PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-35 – Whole Body Fish

PROJECT: USACE NAE Delivery Order #01 Centredale

PARAMETER: PCB Congeners by High Resolution Mass Spectrometry (HRMS)

LABORATORY: Battelle, Columbus, OH

MATRIX: Whole body fish

SAMPLE CUSTODY: Whole body fish were received at Battelle MSL in multiple events between June 21, 2001 and July 10, 2001. Fish samples were processed and tissue homogenates shipped to Battelle Columbus for Dioxin/Furan/TCX/HCX and PCB congener analyses.

Fish tissue homogenates were received at Battelle Columbus between July 19, 2001 and July 31, 2001. Samples were received in good condition and the cooler temperatures upon receipt ranged from 0.3 to 10.3 °C.

In accordance with the QAPP (Battelle, 2001), approximately 20% of the whole body, fillet and offal fish tissue samples received were analyzed for PCBs by HRMS. Samples for PCB analysis were prepared in a total of five analytical batches in the laboratory, as follows:

Batches 48985-35, -48985-53, and 48985-56 — whole body samples
Batches 48985-84 and 48985-74 — fillet and offal samples

This QA/QC narrative will discuss results from batch 48985-35 only. QA/QC narratives are also provided for all other analytical batches.

QA/QC MEASUREMENT PERFORMANCE CRITERIA:

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-35 – Whole Body Fish

METHOD: Whole body fish tissue samples were processed and analyzed for the extended list of PCB congeners following methods described in Battelle's Quality Assurance Project Plan (Battelle, 2001). Briefly,

Sample Preparation – The samples were processed in BATCH 48985-35. Aliquots of each homogenized tissue were weighed into individual jars and mixed with Hydromatrix drying agent. Approximately 10 g wet weight of each tissue sample was used. Thirteen of the field samples were prepared for PCDD/PCDF, TCX, and HCX only, seven of the field samples and all of six QC samples were prepared for PCB analysis in addition to PCDD/PCDF, TCX, and HCX. The tissue/Hydromatrix mixtures for the seven field samples and six QC samples processed for both PCDD/PCDF, TCX, HCX and PCB analyses were placed into Accelerated Solvent Extraction (ASE) cells and spiked with $^{13}\text{C}_{12}$ -labeled PCB internal standard solutions. Matrix spike, matrix spike duplicate, and the laboratory control spike (LCS) samples were spiked with native PCBs at this time. The spiking level for these 13 samples for both internal and matrix spike solutions was at twice the typical spiking level to accommodate the sample being split in half for separate PCB and PCDD/PCDF/TCX/HCX cleanup. The samples were ASE extracted using MeCl_2 : hexane (1:1). Each extract was then spiked with $^{13}\text{C}_{12}$ -labeled PCB cleanup standards for monitoring recovery of analytes through the cleanup procedures. Each extract was acid washed. After the acid wash step, the 13 samples for both PCB and PCDD/PCDF/TCX/HCX were split in half. Half of each extract was submitted for PCB cleanup which included acid/base silica, alumina, followed by additional acid/base silica cleanup columns. The tissue extracts were spiked with $^{13}\text{C}_{12}$ -labeled PCB recovery standards and concentrated to a final sample volume of 50 μL . Because of low internal standard recoveries on samples 48985-35-19 through 48985-35-24, the column rinses from the final acid/base silica column were reprocessed through acid/base silica, concentrated and added back to the original sample and the samples reanalyzed.

PCB Analysis – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. An SPB-Octyl column was used for analysis of the PCB congeners.

The following revisions to Method 1668A as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank, one LCS, one fish standard reference material, one matrix spike, one matrix spike duplicate, and one sample prepared in duplicate.
2. The GC/HRMS instrumentation was calibrated for PCBs using a 6-point calibration of a subset of PCB congeners to assess linearity of the calibration range, and a single point 209 calibration to generate response factors for each PCB congener. The range of the 6 point calibration corresponds to the following levels in the samples assuming an average sample wet weight of 5 g of tissue and a final sample volume of 50 μL : 2.0 to 20,000 pg/g wet.

Any additional minor revisions to Method 1668A are fully documented in the analytical record.

PCB CONGENERES QA/QC SUMMARY

QC Batch 48985-35 – Whole Body Fish

HOLDING TIMES:

Samples were prepared for analysis in one analytical batch. Samples were extracted within 2 months of collection and analyzed within 4 months of extraction.

<u>Batch</u>	<u>Extraction Date</u>	<u>Analysis Date</u>
48985-35	8/01/2001	9/28 – 11/11, 2001

DETECTION LIMITS:

PCB results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the EML (estimated minimum level) for each individual PCB congener listed in Method 1668A, Table 2, adjusted for the amount of sample extracted as follows:

$RL = (EML) / \text{Sample size}$

Where,

$EML = (\text{pg/g EML value from Method 1668A, Table 2}) \times 10$
to adjust for an assumed sample volume of 10 g in the table
Sample Size = approximately 5-g wet

Limited project detection limit goals were available for the PCB congeners. For congeners which had a detection limit goal, achieved RLs did not meet the goals in many instances. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods. If detection limits cannot be achieved, this will be addressed in the uncertainty discussions in the risk assessment.

BLANKS:

One laboratory method blank was processed with the analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

48985-35– Many PCB congeners were detected at a trace level as is common in low-level HRMS PCB analysis due to the prevalence of PCBs in the environment contributing to background; however, the levels detected were below the reporting level for all but PCB 105, PCB 118, and the co-eluting PCBs 129/138/160/163.

Levels of these PCBs in the samples were $>10\times$ the blank level and so results for these congeners did not require the “B” flag.

LABORATORY CONTROL SAMPLE

A laboratory control sample (LCS) was prepared with the analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

48985-35– The recovery of PCBs in the LCS sample were within the 50-150% criteria found in Table 6 of Method 1668A.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-35 – Whole Body Fish

MATRIX SPIKES:

One matrix spike (MS)/matrix spike duplicate (MSD) sample set was prepared with the batch to measure data quality in terms of accuracy and precision. The MS and MSD were fortified with target compounds to monitor data quality in terms of accuracy and precision.

48985-35– For PCBs, the matrix spike recoveries for analytes spiked $>5\times$ background concentration were within the 50-150% range with the exception of PCB-81 which had recoveries of 155% in the matrix spike and 167% in the matrix spike duplicate. An interfering peak close to PCB-81 made assessment of PCB-81 difficult resulting in slightly high recoveries for this analyte.

The relative percent difference between matrix spike duplicates was $<25\%$ for analytes spiked $>5\times$ the background concentration.

INTERNAL STANDARDS:

Twenty-seven internal standards were added to each sample prior to processing, three standards were added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

48985-35– Recoveries of internal standards were within 25-150% for most analytes in the field samples.

As discussed in the method procedure above, several field samples required reprocessing cleanup columns and adding the reprocessed rinses to the original sample extract which was then reanalyzed in order to achieve acceptable internal standard recoveries. The SRM and LCS were not reprocessed; the LCS because the target analytes were recovered within method limits without reprocessing and the SRM because the internal standards used in calculation of certified analyte concentrations were greater than 50% (well within the acceptability limits) and concentrations of certified analytes would not have been affected by reprocessing. As a result, there are a greater quantity of internal standards outside the acceptable limits on these two samples than on the field samples.

REPLICATES:

A laboratory duplicate was prepared with the batch. The RPD between laboratory replicate analyses for target compounds was calculated to measure data quality in terms of precision.

48985-35– Only approximately 27% of the PCB congeners detected above the action level of $>3\times$ EML were within the $<30\%$ RPD goal. Approximately 90% of the PCB congeners detected above $3\times$ EML had RPD values $<50\%$.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-35 – Whole Body Fish

SRM: A standard reference material (CIL EDF 2526) was prepared with the analytical batch. The percent difference (PD) between detected concentrations and certified values was calculated to measure data quality in terms of accuracy.

48985-35– All analytes in the SRM were found to be outside the limit of 30% difference from consensus values. The low SRM recoveries are thought to be due to the high lipid content of the SRM as discussed in the QA/QC narrative for Whole Body Fish (SDG 48985-43). In order to compensate for the high lipid content of the SRM, sample batches extracted after the date this situation was originally discovered in the PCDD/PCDF/TCX/HCX analyses will have SRM weights adjusted so that the lipid content of the SRM will be similar to that of the field tissue samples.

Recovery in the whole body fish tissue is demonstrated by very good matrix spike, matrix spike duplicate, LCS, and internal standard recoveries, indicating that the analytical procedure is in control.

PCB CONGENERS TISSUE QA/QC SUMMARY

QC Batch 48985-53 and -56– Whole Body Fish

METHOD: Whole body fish tissue samples were processed and analyzed for the extended list of PCB congeners following methods described in Battelle's Quality Assurance Project Plan (Battelle, 2001). Briefly,

Sample Preparation – The samples were processed in BATCH 48985-53. Due to a malfunction of the ASE unit during extraction, several samples from batch 48985-53 were re-processed the next day in batch 48985-56. Aliquots of each homogenized tissue were weighed into individual jars and mixed with Hydromatrix drying agent. Approximately 10 g wet weight of each tissue sample was used. Twelve of the field samples were prepared for PCDD/PCDF, TCX, and HCX only, eight of the field samples and all of six QC samples were prepared for PCB analysis in addition to PCDD/PCDF, TCX, and HCX. The tissue/Hydromatrix mixtures for the eight field samples and six QC samples processed for both PCDD/PCDF, TCX, HCX and PCB analyses were placed into Accelerated Solvent Extraction (ASE) cells and spiked with $^{13}\text{C}_{12}$ -labeled PCB internal standard solutions. Matrix spike, matrix spike duplicate, and the laboratory control spike (LCS) samples were spiked with native PCBs at this time. The spiking level for these 14 samples for both internal and matrix spike solutions was at twice the typical spiking level to accommodate the sample being split in half for separate PCB and PCDD/PCDF/TCX/HCX cleanup. The samples were ASE extracted using MeCl_2 : hexane (1:1). Each extract was then spiked with $^{13}\text{C}_{12}$ -labeled PCB cleanup standards for monitoring recovery of analytes through the cleanup procedures. Each extract was acid washed. After the acid wash step, the 14 samples for both PCB and PCDD/PCDF/TCX/HCX were split in half. Half of each extract was submitted for PCB cleanup which included acid/base silica, alumina, followed by additional acid/base silica cleanup columns. The tissue extracts were spiked with $^{13}\text{C}_{12}$ -labeled PCB recovery standards and concentrated to a final sample volume of 50 μL . One sample (48985-53-15 LPX-AE-4002-0000-01) experienced loss of a significant amount of extract during a K-D concentration step resulting in lower recovery of internal standards for that sample.

PCB Analysis – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. An SPB-Octyl column was used for analysis of the PCB congeners.

The continuing calibrations met Method criteria at all times for the native PCB analytes. Several internal standards did not meet method criteria during continuing calibration. In these instances, average daily response factors were used to report internal standard concentrations.

The following revisions to Method 1668A as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank, one LCS, one fish standard reference material, one matrix spike, one matrix spike duplicate, and one sample prepared in duplicate.
2. The GC/HRMS instrumentation was calibrated for PCBs using a 6-point calibration of a subset of PCB congeners to assess linearity of the calibration range, and a single point 209 calibration to generate response factors for each PCB congener. The range of the 6 point calibration corresponds to the following levels in the samples assuming an average sample wet weight of 5 g of tissue and a final sample volume of 50 μL : 2.0 to 20,000 pg/g wet.

Any additional minor revisions to Method 1668A are fully documented in the analytical record.

PCB CONGENERS TISSUE QA/QC SUMMARY
QC Batch 48985-53 and -56– Whole Body Fish**HOLDING
TIMES:**

Samples were prepared for analysis in one analytical batch. Several samples had to be extracted on the next day due to a malfunction of the ASE extraction system. Samples were extracted within 7 weeks of collection and analyzed within 3.5 months of extraction.

Batch	Extraction Date	Analysis Date
48985-53	8/7	10/18-11/26/2001
48985-56	8/8	10/18-11/26/2001

**DETECTION
LIMITS:**

PCB results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the EML (estimated minimum level) for each individual PCB congener listed in Method 1668A, Table 2, adjusted for the amount of sample extracted as follows:

$$RL = (EML) / \text{Sample size}$$

Where,

$$\begin{aligned} EML &= (\text{pg/g EML value from Method 1668A, Table 2}) \times 10 \\ &\quad \text{to adjust for an assumed sample volume of 10 g in the table} \\ \text{Sample Size} &= \text{approximately 5-g wet} \end{aligned}$$

Limited project detection limit goals were available for the PCB congeners. For congeners which had a detection limit goal, achieved RLs did not meet the goals in many instances. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods. If detection limits cannot be achieved, this will be addressed in the uncertainty discussions in the risk assessment.

BLANKS:

One laboratory method blank was processed with the analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

48985-53– Many PCB congeners were detected at a trace level as is common in low-level HRMS PCB analysis due to the prevalence of PCBs in the environment contributing to background; however, the levels detected were below the reporting level for all but the co-eluting PCBs 28/20/21/33 and PCBs 52/73/43.

All levels of 52/73/43 detected in samples were >10× blank level and as such did not require “B” flags. Sample 48985-56-10 (GMP-AE-5001-0000-01) was the only sample where PCB 28/20/21/33 was not detected >10× blank level. As a result PCB 28/20/21/33 in sample 48985-56-10 was the only analyte that required the “B” flag.

**LABORATORY
CONTROL
SAMPLE**

A laboratory control sample (LCS) was prepared with the analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

48985-53 and -56– The recovery of PCBs in the LCS sample were within the 50-150% criteria found in Table 6 of Method 1668A.

PCB CONGENERES TISSUE QA/QC SUMMARY

QC Batch 48985-53 and -56– Whole Body Fish

MATRIX SPIKES:

One matrix spike (MS)/matrix spike duplicate (MSD) sample set was prepared with the batch to measure data quality in terms of accuracy and precision. The MS and MSD were fortified with target compounds to monitor data quality in terms of accuracy and precision.

48985-53 and -56– For PCBs, the matrix spike recoveries for analytes spiked $>5\times$ background concentration were within the 50-150% limits.

The relative percent difference between matrix spike duplicates was $<28\%$ for analytes spiked $>5\times$ the background concentration.

INTERNAL STANDARDS:

Twenty-seven internal standards were added to each sample prior to processing, three standards were added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

48985-53 and -56– Recoveries of internal standards were within 25-150% for most analytes in the samples.

As discussed in the method procedure above, one sample (48985-53-15 LPX-AE-4002-0000-01) experienced loss of a significant amount of extract during a K-D concentration step resulting in lower recovery of internal standards for that sample.

REPLICATES:

A laboratory duplicate was prepared with the batch. The RPD between laboratory replicate analyses for target compounds was calculated to measure data quality in terms of precision.

48985-53 and -56– Approximately 74% of the PCB congeners detected above the action level of $>3\times$ EML were within the $<30\%$ RPD goal.

SRM:

A standard reference material (CIL EDF 2526) was prepared with the analytical batch. The percent difference (PD) between detected concentrations and certified values was calculated to measure data quality in terms of accuracy.

48985-53– All but one analyte in the SRM were found to be outside the limit of 30% difference from consensus values. The low SRM recoveries are thought to be due to the high lipid content of the SRM as discussed in the QA/QC narrative for Whole Body Fish (SDG 48985-43). In order to compensate for the high lipid content of the SRM, sample batches extracted after the date this situation was originally discovered in the PCDD/PCDF/TCX/HCX analyses will have SRM weights adjusted so that the lipid content of the SRM will be similar to that of the field tissue samples.

Recovery in the whole body fish tissues is demonstrated by very good matrix spike, matrix spike duplicate, LCS, and internal standard recoveries, indicating that the analytical procedure is in control.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-74 – Offal Fish

METHOD: Offal fish tissue samples were processed and analyzed for the extended list of PCB congeners following methods described in Battelle's Quality Assurance Project Plan (Battelle, 2001). Briefly,

Sample Preparation – The samples were processed in BATCH 48985-74. Aliquots of each homogenized tissue were weighed into individual jars and mixed with Hydromatrix drying agent. Approximately 10 g wet weight of each tissue sample was used. Thirteen of the field samples were prepared for PCDD/PCDF, TCX, and HCX only, six of the field samples and all of six QC samples were prepared for PCB analysis in addition to PCDD/PCDF, TCX, and HCX. The tissue/Hydromatrix mixtures for the six field samples and six QC samples processed for both PCDD/PCDF, TCX, HCX and PCB analyses were placed into Accelerated Solvent Extraction (ASE) cells and spiked with $^{13}\text{C}_{12}$ -labeled PCB internal standard solutions. Matrix spike, matrix spike duplicate, and the laboratory control spike (LCS) samples were spiked with native PCBs at this time. The spiking level for these 12 samples for both internal and matrix spike solutions was at twice the typical spiking level to accommodate the sample being split in half for separate PCB and PCDD/PCDF/TCX/HCX cleanup. The samples were ASE extracted using MeCl_2 : hexane (1:1). Each extract was then spiked with $^{13}\text{C}_{12}$ -labeled PCB cleanup standards for monitoring recovery of analytes through the cleanup procedures. Each extract was acid washed. After the acid wash step, the 12 samples for both PCB and PCDD/PCDF/TCX/HCX were split in half. Half of each extract was submitted for PCB cleanup which included acid/base silica, alumina, followed by additional acid/base silica cleanup columns. The tissue extracts were spiked with $^{13}\text{C}_{12}$ -labeled PCB recovery standards and concentrated to a final sample volume of 50 μL .

PCB Analysis – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. An SPB-Octyl column was used for analysis of the PCB congeners.

The following revisions to Method 1668A as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank, one LCS, one fish standard reference material, one matrix spike, one matrix spike duplicate, and one sample prepared in duplicate.
2. The GC/HRMS instrumentation was calibrated for PCBs using a 6-point calibration of a subset of PCB congeners to assess linearity of the calibration range, and a single point 209 calibration to generate response factors for each PCB congener. The range of the 6 point calibration corresponds to the following levels in the samples assuming an average sample wet weight of 5 g of tissue and a final sample volume of 50 μL : 2.0 to 20,000 pg/g wet.

Any additional minor revisions to Method 1668A are fully documented in the analytical record.

PCB CONGENERS QA/QC SUMMARY
QC Batch 48985-74 – Offal Fish

**HOLDING
TIMES:**

Offal samples were prepared for analysis in one analytical batch. Samples were extracted within just over 2 months of collection and analyzed within 2 months of extraction.

<u>Batch</u>	<u>Extraction Date</u>	<u>Analysis Date</u>
48985-74	8/23/2001	10/21-22/2001

**DETECTION
LIMITS:**

PCB results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the EML (estimated minimum level) for each individual PCB congener listed in Method 1668A, Table 2, adjusted for the amount of sample extracted as follows:

$RL = (EML) / \text{Sample size}$

Where,

$EML = (\text{pg/g EML value from Method 1668A, Table 2}) \times 10$
to adjust for an assumed sample volume of 10 g in the table
Sample Size = approximately 5-g wet

Limited project detection limit goals were available for the PCB congeners. For congeners which had a detection limit goal, achieved RLs did not meet the goals in many instances. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods. If detection limits cannot be achieved, this will be addressed in the uncertainty discussions in the risk assessment.

BLANKS:

One laboratory method blank was processed with the analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

48985-74– Many PCB congeners were detected at a trace level as is common in low-level HRMS PCB analysis due to the prevalence of PCBs in the environment contributing to background; however, all levels detected were below the reporting level.

**LABORATORY
CONTROL
SAMPLE**

A laboratory control sample (LCS) was prepared with the analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

48985-74– The recovery of PCBs in the LCS sample were within the 50-150% criteria found in Table 6 of Method 1668A.

**MATRIX
SPIKES:**

One matrix spike (MS)/matrix spike duplicate (MSD) sample set was prepared with the batch to measure data quality in terms of accuracy and precision. The MS and MSD were fortified with target compounds to monitor data quality in terms of accuracy and precision.

48985-74– For PCBs, the matrix spike recoveries for analytes spiked $>5\times$ background concentration were within the 50-150% limits. The relative percent difference between matrix spike duplicates was $<11\%$ for analytes spiked $>5\times$ the background concentration.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-74 – Offal Fish

INTERNAL STANDARDS:

Twenty-seven internal standards were added to each sample prior to processing, three standards were added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

48985-74– Recoveries of internal standards were within 25-150% for most analytes in the field samples. The few that are outside of these limits are flagged in the report tables. Results outside the limits are expected to have minimal impact on reported results because of the use of isotope dilution or in instances where the native PCB does not have a $^{13}\text{C}_{12}$ -labeled analog, the average area of all standards of the same chlorination level are used, minimizing the effect of any single standard.

REPLICATES:

A laboratory duplicate was prepared with the batch. The RPD between laboratory replicate analyses for target compounds was calculated to measure data quality in terms of precision.

48985-74– All but four of the PCB congeners detected above the action level of $>3\times$ EML were within the $<30\%$ RPD goal. The four outliers ranged from 31-46% RPD.

SRM:

A standard reference material (CIL EDF 2526) was prepared with the analytical batch. The percent difference (PD) between detected concentrations and certified values was calculated to measure data quality in terms of accuracy.

48985-74– All analytes in the SRM were found to be outside the limit of 30% difference from consensus values. The low SRM recoveries are thought to be due to the high lipid content of the SRM as discussed in the QA/QC narrative for Whole Body Fish (SDG 48985-43). In order to compensate for the high lipid content of the SRM, sample batches extracted after the date this situation was originally discovered in the PCDD/PCDF/TCX/HCX analyses will have SRM weights adjusted so that the lipid content of the SRM will be similar to that of the field tissue samples.

Recovery in the whole body fish tissue is demonstrated by very good matrix spike, matrix spike duplicate, LCS, and internal standard recoveries, indicating that the analytical procedure is in control.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-84 – Fillet Fish

PROJECT: USACE NAE Delivery Order #01 Centredale
PARAMETER: PCB Congeners by High Resolution Mass Spectrometry (HRMS)
LABORATORY: Battelle, Columbus, OH
MATRIX: Fillet Fish
SAMPLE CUSTODY: Whole body fish, offal, and fillet tissues were received at Battelle MSL in multiple events between June 21, 2001 and July 10, 2001. Fish samples were processed and tissue homogenates shipped to Battelle Columbus for Dioxin/Furan/TCX/HCX and PCB congener analyses.

Fish tissue homogenates were received at Battelle Columbus between July 19, 2001 and July 31, 2001. Samples were received in good condition and the cooler temperatures upon receipt ranged from 0.3 to 10.3 °C.

In accordance with the QAPP (Battelle, 2001), approximately 20% of the whole body, fillet and offal fish tissue samples received were analyzed for PCBs by HRMS. Samples for PCB analysis were prepared in a total of five analytical batches in the laboratory, as follows:

Batches 48985-35, -48985-53, and 48985-56 — whole body samples
 Batches 48985-84 and 48985-74 — fillet and offal samples

This QA/QC narrative will discuss results from batch 48985-84 only. QA/QC narratives are also provided for all other analytical batches.

QA/QC MEASUREMENT PERFORMANCE CRITERIA:

PCB Congeners	Reference Method	Blank	Surrogate Recovery	LCS/MS Recovery	SRM % Diff.	MS/MSD Replicate Relative Precision	Achieved RL (pg/g wet)	Project Goals * (pg/g wet)
	L-32 Battelle SOP ASAT.II-009	<5× EML, or associated samples > 10× blank values	25-150% Recovery	LCS: 50-150% ^a MS: 50-150% Recovery for at least 90% of congeners ^b	≤30% PD ^c	≤30% RPD for at least 90% of analytes ^{b, d}	MDL listed for each sample is EML from 1668A Table 2 adjusted for the amount of sample extracted	Selected congeners range from 0.007-61.6, most do not have an available goal

^a Method 1668A, Table 6 OPR requirements for native PCBs.

^b Analyte concentration in MS/MSD must be >5× background to be used for data quality assessment.

^c Certified values must be >3× the EML.

^d *Sample replicate precision:* concentrations in sample replicate must be >3× the EML.

* = Range of HH goal and ECO goal from Table #9b of QAPP (pp 85-89 of 509)

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-84 – Fillet Fish

METHOD: Fillet fish tissue samples were processed and analyzed for the extended list of PCB congeners following methods described in Battelle's Quality Assurance Project Plan (Battelle, 2001). Briefly,

Sample Preparation – The samples were processed in BATCH 48985-84. Aliquots of each homogenized tissue were weighed into individual jars and mixed with Hydromatrix drying agent. Approximately 10 g wet weight of each tissue sample was used. Thirteen of the field samples were prepared for PCDD/PCDF, TCX, and HCX only, six of the field samples and all of six QC samples were prepared for PCB analysis in addition to PCDD/PCDF, TCX, and HCX. The tissue/Hydromatrix mixtures for the six field samples and six QC samples processed for both PCDD/PCDF, TCX, HCX and PCB analyses were placed into Accelerated Solvent Extraction (ASE) cells and spiked with $^{13}\text{C}_{12}$ -labeled PCB internal standard solutions. Matrix spike, matrix spike duplicate, and the laboratory control spike (LCS) samples were spiked with native PCBs at this time. The spiking level for these 12 samples for both internal and matrix spike solutions was at twice the typical spiking level to accommodate the sample being split in half for separate PCB and PCDD/PCDF/TCX/HCX cleanup. The samples were ASE extracted using MeCl_2 : hexane (1:1). Each extract was then spiked with $^{13}\text{C}_{12}$ -labeled PCB cleanup standards for monitoring recovery of analytes through the cleanup procedures. Each extract was acid washed. After the acid wash step, the 12 samples for both PCB and PCDD/PCDF/TCX/HCX were split in half. Half of each extract was submitted for PCB cleanup which included acid/base silica, alumina, followed by additional acid/base silica cleanup columns. The tissue extracts were spiked with $^{13}\text{C}_{12}$ -labeled PCB recovery standards and concentrated to a final sample volume of 50 μL .

PCB Analysis – Each extract was analyzed by gas chromatography/high resolution mass spectrometry (GC/HRMS) in the selected ion-monitoring mode at a resolution of 10,000 or greater. An SPB-Octyl column was used for analysis of the PCB congeners.

The following revisions to Method 1668A as well as several items to note specifically related to these analyses are summarized below:

1. Quality control samples processed with this batch of samples included one method blank, one LCS, one fish standard reference material, one matrix spike, one matrix spike duplicate, and one sample prepared in duplicate.
2. The GC/HRMS instrumentation was calibrated for PCBs using a 6-point calibration of a subset of PCB congeners to assess linearity of the calibration range, and a single point 209 calibration to generate response factors for each PCB congener. The range of the 6 point calibration corresponds to the following levels in the samples assuming an average sample wet weight of 5 g of tissue and a final sample volume of 50 μL : 2.0 to 20,000 pg/g wet.
3. The 12-hour continuing calibrations were within limits for native PCBs at all times. Several internal standard analytes exceeded the Method 1668A Table 6 criteria. In these instances, an average daily response factor for the analytes out of limits was used to calculate analyte concentrations rather than the single point 209 calibration response factors.

Any additional minor revisions to Method 1668A are fully documented in the analytical record.

PCB CONGENERS QA/QC SUMMARY
QC Batch 48985-84 – Fillet Fish

**HOLDING
TIMES:**

Fillet samples were prepared for analysis in one analytical batch. Samples were extracted within just over 2 months of collection and analyzed within 2 months of extraction.

<u>Batch</u>	<u>Extraction Date</u>	<u>Analysis Date</u>
48985-84	8/27/2001	10/23-24/2001

**DETECTION
LIMITS:**

PCB results are reported relative to the sample-specific reporting limits (also referred to as QL in the QAPP) for that compound. The sample-specific RL is based on the EML (estimated minimum level) for each individual PCB congener listed in Method 1668A, Table 2, adjusted for the amount of sample extracted as follows:

$$RL = (EML) / \text{Sample size}$$

Where,

$$EML = (\text{pg/g EML value from Method 1668A, Table 2}) \times 10$$

to adjust for an assumed sample volume of 10 g in the table

$$\text{Sample Size} = \text{approximately 5-g wet}$$

Limited project detection limit goals were available for the PCB congeners. For congeners which had a detection limit goal, achieved RLs did not meet the goals in many instances. As noted in the QAPP, the project detection limit goals are provided for perspective rather than as a requirement for the analytical methods. If detection limits cannot be achieved, this will be addressed in the uncertainty discussions in the risk assessment.

BLANKS:

One laboratory method blank was processed with the analytical batch. Blanks are analyzed to ensure that the sample extraction and analysis methods were free of contamination.

48985-84– Many PCB congeners were detected at a trace level as is common in low-level HRMS PCB analysis due to the prevalence of PCBs in the environment contributing to background; however, all levels detected were below the reporting level.

**LABORATORY
CONTROL
SAMPLE**

A laboratory control sample (LCS) was prepared with the analytical batch. The percent recoveries of target compounds were calculated to measure data quality in terms of accuracy.

48985-84– The recovery of PCBs in the LCS sample were within the 50-150% criteria found in Table 6 of Method 1668A for all but PCB 118 which was recovered at 153%.

**MATRIX
SPIKES:**

One matrix spike (MS)/matrix spike duplicate (MSD) sample set was prepared with the batch to measure data quality in terms of accuracy and precision. The MS and MSD were fortified with target compounds to monitor data quality in terms of accuracy and precision.

48985-84– For PCBs, the matrix spike recoveries for analytes spiked $>5\times$ background concentration were within the 50-150% limits. The relative percent difference between matrix spike duplicates was $<19\%$ for analytes spiked $>5\times$ the background concentration.

PCB CONGENERS QA/QC SUMMARY

QC Batch 48985-84 – Fillet Fish

INTERNAL STANDARDS:

Twenty-seven internal standards were added to each sample prior to processing, three standards were added after extraction and prior to sample cleanup. Internal standard recoveries were calculated to measure data quality in terms of accuracy (sample processing efficiency).

48985-84— Recoveries of internal standards were within 25-150% for most analytes in all samples. The few that are outside of these limits are flagged in the report tables.

Results outside the limits are expected to have minimal impact on reported results because of the use of isotope dilution or in instances where the native PCB does not have a $^{13}\text{C}_{12}$ -labeled analog, the average area of all standards of the same chlorination level are used, minimizing the effect of any single standard.

REPLICATES:

A laboratory duplicate was prepared with the batch. The RPD between laboratory replicate analyses for target compounds was calculated to measure data quality in terms of precision.

48985-84— All of the PCB congeners detected above the action level of $>3\times$ EML were within the $<30\%$ RPD goal.

SRM:

A standard reference material (CIL EDF 2526) was prepared with the analytical batch. The percent difference (PD) between detected concentrations and certified values was calculated to measure data quality in terms of accuracy.

48985-84— Four out of five analytes in the SRM were found to be outside the limit of 30% difference from consensus values. The low SRM recoveries are thought to be due to the high lipid content of the SRM as discussed in the QA/QC narrative for Whole Body Fish (SDG 48985-43). In order to compensate for the high lipid content of the SRM, sample batches extracted after the date this situation was originally discovered in the PCDD/PCDF/TCX/HCX analyses will have SRM weights adjusted so that the lipid content of the SRM will be similar to that of the field tissue samples.

Recovery in the fillet fish tissues is demonstrated by very good matrix spike, matrix spike duplicate, LCS, and internal standard recoveries, indicating that the analytical procedure is in control.
