CONNECTICUT RIVER FISH ASSEMBLAGE ASSESSMENT 2008

Development of Non-wadeable Assessment Tools for New England Rivers: Phase II

Chris O. Yoder

Lon E. Hersha

Center for Applied Bioassessment and Biocriteria

Midwest Biodiversity Institute

Columbus, OH

Bryan Apell and Brandon Kulik

Kleinschmidt Energy and Water Resources

Essex, CT and Pittsfield, ME

Major River Basins in New England

Three Linked Projects:

Development Requires

1. Maine non-wadeable rivers assessment (2001-2008)
2. Connecticut R. assessment (2008-9).
3. Regional EMAP - New England non-wadeable rivers (2008-10).

Why Knowledge of the Fish Assemblage is Important

Current Issues:

- **Limited Knowledge of Extant Fauna** – limited mostly to managed species (especially trout and salmon); need to document relative abundance of co-occurring native and alien species and their respective influence.
- **Naturally Depauperate Faunas** – cold water, coastal drainages – “how will these respond?”
- **Assess Potential Conflicts with High Profile Restoration Goals** – do non-native species pose an unintentional deterrent?

Sampling Methods

An aerial photograph of a river with a rocky, light-colored bank on the left and a darker, more turbulent section of the river on the right. A small motorboat is positioned in the middle of the river. Two people are in the boat; one is standing and using a long-handled net to scoop water from the river. The boat has various equipment on board, including a large white bucket and some gear. The water is dark and appears to be flowing over rocks or a similar substrate.

Developed & Tested in Maine

Standardized Approach:

- Pulsed D.C. boat electrofishing – effort indexed to distance
- Electrode array customized for Maine river conditions
- Intensive survey design – mainstem & non-wadeable tribs.
- Field water quality and habitat data
- July 1 – September 30 index period

Raft added in 2005

- Sampling guided by a QAPP
- Standardized sampling to yield comparable data
- All representative habitat types within each site
- Geo-referenced sample site location and sample track
- Fish are identified to species, enumerated, and weighed
- DELT anomalies recorded

Boat driver

Sampling Procedure

Two netters
collect all fish
sighted

1.0 km distance includes
all nearshore habitats

Sampling boat moves in a
general downstream direction,
but is maneuvered within the
site to produce a thorough
sampling of each site

Connecticut River Fish Assemblage Assessment: 2008

- 43 sites (1x each) – “intensive or pollution survey” design
- July 1 – Sept. 30 index period
- Sampled August 27 – October 15
- Sampling delayed by high flows in July & early August
- ESA issue precluded sampling below Turners Falls

USGS 01129500 CONNECTICUT RIVER AT NORTH STRATFORD, NH

Stream Drawing:

Instructions for scoring the alternate cover metric: Each cover type should receive a score of between 0 and 3, Where: 0 - Cover type absent; 1 - Cover type present in very small amounts or if more common of marginal quality; 2 - Cover type present in moderate amounts, but not of highest quality or in small amounts of highest quality; 3 - Cover type of highest quality in moderate or greater amounts. Examples of highest quality include very large boulders in deep or fast water, large diameter logs that are stable, well developed rootwads in deep/fast water, or deep, well-defined, functional pools.

Yes/No

☐ ☐ Is Stream Ephemeral (no pools totally dry or only damp spots)?
☐ ☐ Is there water upstream?
How Far: _____
☐ ☐ Is There Water Close Downstream?
How Far: _____
☐ ☐ Is Dry Channel Mostly Natural?

Study Area Organization

- **Zone 1: Murphy Dam (Pittsburg, NH) - Wyoming Dam (Guildhall, VT)**
- **Zone 2: Wyoming Dam - McIndoe Dam (McIndoe Falls, VT)**
- **Zone 3: McIndoe Dam - below Wilder Dam (Grafton County)**
- **Zone 4: Wilder Dam - West River confluence**
- **Zone 5: West River Confluence - Turners Falls Dam Impoundment (Turners Falls, MA)**

Zone 1

Murphy Dam - Wyoming Dam

- 21 species
- Pre dominated (biomass) by stenothermic species including:
 - Atlantic salmon
 - Brook trout
 - Brown trout
 - Slimy sculpin
 - Burbot
 - Rainbow trout

Zone 1

Top Five Most Abundant Species Zone 1

Zone 2

Wyoming Dam - McIndoe Dam

- 25 species
- Transition zone
- Reduction in stenothermic species (CPUE)
- Increase in mesothermic and eurythermic sp.
- Impounded habitat effects

Connecticut River Watershed
Selected Tributaries & Dams

Zone 2

Top Five Most Abundant Species Zone 2

Zone 3

McIndoe Dam-Wilder Dam

- 21 species
- Predominated by mesothermic & eurythermic sp.
- Stenothermic species are absent
- First appearance of diadromous species (sea lamprey)

Zone 3

Top Five Most Abundant Species Zone 3

Zone 4

Wilder Dam- West River

- 27 species
- Assemblage predominated by Centrarchids
- American shad (y-o-y)

Connecticut River Watershed Selected Tributaries & Dams

Selected Dams*

- 1 Leesville Dam (Salmon R.)
- 2 Rainbow Dam (Farmington R.)
- 3 Enfield Dam (Breached)
- 4 DSI Dam (Westfield R.)
- 5 Holyoke Dam
- 6 Turners Falls Dam
- 7 Vernon Dam
- 8 Townshend Dam (West River)
- 9 Ballows Falls Dam
- 10 Wilder Dam
- 11 Ryegate (Dodge Falls) Dam
- 12 McIndose Station Dam
- 13 Comerford Station Dam
- 14 Moore Reservoir Dam
- 15 Gilman Project Dam
- 16 Groveton (Wyoming) Dam (breached)
- 17 Lower (Canaan) Dam
- 18 No dam
- 19 Murphy Dam
- 20 First CT Lake Dam
- 21 Second CT Lake Dam
- 22 Moose Falls Dam

*There are over 1,000 dams in the Connecticut River watershed

Map by the U.S. Fish and Wildlife Service

Sunderland, MA 01375
www.fws.gov/r5cro

Zone 4

Top Five Most Abundant Species Zone 4

Zone 5

West River- Turners Falls Impoundment

- 19 species
- Increase in diadromous species:
 - American eel
 - American shad
 - Sea lamprey

Connecticut River Watershed Selected Tributaries & Dams

Selected Dams*

- 1 Leeville Dam (Salmon R.)
- 2 Rainbow Dam (Farmington R.)
- 3 Enfield Dam (Breached)
- 4 DSI Dam (Westfield R.)
- 5 Holyoke Dam
- 6 Turners Falls Dam
- 7 Vernon Dam
- 8 Townshend Dam (West River)
- 9 Bellows Falls Dam
- 10 Wilder Dam
- 11 Ryegate (Dodge Falls) Dam
- 12 McIndose Station Dam
- 13 Comerford Station Dam
- 14 Moore Reservoir Dam
- 15 Gilman Project Dam
- 16 Groveton (Wyoming) Dam (breached)
- 17 Lower (Canaan) Dam
- 18 No dam
- 19 Murphy Dam
- 20 First CT Lake Dam
- 21 Second CT Lake Dam
- 22 Moose Falls Dam

*There are over 1,000 dams in the Connecticut River watershed

Sunderland, MA 01375
www.fws.gov/r5crp

Zone 5

Top Five Most Abundant Species Zone 5

Patterns?

- Brook trout absent & other stenothermic species severely reduced in zones 3-5.
- CPUE reductions (%) in Zone 2
 - Salmon 57%
 - Brown trout 83%
 - Rainbow trout 62%
 - Slimy sculpin 96%

- Generalist and eurythermic species on the rise
- Effects of blackbass?
- % increase in CPUE in Zone 2
 - Smallmouth bass 3000%
 - Pumpkinseed 3100%

Atlantic Slope IBI - Daniels et al. (2003)

Ohio Non-Wadeable IBI - Ohio EPA (1987)

Maine Non-Wadeable IBI - Under Development

Maine & Connecticut Rivers Assemblage Results Comparison: 2002-8

River	Species	Intro.	No/Km	Kg/km	Effort (km)
Kennebec	37	9	437	56.8	132.1
Androscoggin	32	12	598	31.4	97.0
Penobscot	31	6	335	19.8	42.8
St. John	18	2	211	12.5	14.5
Aroostook	22	0	311	15.2	9.3
Allagash	19	1	413	10.6	6.3
Connecticut	41	5*	157 ←	6.1 ←	51.9
Scioto R. (OH)	82	6*	603	157	107.8

* - 5 as hybrids

Checklist of Fish Assemblage Development Tasks:

- Develop an effective & systematic sampling method (2001-3 in Maine)
- Develop a sufficient spatial & temporal database (2008-9)
- Autecology of extant fauna & metric development (started in 2005-6; add new sp.)
- Identify riverine ecotypes (2009)
- Establish "reference condition" - BCG (2009-10)
- Derive and test IBIs with reference and independent test sites (2009-10)

Data Manipulation Hierarchy of Field Collected Biological Samples: New England Non-wadeable IBIs

Tiered Aquatic Life Use Conceptual Model: Draft Biological Tiers

(10/22 draft)

Condition of the Biotic Community

[Specific to Ecosystem]

LOW — Human Disturbance Gradient —> HIGH

Cold Water & Mixed Assemblages

We need an "assumed baseline" for the Biological Condition Gradient applicable to NE large rivers

Assessing Biological Integrity in Running Waters A Method and Its Rationale

James R. Karr
Kurt D. Fausch
Paul L. Angermeier
Philip R. Yant
Isaac J. Schlosser

Process has been refined and "better quantified" by Hughes et al. (1998) and most recently by Whittier et al. (2007)

Illinois Natural History Survey
Special Publication 5 September 1986

Guidelines for Deriving Regionally Relevant "IBI Type" Assessment Tools

- Karr et al. (1986) provides guidance for metric development, substitution, natural history.
- Requires an extensive database from consistent sampling of both reference condition and a gradient of human disturbance.
- Requires extensive testing of candidate metrics and aggregate indices.
