
- Advantages: Systemic action kills entire plant including roots, provides multiple years of control, favorable toxicology profile, species selectivity at low doses
- Limitations: Highly soluble not effective for partial lake or shoreline treatments, requires long contact time
- Plants Controlled: Eurasian Watermilfoil, Fanwort, Curlyleaf Pondweed, Hydrilla, many others at higher doses

Renovate (Triclopyr)

- Formulation: Liquid and Flake/Pellet (OTF)
- Mode of Action: Systemic – auxin mimic interferes with plant growth processes
- Environmental Fate: Phytolysis
- Water Use Restrictions: Irrigation 120 days or until non-detect, Drinking set-back distances based on dose
- Advantages: Rapid action effective for partial lake or shoreline treatments, Systemic kills entire plant including roots, multiple years of control
- Limitations: Expensive, Demonstrated effectiveness on only a few aquatic species
- Plants Controlled: Milfoil, Purple Loosestrife

CASE STUDY: Reward (Diquat)

- Twin Lakes (>800 acres) located in Salisbury in northwest CT in the “marble valley” (Canavan & Siver 1995)
- Considerable littoral zone EWM infestation
- Mechanical harvesting performed over throughout the 1990s was not providing effective control
- Several state protected aquatic plant populations in the lakes

A yellow pencil with green and pink bands is placed vertically between the two plant specimens to provide a scale. The text on the pencil includes "DIXON TICONDEROGA 1388-2/HB SOFT".

State Protected Plants

Maps
provided by
CT DEP

Treatment Program Summary (2003 – 2008)

- Area-selective diquat treatment along high-use shorelines
- No-treatment buffers maintained around state protected plant populations

Program modifications...

- Reduced treatment area by directly applying to EWM beds
- Lowered application rate from 1.5 gals/ac to 1.0-1.25 gals/ac
- Treated earlier in growing season

2004

2005

Second Lake CET treatment work performed in 2007

- 13 acre boat lane for Salisbury School Crew Teams along western shoreline
- Tried to limit impact to rare species by:
 - Treating early, in late May
 - Treating at 1 gallon per acre
 - Injecting herbicide 5-6 feet subsurface
 - Maintaining 100-200 foot buffers from known rare plant beds

Comprehensive Monitoring Program Required by DEP

- Early and late season vegetation surveys; DGPS located data points
- Water chemistry sampling **monthly** [pH, alkalinity, TSS, turbidity, nitrogen series, total phosphorus, dissolved phosphorus, temp/do profiles, Secchi disk]
- Phytoplankton and zooplankton sampling

Water Quality Overview...

Typical Ranges – historic and observed between 2003 and 2008

➤ pH	7.9 – 8.5	(S.U.)
➤ Alkalinity	112 – 130	(mg CaCO ₃ /L)
➤ Secchi disk clarity	5.0 – 6.5	(meters)
➤ Phytoplankton density	<2000	(cells/ml)
➤ Zooplankton density	20 – 40	(org/ml)

Pre and Post Vegetation Monitoring

Pre and Post Vegetation Monitoring

CASE STUDY: Sonar (Fluridone)

- Lake St. Catherine: Poultney and Wells, VT
- 1088 acre lake system: 3-basins
- Total volume: 33,611 ac-ft
- Approximately 50% of lake volume below thermocline
- Thermocline depth 6-8 m
- Watershed 9000 acres
- Flushing rate 0.5 years
- EWM found throughout littoral zone estimated at over 300 acres
- Mechanical harvesting program over prior decade; ineffective

Sonar Treatment Protocol

- Whole-lake application of Sonar AS – initial dose 8 ppb, maintain 5-8 ppb for 90 days
- Use of Differential GPS for precision application
- 4 single-day applications performed by 2 airboats
- Weekly monitoring of thermocline depth
- FastTEST – 14 sites sampled 24-hours after each application and weekly until <5 ppb detected

Targeted fluridone concentrations maintained for >120 days

AQUATIC CONTROL TECHNOLOGY, INC.

POND AND LAKE MANAGEMENT SPECIALISTS

Year One – Program Results

- Good selectivity achieved
- But native species impacted

Years 2-5: Program Results

- **2005** - Late May inspection reveals widely scattered milfoil – main lake free of milfoil
- Diver hand pulling performed in selected areas
- **2006-2008** – Continued hand-pulling, suction-harvesting and, spot-treatments with Renovate (triclopyr herbicide)
- Continued recolonization of native species

Pre and Post Vegetation Monitoring

CASE STUDY: Renovate (Triclopyr)

- ★ Lake Morey: Fairlee, VT
- ★ Eurasian watermilfoil discovered in 1991
- ★ DEC issued permit to apply Garlon 3A (triclopyr) in 1993; permit appealed then revoked
- ★ Hand-pulling, suction harvesting, and bottom barrier installations employed since 1991
- ★ Since 1991 over \$1,000,000 expended on non-chemical controls, including in-kind

Association efforts...

EWM growth pattern changed in 2004 and infestation rapidly expanded

Point Intercept Survey

- DATA POINTS were randomly generated throughout littoral zone of lake on 80 m grid
- PRESENCE / ABSENCE sampling enabled creation of vegetation distribution maps
- Resulting data set used for statistical comparison pre and post-treatment
- GPS and GIS utilized

Legend

Control Predictions

A: 0 - 70 % (regrowth likely)

B: 70 - 85 % (regrowth potential subject to site conditions)

C: >85 % (limited regrowth potential)

2007 Treatment Program

- Site A: Renovate 3 (30 ac, 7 ft)
- Site B: Renovate OTF (8 acres, 8 ft)
- Site C: Renovate OTF (4 ac, 8 ft)
- Site D: Renovate OTF (3 ac, 8 ft)

June 24, 2007, Renovate OTF applied at 1.85 ppm and Renovate 3 applied at 1.5 ppm

EWM topped out or approaching surface in all sites

One month post-treatment...

AUGUST 2006

AUGUST 2007

2008 Treatment Program

- ★ Treated 50 acres with Renovate OTF
- ★ All remaining EWM beds targeted
- ★ Treated in mid-May to improve efficacy and reduce impairment to lake use
- ★ Expanded treatment block size
- ★ Continue hand-pulling to remove scattered EWM regrowth

FIGURE 3 - PROPOSED 2008 TREATMENT MAP

<i>Potamogeton illinoensis</i>	Illinois pondweed	0.9%	8.6%	19.8%

Pre and Post Vegetation Monitoring

Data Point Depth Range (feet)	2006 Species Richness	2007 Species Richness	2008 Species Richness
Less than or equal to 5	5.6	5.1	5.3
Greater than 5 and less than or equal to 10	4.5	4.1	5.2
Greater than 10 and less than or equal to 20	3.1	3.6	4.0
Greater than 20	0.2	0.9	1.5
Total	3.1	3.4	3.8

Conclusions...

- Diquat, Fluridone and Triclopyr herbicides can be used to achieve highly-selective control of Eurasian watermilfoil
- No adverse changes to water chemistry, phytoplankton or zooplankton populations
- Very good non-target species selectivity achieved
- Quantitative post-treatment vegetation monitoring needed to evaluate treatment efficacy and document impacts to non-target species
