CONTRACT NO. DACW33-01-D-0004
DELIVERY ORDER: 1
SUBMITTAL OF DELIVERABLE – Task RI-13 Semi-permeable Membrane Device (SPMD) Investigation, Chemistry Data Report

Dear Ms. Lawrence:

Enclosed please find two double-sided copies of the final, validated chemistry data report for Delivery Order 01, *Centredale Manor Restoration Project Superfund Site.* This report includes *in-situ* and analytical results from the semi-permeable membrane device (SPMD) investigation conducted at the Centredale Manor Restoration Project (CMRP) Superfund site in June 2005. Analytical results reported here will be interpreted with the feasibility study (FS). The SPMD investigation, results and validation activities are summarized below.

## 2005 SPMD INVESTIGATION

The SPMD investigation included two components: 1) deployment and retrieval of SPMDs at water column and sediment locations along the eastern bank of the Woonasquatucket River and at Well MW-05S and 2) chemical analysis of SPMDs, co-located sediments and groundwater from Well MW-05S.

### *SPMD Deployment and Retrieval*

SPMDs were deployed on June 3, 2005 at six locations – five locations in the Woonasquatucket River and one location in the Brook Village parking lot at Well MW-05S (Figure 1). River locations were selected with respect to the area of expected discharge of VOC-contaminated groundwater, as determined from the vapor-to-water diffusion study conducted by the U.S. Geological Survey in 1999 (USGS, 2000). Locations CMS-SPMD2, CMS-SPMD3 and CMS-SPMD4 were located within the area of expected discharge (Figure 1). The other two river stations (CMS-SPMD1 and CMS-SPMD5) were located outside the area of expected discharge (Figure 1).

SPMD deployment and retrieval was conducted according to the approved work plan (Battelle, 2005), with the following exceptions:

- Relative hydraulic head measurements were not collected because the river bottom was dominated by cobble and the mini-piezometer could not penetrate deep enough to get reliable readings.
- The physical USGS stage height gauge is no longer present at the site and visual readings could not be obtained as a result. However, the USGS gauge has been replaced with the real-time

US EPA ARCHIVE DOCUMENT

USGS gauge 01114500, which is physically located at the same place (but in a locked "shed"). Real-time readings from the gauge were obtained from the USGS website (http://waterdata.usgs.gov/ri/nwis/uv/? site_no=01114500&PARAmeter_cd=00065,00060). Water depth measurements in the field were consistent with the stage height readings from that gauge.

- Adjustments to selected SPMD locations were made in the field as follows:
  - CMS-SPMD1 (upstream location) – This is in an area of very high current and the bottom type is cobble and boulder with very little sediment. The deployment location was moved to approximately 200-ft upstream rather than 250-ft. The revised location was selected based on water depth, *i.e.*, the water column SPMD was placed in the deepest location possible to avoid air exposure should the river level drop. Further, the buried SPMD cage could not be buried in the sediment as deep as planned due to the rocky sediment bottom. The top of the buried SPMD cage was approximately 2-in below bottom rather than 3-in.
  - CMS-SPMD5 (downstream location) – The SPMD cage could not be buried in the sediment as deep as planned due to the very hard cobble bottom. The top of the cage was approximately 1-in below sediment bottom rather than 3-in.

*In-situ* water quality data, groundwater elevation data and surface water elevation data collected during SPMD deployment are summarized in Tables 1, 2 and 3, respectively.

During SPMD deployment, co-located sediment samples were collected at each of the five SPMD river locations from a depth equivalent to the center depth of the cage. SPMDs were retrieved on June 30, 2005 after 27-d exposure. During SPMD retrieval, groundwater from Well MW-05S was also collected for chemical testing. SPMD, co-located sediment and groundwater samples collected for chemical testing are summarized in Table 4. Field photos, SPMD deployment and sample collection logs, and elevation survey log sheets are provided in Appendix A. SPMD cages deployed in the water column were fouled. There appeared to be reduced (or no) water flow through the cage deployed in the water column at location CMS-SPMD2 (Figure 1) because the cage was completed fouled (Appendix A). SPMDs in the buried cage located downstream of the Well MW-05S were clear; SPMDs in the buried cages located near Well MW-05S (*i.e.*, CMS-SPMD2 and CMS-SPMD3) and in Well MW-05S were a yellow/green color (Appendix A).

***Chemical Testing of SPMD, Co-located Sediments and Groundwater***

SPMD and co-located sediment samples (Table 4) were analyzed for 2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD) according to the approved work plan (Battelle, 2005) and project Quality Assurance Project Plan (QAPP) (Battelle, 2002a, b). Groundwater was analyzed for dioxin/furans and volatile organic compounds (VOCs) according to Battelle (2002a,b and 2005).

SPMD results are summarized in Figures 2 and 3; complete data are presented in Sections 1 and 2 of this report. SPMDs buried in the river sediment at the upstream locations had relatively low TCDD concentrations (Figure 2). Concentrations increased substantially, however, at locations immediately downstream of Well MW-05S (Figure 2). TCDD concentrations returned to background levels further downstream (Figure 2). Concentrations of TCDD in the SPMDs from the water column locations were comparable at upstream and downstream locations and were not significantly higher than SPMD blank values (Figure 3). TCDD was detected in the SMPD retrieved from Well MW-05S, suggesting that dissolved dioxin was present in the groundwater at Well MW-05S (Figure 3). SPMD results will be further interpreted in the FS.

US EPA ARCHIVE DOCUMENT

## RESULTS

This report is organized in three sections and one appendix, as follows:

**Section 1—Dioxin Results**
**Section 2—Volatile Organic Compound (VOC) Results**
**Section 3—Third Party Validation Reports**
**Appendix A—Field Documentation**

Sections 1 and 2 of this document are organized as follows:

1. A QA/QC narrative, which includes a discussion of the QC results and a description of measurement performance criteria (MPC) exceedances and the impact, if any, the exceedances may have on the overall field sample data.

2. Summary report tables for all field and QA/QC samples. Data for authentic sediment samples are presented on a pictogram per gram (pg/g) dry weight basis. SPMD analytical results are presented in pg/sample basis. Groundwater dioxin data are presented in pg per liter (pg/L) and the VOC data are in microgram per liter ($\mu$g/L). QC samples are presented on a concentration (blanks and laboratory duplicates), recovery (LCS, MS, MSD), and/or percent difference (SRM) basis. All report tables follow EDD reporting format requirements.

Chemistry results were evaluated against the MPC identified in the project QAPP and data qualifiers were applied when the analytical MPCs were exceeded.

All chemistry data have been loaded into the Centredale database.

### VALIDATION SUMMARY

Laboratory data generated for this study received internal verification and validation by the Quality Assurance (QA) officers from each participating laboratory (Table 5). All data were then finalized through third party validation, which was conducted by USEPA Region 1 and Environmental Standards of Valley Forge, PA (Section 3). This data report has also been reviewed and validated by the Battelle Quality Assurance Unit to verify the accuracy and completeness of the report, and by a senior scientist for technical accuracy.

Dioxin data were validated by USEPA Region 1 at a Tier III level using first the criteria in the Centredale Manor Tasks 19-22 QAPP (Battelle 2001) that included the QAPP Addendum (Battelle 2002a) and the QAPP Errata Sheet (Battelle 2002b), and also included the criteria in EPA Method 1613B, September 15, 1997, defaulting next to *Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996 criteria, and to EPA Region I's Environmental Services Assistance Team Dioxin Data Validation SOP ESAT-01-0007 (01/08/2003).

VOC data were validated by Environmental Standards of Valley Forge, PA at a Tier II level in accordance with the *Region I, EPA New England Data Validation Functional Guidelines for Evaluating Environmental Analyses* (US EPA, 12/1996), the *Centredale Manor Restoration Project Site Final Quality Assurance Project Plan (QAPP) – Addendum to Tasks 19-22 QAPP* (Battelle, 2002a), and the *Errata to Centredale Manor Tasks 19-22 Quality Assurance Project Plan – Addendum* (Battelle, 2002b).

US EPA ARCHIVE DOCUMENT

In general, the validator fields in the final, validated EDDs (e.g., FINAL_RESULT) are only populated for study samples, not internal laboratory QC samples (e.g., blank, LCS, or duplicate). Updating the validator fields for internal laboratory QC samples is not a required element of third party validation.

Validation reports are provided in Section 3.

(a) Three sets of SPMDs were deployed at each river location. The SPMD cage buried in the river sediment is denoted by "-S-01" in the sample ID. SPMDs deployed in the water column are denoted by "-W-01" or "-W-02" in the sample ID.
(b) Co-located sediment was collected during SPMD deployment on June 3, 2005. Sediment was collected to a depth of approximately 6-in and within 1-ft of the location where the SPMD was deployed.

# Semi-Permeable Membrane Devices (SPMDs)

# DIOXIN/FURAN SEDIMENT QA/QC SUMMARY
# QC Batch 50971-19

**PROJECT:** USACE NAE Delivery Order #01 Centredale

**PARAMETER:** 2,3,7,8-TCDD (TCDD) by High Resolution Mass Spectrometry (HRMS)

**LABORATORY:** Battelle, Columbus, OH

**MATRIX:** Semi-Permeable Membrane Device (SPMD)

**SAMPLE CUSTODY:** Eighteen SPMD samples were received at Battelle Columbus on July 6, 2005. All but two samples were received in good condition and the cooler temperatures upon receipt were 0.8°C and 2.3°C, respectively. Two samples CMS-SPMD4-W-01 and CMS-SPMD3-W-02 were broken in the bottom of the jar. However, because each sample was packed in individual bubble bags and then placed in the jar, the two samples did not appear compromised. The project manager was notified and gave the OK to proceed with the samples in broken jars. Broken jars were replaced on receipt at the laboratory. The eighteen SPMDs were processed in QC Batch 50971-19.

**QA/QC MEASUREMENT PERFORMANCE CRITERIA:**

| | Reference Method | Blank | Surrogate Recovery | LCS/MS Recovery | SRM % Diff. | MS/MSD Replicate Relative Precision | Achieved RL (pg/sample) | Project Goals [c] (pg/g dry) |
|---|---|---|---|---|---|---|---|---|
| **Dioxin/ Furan/** | L-23 Battelle SOP ASAT.II-001-02 | <5× MDL, or associated samples >5x blank values | 25-150% Recovery | *LCS:* Method 1613B, Table 6 OPR[a] *MS/ MSD:* NA | NA | NA | Tetras: 0.74 – 13.92 | Tetras: NA |

[a] Method 1613B, Table 6 OPR requirements documented on LCS summary report table.

**METHOD:** SPMD samples were processed and analyzed for 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (TCDD) following general procedures in EPA Method 1613 as outlined in the Final Quality Assurance Project Plan Addendum 3, Lyman Mill Pond Sediment Investigation, Centredale Manor Restoration Project Superfund Site, North Providence , Rhode Island (March 2005).

**Sample Preparation** – All SPMDs were spiked with 2,3,7,8-TCDD-$^{37}Cl_4$ by the manufacturer prior to field deployment in order to assess the retention of the target analyte during sampling. The eighteen SPMD samples were processed in BATCH 50971-19. Debris was wiped off each sample using individual Kim Wipes wetted with de-ionized water. After the SPMDs were wiped down it was noted that samples CMS-SPMD2-S-01, CMS-SPMD3-S-01, CMS-SPMD4-S-01 and CMS-SPMD-MW05S-01 were yellow in color. One of the two SPMDs that comprised sample CMS-SPMD1-S-01 contained a pocket of air and one of the two SPMDs that comprised sample CMS-SPMD2-W-01 contained a tear along one side. The cleaned SPMD samples were placed in 250-mL individual jars with Teflon-lined screw caps. An empty jar was used for each of the method blank and the laboratory control sample (LCS). Hexane (100 mls) was added to each sample jar, and then each jar was spiked with $^{13}C_{12}$-labeled PCDD/PCDF internal standard solutions. The LCS sample was spiked with native PCDD/PCDF at this time. The sample jars were capped and sealed with Teflon tape. The samples were then placed on the shaker table and shaken for 12 hours. After 12 hours of shaking the hexane was decanted from each sample into individual Turbo

US EPA ARCHIVE DOCUMENT

tubes. This procedure was repeated adding the second 100 mLs of hexane for each sample to the first fraction of hexane for each sample. Another 100 mLs of hexane was added to each sample jar and the samples were placed on the shaker table for 4 hours of shaking. The third fraction of hexane for each sample was added to the previous two fractions for each sample. Each extract went through gel permeation chromatography (GPC) cleanup then each extract was then processed through acid/base silica and carbon cleanup columns. The SPMD extracts were spiked with 1,2,3,4-TCDD-$^{13}C_{12}$ and 1,2,3,7,8,9-HxCDD-$^{13}C_{12}$ recovery standard and concentrated to a final sample volume of 20 µL.

**2,3,7,8-TCDD Analysis** – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. A DB5, or equivalent, column was used for the analysis of the 2,3,7,8-TCDD.

The following revisions to Method 1613 as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank and one LCS (OPR).

2. The GC/HRMS instrumentation was calibrated for PCDD/PCDF at levels specified in Method 1613 with two additional calibration standards at concentrations equivalent to $^1/_{10}$ and ½ the level of Method 1613's lowest calibration point. The CS-0.5 is used to calculate the reporting limit and the CS-0.1 is used mainly as a sensitivity check. The calibration range corresponds to the following levels on a per sample basis assuming a final sample volume of 20 µL: 5.0 to 4,000 pg/sample for 2,3,7,8-TCDD.

Any additional minor revisions to Method 1613 are fully documented in the analytical record.

Sample CMS-SPMD-5-S-01was found to have poor chromatography in the initial analysis. This sample was diluted and re-analyzed to improve chromatography.

Upon initial analysis it was found that 2,3,7,8-TCDD had peak areas above the level of the calibration curve in samples CMS-SPMD3-S-01 and CMS-SPMD2-S-01; therefore, these samples were diluted and re-analyzed. The results for 2,3,7,8-TCDD for these samples are reported from the dilution analyses.

**HOLDING TIMES:**

Samples were prepared for analysis in one analytical batch. Samples were extracted within 1 week of receipt at the laboratory and completely analyzed within 3 weeks of extraction.

| Batch | Extraction Date | Analysis Date |
|---|---|---|
| 50971-19 | 07/12/2005 | 07/28-08/02/2005 |

**DETECTION LIMITS:**

TCDD results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the low calibration standard and adjusted for sample specific processing factors and volumes, as follow:

RL = (Conc. in CS-0.5 Std. × final extract volume × dilution factor)/ Sample size

US EPA ARCHIVE DOCUMENT

Where,
Conc. in low standard = 0.25 to 2.5 pg/µL
Final Extract Volume = 20 µL
Dilution Factor = documented in project file
Sample Size = 1

**BLANKS:** One laboratory method blank was processed with the analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

**50971-19**– The target analyte was not detected.

**LABORATORY CONTROL SAMPLE:** A laboratory control sample (LCS or OPR) was prepared with the analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

**50971-19** – The LCS sample met the criteria found in Table 6 of Method 1613, Revision B for TCDD.

**MATRIX SPIKES:** NA.

**INTERNAL STANDARDS:** Fifteen internal standards were added to each sample prior to processing. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

**50971-19** – Recoveries of internal standards were within 25-150% for all analytes in all samples.

**SRM:** NA

# QUALITY ASSURANCE STATEMENT

**Project Title:** USACE New England District, Centredale Manor Task RI-13 SPMD Samples (SDG 50971-19): Dioxin/Furan Data

**Project Number:** G487002-RI13B2

**Description of Data:** SPMD samples for Dioxin/Furan

**Description of audit and review activities:**

1)Reviewed sample preparation Laboratory Record Books (LRB). Tracked COC from sample receipt to analytical injection. Reviewed standard/spike preparation records. Resolved all resulting LRB numbers (i.e. sample tracking numbers) with analytical designations. Reviewed data package for data recording consistent with the QAPP and department SOPs.

2)Reviewed analytical (HRMS) data. Reviewed all hand-entered parameters (e.g. sample masses, sample names, calibration curve date, etc) for each analytical run. Reviewed calibrations results to ensure that Relative Response Factors (RRF) were within the limit of calibration RRF. Reviewed 10% data transfer to spreadsheets.

3)Reviewed spreadsheets. Accessed e-file of excel spreadsheets and reviewed formula and relative and absolute cell addresses to ensure accurate data transposition.

4)Reviewed report. Ensured report accurately reflected raw data and resulting spreadsheets.

**Description of outstanding issues or deficiencies which may affect data quality:**

1) Minor QC issues were submitted to the analytical staff for correction, no outstanding issues present.

# Co-Located Sediment

# DIOXIN/FURAN SEDIMENT QA/QC SUMMARY
## QC Batch 50971-29

| | |
|---|---|
| **PROJECT:** | USACE NAE Delivery Order #13 Centredale |
| **PARAMETER:** | 2,3,7,8-TCDD by High Resolution Mass Spectrometry (HRMS) |
| **LABORATORY:** | Battelle, Columbus, OH |
| **MATRIX:** | Sediment |
| **SAMPLE CUSTODY:** | Five sediment samples were received at Battelle Columbus on June 7, 2005. Samples were received in good condition and the cooler temperature upon receipt was 1.0°C. The sediments were processed in QC Batch 50971-29. |

**QA/QC MEASUREMENT PERFORMANCE CRITERIA:**

| | Reference Method | Blank | Surrogate Recovery | LCS/MS Recovery | SRM % Diff. | MS/MSD Replicate Relative Precision | Achieved RL (pg/g dry) | Project Goals [c] (pg/g dry) |
|---|---|---|---|---|---|---|---|---|
| **Dioxin/ Furan/** | L-23 Battelle SOP ASAT.II-001-02 | <5× MDL, or associated samples > 10x blank values | 25-150% Recovery | *LCS:* Method 1613B, Table 6 OPR[a] *MS: MS:* 50-120% Recovery [b] | ≤30% PD[b] | ≤30% RPD[b, d] | TCDD: 0.54 – 0.56 (2.56 for 1:5 dilution) | TCDD: 0.008 (ECO) – 0.0684 (HH) |

[a] Method 1613B, Table 6 OPR requirements documented on LCS summary report table.
[b] Certified values must be >5× the MDL.
[c] Certified values must be >5× the MDL.
[d] *Sample replicate precision:* concentrations in sample replicate must be >10× the MDL.

**METHOD:** Sediment samples were processed and analyzed for 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (TCDD) following general procedures in EPA Method 1613 as outlined in the Final Quality Assurance Project Plan Addendum 3, Lyman Mill Pond Sediment Investigation, Centredale Manor Restoration Project Superfund Site, North Providence, Rhode Island (March 2005).

**Sample Preparation** – The five samples were processed in BATCH 50971-29. Aliquots of each sediment sample were weighed into individual jars and mixed with Hydromatrix drying agent. Approximately 10 g wet weight of each sediment sample was used. The five samples plus five QC samples were prepared for TCDD. The sediment/Hydromatrix mixtures were spiked with $^{13}C_{12}$-labeled TCDD internal standard solution. Matrix spike, matrix spike duplicate, and the laboratory control spike (LCS) samples were spiked with native TCDD at this time. The sediment /Hydromatrix mixtures were placed into Accelerated Solvent Extraction (ASE) cells. The samples were ASE extracted using methylene chloride. Each extract went through gel permeation chromatography (GPC) cleanup then was spiked with 2,3,7,8-TCDD-$^{37}Cl_4$ cleanup standard for monitoring recovery of analytes through the cleanup procedures. Each extract was then processed through acid/base silica and carbon cleanup columns. The sediment extracts were spiked with 1,2,3,4-TCDD-$^{13}C_{12}$ and 1,2,3,7,8,9-HxCDD-$^{13}C_{12}$ recovery standard and concentrated to a final sample volume of 20 µL.

**PCDD/PCDF Analysis** – Each extract was analyzed by gas chromatography/high

US EPA ARCHIVE DOCUMENT

resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. A ZB-5, or equivalent, column was used for initial analysis of TCDD.

The following revisions to Method 1613 as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank, one LCS (OPR), one sediment standard reference material, one matrix spike, and one matrix spike duplicate.

2. The GC/HRMS instrumentation was calibrated for PCDD/PCDF at levels specified in Method 1613 with two additional calibration standards at concentrations equivalent to $^1/_{10}$ and ½ the level of Method 1613's lowest calibration point. The CS-0.5 is used to calculate the reporting limit and the CS-0.1 is used mainly as a sensitivity check. The calibration range corresponds to the following levels in the samples assuming an average sample dry weight of 9.3475 g of soil and a final sample volume of 20 µL: 0.11 to 430 pg/g dry for TCDD.

Any additional minor revisions to Method 1613 are fully documented in the analytical record.

Upon initial analysis of the re-extracted samples, it was found that TCDD peak areas were above the level of the calibration curve peak areas in sample CMS-SD-5002-0005-01; therefore, sample CMS-SD-5002-0005-01 was diluted 1:5 and re-analyzed. The results for TCDD for this sample are reported from the dilution analysis.

**HOLDING TIMES:** The samples were prepared for analysis in one analytical batch (SDG 50971-29). Samples were extracted within 11 weeks of receipt at the laboratory and completely analyzed within 9 days of extraction.

| Batch | Extraction Date | Analysis Date |
|---|---|---|
| 50971-29 | 08/22/2005 | 08/26-08/30/2005 |

**DETECTION LIMITS:** TCDD results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the CS-0.5 calibration standard and adjusted for sample specific processing factors and volumes, as follow:

RL = (Concentration in CS-0.5 Std. × final extract volume × dilution factors)/ Sample size

Where,
Concentration in low standard = 0.25 pg/µL
Final Extract Volume = 20 µL
Dilution Factor = documented in project file
Sample Size = approximately 9.3-g dry

Achieved RLs did not meet project detection limit goals for TCDD. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods.

**BLANKS:** One laboratory method blank was processed with the analytical batch. Blanks are

US EPA ARCHIVE DOCUMENT

analyzed to ensure that the sample extraction and analysis methods were free of contamination.

**50971-29**– TCDD was detected at a trace level; however, the level detected was below the reporting level.

**LABORATORY CONTROL SAMPLE:** A laboratory control sample (LCS or OPR) was prepared with the analytical batch. The percent recovery of target compound was calculated to measure data quality in terms of accuracy.

**50971-29**– The LCS sample met the criteria found in Table 6 of Method 1613, Revision B for TCDD.

**MATRIX SPIKES:** One matrix spike (MS)/matrix spike duplicate (MSD) sample set was prepared with the batch to measure data quality in terms of accuracy and precision. The MS and MSD were fortified with the target compound to monitor data quality in terms of accuracy and precision.

**50971-29**– TCDD was not spiked >5x background; therefore, the alternative percent recoveries and the RPD were calculated. The alternative recoveries were within the 50-120% limit and the alternative RPD between duplicates for TCDD was found to be 14%.

**INTERNAL STANDARDS:** One internal standard was added to each sample prior to processing, one standard was added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

**50971-29**– Recoveries of internal standards were within 25-150% for all analytes in all samples.

**SRM:** A standard reference material (Wellington DX-2) was prepared with the analytical batch. The percent difference (PD) between detected concentrations and certified values was calculated to measure data quality in terms of accuracy.

**50971-29**– TCDD was found to be within the limit of 30% difference from the certified value.

## QUALITY ASSURANCE STATEMENT

**Project Title:** USACE New England District, Centredale Manor Task RI-13 SPMD Sediments Samples (SDG 50971-19): TCDD Data

**Project Number:** G487002-RI13B2

**Description of Data:** SPMD Sediment Samples for TCDD

**Description of audit and review activities:**

1)Reviewed sample preparation Laboratory Record Books (LRB). Tracked COC from sample receipt to analytical injection. Reviewed standard/spike preparation records. Resolved all resulting LRB numbers (i.e. sample tracking numbers) with analytical designations. Reviewed data package for data recording consistent with the QAPP and department SOPs.

2)Reviewed analytical (HRMS) data. Reviewed all hand-entered parameters (e.g. sample masses, sample names, calibration curve date, etc) for each analytical run. Reviewed calibrations results to ensure that Relative Response Factors (RRF) were within the limit of calibration RRF. Reviewed 10% data transfer to spreadsheets.

3)Reviewed spreadsheets. Accessed e-file of excel spreadsheets and reviewed formula and relative and absolute cell addresses to ensure accurate data transposition.

4)Reviewed report. Ensured report accurately reflected raw data and resulting spreadsheets.

**Description of outstanding issues or deficiencies which may affect data quality:**

1) Minor QC issues were submitted to the analytical staff for correction, no outstanding issues present.

# Groundwater

# DIOXIN/FURAN GROUNDWATER QA/QC SUMMARY
# QC Batches 50971-20 and 50971-35

| | |
|---|---|
| **PROJECT:** | USACE New England District Delivery Order #13 Centredale |
| **PARAMETER:** | Dioxin/Furan by High Resolution Mass Spectrometry (HRMS) |
| **LABORATORY:** | Battelle, Columbus, OH |
| **MATRIX:** | Groundwater |
| **SAMPLE CUSTODY:** | Four jars of one groundwater sample were received at Battelle Columbus on July 6, 2005 in one cooler. Sample jars were received in good condition and the cooler temperature upon receipt was 2.3°C. |

**QA/QC MEASUREMENT PERFORMANCE CRITERIA (MPC):**

| | Reference Method | Blank | Surrogate Recovery | LCS/MS/ MSD Recovery | SRM % Diff. | MS/MSD Replicate Relative Precision | Achieved RL (pg/L)[d] | Project Goals [c] (pg/L) |
|---|---|---|---|---|---|---|---|---|
| **Dioxin/ Furan** | L-23 Battelle SOP ASAT.II-001-02 | <5× MDL, or associated samples >5× blank values (>10× blank values for OCDD, OCDF and totals) | 25-150% Recovery | *LCS*: Method 1613B, Table 6 OPR[a] *MS/MSD:* 50-120% Recovery [b] | Not appli-cable | ≤30% RPD[b] | Tetras: 0.44-9.70 Penta-Hepta: 0.70-47.70 Octas: 1.32-41.10 | Tetras : 10.00 Penta-Hepta: 50 Octas: 100 |

[a] Method 1613B, Table 6 OPR requirements documented on LCS summary report table.
[b] Analyte concentration in MS/MSD must be >5× background concentration to be used for data quality assessment.
[c] Based on Chronic Ambient Water Quality Criteria
[d] achieved RLs from batch 50971-35.

**METHOD:** Groundwater samples were processed and analyzed for seventeen 2,3,7,8-substituted polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/PCDF) following general procedures in EPA Method 1613, Revision B as outlined in the Final Quality Assurance Project Plan Addendum 3, Lyman Mill Pond Sediment Investigation, Centredale Manor Restoration Project Superfund Site, North Providence, Rhode Island (March 2005).

**Sample Preparation** – The groundwater sample was processed in Batches 50971-20 (original extraction) and 50971-35 (re-extraction). The water sample jars were visually inspected for solids and determined to contain less than 1 percent solids and, therefore, did not require filtering.

For the samples in Batch 50971-20, approximately 1 L of the one groundwater sample, the laboratory method blank, the laboratory control spike (LCS or OPR), the matrix spike (MS), and the matrix spike duplicate (MSD) were transferred into individual 2-L muffled separatory funnels, and the internal standard was added to each sample. Matrix spike standard was added to the LCS, MS, and MSD samples. Each separatory funnel had 60 mL of methylene chloride added to it, each was shaken for two minutes, and

**METHOD (cont):**

then the methylene chloride layer was drained through 10-15 g of sodium sulfate into a round bottom (RB) flask. This process was repeated two times. Each extract went through gel permeation chromatography (GPC) cleanup then was spiked with 2,3,7,8-TCDD-$^{37}Cl_4$ cleanup standard for monitoring recovery of analytes through the cleanup procedures. Each extract was then processed through acid/base silica and carbon cleanup columns. The water extracts were spiked with 1,2,3,4-TCDD-$^{13}C_{12}$ and 1,2,3,7,8,9-HxCDD-$^{13}C_{12}$ recovery standard and concentrated to a final sample volume of 20 µL.

A GPC malfunction occurred during the processing of batch 50971-20. This malfunction caused less sample extract to be collected for each sample after running through the GPC column. Also, upon analysis of batch 50971-20 it was found that several internal standards, including $^{13}C_{12}$-2,3,7,8-TCDD and the cleanup standard, were either missing from or had very low recoveries in the method blank and LCS extracts. Tests were conducted on laboratory reagents and procedures prior to the re-extraction of the sample in batch 50971-35 to determine the source of TCDD loss.

For the samples in Batch 50971-35, approximately 500 mL of the remaining volume of the one groundwater sample, the laboratory method blank and the LCS /OPR were transferred into individual 2-L muffled separatory funnels, and the internal standard was added to each sample. Matrix spike standard was added to the LCS sample. Each separatory funnel had 60 mL of methylene chloride added to it, each was shaken for two minutes, and then the methylene chloride layer was drained through 10-15 g of sodium sulfate into a round bottom (RB) flask. This process was repeated two times. Each extract went was spiked with 2,3,7,8-TCDD-$^{37}Cl_4$ cleanup standard for monitoring recovery of analytes through the cleanup procedures. Each extract was then processed through acid/base washes, acid/base silica, and carbon cleanup columns. The water extracts were spiked with 1,2,3,4-TCDD-$^{13}C_{12}$ and 1,2,3,7,8,9-HxCDD-$^{13}C_{12}$ recovery standard and concentrated to a final sample volume of 10 µL.

The final 2,3,7,8-TCDD results varied greatly (approximately 10 fold) from SDG 50971-20 to SDG 50971-35. Each sample aliquot used for analysis was taken from separate sample jars. Each of the sample jars contained varying levels of particles which is believed to help account for the varying levels of 2,3,7,8-TCDD. Data for both batches are being reported.

**PCDD/PCDF Analysis** – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. A DB5 column, or equivalent, was used for initial analysis of the seventeen 2,3,7,8-PCDD/PCDF.

The ending calibration for batch 50971-35 contained two labeled analytes, $^{13}C_{12}$-1,2,3,7,8-PeCDF and $^{13}C_{12}$-2,3,4,7,8-PeCDF, that did not meet the Method 1613, Revision B requirements. The natives that correspond to these internal standards meet the Method criteria and were not found in the samples. There is no impact on the data for the two native analytes.

The following revisions to Method 1613 as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with batch 50971-20 included one method blank, one LCS, one MS, and one MSD. Quality control samples processed with batch 50971-35 included one method blank and one LCS.

2. The GC/HRMS instrumentation was calibrated for PCDD/PCDF at levels specified in Method 1613 two additional calibration standards at concentrations equivalent to $^1/_{10}$ and ½ the level of Method 1613's lowest calibration point. The calibration range corresponds to the following levels in the samples assuming an average sample volume of 1 L and a final sample volume of 20 µL: 1.0 to 4,000 pg/L for tetra compounds, 5 to 20,000 pg/L for penta through hepta compounds, and 10 to 40,000 pg/L for octa compounds. The calibration range for samples with an average sample volume of 500 mL and a final sample volume of 10 µL is the same as listed above.

Any additional minor revisions to Method 1613 are fully documented in the analytical record.

**HOLDING TIMES:** Samples were prepared for analysis in two analytical batches. For batch 50971-20, samples were extracted within 6 days of receipt at the laboratory and analyzed within 3 weeks of extraction. For batch 50971-35, samples were extracted within 6 weeks of receipt at the laboratory and analyzed within 2 weeks of extraction.

| Batch | Extraction Date | Analysis Date |
|---|---|---|
| 50971-20 | 07/12/2005 | 07/27-28/2005 |
| 50971-35 | 08/22/2005 | 08/30/2005 |

**DETECTION LIMITS:** PCDD/PCDF results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the CS-0.5 calibration standard and adjusted for sample specific processing factors and volumes, as follow:

RL = (Concentration in CS-0.5 Std. × final extract volume × dilution factors)/ Sample size

Where,
Concentration in low standard = 0.25 pg/µL
Final Extract Volume = 20 µL
Dilution Factor = documented in project file
Sample Size = approximately 1 L

Achieved RLs did not meet project detection limit goals for PCDD/PCDF. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods. If detection limits cannot be achieved, this will be addressed in the uncertainty discussions in the risk assessment.

Analyte peaks which did not meet all identification criteria are reported as estimated maximum possible concentrations (EMPC) and flagged "K".

**BLANKS:** One laboratory method blank was processed with each analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

**50971-20** – The internal standard recoveries were too low for dioxins to accurately determine these analytes in the method blank. The data set was reprocessed.

**50971-35** – The method blank was found to be free of all analytes, except for a trace level of non-2,3,7,8-tetra-dioxin.

US EPA ARCHIVE DOCUMENT

# DIOXIN/FURAN GROUNDWATER QA/QC SUMMARY
# QC Batches 50971-20 and 50971-35

**LABORATORY CONTROL SAMPLE:**

One LCS was prepared with each analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

**50971-20** –The LCS sample met the criteria found in Table 6 of Method 1613, Revision B for PCDD/PCDF for all native analytes except 2,3,7,8-TCDD and 1,2,3,7,8,9-HxCDD. Several $^{13}C_{12}$-labeled analytes were poorly recovered as discussed previously.

**50971-35** –The LCS sample met the criteria found in Table 6 of Method 1613, Revision B for PCDD/PCDF, except 1,2,3,7,8,9-HxCDF which was slightly above the limit.

**MATRIX SPIKES:**

One MS/MSD sample set was prepared with batch 50971-20. The percent recoveries of target compounds in the MS and MSD were calculated to measure data quality in terms of accuracy; the relative percent difference (RPD) between MS and MSD percent recoveries were calculated to measure data quality in terms of precision.

**50971-20** – 2,3,7,8-TCDD was outside the QC limits in both the MS and MSD. The amount of 2,3,7,8-TCDD spiked was not > 5x the background level and the $^{13}C_{12}$-2,3,7,8-TCDD recovery was low in both the MS and MSD.

The RPD between MS/MSD percent recoveries also were within the ≤30% RPD for all except 2,3,7,8-TCDD. The analytes that were within the criteria ranged from 0 to 5%.

**INTERNAL STANDARDS:**

Fifteen internal standards were added to each sample prior to processing, one standard was added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

**50971-20** – Two to seven internal standards failed in all samples except CMS-GW-MW05S-05.

**50971-35** – All internal standard recoveries were within 25-150%.

## QUALITY ASSURANCE STATEMENT

**Project Title:** USACE New England District, Centredale Manor Task RI-13 SPMD Groundwater Samples (SDG 50971-20 and 50971-35): PCDD/PCDF Data

**Project Number:** G487002-RI13B2

**Description of Data:** SPMD Groundwater Samples for PCDD/PCDF Data

**Description of audit and review activities:**

1)Reviewed sample preparation Laboratory Record Books (LRB). Tracked COC from sample receipt to analytical injection. Reviewed standard/spike preparation records. Resolved all resulting LRB numbers (i.e. sample tracking numbers) with analytical designations. Reviewed data package for data recording consistent with the QAPP and department SOPs.

2)Reviewed analytical (HRMS) data. Reviewed all hand-entered parameters (e.g. sample masses, sample names, calibration curve date, etc) for each analytical run. Reviewed calibrations results to ensure that Relative Response Factors (RRF) were within the limit of calibration RRF. Reviewed 10% data transfer to spreadsheets.

3)Reviewed spreadsheets. Accessed e-file of excel spreadsheets and reviewed formula and relative and absolute cell addresses to ensure accurate data transposition.

4)Reviewed report. Ensured report accurately reflected raw data and resulting spreadsheets.

**Description of outstanding issues or deficiencies which may affect data quality:**

1) Minor QC issues were submitted to the analytical staff for correction, no outstanding issues present.

# Groundwater VOC Results

## CASE NARRATIVE

Battelle

STL Lot # C5G010308

**Sample Receiving:**
STL Pittsburgh received samples for analysis on July 1, 2005. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report and batch QC was completed on these samples, anomalous results will be discussed below.

**GC/MS Volatiles:**
Due to the concentration of target compounds detected, the samples were analyzed at a dilution.

The method blank for batch 5195224 had methylene chloride detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with this blank that had methylene chloride detected had the result flagged with a "B" qualifier.

The laboratory control standard had hexachlorobutadiene recover high and outside of criteria. All control compounds recovered within limits.

The matrix spike and matrix spike duplicate had hexachlorobutadiene and 1,2-dibromo-3-chloropropane recover outside of criteria. All control compounds recovered within limits.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The following compounds had the %D > 25% in the calibration verification standard; but were within expected performance range for these compounds: 1,2-dibromo-3-chloropropane -31.0%, benzene -27.2%, dichlorodifluoromethane 26.4%, hexachlorobutadiene 46.8% and trans-1,3-dichloropropene -26.2%.

## CASE NARRATIVE

Battelle

STL Lot # C5G060123

**Sample Receiving:**
STL Pittsburgh received samples for analysis on July 6, 2005. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report and batch QC was completed on these samples, anomalous results will be discussed below.

**GC/MS Volatiles:**
The method blank for batch 5195224 had methylene chloride detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with this blank that had methylene chloride detected had the result flagged with a "B" qualifier.

The laboratory control standard had hexachlorobutadiene recover high and outside of criteria. All control compounds recovered within limits.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The following compounds had the %D > 25% in the calibration verification standard; but were within expected performance range for these compounds: 1,2-dibromo-3-chloropropane -31.0%, benzene -27.2%, dichlorodifluoromethane 26.4%, hexachlorobutadiene 46.8% and trans-1,3-dichloropropene -26.2%.

| 2/Trip Blanks/ | Day Zero, Trip Blank |

Dear Ms. Clark:

A Tier III data validation was performed on the 2378-TCDD analytical data for sixteen Semi-permeable Member Device (SPMD) samples and two SPMD trip blanks collected by Battelle for the U.S. EPA at the Centredale Manor Site in North Providence, RI. The samples were analyzed according to EPA Method 1613B, September 15, 1997. The samples were validated using first the criteria in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (dated March 2005) and the Final Work Plan for Groundwater, Semi-Permeable Membrane Device (SPMD) and Sediment Collections (dated April 2005) prepared by Battelle Duxbury Operations which include the criteria in EPA Method 1613B, September 15, 1997, defaulting next to Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996 criteria, and to EPA Region I's Environmental Services Assistance Team Dioxin Data Validation

US EPA ARCHIVE DOCUMENT

SOP ESAT-01-0007 (01/08/03). The data were evaluated based on the following parameters:

| | | |
|---|---|---|
| | • | Overall Evaluation of Data and Potential Usability Issues |
| | • | Data Completeness (Tier I) |
| * | • | Preservation and Technical Holding Times |
| NA | • | PE Samples/Accuracy Check |
| * | • | Window Defining Mix |
| * | • | Initial and Continuing Calibrations |
| * | • | Chromatographic Resolution |
| * | • | Instrument Sensitivity Check |
| | • | Blanks |
| NA | • | Matrix Spike/Matrix Spike Duplicate |
| * | • | Laboratory Control Sample |
| | • | Field Replicates |
| * | • | Field Surrogate Standard |
| * | • | Internal Standards |
| * | • | Sample Analysis and Identification |
| * | • | Sample Quantitation |
| * | • | Estimated Detection Limits (EDL) and Estimated Maximum Possible Concentration (EMPC) |
| | • | 2378-TCDD Toxicity Equivalents (TE) and Isomer Specificity |
| * | • | System Performance |

* - All criteria were met for this parameter.
NA - A PE sample and Matrix Spike/Matrix Spike Duplicate were included in the sediment SDG 50971-29 as noted in the Final Work Plan.

**The following information was used to generate the Data Validation Memorandum attachments:**

Table I: Recommendation Summary Table - summarizes validation recommendations

Table II: Overall Evaluation of Data - summarizes site objectives and potential usability issues

Data Summary Tables - summarize accepted, qualified, and rejected data

**Overall Evaluation of Data and Potential Usability Issues**

The following is a summary of the site investigation/assessment objectives as found in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (March 2005):

- To generate data of quality sufficient to define where the dioxin contamination is located in sediments laterally and vertically so that decisions can be made about the remedial alternatives that would be undertaken in the clean up of the site.

Two blanks were used for this project. The Day Zero blank was taken to the field in a sealed

container and returned without opening it. The Trip Blank container was opened in the field during deployment and retrieval of the sampling devices. 2378-TCDD was detected in the SPMD trip blank at a concentration greater than 16 times the Reporting Limit (RL). A blank action level is calculated at five times the amount found in the trip blank. If the analyte concentrations in the field samples are less than the corresponding blank action level, then the field sample results reported by the laboratory are qualified as non-detected (U) on the Data Summary Table. See Table I for a summary of the qualifiers applied due to blank contamination.

Four of the 2378-TCDD field sample results were well above the blank action level and are usable for their intended objective. One 2378-TCDD result (CMS-SPMD2-W-01) was slightly above the blank action level. However, its associated duplicate sample was not in agreement - 552 pg compared to 87 pg (146% RPD). Therefore, these results were estimated (J) to highlight the uncertainty in both the values. The remaining 2378-TCDD results were below the blank action limit and were reported as non-detects (U). At levels below the blank action level, it is difficult to determine whether the 2378-TCDD results came from the media in which the SPMDs were deployed or from the source that contaminated the trip blank. The usability of these low level results may be compromised by the contamination and evaluation by the field sampler is advised. See the following discussion for more details.

**Data Completeness (Tier I)**

The following data or information in the data package had discrepancies and/or were missing:

1. The laboratory was asked to provide information on "Sample Zero" since there was no detail in the data package or in the Final Work Plan in regards to this particular sample.

2. There were no sampling dates for the "Trip Blank" and "Sample Zero" on the Chain-of-Custody (C-o-C) and on the tabulated forms. The laboratory was asked to submit this information.

3. The laboratory was asked to provide QC limits for evaluating the SPMD replicate results.

4. The sample number CMS-SPMD1-S-01 (collected on 6/30/05 at 11:38) was incorrectly recorded as CMS-SPMD2-S-01 on the C-o-C. The laboratory was asked to submit a corrected C-o-C.

The above items were requested via the TOPO on August 26, 2005. The laboratory's response was received via TOPO on September 15, 2005. All items were adequately addressed.

**Blanks**

All of the blanks associated with this SDG were evaluated for possible sources of contamination. The following table lists the highest concentration of contamination that was detected in the blanks. The table lists the action levels and the affected samples:

- Trip Blanks

| Congener | Type of Blank | Blank Concentration pg (total) | Action Level pg (total) | Affected Samples |
|---|---|---|---|---|
| 2378-TCDD | Trip Blank* (6/30/05) | 83.37 | 417 | Day Zero, CMS-SPMD5-W-01, CMS-SPMD5-W-02, CMS-SPMD5-S-01, CMS-SPMD4-W-01, CMS-SPMD4-W-02, CMS-SPMD3-W-01, CMS-SPMD3-W-02, CMS-SPMD2-W-02, CMS-SPMD1-W-01, CMS-SPMD1-W-02, CMS-SPMD1-S-01 |

* Unexposed SPMD sampling device that is not removed from the pre-cleaned, secure container. However, the container was opened during deployment and retrieval of the field samples.

Blank actions are based on Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996 and EPA Region I's Environmental Services Assistance Team Dioxin Data Validation SOP ESAT-01-0007 (01/08/03) criteria. Blank action levels are calculated as five times the highest concentration reported in any blank for 2378-TCDD. The positive sample results that are less than the action level are reported as non-detects (U) at the reported concentration on the Data Summary Table.

**Field Replicates**

Each of the five large sampling cages contained four SPMDs which were combined into two analytical samples creating five field replicate pairs. The following five field replicate pairs were evaluated for this SDG: CMS-SPMD5-W-01/CMS-SPMD5-W-02, CMS-SPMD4-W-01/CMS-SPMD4-W-02, CMS-SPMD3-W-01/CMS-SPMD3-W-02, CMS-SPMD2-W-01/CMS-SPMD2-W-02, and CMS-SPMD1-W-01/CMS-SPMD1-W-02.

The tables below summarize the field replicate results which did not meet the Relative Percent Difference (RPD) < 50% duplicate criterion of for a solid matrix as specified in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (dated March 2005).

CMS-SPMD2-W-01/CMS-SPMD2-W-02:

| Congener | CMS-SPMD2-W-01 | CMS-SPMD2-W-02 | RPD | Action | | Affected Samples |
|---|---|---|---|---|---|---|
| | Sample Conc. pg (total) | Replicate Conc. pg (total) | | Positive Detects | Non-Detects | |
| 2378-TCDD | 551.95 | 86.93 (U)* | 146 | J | UJ | CMS-SPMD2-W-01, CMS-SPMD2-W-02 |

* The positive result was reported as non-detect (U) on the Data Summary Table due to trip blank contamination.

The positive and nondetected results for 2378-TCDD are estimated (J, UJ) in samples CMS-SPMD2-W-01 and CMS-SPMD2-W-02 since the field replicate precision is outside the criterion.

CMS-SPMD1-W-01/CMS-SPMD1-W-02:

| Congener | CMS-SPMD1-W-01 | CMS-SPMD1-W-02 | RPD | Action | | Affected Samples |
|---|---|---|---|---|---|---|
| | Sample Conc. pg (total) | Replicate Conc. pg (total) | | Positive Detects | Non-Detects | |
| 2378-TCDD | 154.36 (U)* | 13.21 (U)* | 168 | J | UJ | CMS-SPMD1-W-01. CMS-SPMD1-W-02 |

* The positive result was reported as non-detect (U) on the Data Summary Table due to trip blank contamination.

The positive results for 2378-TCDD reported as non-detects due to blank contamination are estimated (UJ) in samples CMS-SPMD1-W-01 and CMS-SPMD1-W-02 since the field replicate precision is outside the criterion.

**2378-TCDD Toxicity Equivalents (TE) and Isomer Specificity**

All TE values reported on the Data Summary Tables have been calculated by the ESAT data validator using the validated data discussed above in this report. As a result, the TE values in the Data Summary Table differ from the values reported by the laboratory. The validated data accounts for blank contamination. The TEF values used in the Data Summary Table correspond to the TEF values in "Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife", Environmental Health Perspectives, Volume 106 (12), December 1998, Table 1, page 778.

**System Performance**

No trends noted.

1/Soil SRM/Wellington DX-2 (50971-29-09)

Dear Ms. Clark:

A Tier III data validation was performed on the 2378-TCDD analytical data for five sediment samples and one Standard Reference Material (SRM) collected by Battelle for the U.S. EPA at the Centredale Manor Site in North Providence, RI. The samples were analyzed according to EPA Method 1613B, September 15, 1997. The samples were validated using first the criteria in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (dated March 2005) and the Final Work Plan for Groundwater, Semi-Permeable Membrane Device (SPMD) and Sediment Collections (dated April 2005) prepared by Battelle Duxbury Operations which include the criteria in EPA Method 1613B, September 15, 1997, defaulting next to Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996 criteria, and to EPA Region I's Environmental Services Assistance Team Dioxin Data Validation SOP ESAT-01-0007 (01/08/03). The data were evaluated based on the following parameters:

- Overall Evaluation of Data and Potential Usability Issues
- Data Completeness (Tier I)
- * Preservation and Technical Holding Times
- * PE Samples/Accuracy Check
- * Window Defining Mix
- * Initial and Continuing Calibrations
- * Chromatographic Resolution
- * Instrument Sensitivity Check

**The following information was used to generate the Data Validation Memorandum attachments:**

Table I: Recommendation Summary Table - summarizes validation recommendations

Table II: Overall Evaluation of Data - summarizes site objectives and potential usability issues

Data Summary Tables - summarize accepted, qualified, and rejected data

**Overall Evaluation of Data and Potential Usability Issues**

The following is a summary of the site investigation/assessment objectives as found in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (March 2005):

- To generate data of quality sufficient to define where the dioxin contamination is located in sediments laterally and vertically so that decisions can be made about the remedial alternatives that would be undertaken in the clean up of the site.

One Wellington Laboratories Standard Reference Material sample (Wellington DX-2 in soil) was evaluated for this SDG. The 2378-TCDD congener recovered within the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (March 2005) specified criterion of ± 30% D from the consensus values (for certified values > 5xMDL).

The data are accepted as reported by the laboratory. The reported results are usable for the site objectives.

US EPA ARCHIVE DOCUMENT

**Data Completeness (Tier I)**

The following data or information in the data package had discrepancies and/or were missing:

1. The laboratory was asked to provide documentation of the certified and informational values and their respected acceptable ranges for the SRM Wellington DX-2.

2. The laboratory numbered page 466 as 456. As a result, all of the subsequent pages (456 through 558) have incorrect page numbers. The laboratory was asked to make all necessary corrections to the page numbers.

3. There are slight discrepancies between the GPC corrected sample weight reported on page 75 and the values reported on the quantitation reports, e.g., GPC corrected sample weight for sample CMS-SD-5001-0005-01 is reported as 6.3285 g on page 75 and as 6.2561 g on the quantitation report. The laboratory was asked to clarify these discrepancies and if necessary to submit corrected pages.

The above items were requested via the TOPO on September 22, 2005. The laboratory's response was received via TOPO on October 3, 2005. Additional clarification to item #3 was requested on October 4, 2005. The laboratory's response was received on October 13, 2005. All items were adequately addressed.

**2378-TCDD Toxicity Equivalents (TE) and Isomer Specificity**

All TE values reported on the Data Summary Tables have been calculated by the ESAT data validator using the validated data discussed above in this report. There are no differences between the TE values reported by the laboratory and the ones calculated by the data validator. The TEF values used in the Data Summary Table correspond to the TEF values in "Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife", Environmental Health Perspectives, Volume 106 (12), December 1998, Table 1, page 778.

**System Performance**

No trends noted.

Very truly yours,

Re: Task Order No. 024, Task No. 2, TDF No. 1901
Case No. Centredale - SPMD Groundwater, SDG No. 50971-20-35 D/F
Battelle - Columbus, Ohio
Centredale Manor Site - North Providence, RI

Dioxin/Furan: 1/GW/ CMS-GW-MW05S-05

Dear Ms. Clark:

A Tier III data validation was performed on the dioxin/furan analytical data for one groundwater sample collected by Battelle for the U.S. EPA at the Centredale Manor Site in North Providence, RI. The sample was analyzed according to EPA Method 1613B, September 15, 1997. The sample was validated using first the criteria in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (dated March 2005) and the Final Work Plan for Groundwater, Semi-Permeable Membrane Device (SPMD) and Sediment Collections (dated April 2005) prepared by Battelle Duxbury Operations which include the criteria in EPA Method 1613B, September 15, 1997, defaulting next to Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996 criteria, and to EPA Region I's Environmental Services Assistance Team Dioxin Data Validation SOP ESAT-01-0007 (01/08/03). The data were evaluated based on the following parameters:

| | | |
|---|---|---|
| | ● | Overall Evaluation of Data and Potential Usability Issues |
| * | ● | Data Completeness (Tier I) |
| * | ● | Preservation and Technical Holding Times |
| NP | ● | PE Samples/Accuracy Check |

| | | |
|---|---|---|
| * | • | Sample Quantitation |
| * | • | Estimated Detection Limits (EDL) and Estimated Maximum Possible Concentration (EMPC) |
| | • | 2378-TCDD Toxicity Equivalents (TE) and Isomer Specificity |
| * | • | Required Sample Reruns and Second Column Confirmation |
| * | • | System Performance |

* - All criteria were met for this parameter.
NP - Not Provided by the sampler for the groundwater sample as noted in the Final Work Plan.
NA - Not Analyzed due to insufficient sample volume in the second re-extracted batch.

**The following information was used to generate the Data Validation Memorandum attachments:**

Table I: Recommendation Summary Table - summarizes validation recommendations

Table II: Overall Evaluation of Data - summarizes site objectives and potential usability issues

Data Summary Tables - summarize accepted, qualified, and rejected data

**Overall Evaluation of Data and Potential Usability Issues**

The following is a summary of the site investigation/assessment objectives as found in the Centredale Manor Tasks 19-22 QAPP, Addendum 3 (March 2005):

- To generate data of quality sufficient to define where the dioxin contamination is located in sediments laterally and vertically so that decisions can be made about the remedial alternatives that would be undertaken in the clean up of the site.

A GPC malfunction occurred during a clean-up step of the original sample extract and the associated QC samples (batch extracted on July 12, 2005). This lead to the extract losses and consequently, to very low or no recoveries of the internal standards and clean-up standards in the method blank, Laboratory Control Sample (LCS), and Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples. As a result, the laboratory re-extracted the groundwater sample with the required quality control samples on August 22, 2005. In this set of the data, all of the internal standards, including the clean-up standards recovered within the quality control limits of 25-150% as specified in the Centredale Manor Tasks 19-22 QAPP. The data validator used professional judgement to validate and report data only from the batch extracted on August 22, 2005.

Data validation identified some data quality problems which do not have a significant impact on the usability of the data. See the following discussion for details.

US EPA ARCHIVE DOCUMENT

## Initial and Continuing Calibrations

The following table summarizes the ending Calibration Verification (CV) concentrations which did not meet the quality control limits as specified in Table 8 of EPA Method 1613B.

| CV Date | Congener | Conc Found ng/mL | Conc. Range ng/mL | Action | | Affected Sample |
|---|---|---|---|---|---|---|
| | | | | Positive Detects | NDs | |
| 8/30/05 (ending) | $^{13}C_{12}$-12378-PeCDF | 143 | 76-130 | J | UJ | CMS-GW-MW05S-05 |
| | $^{13}C_{12}$-23478-PeCDF | 140 | 77-130 | | | |

The data associated with the noncompliant calibration verification are qualified due to the variability of the calibration standard. The quantitation of the associated analytes in the samples could be biased.

## 2378-TCDD Toxicity Equivalents (TE) and Isomer Specificity

All TE values reported on the Data Summary Tables have been calculated by the ESAT data validator using the validated data discussed above in this report. There are no differences between the TE values reported by the laboratory and the ones calculated by the data validator. The TEF values used in the Data Summary Table correspond to the TEF values in "Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife", Environmental Health Perspectives, Volume 106 (12), December 1998, Table 1, page 778.

## System Performance

The laboratory experienced problems with a GPC clean-up process. A re-extracted field sample was processed without any clean-up problems.

October 28, 2005

Ms. Dierdre Dahlen
Battelle Duxbury Operations
397 Washington Street
Duxbury, MA 02332

Dear Ms. Dahlen:

Enclosed is the quality assurance (QA) review of the organic data for the Centredale Manor Restoration Project Superfund Site in North Providence, Rhode Island. The investigative samples, which were collected on June 30, 2005, were grouped into sample delivery groups (SDGs) C5G010308 and C5G060123 by Severn Trent Laboratories, Inc. of Pittsburgh, Pennsylvania. The Environmental Standards data reviewer performed a Region I Tier II limited validation of the data concentrating on method compliance and data usability issues; however, this QA review also includes any contractual reporting inconsistencies affecting data that were noted during the usability assessment.

Overall, the data quality is good. Based on this QA review, several volatile organic results were qualified due to blank contamination, out-of-criteria matrix spike/matrix spike duplicate recoveries, and calibration issues.

If you have any questions/comments, please do not hesitate to call.

Sincerely,

Kyle R. Clay
Senior Quality Assurance Chemist II/
Project Manager

## Section 1 Quality Assurance Review

A. Organic Data

The organic analyses of five aqueous samples (including QC samples) were performed by Severn Trent Laboratories, Inc. (STL) of Pittsburgh, Pennsylvania. The samples were analyzed for volatile organic compounds (VOCs) by US EPA SW-846 Method 8260B. These analyses are specified on Table 1. The laboratory organized the samples into two sample delivery groups (SDG C5G010308 and SDG C5G060123).

The findings in this report are based upon a rigorous review of holding times, condition of samples upon laboratory receipt, blank analysis results, laboratory control sample (LCS) recoveries, matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision, surrogate recoveries, field duplicate precision, instrument sensitivity, instrument tuning, internal standard areas, and calibrations.

Overall, the organic data quality appears to be good. The data reviewer has edited the laboratory-reported data and QC forms based on the deficiencies and comments in this QA review. Contractual and reporting requirements were met for this data set. Organic data qualifiers associated with the samples that underwent data validation are based upon a Tier II review of the data provided and are presented in the Organic Data Qualifiers section; these qualifiers should not be applied to any organic results that did not undergo data validation. Data usability issues represent an interpretation of the QC results obtained for the project samples. Quite often, data qualifications address issues relating to sample matrix problems. Similarly, the validation guidelines specify areas of the data that require qualification, yet the methods used for analysis do not require any corrective action by the laboratory. Accordingly, the data usability issues that follow should not necessarily be construed as an indication of laboratory performance.

Noncorrectable Deficiencies

1. Samples CMS-GW-MW05S-05, CMS-GW-MW05S-05DU, CMS-GW-MW05S-05MS, and CMS-GW-MW05S-05MSD were collected and submitted to the laboratory on 6/30/05 (SDG C5G010308). The associated trip blank (sample TB) was not submitted until 7/05/05 (SDG C5G060123). According to the Centredale Manor Tasks 19-22 QAPP – Addendum (Worksheet #22a), trip blanks should be submitted with every sample cooler. The trip blank sample was not utilized to assess possible contamination introduced during transport of samples CMS-GW-MW05S-05, CMS-GW-MW05S-05DU, CMS-GW-MW05S-05MS, and CMS-GW-MW05S-05MSD. It should be noted that positive results for toluene and methylene chloride were reported in the trip blank sample; however, toluene was not observed in the associated field samples and methylene chloride was present in the method blank associated with samples CMS-GW-MW05S-05, CMS-GW-MW05S-05DU, CMS-GW-MW05S-05MS, CMS-GW-MW05S-05MSD, and TB. Qualification of data was not warranted due to the lack of a trip blank associated with the project samples or the positive results in sample TB.

US EPA ARCHIVE DOCUMENT

2. An equipment blank was not collected and analyzed with this data set. According to the Centredale Manor Tasks 19-22 QAPP – Addendum (Worksheet #22a), equipment blanks should be collected and submitted at a frequency of 1 per 20 field samples. The possibility of contamination introduced during the sampling process could not be evaluated for samples CMS-GW-MW05S-05, CMS-GW-MW05S-05DU, CMS-GW-MW05S-05MS, and CMS-GW-MW05S-05MSD. Qualification of data was not warranted due to the lack of an equipment blank associated with the project samples.

Comments

1. Instrument tuning and calibration summary forms were not originally provided in the data packages submitted for review. Upon request, these forms were provided (see Project Correspondence [Section 6]).

2. Samples CMS-GW-MW05S-05, CMS-GW-MW05S-05DU, CMS-GW-MW05S-05MS, and CMS-GW-MW05S-05MSD were analyzed at initial 1000-fold dilutions. Reporting limits were raised accordingly for the compounds that were not detected in these samples.

With respect to data usability, the principal areas of concern are blank contamination, out-of-criteria MS/MSD recoveries, and calibration issues. Based on a Tier II review of the data provided, the following organic data qualifiers are offered. The following data usability issues represent an interpretation of the QC results obtained for the project samples. Quite often, data qualifications address issues relating to sample matrix problems. Similarly, the data validation guidelines routinely specify areas of the data that require qualification, yet the methods used for analysis may not require corrective action by the laboratory. Accordingly, the following data usability issues should not be construed as an indication of laboratory performance.

Organic Data Qualifiers

- Due to presence of methylene chloride in an associated laboratory method blank, the reported positive results for methylene chloride in samples GW-MW05S-05 and CMS-GW-MW05S-05DU should be considered "not-detected" and have been flagged "U" on the data tables. It should be noted that dilution factors and sample volume were taken into consideration when evaluating blank contamination.

- The reporting limits for 1,2-dibromo-3-chloropropane in samples GW-MW05S-05 and CMS-GW-MW05S-05DU may be higher than reported; the "not-detected" results should be considered estimated and have been flagged "UJ" on the data tables. Low recoveries (%R<70%) were observed for 1,2-dibromo-3-chloropropane in the associated MS/MSD analyses.

- The reporting limits for benzene; 1,2-dibromo-3-chloropropane; dichlorodifluoromethane; *trans*-1,3-dichloropropene; and hexachlorobutadiene in samples GW-MW05S-05, CMS-GW-MW05S-05DU, and TB may be higher than reported; the "not-detected" results

should be considered estimated and have been flagged "UJ" on the data tables. High percent differences (%Ds>25%) were observed between the relative response factors (RRFs) for these compounds in the continuing calibration and average RRFs in the associated initial calibration.

- One field duplicate pair (sample GW-MW05S-05 and its field duplicate, sample CMS-GW-MW05S-05DU) was submitted to the laboratory with this data set. Acceptable precision and sample representativeness were demonstrated by the correlation between the reported results in the field duplicate pair. A complete comparison of the field duplicate positive results has been included in Section 3.

- Based on the project-specific reporting requirements, all reported positive results with concentrations between the laboratory method detection limit (MDL) and the project quantitation limit (QL) should be considered estimated and have been flagged "J" on the data tables.

Complete support documentation for this organic QA review is presented in Section 3 of this report. The cover sheet for this section is a checklist of all QA procedures required by the methods and examined in this data review.

US EPA ARCHIVE DOCUMENT

C. Conclusions

Overall, the data quality is good. Based on this QA review, several volatile organic results were qualified due to blank contamination, out-of-criteria MS/MSD recoveries, and calibration issues. Overall, the data are acceptable for use, provided the data user understands the limitations and qualifications stated in this QA review. The Laboratory Case Narratives and Chain-of-Custody Records are presented in Sections 4 and 5, respectively. Project Correspondence is presented in Section 6.
