US EPA ARCHIVE DOCUMENT

1. INTRODUCTION

The U.S. Environmental Protection Agency (USEPA) Region I and U.S. Army Corps of Engineers (USACE) are conducting a Human Health Biota Consumption Risk Assessment (BCRA) and a Baseline Ecological Risk Assessment (BERA) for the Centredale Manor Restoration Superfund Site located in North Providence, Rhode Island (hereafter referred to as "the Site"). This effort is being performed for the USACE under Contract No. DACW33-01-D-0004, Delivery Order 01. A layout of the Site is provided as Figure 1.

This Data Evaluation Report (DER) has been developed to reflect the goals and objectives discussed and agreed upon during meetings with USEPA, USACE, Battelle, and Harding ESE (now MACTEC Engineering and Consulting, Inc.) conducted on July 17, 2000, November 17, 2000, December 4, 2000, December 19, 2000, and February 28, 2001, and presented in meeting minutes and other support documents. This report was prepared to be consistent with the requirements set forth in the Statement of Work (SOW) and the Addendum to the Statement of Work prepared by USEPA (USEPA, 2000a and USEPA, 2000b).

1.1 PURPOSE

The purpose of this report is to provide a discussion of the methods and results of BCRA/BERA summer 2001 data collection and evaluation activities conducted to provide additional analytical data needed to perform the quantitative human health and ecological risk assessments for the Site. The product of these activities, discussed in this report, is a series of media- and exposure area-specific data summaries, which will be used to determine exposure point concentrations (EPCs) for the upcoming risk assessments. The data summaries provided as part of this report rely on post-third party validated data as presented in the media-specific chemistry data reports (Battelle, 2002a through 2002j).

The activities involved in the data evaluation process include compilation of data sets for the quantitative risk assessments. All data were analyzed for compliance with data quality objectives (DQOs) presented in the Work Plan and Field Sampling Plan (Harding ESE, 2001a,b). Data were reviewed with respect to project goals and objectives to verify that data collected meet project data needs (e.g., number and type of samples, species, analyses, and appropriateness for calculation of biota/sediment accumulation factors [BSAFs]). Limitations of the data that will need to be considered in the risk assessments were also identified.

1.2 BACKGROUND

The data evaluation process has involved a series of steps. These steps are listed below and are discussed further in the following paragraphs. Initially, the project team developed goals, objectives, and data requirements to support the upcoming risk evaluations. Historical data were compiled and reviewed to determine the need for additional data. Additional data needs were identified and the BCRA/BERA 2001 field program was conducted to address these needs.

In accordance with the SOW dated April 6, 2000, Harding ESE identified project goals, objectives, and data requirements to support human health and ecological risk assessments for the Site. On Tuesday, December 19, 2000, a meeting was held with the project team (USEPA, USACE, Battelle, and Harding ESE) to discuss DQOs. Subsequently, a report was prepared that presented the goals, objectives, and data needs for evaluating the human health biota consumption pathway and the objectives and data requirements for the ecological assessment endpoints (Harding ESE, 2000). The SOW and the DQO report prepared by Harding ESE were reviewed in conjunction with the current database to determine whether or not data collected during the BCRA/BERA 2001 sampling effort satisfy goals, objectives, and data needs identified by the project team that would be required to conduct the upcoming risk assessments.

In the Work Plan prepared to support the human health and ecological risk assessments (Harding ESE, 2001a), Harding ESE evaluated the existing data and documents (as of March 2001) provided by USEPA and the USACE. Available information was reviewed to determine the need for additional data for successfully accomplishing the planned biota consumption and ecological risk assessments. During the data review, the number of samples collected for each medium, chemical analyses performed for samples collected during particular sampling events, and the location of samples collected were evaluated. It was determined that insufficient historical biota, soil, sediment, and surface water were available to perform the BCRA and BERA. Additional samples needed to be collected from these media to fill the data gaps.

Following identification of data needs for the risk assessments, the Field Sampling Plan (FSP) (Harding ESE, 2001b) was prepared to identify the specific data that would be required for each medium in each exposure area to evaluate the human health biota consumption pathway and ecological exposure pathways.

The BCRA/BERA 2001 field collection activities began in May 2001. Tissue samples collected in the Allendale and Lyman Mill reaches and in upstream areas included fish, crayfish, emerging insects, and earthworms. Media sampled in those areas included floodplain soil, aquatic sediment, and surface water. In the Assapumpset reference area, fish, crayfish, aquatic sediment, and surface water samples were also collected. Fish sampling was conducted in Manton and Dyerville Ponds. No other sampling occurred in those reaches. BCRA/BERA field activities were completed in late July 2001.

The abiotic media data were collected to support the bioassessment data. A variety of bioassessment studies were identified as necessary to conduct the ecological risk assessment (e.g., floodplain invertebrate study, aquatic macroinvertebrates study). The additional sediment, soil, and surface water samples were necessary to interpret the additional biological data.

US EPA ARCHIVE DOCUMENT

The samples collected during the BCRA/BERA field sampling program were analyzed or tested for chemical, physical, and biological parameters by laboratories in several organizations, including:

PARAMETERS	LABORATORY
Dioxin/Furan and PCB Congener	Battelle, Columbus OH
HCX	Battelle, Columbus OH
TCX	Battelle, Columbus OH
PCB Aroclor and Chlorinated Pesticides	Battelle, Duxbury MA
Polycyclic aromatic hydrocarbons	Battelle, Duxbury MA
Metals, AVS/SEM	Battelle, Sequim WA
SVOCs and VOCs	Severn Trent Laboratories, Baltimore MD
BOD	Cassell Testing, Hunt Valley MD
Nutrients	Chesapeake Biological Laboratory, Solomons MD
Sediment Toxicity	Great Lakes Environmental Center, Traverse City MD
Taxonomy	Normandeau Associates, Bedford NH

Additional field efforts and analyses have been performed by other parties in 2001. USGS collected tree swallow samples in May and June of 2000 and 2001. USACE collected fish data to support the early life stage testing. Battelle performed the ELS bioassay study. TetraTech collected floodplain soil samples in June and July 2001, sediment samples in July 2001, and groundwater samples in August 2001. These additional efforts are not described or evaluated here. This report summarizes and evaluates the field and analytical data resulting from the BCRA/BERA 2001 sampling effort conducted for the USACE under Contract No. DACW33-01-D-0004.

Third party data validation has been conducted by USEPA and Environmental Standards, Inc. The validated data have been presented in several medium-specific post-third party data validation chemistry data reports (Battelle, 2002a through 2002j).

1.3 ORGANIZATION OF REPORT

This DER is divided into five sections. Section 1 presents introduction and background information. Section 2 provides a description of the Site, a summary of environmental conditions, and a conceptual site model (CSM), which discusses sources of contamination, migration pathways, and potential human and ecological receptors. Section 3 describes the specific project goals and objectives for the BCRA and BERA. Section 4 includes a summary of data needs and DQOs followed by a summary of the BCRA/BERA 2001 data collection activities. Also presented is a description of the deviations from proposed data collection efforts along with rationale for such deviations. Section 5 presents the key data limitations and the associated implications of those limitations on the risk assessments.

US EPA ARCHIVE DOCUMENT

2. GENERAL SITE INFORMATION

2.1 DESCRIPTION OF SITE

The main area of the Site, consisting of approximately 9.04 acres, is located in North Providence, Rhode Island, just south of Route 44 on the eastern bank of the Woonasquatucket River. The main area is known as 2072 and 2074 Smith Street. The Site also consists of reaches of the Woonasquatucket River associated with Allendale Pond and Lyman Mill Pond. The Site consists of all contaminated areas within this area as well as any other location to which contamination from that area has come to be located, or from which that contamination came.

Currently, two high rise buildings (Centredale Manor and Brook Village, both federally-subsidized, senior housing complexes) are located in the main area of the Site, which is zoned for residential occupancy. In addition to the buildings, the main area is covered by roadway and parking lots. On the eastern portion of the main area is a drainage swale that begins near the northern portion of the main area and extends south, then curves to the west and discharges south of the main area into the Woonasquatucket River and Allendale Pond.

The Site was used for disposal of wastes containing hazardous substances. Between approximately 1940 and 1970, USEPA has reason to believe that the main area of the Site was the location of a chemical manufacturing facility (which produced hexachlorophene, among other chemicals) and an incineration-based drum recycling facility. The first housing complex was built in approximately 1976. The second high rise was built in 1982. Construction records show that hazardous substances were removed from the Site during the construction of the second complex. Samples indicate the presence of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) and other contaminants in soil and sediment at the main portion of the Site and the river sediment and floodplain soils downstream. Figure 1 provides an overview of the study area.

2.2 EXPOSURE AREAS

As discussed in the Work Plan and FSP (Harding ESE, 2001a,b), the study area was segregated into general exposure areas (EAs) as defined by the four historical impoundments in the Woonasquatucket River (see Figure 1). EA1 consists of the Centredale Reach portion of Woonasquatucket River, Allendale Pond floodplains, and the Allendale Pond channel. The Lyman Mill reach of the Woonasquatucket River and the Lyman Mill Pond represent EA2. Manton Pond is EA3 and Dyerville reach of the Woonasquatucket River and Dyerville Pond constitute EA4. Reference sample collection areas include Woonasquatucket River upstream of the Site (including Greystone Mill Pond), and Assapumpset Pond and Brook.

2.3 CURRENT AND REASONABLY FORESEEABLE USES OF THE SITE

The northern portion of the Site is occupied by the Brook Village and Centredale Manor apartment complexes. These parcels are currently occupied and covered by buildings, pavement, or landscaping. The remaining portions of the Site consist of reaches and wetlands associated with the Woonasquatucket River and four manmade ponds. The river is not used as a source of

US EPA ARCHIVE DOCUMENT

drinking water. Per the Rhode Island Department of Environmental Management (RIDEM) Water Quality Regulations EVM 112-88.97-1 (June 23, 2000), the Woonasquatucket River (from Esmond Mill Drive in Smithfield to the CSO Outfall at Glenbridge Avenue in Providence) is classified as a Class B1 water body. Class B1 water bodies are:

> "designated for primary and secondary contact recreational activities and fish and wildlife habitat. They shall be suitable for compatible industrial processes and cooling, hydropower, aquacultural uses, navigation, and irrigation and other agricultural uses. These waters shall have good aesthetic value. Primary contact recreational activities may be impacted due to pathogens from approved wastewater discharges."

The land-use for the northern portion of the Site is expected to remain multi-family residential. USEPA plans to restore the Woonasquatucket River and associated reaches and ponds to a fishable condition.

2.4 Summary of Environmental Conditions

Sampling activities conducted by USEPA and RIDEM revealed elevated polychlorinated dibenzo dioxins and furans (dioxins and furans) in soils and sediments as well as from fish taken from the Woonasquatucket River. As mentioned above, other contaminants detected onsite include: Polychlorinated biphenyls (PCBs), chlorinated and aromatic volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), phthalates, and metals. The Site was added to the National Priorities List on February 4, 2000. For the Woonasquatucket River, there is currently a dioxin-, PCBs- and mercury-related fish consumption advisory in place that recommends that people not eat fish, eels, turtles, or plants from the river downstream of the Smithfield Treatment Plant.

Approximately 400 drums and 6,000 cubic yards of soil were removed from the property during construction of the apartment complexes. However, the exact locations of these remediation activities are not known. Temporary caps were installed over heavily contaminated areas near residences. Interim soil caps were placed in the source area in July 2000.

Temporary fencing was erected around areas of contaminated surface soil in January 1999. The temporary fencing was replaced with chain-link fence between May and September 1999 to prevent access to contaminated areas.

Allendale Dam was partially breached in 1991, allowing the water level in Allendale Pond to recede. As a result, most of the pond bottoms adjacent to residential properties along the eastern bank of Allendale Pond were exposed because they were no longer flooded. Since 1991, much of the Allendale Pond area had become vegetated. USEPA planned to reconstruct Allendale Dam during the summer of 2001, thus restoring Allendale Pond. In May 2001, prior to any reconstruction efforts, two successive breaches occurred at Allendale Dam. This likely resulted in the migration of contaminated sediment to Lyman Mill Pond and a substantial lowering of Allendale Pond water. Since then, a new dam has been installed and water levels in Allendale Pond are back to levels that existed prior to the 1991 breach.

2.5 Conceptual Site Model

The CSM identifies potential source areas from which oil and/or hazardous materials (OHM) may have been released, the migration pathways through which OHM may have been transported and/or translocated to other environmental media, and where possible exposure may occur. The CSM provides a framework for understanding sources of OHM, migration pathways, identification of potential receptors, and development of exposure profiles. The CSM for the Site was developed as part of the Work Plan and is also presented here.

2.5.1 Source Area

Releases of hazardous substances from former industrial operations have occurred at the Site. The source area consists of two parcels located at 2072 and 2074 Smith Street (Lots 200 & 250) that cover approximately 9.04 acres (see Figure 1). Evidence suggests that operations at the former chemical company and drum reconditioning facility resulted in waste disposal onto surface soil and beneath the ground surface. Wastes have also been released directly into the Woonasquatucket River, which runs along the western side of the source area (Tetra Tech NUS Inc., 2000). Dioxins and furans have been detected in soils and sediments as well as in fish tissue collected in 1996 from the Woonasquatucket River. Other contaminants detected in Site media include PCBs, VOCs, PAHs, hexachloroxanthene (HCX), phthalates, and metals.

2.5.2 Migration of OHM

Downstream sediments have been impacted through the transport and deposition of contaminants from the source area. Dioxins and furans have been detected in sediments at Allendale Pond and Allendale Dam, which is approximately 2000 feet from the source area. With the partial breaching of Allendale Dam in 1991 and the more recent breach in 2001, contaminants have migrated downriver to Lyman Mill Pond. Evidence suggests that contaminants originating from the source area have migrated beyond Manton Dam down to Dyerville Pond (Figure 1 shows the location of these ponds and associated dams).

2.5.3 Potential Human Receptors

Consistent with USEPA objectives, the following pathways will be evaluated for the baseline human health risk assessment: potential exposure to chemicals of potential concern (COPCs) via ingestion of fish; and potential inadvertent ingestion and dermal contact with bank soils, surface water and sediment. These pathways will be evaluated for both neighborhood residents and site visitors. Contaminants that are present in surface water and aquatic sediments may have bioaccumulated in fish and other biota present in the Woonasquatucket River. These fish may be consumed by individuals that catch and/or consume biota from the river. Child, adolescent, and adult consumers may be exposed to COPCs via ingestion of fish and other biota and via inadvertent ingestion and dermal contact with bank soils, surface water, and sediment. Both recreational and subsistence anglers/consumers will be evaluated in the human health risk assessment.

US EPA ARCHIVE DOCUMENT

2.5.4 Potential Ecological Receptors

In general, aquatic receptors (including invertebrates and both demersal and pelagic fish species) are exposed to COPCs in sediment and surface water via direct contact, direct ingestion, or by consuming prey items that have bioaccumulated COPCs. Semi-aquatic receptors (including mammals, birds, reptiles, and amphibians) may be exposed as a result of incidental ingestion of sediment, consumption of water, or ingestion of contaminated prey. Terrestrial invertebrates and wildlife that prey on these species may be exposed to COPCs in floodplain soil directly or by ingesting contaminated prey. The Work Plan (Harding ESE, 2001a) describes the receptors and exposure pathways that will be evaluated in greater detail.

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

3. PROJECT GOALS AND OBJECTIVES

The overall project goals are as follows:

1. to evaluate risk to human health associated with the consumption of fish present in the portion of the Woonasquatucket River that constitutes the Site and with potential ingestion and dermal contact with bank soil, surface water, and sediment in the portion of the Woonasquatucket River that constitutes the Site; and

Contaminants that are present in surface water and aquatic sediments may have bioaccumulated in fish and other biota present in the Woonasquatucket River. These fish may be consumed by individuals that catch and/or consume biota from the river. Neighborhood residents and visitors may contact bank soil, surface water, and sediment during angling and recreational activities.

2. to evaluate risks to onsite ecological receptors associated with COPCs identified in the Site.

In general, aquatic receptors (including invertebrates and both demersal and pelagic fish species) are exposed to OHM in sediment and surface water via direct contact, direct ingestion, or by consuming prey items that have bioaccumulated OHM. Semi-aquatic receptors (including mammals, birds, reptiles, and amphibians) may be exposed as a result of incidental ingestion of sediment, consumption of water, or ingestion of contaminated prey. Terrestrial invertebrates and wildlife that prey on these species may be exposed to OHM in floodplain soil directly or by ingesting contaminated prey.

3.1 HUMAN HEALTH OBJECTIVES

Specifically, the human health human health risk assessment will include an evaluation of multiple exposure pathways for neighborhood residents and visitors to the Site: ingestion of biota from the reach of the Woonasquatucket River that constitutes the Site; and ingestion and dermal contact with bank soil, surface water, and sediment in the portion of the Woonasquatucket River that constitutes the Site. The primary objectives associated with these pathways will be:

(1) to calculate potential human health risks associated with biota consumption and contact with bank soil, surface water, and sediment from the portion of the river within the Site boundaries; and
(2) to achieve and/or maintain acceptable risks related to biota consumption and contact with bank soil, surface water, and sediment through risk management procedures that may include development of preliminary remediation goals (PRGs) for sediment and possibly for one or more of those other media.

The objective of the baseline human health risk assessment is to analyze potential adverse human health effects for both current and future conditions caused by hazardous substances found at the site in the absence of any actions to control or mitigate these releases (i.e., under an assumption of no action or in the absence of the RI DOH health advisories on fish consumption for this particular site). Currently, there is a fish consumption advisory issued by the State of Rhode

Island that is not believed to be a sufficient barrier to precluding exposure to biota from the Woonasquatucket River in the short-term. Current and potential future exposure to fish and other biota (including high lipid content biota such as eels) may occur at the river. EPA's goal is to restore the river to an unrestricted "fishable" river.

3.2 Ecological Objectives

In general, the objectives (i.e., assessment endpoints) for the BERA are the protection and maintenance of aquatic, semi-aquatic, and terrestrial receptor populations at the Site. The overall objective of the BERA is to determine if exposure to contaminant concentrations detected in Site media is likely to cause a decline in receptor populations or to adversely affect the integrity of aquatic or floodplain soil communities. The general types of effects of concern include:

- mortality, growth, or reproductive effects resulting from direct exposure to contaminants that affect a significant proportion of a receptor population;
- mortality, growth, or reproductive effects resulting from exposure to contaminants that have bioaccumulated in the ecological food chain that affect a significant proportion of a (higher trophic level) receptor population; and,
- indirect effects associated with a substantial reduction in abundance of prey populations.

Field population and community studies were implemented to evaluate potential population-level effects (e.g., survival, growth, or reproduction) or community-level effects (e.g., species richness and abundance) associated with exposure to Site media. The six assessment endpoint receptor groups selected for the BERA include:

(1) Aquatic and floodplain invertebrates (crayfish, earthworms);
(2) Demersal and omnivorous fish;
(3) Pelagic, piscivorous, or semi-piscivorous fish;
(4) Piscivorous mammals and birds;
(5) Insectivorous mammals and birds; and
(6) Omnivorous mammals and birds.

The BERA will evaluate the protection and maintenance of communities and/or populations of the receptors identified above. There are multiple measures of effect for each of the BERA assessment endpoints. Many of these measures of effect depend on the evaluation of historical and/or recently collected biotic and abiotic data, including analytical chemistry data for surface water, sediment, soil, and biological tissue.

Table 1 originally presented in the FSP (Harding ESE, 2001b) identified the information that would be needed to meet project goals and objectives. This table formed the basis of the BCRA/BERA field collection activities conducted in the summer of 2001.

US EPA ARCHIVE DOCUMENT

4. DATA EVALUATION

The objectives of this section are as follows:

- to provide a summary of the historical tissue and abiotic data for the Site (as presented in the Work Plan [Harding ESE, 2001a]);
- to present the data needs identified based on the available data (as presented in the FSP; Harding ESE, 2001b);
- to provide a presentation of the data for media sampled during the BCRA/BERA summer 2001 sampling effort; and
- to identify deviations between proposed and actual samples collected/analyzed and to evaluate data usability for the data collected during the BCRA/BERA 2001 field sampling effort.

The methods used to achieve these objectives are as follows:

- Historical data for tissue and abiotic media were reviewed and summarized (as presented in the Work Plan [Harding ESE, 2001a]);
- Based on the available data, the project team identified remaining data needs for completing the human health and ecological risk assessments (see FSP; Harding ESE, 2001b);
- Field activities were conducted during the summer of 2001 to address these data needs; and
- Based on the results of the recent field effort, deviations from what was proposed versus what was actually collected in the field and analyzed in the laboratory were identified. Data limitations (as they relate to the risk assessments) have been identified and their implications discussed.

Section 4.1 of this report provides an abbreviated summary of the available historical data that was previously presented in the Work Plan (Harding ESE, 2001a). Data needs were identified based on what data were already available. Section 4.2 presents those data needs (as presented in the FSP; Harding ESE, 2001b). A summary of the field collection activities is also presented in Section 4.2. The validated data were grouped by medium and exposure area and statistically summarized as part of the data evaluation process. Data summaries are included in Appendix A to this report. A presentation of data summaries by media and exposure area is provided in Section 4.3. Deviations from the proposed data collection activities are also discussed in Section 4.3.

Section 4.4 identifies deviations from proposed sample collection and physical and chemical analyses during the BCRA/BERA 2001 field program. Section 4.5 presents a comparison between human health and ecological project action goals (PAGs) and achievable laboratory limits, which could affect the assessment of risk at the Site. Recommended detection limits used to support the human health BCRA and the BERA are compared to the achievable laboratory limits. Section 4.6 provides a brief review of the biotic and abiotic data as it relates to frequencies of detection for various chemical groups, specifically dioxins (i.e., 2,3,7,8-TCDD) and hexachloroxanthene (HCX). A discussion of the identified data limitations and implications with respect to quantifying risk at the Site is provided in Section 5 of this report.

US EPA ARCHIVE DOCUMENT

4.1 Summary of Historical Data

As part of Work Plan (Harding ESE, 2001a) preparation, historical analytical data for biota collected in the Woonasquatucket River, as well as for Site sediments, surface water, and soil were compiled and reviewed. A summary of the historical data is presented here to provide a basis for the data needs identified in Section 4.2. This information was used by the project team to identify additional data needs in preparation for the BCRA/BERA 2001 field sampling effort. The historical data that are available are discussed below.

Limited historical tissue data are available for fish. The project team determined that these data would be insufficient to adequately characterize risks at the Site. Moreover, laboratory validation reports are unavailable and the analytical methods employed are not consistent with those to be used during the BCRA/BERA 2001 sampling and analysis program.

Historical soil data are available for areas in and downgradient of the source area down to Lyman Mill Dam. These samples consist of bank and floodplain samples as well as source area samples and residential soil samples.

Historical data are available for floodplain, bank, and aquatic sediments. Floodplain sediment data are available for the Allendale and Lyman Mill reaches and in reference areas of the Site (Assapumpset Brook and in the area of Greystone Mill Pond). Bank sediment data are available for the Allendale and Lyman Mill reaches and in Greystone Mill Pond. No floodplain or bank sediment data had been collected for the Manton and Dyerville reaches. Aquatic sediment data are available for the Allendale, Lyman Mill, Manton, and Dyerville reaches and in reference areas of the Site.

Surface water data are available for the Allendale and Lyman Mill reaches and in the area of Greystone Mill Pond. According to the January 2001 database, no surface water samples had been collected from the Manton or Dyerville Reaches or from Assapumpset Brook.

Available information (as discussed above) was reviewed to determine the need for additional data for successfully accomplishing the planned biota consumption and ecological risk assessments. The database was queried for distribution of the samples collected and chemical analyses performed for each of the EAs. The adequacy of the reference sample and upstream sample results was also evaluated. A detailed summary of Site data available by medium and exposure area, which presents number of samples and types of analyses performed, was provided in Table 3-1 of the Work Plan (Harding ESE, 2001a). Although the spatial coverage of sampling locations within the Site appeared adequate to characterize baseline ecological risks, there were a number of data needs identified by the project team that would be required to characterize potential human health biota consumption and ecological risks. These data needs are discussed in the following subsection.

US EPA ARCHIVE DOCUMENT

4.2 Presentation of Data Needs with Overview of BCRA/BERA 2001 Data Collection

A summary of the data needs by EA and medium (as presented in Table 1 of the FSP; Harding ESE, 2001b) is provided in Table 1. Table 1 presents the data collection needs (number of samples for each medium and EA) *proposed* by the project team in the FSP and, in addition, provides a column that shows the *actual* number of samples collected by medium and EA during the BCRA/BERA 2001 sampling program.

Based on these data needs, the BCRA/BERA 2001 field sampling activities to support the risk assessments consisted of the following subtasks:

- Biota Tissue Sampling
- Field Population and Community Studies
- Sediment Sampling
- Surface Water Sampling
- Floodplain Soil Sampling

Data summaries for the above sampling results are provided in Appendix A. Provided in the data summaries are raw results and summary statistics, including the frequency of detection, range of detected concentrations, minimum and maximum sample quantitation limits (SQLs), and the average of all samples (using half the SQL as the value for non-detects). Note that primary sample results as well as laboratory duplicate and field replicate results are provided in these tables. Laboratory duplicates and field replicate sample results are not factored into the calculation of summary statistics.

In addition to chemical data, laboratory analysis included physical properties. These additional data include TOC and grain size for soil and sediment, percent moisture for tissue and abiotic media and percent lipid for tissue samples. TOC and grain size data will be used to evaluate contaminant bioavailability and to categorize substrate habitat type. Method detection limits (MDLs) are dependent on percent moisture data to determine sample quantitation limits that will be used in risk assessment calculations. Percent lipid data will be used in deriving biota-sediment accumulation factors (BSAFs) for each species. Percent lipid varies notably among fish species. For the white sucker, percent lipid ranges from 6 to 11 percent wet weight in exposure areas and reference areas. For the largemouth bass, percent lipid ranges from 1.6 to 1.9 percent wet weight in exposure areas and reference areas. American eel are biota with high lipid content, ranging here from 12 to 19 percent wet weight.

Discussion of the above sampling efforts and the sample results are provided in the following subsections and in Section 4.3. Early life stage (ELS) fish and egg samples and tree swallow tissue samples were also collected and analyzed as part of the BCRA/BERA 2001 sampling effort. Summary statistics and raw results for ELS and tree swallow are presented as part of Appendix A, but discussion of the results and an evaluation of DQOs for these data are prepared in separate reports prepared by others. Note that Appendix A provides 2001 tree swallow data only. In addition, all tissue types for tree swallow and ELS are summarized together.

US EPA ARCHIVE DOCUMENT

ELS analytical tissue data along with other study results (e.g., photomicrographs) will be used in the evaluation of risks to fish progeny in the BERA. Tree swallow data (i.e., levels of bioaccumulating compounds in eggs, nestling tissue, and composite stomach content samples) will be used in the BERA to evaluate the bioaccumulation hazard posed by food chain exposures to these receptors. Evaluation of the ELS and tree swallow data is not within the scope of this report. Additional groundwater and floodplain soil samples were collected in 2001 by Tetra Tech NUS. Three archived sediment samples collected by TetraTech NUS in 1999 were analyzed for dioxins/furans, HCX and TCX in 2001 (Battelle, 2002i). These data are not included in this data evaluation, but will also be used in the risk assessments.

4.2.1 Biota Tissue Sampling

4.2.1.1 Data Needs

For the purpose of the human health and ecological risk assessments, data needs included a variety of tissue collection activities. Analytical chemical results for fish tissue collected from the portion of the Woonasquatucket River that constitutes the Site were needed to evaluate human health risks associated with potential exposures to local populations via consumption of biota from the river.

Various biota tissue data were required to evaluate ecological risks associated with receptors that may ingest aquatic biota that have bioaccumulated or bioconcentrated Site-related compounds in their tissue. Fish samples would be used to evaluate potential risks to ecological receptors that ingest fish and other organisms that have bioaccumulated Site-related compounds in their tissue. The tissue data will be used directly in the BERA to estimate both direct effects to the sampled organisms and potential bioaccumulation risks to consumer species. Additional biota tissue data needed to support the BERA included crayfish, emerging aquatic insects, and earthworms.

Crayfish would be collected in each exposure area to evaluate aquatic food chain exposures in the BERA. Floodplain invertebrates (earthworms) would be collected in each exposure area to evaluate worm-eating wildlife exposures and to estimate direct toxicity to soil fauna based on measured tissue burdens of bioaccumulating compounds.

Figures 2 through 5 provide BCRA/BERA sample locations.

4.2.1.2 Sampling Summary

Fish samples were collected from the four EAs to evaluate human health risks associated with eating fish from the four reaches of the Site (Allendale, Lyman Mill, Manton, and Dyerville Ponds). In addition, fish samples were collected from the reference areas (Upstream and Assapumpset Brook).

Three biota species were targeted for collection. The objectives of the ecological risk assessment required that representatives of both demersal and piscivorous categories be included in the sampling program. Preliminary target species included white sucker and largemouth bass. The third target species, focused on meeting requirements for the human health fish consumption

assessment, is the American eel. The specific species collected for tissue analysis to support the BCRA and the BERA were based on availability of species in the collection areas and the need to represent different trophic levels in the ecological risk assessment. When field activities were implemented, if the target species were not available in abundances necessary to meet sample number requirements, identified "alternative" species (as identified in the Work Plan) were selected based on the project objectives and relative abundances. Areas of fish collection are shown on Figures 4 and 5.

The BCRA will include evaluation of both American eel and largemouth bass. Whole body analysis was conducted for the eel. For the largemouth bass, fillet and offal were collected. Largemouth bass fillet samples were analyzed to support the BCRA because this is the portion of the fish that is typically consumed. To evaluate ecological risks, the offal portions (i.e., remaining flesh, bones, and internal organs) were also analyzed and whole body tissue concentrations were derived as the wet-weight weighted average of the separate fillet and offal analyses. Separate fillet and offal analytical results are provided in the Appendix A data summaries.

In addition to the tissue samples from the three species identified above, additional tissue samples were collected specific to support the evaluation of ecological risks at the Site. These additional tissues included crayfish, emerging macroinvertebrates, earthworms, and various samples collected as part of a swallow population study. Sampling locations for crayfish, emerging insects, and earthworms are presented on Figures 2 and 3.

4.2.2 Field Population and Community Studies

4.2.2.1 Data Needs

Additional population- and community-level studies, focused on evaluating relative population abundance, species richness, and/or reproductive success, were also required for the ecological risk assessment. These studies included:

- a fish population and community survey in pond environments downstream of the Site following the framework of the Index of Biotic Integrity (IBI);
- ichthyoplankton (i.e., larval fish) surveys to obtain community measures of species richness and relative abundance that will be used in the effects assessment of the BERA;
- aquatic macroinvertebrate community survey in riverine environments downstream of the Site (following the multi-habitat approach outlined in Rapid Bioassessment Protocols (RBP) for Use in Wadeable Streams and Rivers, 2nd Edition [Barbour et al., 1999]). The specific focus of this study was to evaluate the potential effects of discharging groundwater in the reach adjacent to the Site and to assess the potential role that surface water COPCs and nutrients may have on this community; and
- soil invertebrate community surveys in floodplain environments associated with the Woonasquatucket River.

4.2.2.2 Sampling Summary

Several surveys were completed to evaluate the impacts that Site-related OHM may have on invertebrates, fish, and avian populations and/or communities. Population- and community-level studies collected information relative to population abundance, species richness, relative abundance of pollution-sensitive species, and reproductive success.

A fish population and community survey was completed in lotic and lentic (i.e., pond) environments downstream of the Site and in reference areas following the framework of the Index of Biotic Integrity (IBI), as outlined in Rapid Bioassessment Protocols for Use in Wadeable Streams and Rivers, 2nd Edition (Barbour et al., 1999). IBI metrics were estimated for each fish community sample to assess species richness and relative health of foraging guilds within the study area. The draft Bioassessment Report of the Fish Community (Normandeau Associates, 2002a) provide results of the IBI assessment. These results will be used in the BERA.

Similarly, benthic macroinvertebrate community evaluation and habitat assessment was conducted in riverine habitats following the framework by Barbour et al. (1999). The draft Benthic Macroinvertebrate Bioassessment Report (Normandeau Associates, 2002b) provide results of the RBP assessment. These results will be used in the BERA.

Sampling areas for the IBI, ichthyoplankton tows, and RBP are presented in Figures 4 and 5.

4.2.3 Sediment Sampling

4.2.3.1 Data Needs

Additional sediment samples were needed in the areas of crayfish sample collection to estimate trophic transfer factors. Additional sediment samples were also required to conduct the laboratory macroinvertebrate bioassays needed to evaluate the direct toxicity that sediment exposure poses to macroinvertebrate receptors. The whole sediment toxicity test endpoints were survival, reproduction, and emergence and growth for two receptors: *Hyalella aztecta* and *Chironomus tentans*. The results of sediment bioassay study are provided in the Whole Sediment Toxicity Testing report (GLEC, 2002).

4.2.3.2 Sampling Summary

Additional sediment samples were collected to support the evaluation of potential bioaccumulation into crayfish tissue and to conduct laboratory bioassays. Sediment bioassay locations are shown on Figures 2 and 3.

4.2.4 Surface Water Sampling

4.2.4.1 Data Needs

Surface water samples were needed to support the aquatic macroinvertebrate community study that was conducted as part of the BERA to evaluate the effects of groundwater discharge (in the vicinity of the Site).

4.2.4.2 Sampling Summary

Surface water samples were collected from sampling areas associated with the aquatic macroinvertebrate community study sampling areas. Sampling locations are presented in Figures 4 and 5. Surface water grab samples were collected from stations co-located with the macroinvertebrate community study.

4.2.5 Floodplain Soil Sampling

4.2.5.1 Data Needs

Additional floodplain soil samples were needed in the areas of earthworm collection to estimate trophic transfer factors for bioaccumulating compounds and to evaluate patterns of response observed in the soil invertebrate community study.

4.2.5.2 Sampling Summary

Floodplain soil samples were collected to support the evaluation of earthworm tissue analytical results and the soil fauna community study. Sampling locations are presented in Figures 2 and 3. Floodplain soil samples were collected from stations co-located with the soil invertebrate community study.

4.3 Identification of Deviations from Proposed Sample Collection and Analytical Activities

The ultimate product of data evaluation and data summarization is a set of analytical data in a form that can be used in the quantitative risk assessment. Data collected from the BCRA/BERA 2001 field program were compiled for each medium by exposure area. Data summaries are provided in Appendix A.

Each data set provided in Appendix A was summarized to provide the following statistical descriptors: (1) the ratio of the number of samples in which the analyte is detected to the total number of samples (i.e., frequency of detection), (2) range of analytical quantitation limits (QLs), (3) range of detected concentrations, and (4) arithmetic mean of reported concentrations. Rejected analytical results (i.e., results assigned an "R" qualifier) were not included in any of the statistical data analyses. When calculating the arithmetic mean concentrations, one-half the analytical QL was used as the reported concentration for results reported as not-detected (i.e.,

US EPA ARCHIVE DOCUMENT

results assigned a "U" and "UJ" qualifier). In addition to the data summaries provided for each medium/exposure area combination, the raw results by sample identifier are also provided.

The following subsections discuss the data sets developed for biological tissue (fish, earthworms, crayfish, and emerging insects), floodplain soil, aquatic sediment, and surface water. Only the fish data (fillet for largemouth bass and American eel whole body) will be used in the human health BCRA. The BERA will use all data sets compiled in Appendix A. As mentioned previously, largemouth bass exposures will be based on whole body-derived exposure concentrations.

Also provided in the following subsections is the explanation of any deviations from the proposed sampling and analytical requirements specified in the Work Plan and FSP (Harding ESE, 2001a,b). USEPA was consulted prior to making changes in the locations sampled, number of samples collected and/or numbers and types of species collected. In addition, any deviations from the proposed versus actual analyses performed (for chemical and physical parameters) are also discussed. Tables 1 and 2 highlight the deviations from the proposed samples collected (Table 1) and from the proposed analyses performed by the contracted analytical laboratories (Table 2).

4.3.1 Fish

Samples Collected:
As shown in Table 1, during the BCRA/BERA 2001 sampling efforts the following fish samples listed by exposure area were collected:

Allendale:	13 demersal fish (11 white sucker and 2 Fall fish samples) and 10 American eel. No piscivorous fish (e.g., largemouth bass) collected
Lyman Mill:	12 demersal fish (white sucker) and 1 white sucker egg sample , 10 piscivorous fish (largemouth bass), and 10 American eel
Manton:	3 piscivorous fish (largemouth bass)
Dyerville:	3 American eel
Assapumpset:	3 demersal fish (brown bullhead), 4 piscivorous fish (largemouth bass), and 6 American eel
Upstream:	10 demersal fish (white sucker), 10 piscivorous fish (largemouth bass) and 10 American eel were collected

Deviations from Proposed Location and Number of Samples:
In Allendale Pond, no piscivorous fish were observed or caught during the sampling event. At the time of sampling, the dam had been breached and the pond had become a shallow (i.e., less than two feet deep) riverine channel. The resulting habitat (i.e., post dam breach) no longer provided adequate habitat for large piscivorous fish. Fish were likely either swept downstream at the time of the dam breach or migrated upstream.

Assapumpset Pond was sampled extensively; however, field personnel were unable to meet specified data requirements.

US EPA ARCHIVE DOCUMENT

The Dyerville reach was sampled and no piscivorous fish were observed or caught. American eel was the only species observed in abundance that would provide enough tissue for the required sample analyses. Therefore, the decision was made to sample this species. The dam below this reach had been breached for many years and the shallow riverine habitat does not provide adequate habitat for large piscivorous fish species. In any case where a single fish did not meet the minimum weight requirement for the required analyses, a composite of multiple fish was collected for analysis. The two Fall fish samples from Allendale pond were composite samples.

The number of samples of each fish category at all other EAs are consistent with those proposed.

4.3.2 Crayfish/Aquatic Sediment/Sediment Bioassay

Samples Collected:
As shown in Table 1, during the BCRA/BERA 2001 sampling effort the following paired crayfish/aquatic sediment samples and invertebrate bioassay samples were collected:

Allendale:	3 crayfish and 3 sediment samples; 3 bioassay sediment samples
Lyman Mill:	4 crayfish and 4 sediment samples; 3 bioassay sediment samples
Manton:	not required per the FSP
Dyerville:	not required per the FSP
Assapumpset:	1 crayfish and 1 sediment sample; 1 bioassay sediment sample
Upstream:	4 crayfish and 3 sediment samples; 1 bioassay sediment sample

Deviations from Proposed Location and Number of Samples:
An additional crayfish sample was analyzed in the upstream exposure area. This sample was submitted to the laboratory with a request to hold analysis in the event that sufficient sample volume was not obtained. This sample was inadvertently analyzed by the contract laboratory. All other actual samples collected are consistent with the number of samples proposed.

4.3.3 Emerging Insects

Samples Collected:
As shown in Table 1, during the BCRA/BERA 2001 sampling effort the following emerging insect samples were collected:

Allendale:	none collected
Lyman Mill:	1 composite of 5 samples
Manton:	not required per the FSP
Dyerville:	not required per the FSP
Assapumpset:	not required per the FSP
Upstream:	1 composite of 5 samples

Deviations from Proposed Location and Number of Samples:
In Allendale Pond, the emerging insect traps did not collect enough insects to provide the quantity of sample required to complete chemical analyses. The dam at Allendale Pond had breached prior to sampling, resulting in this reach reverting back to a river channel. Emerging insect traps

US EPA ARCHIVE DOCUMENT

were placed in available backwater areas; however, water levels continued to drop during the sampling period. The traps were moved once during the sampling program, but low river flows resulted in the sediments in the relocated areas also becoming exposed. No emerging insects were collected from Allendale Pond as a result. Field personnel collected samples from each of the five traps from Lyman Mill and the upstream reference area. However, in both cases, the five samples collected were composited due to insufficient biomass.

4.3.4 Floodplain Soil/Earthworms

Samples Collected:
As shown in Table 1, during the BCRA/BERA 2001 sampling effort the following paired earthworm/floodplain soil samples were collected:

Allendale:	5 earthworm and 4 floodplain soil samples
Lyman Mill:	3 earthworm and 3 floodplain soil samples
Manton:	not required per the FSP
Dyerville:	not required per the FSP
Assapumpset:	none collected
Upstream:	4 earthworm and 4 floodplain soil samples

Deviations from Proposed Location and Number of Samples:
Suitable habitat for earthworms was not found in the area identified in the Work Plan for Assapumpset Pond. It was determined in the field that the soils were likely too acidic for earthworms to tolerate as none were found in numerous test pits dug in the area. Therefore, an alternate location was selected in a "non-impacted" (i.e., up stream of Rte. 44, in the floodplain adjacent to the Woonasquatucket River).

Similarly, only two suitable floodplain/earthworm locations were identified and sampled in the Lyman Mill Pond area. The locations that were previously identified in the Work Plan and during reconnaissance did not provide adequate floodplain habitat or yield adequate earthworms. Therefore, the one additional sample that was to be collected in the "impacted area" (i.e., Lyman Mill Pond) was moved to the "impacted" floodplain habitat in the Allendale Pond area.

All other actual samples collected are consistent with the number of samples proposed.

4.3.5 Surface Water

Samples Collected:
As shown in Table 1, during the BCRA/BERA 2001 sampling effort the following surface water samples were collected:

Allendale:	4 surface water samples
Lyman Mill:	2 surface water samples
Manton:	not required per the FSP
Dyerville:	not required per the FSP
Assapumpset:	1 surface water sample

US EPA ARCHIVE DOCUMENT

Upstream: 2 surface water samples

Deviations from Proposed Location and Number of Samples:
For Greystone Mill Pond, the upstream surface water sample, which was to be collected in the vicinity of the RBP station was not collected there. Both the RBP station and the surface water sampling location were moved to Allendale Pond, which had become more suitable for the RBP analysis due to the breaching of the Allendale Dam.

For Assapumpset Pond, the second sample that was to be collected in the stream flowing from Assapumpset Pond was eliminated because the stream below the pond is culverted, and it was not clear that there were no other inputs to the stream prior to it "day-lighting." It was determined following a discussion with USEPA during site reconnaissance that the second sample could be eliminated.

4.4 Deviations in Chemical and Physical Analyses

Table 2 provides a summary of chemical and physical data analyses performed for the samples collected during the BCRA/BERA 2001 field sampling effort. Deviation from what was proposed in the FSP is identified by shading. The only sample analyses performed for emerging insects include dioxins/furans and PCB congeners. There was insufficient insect biomass available to perform the other analyses proposed for these samples (i.e., PCBs,/pesticides, metals, and methylmercury).

4.5 Comparison of Project Action Goals and Quantitation Limits

The analytical data were further evaluated for usability by evaluating QLs. This evaluation is conducted as one component in determining the potential impact of limits of detection on the results and conclusions of the planned risk assessments. If a data set has a high frequency of "non-detects" and the limits of detection are elevated with respect to concentrations that are of potential concern to human or ecological receptors, those limits of detection could have a significant impact on the results and conclusions of the risk assessments. During preparation of the FSP and Quality Assurance Project Plan (QAPP), the human health and ecological risk assessors identified PAGs that would be adequate to ensure that concentrations of concern in Site media from a risk or regulatory perspective would be detected and quantified. The lower of the human health and ecological PAGs were identified as a data quality objective for each parameter by medium (as shown in Tables 3 through 6).

The expected Achievable Laboratory Limits (QLs) for various media provided in Worksheet #9b of the QAPP (Battelle, 2001) have been compared to the PAGs in Tables 3-6. A summary of those comparisons is provided below. The actual quantitation limits for these analyses can be viewed in the data summary tables in Appendix A. Typically, actual quantitation limits were consistent with the expected Achievable Laboratory Limits, unless a sample was diluted prior to analysis.

Table 3 provides a comparison of the PAGs for soil to the projected Achievable Laboratory Limits QLs for soil provided in Worksheet #9b of the QAPP (Battelle, 2001). The QLs are less

US EPA ARCHIVE DOCUMENT

US EPA ARCHIVE DOCUMENT

than or equal to the PAGs for PCBs (Aroclors). The QLs exceed associated PAGs for 9 of the 20 pesticides by a magnitude of less than 10 times. The dieldrin QL exceeds the PAG by 59 times. For PAHs, the QLs are less than or equal to the PAGs except for two (benzo(a)pyrene and dibenz(a,h)anthracene). However, the magnitude of exceedance is low. For four inorganics (arsenic, cadmium, mercury, and thallium), QLs exceed PAGs by between 10 and 50 times. The most notable exceedances of PAGs occur for dioxins and the PCB congeners. The majority of dioxin QLs exceed PAGs by less than 50 times. Three dioxins have QLs that exceed PAGs by a greater magnitude (between 125 and 625 times). Significant exceedances of PAGs occurred for the PCB congeners. The magnitudes of exceedances ranged from 10 to 91,743 times the PAG.

Table 4 provides a comparison of the PAGs for sediment to the Achievable Laboratory Limits (QLs) for sediment provided in Worksheet #9b of the QAPP (Battelle, 2001). As for soil, the QLs are less than or equal to the PAGs for PCBs. The QLs exceed associated PAGs for 11 of the 20 pesticides by a magnitude of less than 12 times. The dieldrin QL is 59 times the PAG. The QLs are less than or equal to the PAGs for all PAHs. For four inorganics (arsenic, cadmium, mercury, and thallium), QLs exceed PAGs by between 10 and 50 times. The majority of dioxin QLs exceed PAGs by less than 50 times. Three dioxins have QLs that exceed PAGs by a greater magnitude (between 125 and 625 times). Significant exceedances of PAGs occurred for the PCB congeners. The magnitudes of exceedances ranged from 10 to over 91,000 times the PAG.

Table 5 provides a comparison of the PAGs for surface water to the Achievable Laboratory Limits (QLs) for surface water provided in Worksheet #9b of the QAPP (Battelle, 2001). For PAHs, inorganics, and VOCs, QLs are less than or equal to the PAGs. For PCBs (Aroclors), the QL generally exceeds the PAG by about 100 times. The magnitudes of PAG exceedances are generally low for pesticides (less than 12 times), except for toxaphene where the QL exceeds the PAG by 250 times. For semivolatile organic compounds (SVOCs) that include phenols and phthalates, the magnitude of PAG exceedances ranges from 2 to 98 times.

Table 6 provides a comparison of the PAGs for tissues to the Achievable Laboratory Limits (QLs) for tissues provided in Worksheet #9b of the QAPP (Battelle, 2001). In general, the QLs are less than or equal to the PAGs for pesticides. The QLs exceed associated PAGs for only 6 of the 20 pesticides by a magnitude of less than 10 times. For PCBs, QLs exceed PAGs by a magnitude of 12 times. The QLs are less than or equal to the PAGs for all PAHs, except two (benzo(a)pyrene and dibenz(a,h)anthracene). However, the magnitude of these exceedance is low. For inorganics, PAGs exceedances are generally minor. The QLs for two inorganics (arsenic and cadmium) exceed the associated PAGs by less than 50 times. Again, the most notable exceedances of PAGs occur for dioxins and the PCB congeners. The majority of dioxin QLs exceed PAGs, with magnitudes ranging from 36 to 3571 times. The magnitudes of exceedances of PAGs for PCB congeners were generally less than 50, with two exceptions (PCB 126 and PCB 169).

The discussion presented above concerning the ratio of Achievable Laboratory Limits and PAGs by itself might suggest that the limits of detection could significantly impact the planned risk assessments. However, the significance of those ratios for the risk assessments is also affected by another important parameter. That parameter is the frequency of detection (and by association the frequency of non-detects). The available data indicate that there is a very low frequency of

"non-detects" for sediment, floodplain soils, and biological tissue for EAs, the background location, and the upstream location for dioxins, HCX, metals, pesticides, and PAHs. In other words, the limits of detection that are greater than the PAGs are an issue that occurs very infrequently, and therefore, would have a minimal impact on risk assessment activities.

4.6 PRELIMINARY DATA REVIEW

A review of the tissue data summaries (i.e., for fish, crayfish, and earthworm) and abiotic data summaries (i.e., for floodplain and aquatic sediment) provided in Appendix A indicate that contaminants of particular concern at the Site (HCX and TCDD) were generally detected in all media and at high frequency.

- American eel was collected from the Allendale, Lyman Mill, and Dyerville EAs and from both reference areas. TCDD was detected in *all* eel samples collected from Site EAs. TCDD was detected in all but one sample collected from the reference areas. HCX was detected in approximately 80% of samples collected from Site EAs. HCX was not detected in eel collected from the reference areas.

- White sucker was collected from the Allendale and Lyman Mill EAs, and from both reference areas. TCDD was detected in *all* white sucker samples collected from Site EAs. TCDD was detected in all but one sample collected from the reference areas. HCX was detected in approximately 90% of samples collected from Site EAs.

- Largemouth bass was collected from the Lyman Mill, and Manton EAs, and from both reference areas. TCDD was detected in *all* largemouth bass samples collected from Site EAs. TCDD was detected in all but two samples collected from the reference areas. HCX was detected in approximately 70% of samples collected from Site EAs.

- Paired crayfish and aquatic sediment samples were collected from the Allendale and Lyman Mill EAs and from both reference areas. TCDD and HCX were detected in all aquatic sediment samples collected from Site EAs and the reference areas, and in all crayfish samples from the Site EAs. HCX was detected in one crayfish sample from the Assapumpset reference area, and TCDD was detected in about 50% of the samples collected from the reference areas.

- Paired earthworm and floodplain samples were collected from the Allendale and Lyman Mill EAs and from the upstream reference area. TCDD and HCX were detected in all floodplain soil samples collected from Site EAs and the reference areas. TCDD was detected in all Allendale and Lyman Mill samples, and HCX was detected in about 75% of those samples. TCDD was detected in 75% of the upstream reference area; however, HCX was not detected there.

- Analysis of the compound 2,3,6,7-tetrachloroxanthene is associated with considerable uncertainty. The large majority of analytical results for this compound were considered unusable by the data validators primarily due to noncompliant initial calibration, low ongoing precision and recovery, and low MS and MSD recoveries.

US EPA ARCHIVE DOCUMENT

Similarly, chemicals within other parameter groups including PAHs, pesticides, PCBs, and metals were detected at high frequency in all sampled media. As seen in Appendix A, it is common to find many of the constituents within each chemical group detected at a frequency of 100%.

Dioxins have been detected in all sampled media from both reference areas (upstream and Assapumpset). Concentrations in reference areas were generally two or three orders of magnitude lower than those in Site EAs.

There were some unanticipated results with respect to the detection of HCX in sediment, floodplain soil and biological tissue at the "upstream" location and at Assapumpset. Since these locations are upstream and remote from the Site, detection of HCX (a signature compound of the Site) in sediments in particular was not anticipated. HCX was detected in 3 of 3 sediment samples at the "upstream" location and in the only sediment sample from Assapumpset. HCX was detected in 4 of 4 floodplain soils at the "upstream" location. HCX was detected in 5 of 12 largemouth bass samples from Assapumpset. No HCX was detected in tissue samples of American eel or crayfish from Assapumpset. HCX was detected in 1 of 4 crayfish tissue samples from the "upstream" location. No HCX was detected in tissue samples of American eel or white sucker from the "upstream" location.

A full review of the data will be conducted as part of the human health and ecological risk assessments.

US EPA ARCHIVE DOCUMENT

5. SUMMARY AND IMPLICATIONS OF DATA LIMITATIONS

Key data limitations and the associated implications of those limitations on the human health and ecological risk assessments are summarized below. In addition, all data limitations will be identified and discussed in the Uncertainty Analysis of the risk assessments.

1. No piscivorous fish species (i.e., largemouth bass) was collected in Allendale Pond.

   For the BCRA, risks associated with consumption of piscivorous fish in Allendale Pond will not be assessed. The existence of this data limitation will have minimal impact on the conclusions of the human health risk assessment. A sufficient number of samples of American eel have been collected. The American eel is the target species focused on meeting requirements for the human health fish consumption assessment. Evaluation of the American eel will provide adequate information to estimate potential biota consumption risks in Allendale.

   For the BERA, exposure to that trophic level in Allendale will not be assessed. This will not have a significant impact on the conclusions of the ecological risk assessment. It is likely that potential ecological risks associated with the Allendale reach will be driven by the white sucker, a bottom feeding species with more significant exposures related to direct contact with contaminated sediments. A sufficient number of white sucker were collected in Allendale Pond.

2. Fewer than the target number of each of the three target fish species (brown bullhead, largemouth bass, and American eel) were collected in Assapumpset Pond.

   For the BCRA and BERA, the fewer number of samples leads to further uncertainty as to whether those collected are representative of the population. If 95% Upper Concentration Levels (UCLs) are calculated using less than 10 samples, they may represent a less accurate estimate of the EPC. However, Assapumpset Pond is one of two reference areas, and sufficient data are available from the upstream reference area (that includes Greystone Mill Pond). Therefore, this will not be a significant issue for the risk assessments.

3. Sufficient emerging insect biomass was not collected in Lyman Mill Pond and in the upstream reference area. Those samples obtained were composited into a single sample for each of these areas. Sufficient emerging insect biomass could not be obtained to represent a single composite sample in the Allendale EA.

   Emerging insect data were collected to estimate insectivorous bird dietary exposures. This data limitation will not have significant impacts on the ecological risk assessment. The analysis of fledgling tree swallow stomach contents provides a second set of data to estimate the exposures and the emerging insect tissue data that were obtained can be used to corroborate these results. With only a single emerging insect composite attained from Greystone Mill Pond and Lyman Mill Pond, no measure of variability is available;

US EPA ARCHIVE DOCUMENT

however, the tree swallow stomach content analytical results will be used to assess this uncertainty in the BERA.

4. No paired earthworm/floodplain soil sample was collected in the Assapumpset reference area.

   To compensate for this, an additional paired earthworm/floodplain soil sample was collected in the upstream reference area. It is unlikely that this data limitation will have significant impacts on the ecological risk assessment.

5. Although the Achievable Laboratory Limits identified in the QAPP exceeded human health and ecological PAGs, particularly for dioxins and PCB congeners, the frequency of detection is actually quite high (> 80%).

   The comparison of Achievable Laboratory Limits and the human health and ecological PAGs is conducted to determine the potential impact of higher detection limits for "non-detects" on the risk assessments. For example, at one end of the theoretical spectrum, very high detection limits combined with low detection frequency could result in a risk assessment concluding that a particular compound is not present when in fact it is present at concentrations of potential concern. The available data for this Site perhaps represents the other end of the spectrum. The difference between the Achievable Laboratory Limits and the PAGs will have minimal impact on the risk assessment results. There is a very small frequency of "non-detects" for dioxins, HCX, PAHs, and metals in sediment and biological tissue. For Site-related EAs, the background location, and the "upstream" location the presence of the analytes in tissue and sediments is well established by the available data. Therefore, it is highly unlikely that the ratio of Achievable Laboratory Limits and PAGs will have any material impact on the assessment of human health and ecological risks.

6. The breach of Allendale Dam resulted in significant lowering of the water level in Allendale Pond. Fish collected from Allendale Pond may not be representative of fish currently present in Allendale Pond. The breach in the dam has been repaired and the water level in the pond has been restored.

   Fish samples for the ELS test were collected in Allendale Pond prior to the 2001 breach of Allendale Dam. Fish tissue samples from Allendale Pond were collected after the dam's breach. In reviewing the HCX and TCDD data for ELS and fish tissue data for white sucker, concentrations appear to be comparable, indicating that the fish collected in Allendale following the dam breach are still representative of species that would be present after the dam was reconstructed and the pond conditions were restored.

The key data limitations with potentially significant implications have been identified and reviewed. None were identified that will have significant implications on the BCRA and BERA. The data are clearly usable for the estimation of potential human health and ecological risks at the Site.

Notes:
[a] - Number in brackets is the number of samples from each area that were proposed to be or were analyzed for PCB congeners.
[b] - Emerging insect samples were collected from each of the 5 traps, but were composited together due to the low sample volume obtained from the traps.
[c] - Three whole body samples collected, but samples required analysis of separate tissue fractions to support the human health and ecological risk assessments.
[d] - The first number in the cell is the number of samples that were analyzed for Dioxin/Furan/HCX/TCX.
The first number in brackets is the number of samples from each area that were proposed to be or were analyzed for PCB congeners.
The second number in brackets (if the second number presents) is the number of samples that were analyzed for PCB Aroclor/Pesticides/Lipid,
and the third number (if the third number presents) is the number of samples that were analyzed for metals and MeHg.
[e] - Actual total number of samples is the sum of the number of samples for all tissue matrices (28 samples for eggs, 15 samples for nestlings, 3 samples for stomach contents, and 15 samples for liver)
[f] - Six fish were collected, but AP-SC-01, AP-SC-02 and AP-SC-03 were composited into one sample per EPA direction; and AP-SC-04 and AP-SC-05 were composited into one sample per EPA direction.
[g] - Two fish were collected, but LP-CC-07 was a female fish and eggs were removed to generate one egg sample and the remaining whole body generated another sample.
AVS/SEM - acid volatile sulfides/simultaneously extracted metals

ERA - ecological risk assessment
HCX - hexachloro(9H)xanthene
BCRA - human health biota consumption risk assessment
PCB - polychlorinated biphenyls
SVOC - semivolatile organic compound
TIC - tentatively identified compound
TOC - total organic carbon
VOC - volatile organic compound
"AE" = American eel
"BB" = Brown bullhead
"LB" = Largemouth Bass
"WS" = White sucker
"WS/FF" = White sucker and Fall fish

Notes:

[a] Analytes without PAGs have not been included in this table (e.g., magnesium)

[b] QLs for additional non-chemical parameters, including % lipid, grain size, and % moisture, have been provided in the QAPP; however, PAGs have not been established for comparison.

[c] PAG - Project Action Goal; represents the lower of the Project Action Human Health Goal and the Project Action Ecological Goal.

[d] QL - Achievable Laboratory Limit; QL determined from the low calibration standard and adjusted for sample processing volumes and factors.
(obtained from the QAPP Worksheet #9b; Battelle, 2001)

[e] The value indicates that the QL exceeds the PAG by this number of times.

Ethylbenzene	100-41-4	36	1	No	--
Hexachlorobutadiene	87-68-3	4.4	1	No	--
Methylene Chloride	75-09-2	47	1	No	--
Naphthalene	91-20-3	2.6	1	No	--
Toluene	108-88-3	14	1	No	--
Vinyl Chloride	75-01-4	20	1	No	--

Notes:

[a] Analytes without PAGs have not been included in this table (e.g., magnesium)

[b] QLs for additional non-chemical parameters, including % lipid, grain size, and % moisture, have been provided in the QAPP, however, PAGs have not been established for comparison.

[c] PAG - Project Action Goal, represents the lower of the Project Action Human Health Goal and the Project Action Ecological Goal.

[d] QL - Achievable Laboratory Limit; QL determined from the low calibration standard and adjusted for sample processing volumes and factors.
(obtained from the QAPP Worksheet #9b, Battelle, 2001)

[e] The value indicates that the QL exceeds the PAG by this number of times.

ng = nanogram

pg = picogram

ug = microgram

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,6,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

North Providence, RI

PARAMETER	RWR-SD-5003-0000-01 7/12/2001	RWR-SD-5004-0000-01 7/12/2001
Total Organic Carbon	2.01	2.02
% Water	56	63
Solids, Percent		
Percent_moisture		

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
F - Fillet
O - Offal
W - whole body

Toxicity Equivalency (Dioxins, Furans, HCX)								
Toxicity Equivalency (PCB)					0.00248			
Other (%)								
Lipid_percent	0.395	1.73		0.628	3.6		0.389	2.41

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
F - Fillet
O - Offal
W - whole body

OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

Samples ending with:
F - Fillet
O - Offal
W - whole body

Toxicity Equivalency (PCB)								
Other (%)								
Lipid_percent	3.64		0.89	2.55		0.889	3.71	

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
F - Fillet
O - Offal
W - whole body

Toxicity Equivalency (Dioxins, Furans, HCX)						
Toxicity Equivalency (PCB)						
Other (%)						
Lipid_percent	0.711	1.63		0.931	3.14	

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., *et al.*, 1998. *Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. Environ. Health Persp.* 106(12):775-792.

Samples ending with:
F - Fillet
O - Offal
W - whole body

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quanitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-*Tetrachloroxanthene*
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX *toxicity equivalency factor* (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
W - whole body

Toxicity Equivalency (PCB)		0.0215	0.0182	
Other (%)				
Lipid_percent	NA	5.36	6.82	5.74

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* **106**(12):775-792.

Samples ending with:
W - whole body

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

NOTES:
SQL - Sample Quantitation Limit
HCX - 1,2,4,5,7,8-Hexachloroxanthene
TCX - 2,3,6,7-Tetrachloroxanthene
OCDD - Octachlorinated dibenzodioxin
OCDF - Octachlorinated dibenzofuran
Toxicity Equivalency (Dioxins, Furans, HCX) based on application of mammalian toxicity equivalency factors (Van den Berg, et al., 1998) to measured concentrations of dioxins, furans, and by application of USEPA HCX toxicity equivalency factor (0.0002) based on personal communication from USEPA, Chau Vu, May 22, 2002.
Toxicity Equivalency (PCB) based on application of mammalian toxicity equivalency factors to measured concentrations (Van den Berg, et al., 1998) of dioxin-like PCB congeners. Dioxin-like PCB congeners include PCBs 81, 77, 126, 169, 105, 114, 118, 123, 156, 157, 167, and 189.

Van den Berg, M., et al., 1998. Toxic Equivalency Factors (TEFs) for PCBs, PCDDs, PCDFs for Humans and Wildlife. *Environ. Health Persp.* 106(12):775-792.

Samples ending with:
W - whole body
