PROJECT/CLIENT:	Peterson/Puritan OU2 Superfund Site	DATE COMPLETED:	9/19/2003
SHIELD PROJECT NO:	300-1821	DRILLING COMPANY/OPERATOR:	Geologic/Tim Tucker
SITE NAME/LOCATION:	Unnamed Island	RIG TYPE/METHOD:	Track mounted CMD55; 4.25" ID Hollow Stem Augers
WELL LOCATION	Cumberland, RI	GROUND SURFACE (GS) ELEVATION:	64.51 feet
LOGGED BY:	M. Morris/S. Scheidt	TOP OF CASING (TOC) ELEVATION:	67.02 feet
SIGNATURE:		DEPTH OF WELL FROM TOC:	22.7 feet

Materials	Construction Diagram	Dimensions (Feet)	Depth (Ft Below GS)	Elevations (Ft Above Datum)
		Top of Riser	-2.5	67.02
Surface Materials: Above ground , steel, 6" diameter stand pipe with a locking cap in a 2.5' by 2.5' concrete pad. Water tight expansion plug cap at top of riser.		Ground Surface	0.0	64.51
		Top of Seal	2.0	62.5
Annular Seal: Hydrated Pure Gold® Medium Bentonite Chips		Top of Sandpack	8.0	56.5
Filter Pack: #2 Quartz Filter Sand		Top of Screen	10.0	54.5
Well Riser: 2" Diameter PVC Schedule 40				
Well Screen: 10 Slot (0.010 inch) 2" Diameter PVC Schedule 40				
Bottom Cap: 2" PVC End Cap		Bottom of Screen	20.0	44.5
Borehole Diameter: 8.5 Inches		Bottom of Well	20.2	44.3

Comments:
Well developed on 9/23/03 by surging and pumping approximately 60 gallons of water using an electric submersible pump.

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Mounded area above ground surface covered with vegetation. Silty sand and gravel, dry. Littered with surface debris such as scrap metal, pipe, & tires.	
0 - 5	Dark gray to brown silty sand and gravel, loose, dry, no odor. Debris: bricks, pipe, scrap metal, glass bottles, hose, and electical wire insulation.	**SO-W03-UI***
5 - 8	Dark gray to brown (with some black mottling) silty sand and gravel, loose, dry, no odor. Debris SAA. Additional debris: burnt wood fragments and ceramic electric wire mounts.	
8 - 10	Light gray sandy river gravel with cobbles, poorly sorted, fine to coarse, rounded, loose, saturated, no odor or staining. Below water table.	NA

Note: Final dimensions: 20' long x 7' wide x 10' deep. Oriented northeast/southwest. Northeast edge of test trench is 10' from Pond A. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.
* Composited with sample collected from UI-TT-01; VOC sample collected at UI-TT-01.

Test Trench- UI-TT-03

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Mounded area above ground surface covered with vegetation. Large amount of surface debri is present: scrap metal, rusted household appliances such as refrigerators and stoves, rusted/crushed 55 gal drums, and tires.	
0 - 8	Brown silt and fine sand, well sorted, loose, moist, no odor/staining noted. Debris similar to surface debris, but in addition: metal piping, bricks, wire, car parts, large pieces of concrete, cinder blocks, and large tank (estimated to be 250 gal. Tank was not removed.)	**SO-W04-UI**
> 8	Below tank, similar materials, water table present. Excavation ceased; debris extended to top of water table.	NA

Note: Final dimensions: 27' long x 8' wide x 8' deep. TT3 is located at the southeast end of Pond A where it meets the old access road, and is oriented in the northeast/southwest direction. On 8/15, TT3 was extended approximatedly another 20' in the west/southwest direction. Additional debris found included a water heater, railroad ties, pipe, and small tanks. Buried debris appeared to extend under the currently used access road between TT1 and TT3. The lateral extend of buried waste was explored in this area. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.

Test Trench- UI-TT-04

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Vegetated mound of soil/debris consisting mostly of tires. Brown silt and sand, loose, moist, no odor/staining noted. Pond E ground surface littered with tires.	
0 - 8	Dark grey to brown silty sand and gravel, loose, dry, no odor. Similar demolition debris found (see TT1 - TT3): pipe, brick, tires, scrap metal, car parts, bed springs and a heater tank.	NA
8 - 12	Buried waste extends below water table. Soil SAA & saturated. Side of TT4 extending into low area southwest of Pond E; below water table are a large number of tires. Central area adjacent to Pond E was dug into and more tires were found, approximately 3 - 4' deep.	NA

Note: The ground surface in and around Pond E is littered with tires, and exploratory digging yields buried tires at least 3 - 4' bgs, and extends below water table. Entire Pond E area appears to hold buried tires and debris. The ground surface visibly "bounced" throughout the Pond E area when driven over by the excavator. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.

Test Trench- UI-TT-05

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Large vegetated mounded area. Aerosol cans of "Cough whip" dated 1965 and a needleless syringe plunger were found in the area.	
0 - 6	Light grey/brown Silt and fine Sand, loose, dry, no odor/staining.	NA
6 - 10	Grey/brown Silt and Sand, loose, moist, no odor/staining noted. Debris: plastics, wires, glass, plastic doll parts, pipe, unidentified cohesive, white granular material, plastic bag labeled "Union Carbide - Polyethylene," and unidentified metal machine parts.	NA
10 - 15	Dark grey Silt and Sand, loose, moist, strong organic/decay odor and black/purple staining. Additional debris: rubber, tires, machine parts, string, unidentified burned material, wire/cable insulation, glass vials, glass bottles, and syringe needles. Glass vials labeled "Abbot Laboratories" and "Sterile Sodium Chloride for Injection." A chunk of of material was closely investigated consisted of rust stained deteriorated plastic bags, material, and an aggregate of hollow-point needles.	NA

Notes: Final dimensions: 30' long x 6' wide x 15' deep. Trench is located on the berm of the depression southeast of the abandoned excavator. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.

Test Trench- UI-TT-06

Depth Interval (ft bgs)		Description	Lab Sample ID
Ground Surface		Surface littered with rusted appliances and scrap metal. Covered with vegetation. Berm opposite TT5.	
0 - 2		Brown Silt/Sand, loose, no odor/staining. Debris present.	NA
2 - 8		Municipal waste, bottles, paper, tires, strips of material, rubber and hose, plastic bags and wood debris in black sediment, saturated with water. Waste extends below water table. Strong odors: hydrocarbon, H_2S, and decayed organics.	SO-W01-UI GW-LE01-UI

Note: Final dimensions after exploring the lateral extent of buried wastes: 30' long x 7' wide x 8' deep. Extent of waste extends into central depression between TT5, TT6, TT7 and TT8. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.

Test Trench- UI-TT-07

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Vegetated berm.	
0 - 2	Berm contains burnt and unburnt waste, plastics, cardboard, paper, wood, glass and metal scrap. Water table encountered at 2'.	NA
2 - 11	Area of TT7 extended towards central depression surrounded by TT5, TT6, and TT8. Little to no soil. Waste completely saturated with water. Depth of waste below 11 ft undetermined. Neoprene electrical wire insulation, clear plastic sheeting, rubber strips, garden hose, wooden 2 x 4's, tires, and wastes such as deodorant cans, shaving cream cans, and an old Tabasco sauce bottle. Strong odors: hydrocarbon H2S, and decayed organics. Leachate is dark grey color.	NA

Note: Extent of waste could not be determined in the north direction. Excavation of berm would break small ponded area on the other side. Final dimensions: Approximately 25' long x 7' wide x 11' deep. Photo-documented by Mike Morris & Steve Scheidt. Air monitoring conducted by Chad Kelly.

Test Trench- UI-TT-10

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Vegetated berm top. Little debris on surface.	
0 - 3	Light brown Silt and fine Sand, well sorted, loose, no odor staining. Some debris: pipe, wood, plastic, vinyl strips, and municipal waste items.	NA
3 - 16	Groundwater encountered at 4' BGS. Contents include plastic toys, pipe, wire, plastic sheeting, vinyl strips, rubber strips, electrical insulation, glass bottles, scrap metal, rubber garden hose, unidentified materials/objects, propane cylinder and wood. Waste saturated with water, gray leachate. Slight hydrocarbon odor, dark gray to reddish gray stained soil.	**SO-W02-UI** **GW-LE02-UI**

Note: Waste depth ranged from 4' to 16' bgs. TT10 consisted of several small test trenches and therefore do not have length and width measurements. Trenching was photo-documented by Steve Scheidt and air monitoring conducted by Chad Kelly. Refer to S.S. fieldbook for trenching activities log.

Test Trench- UI-TT-11

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Vegetated berm top. Some debris: pipe, scrap metal, and plastic.	
0 - 1	Light brown Silt and Sand, loose, dry, no odor, orange rust staining. Debris increasing with depth immediately upon excavation: rusted pipe and plastic.	NA
1 - 9	Debris and waste extending into water table 4' bgs. Rubber hose, rusted metal, pipe, car parts, cylinders, canisters, plastic, and paper.	NA

Note: TT11 adjecent to TT10 to the southwest. Dimensions: Approximately 20' long x 7' wide x 9' deep. Depth of buried waste could not be determined due to high groundwater in test trench. Trenching was photo-documented by Steve Scheidt and air monitoring conducted by Chad Kelly. Refer to S.S. fieldbook for trenching activities log. Leachate and waste samples collected from trench.

Test Trench- UI-TT-17

Depth Interval (ft bgs)	Description	Lab Sample ID
Ground Surface	Vegetated berm and slope into depression (suspected waste pit). Debris: woods planks and scrap metal from cars, appliances, tires, and cinder blocks	
0 - 3	Brown Silt and Sand, loose, low moisture, no odor/staining. Debris: tires, scrap metal, tires, plastics, paper, and wood debris.	NA
3 - 6	Dark grey Silty, Sandy mud, saturated, strong hydrocarbon, H_2S, and decayed organic odors. Mostly waste: rubber hose, plastics, scrap metal, strips of material, wood, pipe, and unidentified metal machine parts. Water table at 6' bgs.	NA
> 6	Same as above.	NA

Note: Trash is 6' thick in crest of berm, and slopes into depression where waste is found below water table. Waste at depth could not be determined due to the water table. Area between berms in this area shakes and vibrates with the movement of the excavator similar to Pond E tire pit area. Trenching was photo-documented by Steve Scheidt and air monitoring conducted by Chad Kelly. Refer to S.S. fieldbook for trenching activities log.

Problems / Observations

~~Initial Purge~~ previous sampling at this well, it is not based on ~~[illegible]~~ possible to get the ~~[illegible]~~ 1" bladder pump all the way down to well screen. Used peristaltic pump (as was done in the past) to sample well. VOC samples collected w/ a bailer.

Benthic Community Species Abundance Report (Normandeau)

From: George Christian <gchristian@normandeau.com>
To: <DJB@bbl-inc.com>
Date: 8/12/2005 2:17:09 PM
Subject: Blackstone River benthos analysis

Hello Dave:

Biomass determinations for your project at the Peterson/Puritan super-fund site are complete. The attached file contains the completed data matrix. You may discard the one I sent you on 8 August.

The samples from Stations BR - 002 and BR - 004 are being retained here as requested on your Chain-of-Custody. The completed Chain-of-Custody is being mailed back to you today. All tracking and Quality Control information are on file and available upon request.

If you have any questions please give me a call. I should be back in the office the week of 21 August pending a Jury Duty obligation. Thank you for letting us be of service.

Sincerely,

George M. Christian
(Project Biologist)

Benthic Macroinvertebrates Collected by BBL Sciences at the Peterson/Puritan Superfund Site (Project Number 37902.013).

Subject: Fwd: Re: Reports

Jen,

Based on Kens response from Envirosystems, it looks like the report should have all the correct information in it, but that their statistical software prints the page numbers in an odd way. As long as all the information is contained in the report, is in the correct order, and is accessible, we may want to leave it as is.

>>> Ken <ksimon@envirosystems.com> 12/08/05 3:35 PM >>>
David,

I checked the original data file printout and the electronic CETIS file
to confirm; the three pages in question were not included in the report
as they were duplicates. One problem with the CETIS program is that it
is difficult, if not impossible, to identify individual statistical
analyses in the report function prior to printing the report. In this
case I had mistakenly run the same comparison twice. The easiest/only
way to remove the extra data page is to print the lot and discard the
extra. One other issue I have with the program is that there is no
control over order in which the pages are printed. It would be nice to
see data reported in the same fashion as the analyses are conducted. The
program however stores all data by endpoint, survival or growth, and
then stores individual reports by statistical method used and then order
of analysis. Unfortunately when we print a large data array we end up
having to manually reorder all the individual data sheets to obtain
easily readable reports. This is when we remove any duplicate analysis
reports.

Sorry for the confusion.

Regards,
Ken

TOXICOLOGICAL EVALUATION OF SEDIMENT SAMPLES

Blackstone River Sediment Evaluation

1.0 INTRODUCTION

Toxicity tests expose groups of organisms to environmental samples and a laboratory control and/or a field reference site for a specified period to assess potential impacts on a variety of endpoints, such as survival, growth or reproduction. Analysis of variance techniques are used to determine the relative toxicity of the samples as compared to the laboratory control and/or field reference site.

This report presents the results of survival and growth toxicity tests conducted on eighteen (18) sediment samples collected from the Blackstone River. The samples were provided by BBL Sciences, Inc., Syracuse, New York. Testing was based on programs and protocols developed by the ASTM (2001) and US EPA (2000). The toxicity of the samples was assessed by conducting long term survival and growth toxicity tests using the freshwater amphipod, *Hyalella azteca* and midge larvae *Chironomus dilutus* Toxicity tests and supporting analyses were performed at EnviroSystems, Incorporated (ESI), Hampton, New Hampshire.

2.0 MATERIALS AND METHODS

2.1 General Methods, Biological Evaluations

Toxicological and analytical protocols used in this program follow procedures outlined in *Standard Test Methods for Measuring the Toxicity of Sediment-Associated Contaminants with Freshwater Invertebrates* (ASTM 2001), *Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates* (US EPA 2000) and *Standard Methods for the Examination of Water and Wastewater*, 20th Edition (APHA 1998). These protocols provide standard approaches for physical and chemical analysis and for the evaluation of toxicological effects of sediments on aquatic invertebrates.

2.2 Test Species

H. azteca were obtained from Aquatic Research Organisms (ARO), Hampton, New Hampshire. Organisms were second instar at the start of the assay. Organisms were received at ESI the day prior to starting the assays. Organisms were held in a mix of moderately hard and natural surface water prior to the start of the assay.

C. dilutus were obtained from Aquatic BioSystems, Inc., Fort Collins, Colorado. Egg cases were shipped to ESI the day they were deposited. At ESI egg cases were transferred to fresh water and placed in an incubator at 23°C. Observations and water changes were made daily until hatch. Once larvae started to hatch, approximately 48 hours after receipt, the cases were transferred to a new culture vessel. After approximately 20 hours the hatched larvae were collected and added to the test vessels.

2.3 Test Samples, Laboratory Control Sediment and Overlying Water

Samples from the Blackstone River project site were sampled between June 21 and 23, 2005 and received at ESI on June 24, 2005. Once received, samples were inspected, to determine integrity, given unique sample numbers and logged into the laboratory sample management database. Once logged into the sample management database, samples were placed in a secure refrigerator, 2 - 4 °C, storage area until required. A listing of sample sites, sample collection and receipt information is summarized in Table 1.

Sediment samples from the project site were collected from two distinct environments, pond and riverine areas. A total of 6 pond samples, including 2 reference sites, were evaluated. Samples were also analyzed from 10 riverine samples, including 5 reference site samples.

The laboratory control substrate for both species was an artificial sediment consisting primarily of silica sand, with approximately 2-3%, by weight, of natural detritus. The detritus was collected above the water line at a natural water body, but in a damp area. Only the top 0.5 to 1.0 cm of the sediment was collected. The organic detritus was mixed into the silica sand. Additionally, the sediment was supplemented with a laboratory organic mixture prepared by ESI. The material was prepared by soaking trout chow with yeast until it fermented. The digested material was then autoclaved, bottled and stored until required.

Overlying water for the amphipod assay was a mix of moderately hard synthetic and natural surface water. The surface water was collected from Bow Lake, Strafford, New Hampshire. Use of synthetic/natural surface water over an artificial reconstituted water is recommended by the protocol (EPA 2000, ASTM 2004).

Overlying water for the midge assay was natural surface water. The surface water was collected from Bow Lake, Strafford, New Hampshire. Use of natural surface water over an artificial reconstituted water is recommended by the protocol (EPA 2000, ASTM 2004).

2.4 *H. azteca* Survival and Growth Assays

The 28 day amphipod survival and growth tests were conducted according to ASTM Method E 1706-95 (ASTM 2001) and EPA method 100.4 (EPA 2000). Endpoints of the assay were survival and growth, measured as dry weight.

The site sediment and laboratory control sediment treatments consisted of 8 replicates with 10 organisms/replicate. Test vessels were 400 mL glass beakers containing approximately 100 mL of sediment and 250 mL of overlying water. The overlying water volume to sediment surface area ratio was approximately 7:1. Test vessels were drilled at a consistent height above their bases and the hole covered with Nytex® screen. The screened hole facilitated water exchange without compromising organisms. Vessels were maintained in a water bath during the assay. Depth of the water in the bath was set to be approximately 1 cm below the drain hole in the test vessel to eliminate flow of water from the bath into the test vessel. The water bath was maintained in a limited-access temperature controlled room. Temperatures in the room and water bath were independently maintained at 23 ±1°C. The photoperiod in the test chamber was set at 16:8 hour light:dark. Light was provided by cool white flourescent bulbs.

One day prior to test initiation (Day -1), control and test sediments were sieved using a 2 mm sieve to remove rocks, twigs, and other debris. Sediments were placed in the test vessels. Overlying water was immediately added, and the vessels were left undisturbed overnight to settle. Floating detritus was removed the next morning. On Day 0, organisms were added below the water surface of each test vessel.

Overlying water in each replicate was renewed daily after collection of water quality data. The volume of water added to each test chamber was approximately 500 mL or two volumes. Water exchanges were facilitated by use of a distribution system designed to provide equal, regulated, flow to each chamber. The system was activated manually by the addition of water during the assay.

Prior to the daily overlying water renewal, temperature, specific conductance, pH, and dissolved oxygen were measured in one replicate of each treatment. Temperature data was collected in a surrogate test chamber on an hourly basis during the 10 day exposure period documented a mean temperature of 23.3°C with values ranging from 20.9 to 25.1°C. Alkalinity, ammonia and hardness of the overlying water were measured at the beginning and end of the assay. Water quality data are presented in Table 12. Daily overlying water quality records are available in Appendix A. Each replicate was fed 1.0 mL of a yeast/trout chow/alfalfa suspension after the daily renewal.

After 28 days exposure, all replicates of each test treatment were terminated to collect data for the survival and growth endpoints. Each test chamber was gently swirled to loosen the sediments and the test material was dumped into an 8" stainless steel sieve with a 0.35 mm mesh screen. The sediments were washed through the sieve using synthetic, moderately hard reconstituted water and material left on the screen was sorted to recover the organisms. This process was continued until the entire sample was evaluated. Organisms recovered were set aside to determine growth. Surviving amphipods were counted and placed on tared weighing pans. Pans were dried overnight at 70°C to obtain dry weight to the nearest 0.01 mg. The mean dry weight of surviving organisms was determined to assess growth.

2.5 *Chironomus dilutus* Survival and Growth Assays

The 20-day midge survival and growth evaluation sediment tests were conducted according to ASTM method E 1706-95 (ASTM 2004) and EPA method 100.5 (EPA 2000). Endpoints of the 20 day exposure were survival and growth, measured as ash free dry weight.

The site sediment and laboratory control sediment treatments consisted of 8 replicates with 10 organisms/replicate. Test vessels were 400 mL glass beakers containing approximately 100 mL of sediment and 250 mL of overlying water. Test vessels were drilled at a consistent height above their bases and the hole covered with Nytex® screen. The screened hole facilitated water exchange without compromising organisms. The overlying water volume to sediment surface area ratio was approximately 7:1. Vessels were maintained in a water bath during the assay. Depth of the water in the bath was set to be approximately 1 cm below the drain hole in the test vessel to eliminate flow of water from the bath into the test vessel. The water bath was maintained in a limited access, temperature controlled room. Temperatures in the room and water bath were independently maintained at 23 ±1°C. The photoperiod in the test chamber was set at 16:8 hour light:dark. Light was provided by cool white flourescent bulbs.

The day prior to test initiation (day -1), control and test sediments were sieved using a 4 mm sieve to remove rocks, twigs, and other debris. Sediments were placed in the test vessels. Overlying water was immediately added, and the vessels were left undisturbed overnight to settle. Floating detritus was removed the next morning. On day 0, larvae were added below the water surface of each test vessel.

Overlying water in each replicate was renewed daily after collection of water quality data. The volume of water added to each test chamber was approximately 500 mL, two volumes. Water exchanges were facilitated by use of a distribution system designed to provide equal, regulated, flow to each chamber. The system was activated manually by the addition of the water.

Prior to the daily overlying water renewal, temperature, specific conductance, pH, and dissolved oxygen were measured in one replicate of each treatment. Temperature data was collected in a surrogate test chamber on an hourly basis during the 20 day exposure period. Alkalinity, ammonia, and hardness of the overlying water were measured at the beginning and end of the assay. Water quality data are presented in Table 11. Daily overlying water quality records are available in Appendix A. Each replicate was fed 1.5 mL of a 6 g/L Tetramin® flake fish food suspension after the daily renewal.

After 20 days exposure, all replicates of each test treatment were terminated to collect data for the initial survival and growth portion of the tests. Each test chamber was gently swirled to loosen the sediments and the test material was dumped into an 8" stainless steel sieve with a 0.5 mm mesh screen. The sediments were washed through the sieve using synthetic, moderately hard reconstituted water and material left on the screen was sorted to recover the organisms. This process was continued until the entire sample was evaluated. Surviving larvae were placed on tared weighing pans; partially and fully emerged organisms were recorded in survival counts but not included in weight measurements. Pans were dried overnight at 70°C to obtain dry weight to the nearest 0.01 mg. The organisms were then fired in a muffle furnace for two hours at 550 °C to obtain the ash free dry weight to the nearest 0.01 mg. The mean weight of surviving organisms was determined to assess growth.

2.6 Statistical Analysis

Endpoints were analyzed using CETIS® (Comprehensive Environmental Toxicity Information System) software to determine significant differences between the test sediments and the laboratory control sediment and project reference site samples. Individual statistical analyses were made based on EPA decision tree guidelines. Comparisons of sample site verses reference area are based on the sample site being statistically less than the associated reference site. Comparison of endpoints for reference site verses reference site are based on there being a statistical difference between the two sites without regards as to if the difference is either greater than or less the other site. Statistical difference was evaluated at α=0.05.

Initial statistical evaluations were made comparing composited sample groups; *i.e.* all pond samples verses all pond reference sites. After the initial composite, statistical comparisons were made on a sample by sample basis against each appropriate reference site sample and laboratory control. Subsequently, statistical comparisons were made for each sample site against each reference site without segregating varying environmental type areas.

2.7 Quality Control

As part of the laboratory quality control program, reference toxicant evaluations are conducted on a regular basis for each test species. These results provide relative health and response data while allowing for comparison with historic data sets. Results are summarized in Table 2.

2.8 Protocol Deviations

Review of data collected during this assay indicated no deviation from mandated or suggested protocols. One non-deviation was observed during the study, the temperature logger used during the assays appears to have functioned normally through July 10. After that time the unit appears to have become less stable reporting more short term variation in the recorded temperature than during previous periods. Additionally, there were periodic spikes in the recorded temperatures of plus 100°C from one reading to the next and then a return to normal values. These spike values were considered as artifacts related to the logger's data storage/collection mechanisms and both not realistic or representative of actual conditions. As such they were removed from the data record prior to analysis. Temperature values reported by the data logger at the time daily observations were made were similar to those daily data points obtained with a standard thermometer. As such, the data from the data logger, minus spike values, was considered to represent conditions during the assay. This variation was considered to have had no impact on the outcome of the assay or impact interpretation of the data.

3.0 TOXICOLOGICAL TESTING RESULTS AND DISCUSSION

Tables 3 and 14 provide summaries of survival and growth data with comparisons based on composite sample types, individual sites to specific reference sample types and all samples compared against all reference types.. Support data, including copies of laboratory bench sheets and individual endpoint summaries, are provided in Appendix A.

3.1 *Hyalella azteca* Initial 28 Day Survival and Growth Evaluation

At the end of the initial 28 day exposure period, mean survival in the laboratory control sediment was 91.25%; survival in the individual replicates ranged from 80% to 100%. Larvae recovered from the laboratory control sediment had a mean dry weight of 0.595 mg/amphipod, with mean dry weights of amphipods recovered from individual replicates ranging from 0.54 to 0.71 mg/individual. The dry weight of a representative group of amphipods at the start of the assay was 0.035 mg/individual. The minimum acceptable criteria for survival in the laboratory control is 80%. The minimum acceptable criteria for growth is a demonstration of increased dry weight after 28 days exposure. These data indicate that the organisms were healthy and not stressed by handling.

Temperature data collected in a surrogate test chamber during the 28 day exposure period documented a mean temperature of 22.9°C with values ranging from 20.8 to 25.6°C. Acceptable criteria are a mean value of 23±1°C with maximum temporary fluctuations of 23±3°C. Review of daily temperature data, taken from the overlying water of the laboratory control treatment, showed values ranging from 22 to 23 °C.

Alkalinity, ammonia and hardness concentrations collected from the laboratory control and project sample treatment at the beginning and end of the test are summarized in Table 12.

3.2 *Chironomus dilutus* Survival and Growth Evaluation

Survival and growth in the laboratory control treatment at the end of the 20-day exposure period was 83.7% and ash free dry weight of 1.79 mg/larvae, respectively. These values exceeded minimum endpoint requirements for the assay of 70% survival and a mean ash free dry weight of 0.48 mg/larvae. These data indicate that the organisms were healthy and not stressed by handling.

Temperature data collected in a surrogate test chamber during the 28 day exposure period documented a mean temperature of 23.1°C with values ranging from 20.8 to 25.6°C. Acceptable criteria are a mean value of 23±1°C with maximum temporary fluctuations of 23±3°C. Review of daily temperature data, taken from the overlying water of the laboratory control treatment, showed values ranging from 22 to 23 °C.

Alkalinity, ammonia and hardness concentrations collected from the laboratory control and project sample treatment at the beginning and end of the test are summarized in Table 11.

3.3 Summary

Review of data collected during this series of assays documented varying levels of response between the project reference and test sites. This held true for analysis of both composited groups of samples, *i.e.* all riverine reference sites verses all riverine test sites, and for individual comparisons of reference verses test site.

Review of survival and growth data for the reference sites document that sediments from sites T05BL-003 and T05BL-005 had significant impact on organism survival to an extent that survival failed to meet protocol acceptability criteria, 70% for the midge larvae and 80% for the amphipod.

Data from the individual project sites document that for these samples the amphipod appeared to be more sensitive than the midge larvae based on the number of instances where an endpoint for a sample was determined to be statistically less than the associated reference site. Additionally, that for these samples survival appears to be a slightly more sensitive endpoint indicator than growth.

Hyalella 28-d Survival and Growth Sediment Test — **EnviroSystems, Inc.**

Test No:	20-9519-9280	**Test Type:**	Growth-Survival (10d)	**Duration:**	28d 0h
Start Date:	01 Jul-05 12:00 PM	**Protocol:**	EPA/600/R-99/064 (2000)	**Species:**	Hyalella azteca
Ending Date:	29 Jul-05 12:00 PM	**Dil Water:**	50/50 Mix of Surface Water and MHR	**Source:**	Aquatic Research Organisms, NH
Setup Date:	01 Jul-05 12:00 PM	**Brine:**	Not Applicable		

Sample No:	17-8578-7404	**Material:**	Freshwater Sedment	**Client:**	BBL Sciences, Inc.
Sample Date:	01 Jul-05 12:00 PM	**Code:**	13446-000	**Project:**	Ecologcal Risk Assessment
Receive Date:	01 Jul-05 12:00 PM	**Source:**	Blackstone River		
Sample Age:	N/A	**Station:**	Lab Control		

Sample No:	11-6952-0824	**Material:**	Freshwater Sedment	**Client:**	BBL Sciences, Inc.
Sample Date:	29 Jul-05 12:00 PM	**Code:**	13446-100	**Project:**	Ecologcal Risk Assessment
Receive Date:	29 Jul-05 12:00 PM	**Source:**	Blackstone River		
Sample Age:	N/A	**Station:**	Composite River Reference Site -100		

Sample No:	06-5176-0793	**Material:**	Freshwater Sedment	**Client:**	BBL Sciences, Inc.
Sample Date:	29 Jul-05 12:00 PM	**Code:**	13446-101	**Project:**	Ecologcal Risk Assessment
Receive Date:	29 Jul-05 12:00 PM	**Source:**	Blackstone River		
Sample Age:	N/A	**Station:**	Composite River Sites -101

Hyalella 28-d Survival and Growth Sediment Test — **EnviroSystems, Inc.**

Start Date: 01 Jul-05 12:00 PM
Ending Date: 29 Jul-05 12:00 PM
Sample Date: 06 Jul-05 12:00 PM
Species: Hyalella azteca
Protocol: EPA/600/R-99/064 (2000)
Material: Freshwater Sedment
Sample Code: 13446-000
Sample Source: Blackstone River
Sample Station: Lab Control

Aquatic Research Organisms

DATA SHEET

I. **Organism History**

Species: Hyalella azteca

Source: Lab reared ✓ Hatchery reared _____ Field collected _____

Hatch date 6/29/05 Receipt date _____

Lot number 062905HA Strain AKO

Brood Origination USFWS MO

II. **Water Quality**

Temperature 24 °C Salinity — ppt DO SAT

pH 7.2 Hardness ~120 ppm

III. **Culture Conditions**

System: FW SPATIRRENEW

Diet: Flake Food ✓ Phytoplankton _____ Trout Chow ✓

Brine Shrimp _____ Rotifers _____ Other _____

Prophylactic Treatments: _____

Comments: _____

IV. **Shipping Information**

Client: ESI # of Organisms: 1400

Carrier: PICK UP Date Shipped: 7-1-05

Biologist: Stan Leather

ABSTRACT

An analysis of historical aerial photography of the Peterson-Puritan, Inc. study area has been conducted to provide general information on the study area and to identify past disposal practices and possible sources of contamination detected in several municipal supply wells in the study area. General information on the study area consists of a land use analysis, historical river course change analysis, wetlands analysis, and a fracture trace analysis.

The study area is composed of five distinct operational areas: a section of an industrial park (seven facilities analyzed), an extraction area, a landfill, a disposal area, and a reported quarry/landfill. Features of interest detected in the study area include numerous drums, a possible spill, a liquid-filled pit, standing liquid, ground staining, debris, and discolored liquid (possibly leachate).

The Environmental Protection Agency's (EPA) Environmental Photographic Interpretation Center in Warrenton, Virginia, a field station of the Environmental Monitoring Systems Laboratory in Las Vegas, Nevada, performed this study at the request of EPA Region 1. This analysis covers the period between 1941 and 1986; the report was completed in March 1987.

INTRODUCTION

The Peterson-Puritan, Incorporated study area is an approximate 82-hectare (205-acre) area straddling the Blackstone River in the towns of Lincoln and Cumberland, Rhode Island. Figure 1 depicts the study area location, keyed to a U.S. Geological Survey (USGS) 1:24,000 scale topographic quadrangle map. Volatile organic contamination was detected in several municipal supply wells located in the study area.[1]

This analysis of historical aerial photography was conducted to provide general information on the study area and to identify past disposal practices and possible sources of contamination. Aerial photography of the study area was obtained to represent the period from 1941 to 1986.[2] Historical black and white photography for the years 1941, 1951, 1956, 1960, 1963, 1970, and 1976, and color photography for 1981, 1983, and 1986 were used for this analysis. The current color mission was flown on June 19, 1986. This report is divided into two volumes: Volume 1 includes the complete text and Volume 2 includes all figures.

In the Aerial Photo Site Analysis section of this report, the study area is divided into and referred to as five operational areas: an industrial park, an extraction area, a landfill (J.M. Mills Landfill[1]), a disposal area, and the Dexter Quarry/Landfill.[1] These five areas are outlined on Figures 3-9 and 11. Industries which are currently located in the section of the industrial park analyzed include Roger Williams Food, Incorporated (Area 2); Lonza, Incorporated (Area 3); Okonite Cable Company (Area 4); Peterson-Puritan, Incorporated (Area 5); and Healthtex Incorporated (Area 7).[1]

[1]Collateral information supplied by EPA Region 1.

[2]A complete listing of all maps and photography used for this report can be found in the References section.

The names of the industries located in Areas 1 and 6 were not determined. Throughout this analysis, the individual industrial sites will be referred to by area number only. Significant activities beyond the five operational areas are also discussed. Significant features are annotated and discussed the first year they are visible. They are generally not discussed further unless significant change is evident. Site boundaries or areas used in the analysis were determined from observations made from the aerial photography and do not denote legal property lines or ownership.

General information provided for the study area includes a land use analysis for the year 1983 (Figure 2), updated with 1986 photography. Surface drainage has been delineated on 1951 and 1983 photographs (Figures 4 and 11). A fracture trace analysis has been keyed to a 1951 photo (Figure 13). Historical changes in the Blackstone River course have also been plotted on a 1983 photo (Figure 14). A wetlands analysis was performed for the years 1951 and 1976 (Figures 15 and 16).

The Environmental Protection Agency's (EPA) Environmental Photographic Interpretation Center in Warrenton, Virginia, a field station of the Environmental Monitoring Systems Laboratory in Las Vegas, Nevada, performed this study at the request of EPA Region 1. This report was completed in March 1987.

METHODOLOGY

A search of government and commercial aerial photographic sources was undertaken to obtain the best photography available of the site spanning the desired time frame. A listing of all maps and photography used for this report can be found in the References section.

The analysis was performed by stereoscopically viewing transparencies, backlit on a light table. By observing the site three-dimensionally, and at various magnifications, the analyst could search for objects, features, or signatures associated with different environmental conditions. The term "signature" refers to a combination of characteristics (such as color, tone, shadow, texture and size) which indicate a specific object or condition, even though the object itself is not identifiable from the photography.

Prints were made from coverages which reveal significant changes in the study area. Findings are annotated on overlays to these prints, or to maps of the study area, and full descriptions are provided in the accompanying text. The resolution quality of the original, transparent photography used by the analyst is degraded on the prints due to factors inherent in the printing process. Therefore, some objects or features identified from the original film and described in the text may not be clearly discernible, or even visible, on the photographic prints presented in this report.

It should be noted that site boundaries or areas used in this analysis were determined by observations made from the aerial photography and do not denote legal property lines or ownership.

In this report, a distinction is made between probable and possible identifications. Probable is used when a limited number of discernible signatures allows the analyst to be reasonably sure of a particular identification. Possible is used when few signatures are discernible, and the analyst can only infer an identification.

LAND USE

Figure 2 depicts the various types of land uses within an approximate 2-kilometer (1.2-mile) radius of the Peterson-Puritan, Incorporated study area. The land use classification system used in this report was adapted from a United States Department of the Interior publication (Reference 1) on land use identification using remote sensor data. Minor modifications to this system were required to provide an accurate representation of land usage in the area.

The study area is mostly composed of industrial (13), residential (11), and extraction (75) land use areas. The analysis was performed from photography dated July 23, 1983 and updated with June 19, 1986 photography. The following categories are used in this analysis:

11 - Residential
12 - Commercial
13 - Industrial
14 - Transportation/Communication
16 - Mixed Urban or Built-Up Land
17 - Other Urban or Built-Up Land
18 - Institutional/Governmental
19 - Recreational
21 - Cropland and Pasture
24 - Farmsteads and Farm-Related Buildings
41 - Deciduous Forest
51 - Waterways, Streams and Canals
52 - Natural Lakes and Ponds
53 - Man-Made Reservoirs and Impoundments
61 - Forested Wetlands
62 - Non-Forested Wetlands
72 - Beaches and River Banks
75 - Extraction

AERIAL PHOTO SITE ANALYSIS

SUMMARY

Table 1 is a summary of significant features or activities observed in the Industri Park section of the study area. Table 2 summarizes significant features or activiti observed in the Extraction (EXT) Area, Landfill (LF), Disposal Area, and Dext Quarry/Landfill sections of the study area.

Features are listed in the year in which they are first noted and are not furth listed unless significant change occurs.

TABLE 1
INDUSTRIAL PARK AREA SUMMARY

Year	1	2	3	4	5	6	7
1941	NP	NP	NP	NP	Small bldg.; prob EX	Bldg.	Poss FA
1951	NP	NP	NP	Airfield	EX; poss stained parking lot	SL; poss liquid discharge structure	Faint acces road to poss FA
1956	2 construc-tion areas; bldg.	NP	2 tanks; small bldg; 2 EX	Construction of bldg. in former air-field; MM	EX enlarged; MM; poss stacked M	SL not visible	NC
1960	DKM; bldg. in former construction area; 2 tanks; poss GST	Small bldgs.; circular GS	EX graded	Bldg; MM not visible	EX enlarged; MM and poss stacked M not visible	NC	Acce road to non-deve lope area
1963	Stacked M; 2 tanks; no poss GST	NC	2 tanks removed	Containers in GST area; poss tank	New bldg. and GA in former EX; 9 tanks; GS	NC	NC

TABLE 1 (Cont'd)

r	1	2	3	4	5	6	7
0	3 tanks	Large bldg.; prob GST; poss stained area; prob pipe	Bldg. on former GA; 4 tanks	4 tanks; drainage pathway and poss tank not visible	Bldg. enlarged over GA; 23 tanks; prob pipe; drainage pathway to SL; GST	Poss discharge structure not visible	Bldg.; poss F with MM, SL
5	2 tanks not visible; 2 tanks added	Bldg. enlarged; GST surrounds 3-4 tanks	Bldg. enlarged	Additional containers	28 tanks; bldg. enlarged; prob pipes; drainage pathway, SL, GST not visible	NC	Bldg. enlarged stacke M; DA filled and RE
1	Cylindrical objects replace stacked M	GST, 3-4 tanks not visible; SL; MM; DB; tarpaulin-covered IM; tank	Approx. 1,278 drums; SL in EX; second EX; 26 tanks	Numerous spools; 6 tanks; GST; SL	Approx. 110 drums; 48 tanks; bldg. enlarged; crates; drainage channel and pathway; SL; compactor; SL in place of small bldg.	NC	Pipeli to river; crates tires; traile
3	4 tanks	MM not visible	Drums not discernible; stacked M; 11 prob tanks; pit with SL in EX	SL, one tank and GST not discernible; 5 tanks	Drums not discernible; stacked M; no SL, drainage channel or pathway visible; 28 tanks; other tanks probably remain	NC	Pipe-line, tires not discer ible; stacke M
5	No cylindrical objects visible	15 drums; tires; 2 pipelines to river	Approx. 1,167 drums; DKM in EX; GST, poss spill area borders 7 tanks, small bldg.; liquid-filled pit in EX larger; 16 tanks	6 tanks and wet GST again visible; 25 drums	1,150 drums; 43 tanks; GST; 2 empty revetted areas; drainage channel	NC	Pipe-line; tires

TABLE 2
EXTRACTION AREA, LANDFILL, DISPOSAL AREA
AND DEXTER QUARRY/LANDFILL SUMMARY

Year	EXT Area	LF	Disposal Area	Dexter Quarry/ LF
1941	Poss EXT activity	NP	NP	No photo coverage
1951	EXT activity; DA/prob EXT with SL	NP	NP	Poss FA; DK area with linear channels; IM
1956	Activity expanded; SL not visible	NP	NP	FA with DB; linear channels, IM not visible
1960	Activity expanded	NP	NP	FA expanded
1963	Activity expanded; poss SL	NP	NP	GST on expanded FA
1970	Activity expanded; poss linear scrapes replace poss SL	LF built between railroad bed and shifted main river channel; disturbed, scraped areas with SL; 3 TR; DB	MM; 2 pits with SL; bermed area with DB	FA occupies entire quarry; working fill face; GST not visible
1976	Activity expanded; poss linear scrapes not visible	LF built up; TR; DA filled; 2 pools SL	Less MM; filling at bermed area; 2 liquid-filled EX; 2 pits not visible; 3 pools SL; MM, DB adjacent to racetrack	Quarry filled to grade

TABLE 2 (Cont'd)

Year	EXT Area	LF	Disposal Area	Dexter Quarry/ LF
1981	Activity expanded; poss construction rubble	Portion of LF REV; 2 pools SL overgrown; working fill face; DB; 60 drums; rusted tank; discolored liquid	More EX with SL; 2 shalloow EX with discolored liquid; cylindrical DB in 2 liquid-filled EX; tires; filling not visible at former bermed area; bull-dozer; DB. Next to racetrack: DB; 285 drums; gatehouse to LF	No photo coverage
1983	Activity slightly expanded	Most of LF inactive; groups of DB at southern end; drums, rusted tank not visible	New liquid-filled EX; cylindrical DB, tires not discernible; bulldozer not present. Next to racetrack: large amount of DB; drums not discernible; gatehouse not visible	REV
1986	NC	DB at southern end; approx. 65 drums; 5 rusted tanks; large pool of poss LE	EX combined into one large, liquid-filled EX; small amount of DB. Next to racetrack: At least 500 drums in DB; red GST near drum group; tires; crates; 4 tanks	No photo coverage

OCTOBER 8, 1941 (FIGURE 3)

NOTE: Only partial, monoscopic film coverage was available.

Industrial Park[1]

Area 5: Probable excavation (EXC) and a small building (B) present.

Area 6: Building (not annotated) present.

Area 7: A possible former fill area which contains little vegetation appears associated with this area.

Extraction (EXT) Area

Possible extraction activity (sand/gravel mining) along the riverbank.

Other

A light-toned disturbed area (DA) borders a flooded area which is separated from the main channel of the Blackstone River by an elevated railroad bed. The Blackstone River is dammed at the southern end of the study area. Two additional disturbed areas and an extraction area are present west of the river.

OCTOBER 26, 1951 (FIGURE 4)

Industrial Park

Area 4: Area is being used as an airfield.

Area 5: A portion of the area has been excavated. A possibly stained parking lot (not annotated) borders a small building at the southwest corner of Area 5.

Area 6: Standing liquid (SL) may have drained from the large building in Area 6. The wellhouse covering the Martin Street well[2] is visible

[1]Each of the five operational areas, and the individual areas of the Industrial Park, are discussed only as they become active.

[2]Collateral information supplied by EPA Region 1.

west of Area 6 throughout the remainder of the analysis. A structure (S), possibly used for liquid discharge, is situated at the head of a drainage channel near the southwest corner of Area 6.

Area 7: A faint access road (not annotated) leads from the Martin Street wellhouse onto the possible fill area first visible in 1941.

Extraction Area

Probable extraction activity has expanded the light-toned area along the riverbank. A small, partially vegetated excavation is present north of the probable extraction activity. This excavation may have been related to nearby housing construction. A series of small excavations and a second probable extraction area are present near Mendon Road. The series of small excavations will not be further annotated or discussed unless significant change is evident. A disturbed area in which probable extraction activity has occurred is present at the southern tip of the encompassing extraction area. A pool of standing liquid is present in the disturbed area. This area was grassy and contained many trees in 1941.

Dexter Quarry/Landfill

The floor of the Dexter Quarry appears lightly mottled in tone and coarse in texture. A dark-toned (DK) area on the floor of the quarry contains a few linear channels. These channels possibly contain liquid, and may represent an attempt to drain a moist area of the quarry. A possible fill area containing lighter-toned and finer-textured material than that on the majority of the quarry floor is present in the quarry. A probable vehicle (V) is visible on the access road to the possible fill area. A liquid-filled impoundment (IM) and several partially dismantled structures north of the quarry may have been associated with quarry activities.

Other

The disturbed area bordering the flooded area in 1941 now appears smoothly graded (GR) and partially vegetated. This area may have been disturbed for construction purposes; it will not be discussed further. The northern disturbed area visible west of the river in 1941 has become an extraction area. The second disturbed area has been incorporated into a cultivated field, and will not be discussed further. The extraction area on the western edge of the river remains active. A small excavation is present in the northwestern portion of the study area.

MAY 1, 1956 (FIGURE 5)

NOTE: Only monoscopic film coverage was available for the area north of Martin Street.

Industrial Park

Area 1: Two construction areas and a new building are present.

Area 3: Two horizontal tanks (T) border a small building. Two excavated areas appear north of the building.

Area 4: A large building is under construction in the former airfield area. An access road leads through a large graded area west of Area 4 to the construction area. Light- and dark-toned mounded material (MM) is present between the graded area and Area 4.

Area 5: The excavation has been enlarged; it contains a small amount of mounded material. Possible stacked material (M) borders the railroad north of the building at the southwest corner of Area 5.

Area 6: Standing liquid is no longer visible. The possible discharge structure remains near the southwest tip of the area. Standing liquid is present on the floor of an excavation east of the area. A smaller adjacent excavation may be construction-related.

Area 7: Only traces remain of the access road (not annotated) from the Martin Street wellhouse to the possible fill area.

Extraction Area

. Extraction activity has expanded, and extraction-related equipment and vehicles (not annotated) are present. An access road (not annotated) to the active extraction area cuts through the former partially vegetated excavation visible in 1951. The extraction area near the disturbed area/probable extraction area has expanded. The disturbed area/probable extraction area has not changed significantly since 1951. Standing liquid is no longer visible in this area.

Dexter Quarry/Landfill

The floor of the quarry appears darker-toned than in 1951, although it is still coarse-textured. This change in tone may be due to the presence of vegetation. The linear channels seen on the quarry floor in 1951 are no longer visible. The possible fill area present in 1951 has expanded into a larger fill area which contains light-toned debris. Possible debris (DB) is visible in two other areas in the quarry. A probable vehicle is located on the access road to the fill area. The impoundment present in 1951 is no longer visible; slight ground scarring marks its location. One partially dismantled structure remains.

Other

The two extraction areas visible west of the river in 1951 have been enlarged. Standing liquid is visible in the westernmost extraction area. An access road runs from this extraction area to the road at the northern edge of the Dexter Quarry/Landfill. A triangular ground scar (GS) is visible next to the road, east of the quarry. The small excavation in the northwestern portion of the study area is revegetating. An impoundment has been built on the northern side of the dam at the southern end of the study area. A large portion of the river immediately north of the impoundment has filled with sediment.

MAY 5, 1960 (FIGURE 6)

Industrial Park

Area 1: Dark-toned material is stacked or mounded near the building at the north end of the area. A new large building occupies the former construction area. Two tanks are located near the two buildings. Possible ground staining (GST), some of which appears linear, is visible east of the new building.

Area 2: A small building, possibly a wellhouse, and an adjacent circular ground scar are present at the end of the access road (not annotated) that separates Area 1 from Area 3.

Area 3: The former excavated areas have been graded. The building (not annotated) and two tanks remain unchanged.

Area 4: The large building has been completed. The former graded area and access road west of Area 4 have revegetated (REV). A new access road parallels the western edge of Area 4. The mounded material present in 1956 is no longer visible.

Area 5: The excavation has been further enlarged; however, no mounded material remains. Possible stacked material is no longer visible near the building at the southwest corner of Area 5.

Area 6: No significant change is visible within Area 6. Probable standing liquid is present in one of the two excavations east of Area 6.

Area 7: A new access road leads southward from near the Martin Street wellhouse to an undeveloped area. The possible fill area appears disturbed.

Extraction Area

Extraction activity has further expanded. The disturbed area/probable extraction area has not changed significantly.

Dexter Quarry/Landfill

The fill area has expanded. Debris and possible debris are not discernible in this year. No vehicles are noted on the access road (not annotated) to the fill area. The partially dismantled structure remains north of the quarry.

Other

The western extraction area has expanded, and contains a pool of possible standing liquid. The other two extraction areas present in 1956 remain. A fourth extraction area has developed in the northwestern portion of the study area. The small revegetating excavation present in the northwestern portion of the study area in 1956 has been replaced by a graded area. Two other graded areas are present nearby. The impoundment north of the dam has been breached. The sediment-filled area (not annotated) north of the impoundment has not changed significantly, and will not be further discussed or annotated until significant change is noted.

Most of the flooded area has been drained. An impoundment and two rectangular liquid-filled excavations have formed at the southern end of the former flooded area. This impoundment will not be further discussed unless a significant change is noted.

SEPTEMBER 2, 1963 (FIGURE 7)

Industrial Park

. Area 1: Stacked material, possibly some type of crates/cases, is stored throughout Area 1. One of the two tanks present in 1960 is no longer visible; however, a new tank has been added nearby. Possible ground staining is no longer visible.

Area 2: No significant change.

Area 3: The two tanks have been removed. The remainder of the area is relatively unchanged.

Area 4: Several containers are stored in a ground stained area north of the Area 4 building (not annotated). A drainage pathway and a possible tank are present at the southwest corner of the building. The access road paralleling the western edge of Area 4 has been extended into Area 2.

Area 5: A new building and a large grassy graded area occupy most of the former excavated area. A railroad spur (not annotated) curves to the northern side of the building. An array of at least nine tanks has been placed on the west side of the building. The small building (not annotated) remains at the southwest corner of Area 5.

Area 6: No significant change is seen within Area 6. The excavation east of Area 6 which contained probable standing liquid in 1960 now contains dark-toned mounded material. A small building (not annotated) is visible in the eastern excavation.

Area 7: No significant change.

Extraction Area

Extraction activity has increased slightly since 1960; the eastern extraction area has been enlarged. Several linear pools of possible standing liquid are present near a roadblock at the southern end of the disturbed area/probable extraction area.

Dexter Quarry/Landfill

Ground staining is visible on the surface of the expanded fill area. A second small fill area has developed near the north end of the quarry. The structure remains north of the quarry.

Other

The extraction areas remain relatively unchanged. One of the graded areas present in 1960 has revegetated. Portions of the two remaining graded areas have also revegetated. The flooded area has once again become liquid-filled. The two liquid-filled excavations present in the flooded area in 1960 have been inundated. The impoundment north of the dam is also flooded.

MARCH 9, 1970 (FIGURE 8)

Industrial Park

Area 1: Stacked material remains stored throughout Area 1. One tank has been added near one of the two existing tanks.

Area 2: A large building has been placed onsite. Several probable ground stains are present at the northern end of the building. A large, dark-toned area, which may be stained extends beyond the northern edge of Area 2. A mound of material at the western side of the building is surrounded by a dark-toned area (not annotated) which may also be stained. Probable sections of pipe are present at the western edge of Area 2. They are apparently being placed into a pipeline which extends south to Martin Street, and joins a trench (TR) that leads west to the river.

Area 3: A building covers the former graded area. Four small tanks are seen beside the building. The remainder of the area has not changed significantly.

Area 4: Containers remain in the ground stained area north of the Area 4 building. Four tanks have been placed at the southern edge of the building. The drainage pathway and possible tank present in 1963 are no longer visible. The access road that paralleled the western edge of Area 4 in 1963 is no longer visible. A new permanent access road (not annotated) to Area 2 is visible near the river west of Area 4. This road will not be further discussed.

Area 5: The building has been enlarged, and now covers the former grassy graded area. The railroad spur (not annotated) has been rerouted to the western side of the building, near the array of tanks. At least 23 tanks are now in the array. Lengths of probable pipe are scattered north of the building. Containers are stored next to the building. A short drainage pathway leads to a small pool of

standing liquid (not annotated) at the northeast corner of the building. The drainage pathway may be an extension of a dark-toned ground stain that extends along the eastern side of the building. The small building (not annotated) remains at the southwestern corner of the area.

Area 6: No significant change is seen within Area 6. The excavation to the east of Area 6 has been partially converted into a parking lot (not annotated). The eastern former excavation now contains a new small building and several vehicles. The possible discharge structure is no longer visible.

Area 7: A large building has been erected onsite. The former possible fill area has been graded and is part of the lot surrounding the new building. The area adjacent to the northeast corner of Area 7 has been disturbed, and contains mounded material and two areas of standing liquid. This area may have been disturbed during the construction of a parking lot (not annotated) bordering Martin Street.

Extraction Area

Extraction activity has expanded towards the industrial park. Possible linear scrapes in the surface of the disturbed area/probable extraction area are probably the same features which contained pools of standing liquid in 1963. The roadblock has been moved closer to Mendon Road.

Landfill

The landfill has been established between the railroad bed and the shifted main channel of the river. It is accessible from both its north and south ends, although primary access appears to be from the south (landfill

access roads are annotated in this year only). The area nearest the railroad bed, which formerly contained a small channel of the river, appears disturbed, with several scraped areas containing standing liquid. Mounded material in this area may be used as cover or fill material. A trench has been excavated at the northwestern end of the disturbed area. At least two other trenches, one of which contains standing liquid, are present in the landfill. Debris is mounded at the ends of these trenches, and in two nearby locations. Light-toned (LT) standing liquid is impounded in a section of the old river channel at the southern end of the landfill. Similar light-toned standing liquid is visible in the portion of the old river channel immediately adjacent to the impounded light-toned standing liquid.

Disposal Area

The sediment-filled area formed north of the dam by 1956 is being reworked; mounded material (not annotated), which is probably being used as fill material, lines the perimeter, and is deposited throughout the area. Two pits containing standing liquid are present at the northwestern edge of the area. An earthen berm has been constructed in the southern section of the area. A small amount of debris has been deposited inside and to the west of the bermed area. Light- and dark-toned mounded material is being used as fill at the southeast edge of the disposal area, adjacent to an abandoned racetrack.

Dexter Quarry/Landfill

The fill area now occupies the entire quarry, filling most of it to grade. The working face is present at the southern end of the fill area. Individual piles of debris were not discernible. The structure (not annotated) remains north of the quarry.

Other

The southernmost extraction area appears inactive, although the other extraction areas remain relatively unchanged. Portions of the two graded areas which were present in 1963 have expanded. The impoundment north of the dam is no longer flooded; however, it does still contain liquid.

MAY 5, 1976 (FIGURE 9)

Industrial Park

Area 1: Stacked material remains stored throughout Area 1. The two southernmost tanks present in 1970 are no longer visible; the other tank present in 1970 remains. Two tanks have been added at the northern end of the area.

Area 2: The building has been enlarged. Ground staining surrounds three or four possible tanks at the northern end of the building. The large dark-toned, possibly stained area extending beyond the northern edge of Area 2 in 1970 is now vegetated and undisturbed. A probable tank is present at the southern end of the building. An earthen-bermed, liquid-filled lagoon (L) has been constructed south of the building. The probable sections of pipe are no longer visible west or south of Area 2.

Area 3: The building has been enlarged. The remainder of Area 3 has not changed significantly since 1970.

Area 4: More containers are stored around the building than in 1970. The four tanks visible in 1970 remain at the southern edge of the building.

Area 5: There are now at least 28 tanks in the array on the western side of the building. An extension has been built onto the southwest corner of the building. Stacked material, probably crates, occupies the area in which probable lengths of pipe were scattered in 1970. The drainage pathway and standing liquid present at the northeast corner of the building and the ground stain along the eastern side of the building in 1970 are no longer visible. The small building (not annotated) remains at the southern end of the area.

Area 6: No significant change is visible within Area 6 or the two excavations to the east.

Area 7: The building has been enlarged. Stacked material is stored at its southern end. The disturbed area adjacent to the northeast corner of Area 7 which contained mounded material and standing liquid in 1970 has been filled and has revegetated.

Extraction Area

Extraction activity has expanded further. The disturbed area/probable extraction area appears relatively unchanged since 1970. The possible linear scrapes are no longer visible.

Landfill

The landfill area has been built up considerably since 1970. Access to the landfill has not changed. The trenches and disturbed area that contained standing liquid in 1970 have been filled. The area at the southern end of the landfill which contained impounded light-toned standing liquid has also been filled. Two small liquid-filled impoundments are visible at the western edge of the landfill. Debris has been deposited in several areas on the landfill's surface, and near the southern entrance (not annotated) to the landfill.

Disposal Area

The disposal area continues to be reworked, although the amount of mounded material (not annotated) present has decreased since 1970. The southern end of the bermed area is being used as a fill area. Debris is no longer exposed near the bermed area. Two liquid-filled excavations are present. Three small pools of standing liquid border the northern excavation. The liquid-filled pits present near this area in 1970 are no longer visible. Mounded material and debris are present in the area adjacent to the abandoned racetrack.

Dexter Quarry/Landfill

The entire quarry has now been filled to grade. The structure present north of the quarry in preceding years has been removed.

Other

All of the extraction areas are partially revegetating. The two graded areas are also beginning to revegetate.

SEPTEMBER 25, 1981 (FIGURES 10A-10H)

Photographic prints have been included only for those areas in which significant change or activity is apparent.

Industrial Park

Area 1 (Figure 10A): Cylindrical objects, possibly large barrels or pipe segments, are stored around the Area 1 buildings. These objects are probably the same features identified as stacked material in previous years. The southernmost tank present in 1976 remains (not visible on Figure 10A). Available photography did not cover the northern end of the area.

Area 2 (Figures 10A and 10B): Ground staining and possible tanks present at the northern end of the building in 1976 are no longer visible. Standing liquid has accumulated near trailers (not annotated) parked at the northern end of the large building. Two mounds of very light-toned material are present between one of the pools of standing liquid and a tank trailer (not annotated). A new small building has been built near the southwest corner of the large building. Standing liquid is pooled in a loading dock area at the southwest corner of the large building. Equipment (EQ) and a small amount of debris are stored at the southern edge of the large building. The lagoon located at the southern tip of the area is covered with a black tarpaulin. A tank is visible at the northern edge of the lagoon.

Area 3 (Figures 10A and 10B): Approximately 400 drums (D) line an access road to an excavation at the northeast corner of the main building. No drums are visible within the excavation. Approximately 60 drums are stacked and scattered near three interconnected tanks at the northern edge of the area. At least 39 drums are stacked at the northern edge of the building; more may be obscured by the building's shadow. Approximately 42 drums are exposed at the edge of an open shed at the northwest corner of the building. Approximately 279 drums are neatly arranged on a concrete pad north of the shed. No ground staining is evident on the pad. Two small pools of standing liquid (not annotated), possibly accumulated rainfall, are present in an excavation north of the drum pad. Approximately 440 drums are neatly stacked beside three rusty tanks

south of the shed. A total of nine tanks are visible in two areas south of the drums. The four southernmost tanks appear to be in storage. Eleven tanks are present on the eastern side of the building. At least 18 drums are present at the edge of a loading dock at the southern side of the building.

Area 4 (Figures 10C and 10D): Many large spools are stored on the north, west, and south sides of the building. Crates are intermixed with the northern group of spools. Objects that were annotated as containers in previous years may have also been wire spools or crates. One tank and a ground stained area are visible near the northeast corner of the building. Standing liquid near the northwest corner of the building may have drained from the building. Five tanks are located at the southern edge of the building.

Area 5 (Figures 10C and 10D): Many crates are neatly stacked at the northern edge of Area 5. Approximately 50 drums, many of which are open, are stored between an open shed and four tanks near the northeastern corner of Area 5. Approximately 50 more drums are stored near a stack of crates in the northeastern corner of the site. A drainage channel leads from the northwestern corner of Area 5 down to the railroad bed. A drainage pathway leads from a compactor at the western edge of the building to one of the tanks included in the array of 42 tanks. Standing liquid visible between the tank array and the compactor may have drained from the tank array area. A railroad tank car is stopped in the midst of the tank array. Two additional tanks are present at the western edge

of the building. Approximately ten probable drums are visible between the two tanks. The southern third of the main building has been enlarged or rebuilt. The small building has been removed from the southwestern corner of Area 5. Several pools of standing liquid have collected in its place.

Area 6 (Figure 10E): No significant change is seen within Area 6 or the two excavations to the east.

Area 7 (Figure 10E): A pipeline now leads from the western edge of the building to the river's edge. A few crates are stored at the southwestern corner of the building (not visible on Figure 10E). A few tires (not visible on Figure 10E) have been discarded east of the building, along the access road to the landfill located south of the industrial park. The access road is lined with trailers.

Extraction Area (No print included)

Extraction activity has expanded further. A small amount of possible construction rubble is mounded at the western edge of the central portion of the extraction area (see Figure 11, 1983 photo enlargement for location). Extraction activity has expanded into the former disturbed area/probable extraction area.

Landfill (No print included)

The locations of many of the following features are annotated on Figure 11, a 1983 photo enlargement.

Debris is again visible in several areas of the landfill, although it is mostly concentrated at a working face at the southern end of the landfill. A small group of at least 20 drums is stored at the northern end of the

landfill, while a group of at least 50 drums is interspersed with other debris at the southern end. Many of the drums appear rusted. A rusted tank and a small pool of discolored liquid are present near the river's edge at the southern end of the landfill. The northern, southwestern, and northeastern edges of the landfill have begun to revegetate. Access to the landfill has not changed. Trailers edge the northern access road. The two pools of impounded standing liquid visible at the western edge of the landfill in 1976 are now mostly dry and overgrown with vegetation.

Disposal Area (Figures 10F-10H)

Extensive excavation activity has occurred since 1976. The northwestern excavation (Figure 10F), which was present in 1976, is now bordered by a liquid-filled excavation which extends along the eastern edge of the disposal area. The color of the liquid in these two excavations varies from brownish-green to brownish-orange. The area between these two large excavations has also been excavated and graded. Two additional small shallow excavations (Figure 10F) at the edge of the excavated/graded area contain discolored brownish-orange liquid. The three small pools of standing liquid bordering the northwestern excavation in 1976 were not observed. An L-shaped excavation (Figure 10G) filled with brownish-green liquid borders the northern and western sides of the former bermed area. The southern tip of this L-shaped excavation was present and liquid-filled in 1976. Debris composed of dark, cylindrical objects is half-submerged in this portion of the excavation. Dark-toned standing liquid has pooled in a smaller shallow excavation at the eastern edge of the excavation. A new small excavation, filled with discolored brownish-orange liquid, visible within the former bermed area, also

contains cylindrical debris. Scattered debris throughout the former bermed area includes discarded tires (not annotated). Filling (1976) could no longer be detected within the former bermed area. East of the former bermed area a bulldozer is pushing earthen material toward the long excavation at the eastern edge of the area. An earthen ridge rises above the water level inside the western edge of this excavation. Two piles of debris are present west of the former bermed area and L-shaped excavation. Discarded lumber and possible containers are visible in the southern pile of debris.

The southeastern end of the disposal area (Figure 10H) is now debris-filled, and is associated with the landfill north of the disposal area. The gatehouse permitting access to the landfill is located in this area. Grey material has been mounded next to the landfill access road. Three groups totaling at least 285 drums are stored among the debris in the western half of the area. Most of the debris is composed of discarded equipment and containers, although one area of finer-textured debris is present. Spools similar to those located at Area 4 are also visible.

Dexter Quarry/Landfill; Other

No photo coverage was available of these areas.

JULY 23, 1983 (FIGURE 11)

Industrial Park

Area 1: Fewer cylindrical objects are present than in 1981. Four tanks are now visible in the area.

Area 2: Probable standing liquid is evident near trailers (not annotated) at the northern end of the building. Mounded material is no longer visible in the northeast corner of the area. Standing liquid (1981) is no longer visible in the loading dock area (not annotated) at the southwest corner of the large building. Equipment and debris (not annotated) remain stored at the southern edge of the large building. The tarpaulin-covered lagoon and the tank at the southern tip of the area remain relatively unchanged since 1981.

Area 3: Individual drums could not be discerned on this photography; however, stacked material that could be drums is located in most of the areas which contained drums in 1981. The excavation remains at the northeast corner of Area 3. The three interconnected tanks present in 1981 at the northern edge of the area are no longer visible. At least six probable tanks are visible at the northeast corner of the building (not annotated). The shed remains at the northwest corner of the building. The drum pad and excavation (neither are annotated) remain north of the shed. The excavation now contains a pit with standing liquid. Stacked material on the drum pad may be drums. At least five probable tanks are present south of the shed, in the area that contained nine tanks in 1981.

Area 4: Probable spools are neatly stored at the northern and western edges of the area. The tank and ground stained area visible near the

northeast corner of the building in 1981 could not be discerned on this photography. Five tanks remain at the southern edge of the building. Standing liquid (1981) is no longer visible.

Area 5: Stacked material lines the northern edge of Area 5. The individual crates, drums and small tanks visible in this area in 1981 could not be discerned on the 1983 photography. A small building has been added next to the shed (not annotated) visible in this area in 1981. Standing liquid and drainage channels or pathways which were visible in 1981 are no longer visible. The compactor visible in 1981 remains. At least 28 large tanks remain visible in the array at the western edge of the building. A bright white signature is visible in the area of the tank array that contained smaller tanks; the brightness of the signature precludes counting these probable tanks (not annotated). Six railroad tank cars (not annotated) are stopped in the midst of the tank array. Standing liquid is no longer pooled at the southwestern corner of Area 5.

Area 6: No significant change.

Area 7: The pipeline present in 1981 could not be discerned on this photography. Stacked material (probably crates) is stored at the southwestern corner of the building. East of the building, trailers remain along the northern access road to the landfill; however, tires noted in 1981 could not be discerned.

Extraction Area

Extraction activity has expanded slightly since 1981. The location of rubble noted in 1981 is annotated on this photo.

Landfill

Most of the landfill appears inactive; the northern, southwestern and northeastern edges of the landfill continue to revegetate. Access to the landfill has not changed. Groups of debris remain at the southern end of the landfill, although a working face is no longer present. The pool of discolored liquid noted in 1981 remains at the southern end of the landfill. Other features, such as debris, the working face drums, and a rusty tank noted in 1981 are no longer visible. Their former locations are noted on this photo.

Disposal Area

The area remains basically unchanged since 1981. A new small liquid-filled excavation is present near the two largest liquid-filled excavations noted in 1981. Liquid in the large excavation at the eastern edge of the disposal area and in the L-shaped excavation no longer appears discolored. Small features such as the cylindrical objects, scattered debris, discarded lumber and possible containers noted in 1981 could not be discerned on this photography. Two mounds of debris are present in the area which contained the lumber and possible containers in 1981. The bulldozer present in 1981 is no longer visible.

The southeastern end of the disposal area is relatively unchanged and still contains a large amount of debris. The grey mounded material, finer-textured debris, spools, and drums visible in 1981 could not be distinguished on this photography. The gatehouse present in 1981 on the access road to the northern landfill is no longer present, and access to the landfill from this road has been blocked. Access to the landfill (not annotated) has been rerouted to the northeastern edge of this portion of the disposal area.

Dexter Quarry/Landfill

The northern two-thirds of the quarry is beginning to revegetate. No access roads are visible onsite.

Other

The extraction areas are relatively unchanged since 1976. Houses have been built on the two former graded areas.

JUNE 19, 1986 (FIGURES 12A-12C)

Figures 12A-12C are photo enlargements of only the portions of the study area in which the most significant features, activities, or changes in activity are evident. Features that are annotated on the photo enlargement are marked with an asterisk (*) in the accompanying discussion. Significant features that do not appear on the photo enlargements are also discussed.

Industrial Park

Area 1 (No photo included): Cylindrical objects are no longer visible. No photo coverage was available of the northern end of Area 1, which contained four tanks in 1983.

Area 2 (Figure 12A): A few puddles of standing liquid, probably rainwater, have accumulated near trailers* at the northern end of the building.* Discarded tires and at least seven drums are stored near the northwest corner of Area 2. Two pipelines lead from two structures at the western edge of Area 2 to the river's edge. Equipment* and debris,* including at least eight drums, are stored at the southern edge of the large building. The tarpaulin-covered lagoon and the tank remain at the southern tip of the area.

Area 3 (Figure 12A): Many drums are again visible onsite. At least 485 drums* are stored between the northeast corner of the building* and the excavation* at the northeast corner of the site. A small amount of dark-toned material* is visible in the excavation. At least 169 drums* are stored at the northern edge of the building. One large tank,* six smaller tanks,* and a small building* have been placed at the northern edge of the site. Ground staining,* which may have originated from a spill in the tank area (arrows denote probable flow from one tank), surrounds one end of the large tanks and extends north to a more darkly stained area which contains a pool of discolored liquid (not visible on photo). Two dead trees stand at the western end of the darkly stained area (not visible on photo). A patch of dead vegetation* and a small pool of standing liquid* are present east of the tank area. The liquid-filled pit in the excavation at the northwest corner of the site (not visible on photo) appears larger than in 1983. The shed* remains at the northwest corner of the building. Approximately 488 drums* are neatly stored on three concrete pads (not annotated) around the shed. Two of the three pads are revetted or fenced. Four revetted or fenced tanks* are located near the drum pads. An additional twelve revetted tanks* are located at the eastern edge of the building. A group of 25 drums* is stored next to two of these tanks. A small amount of debris,* possibly discarded equipment, is stored near a building* at the southwest corner of the site.

Area 4 (Figure 12A): Many spools are again stored at the northern and western edges of the site. At least 25 drums* are stored next to

spools* in a wet, darkly stained area* in the northeast corner of the site. The tank* that was visible in this area in 1981 remains (the tank was not discernible on the 1983 photography). Five tanks remain at the southern edge of the building.*

Area 5 (Figure 12A): At least 1,150 drums* are neatly stored at the northern edge of the site. Several crates* are stacked near the drums. A second small building* has been added west of the building* and shed* noted at the northern end of the site in 1983. A tank* bordered by a ground stain* and two empty revetted areas* are present in the northeast corner of the site. A drainage channel* along the northern edge of the site extends west to the railroad tracks,* where it bends south; it appears to be routed under the railroad tracks to Area 4, then flows south to Martin Street, where it can no longer be traced.

As in 1981, there are 42 tanks* in the array at the western edge of the building. Three railroad tank cars* are stopped in the midst of the tank array. The compactor* remains at the western edge of the building.*

Area 6: No significant change.

Area 7: The pipeline is again visible. A few crates are stored south and west of the building. East of the building, trailers and a few discarded tires remain along the northern access road to the landfill. Dark- and light-toned mounded material borders the access road to the Martin Street wellhouse. A ground stain and ground scar are present beside the wellhouse. Fuel oil reportedly leaked from a broken fill cap in this area.[1]

[1]Collateral information provided by EPA Region 1.

Extraction Area

No significant change.

Landfill (Figure 12B)

Most of the landfill appears inactive; however, debris, including a total of at least 65 drums,* remains scattered at its southern end.[1] Five rusted tanks* are also scattered among the debris. The pool of discolored liquid noted at the southern end of the landfill in 1981 and 1983* is now open to the river channel; the liquid appears identical in tone to that in the river channel. A large pool of discolored liquid,* possibly leachate, is present near the river on the southwestern edge of the landfill. The landfill remains accessible from both its northern and southern ends.

Disposal Area (Figure 12C)

The liquid-filled excavations present in 1983 have been combined into one liquid-filled excavation occupying most of the northern part of the disposal area. Many marshy areas and pools of standing liquid dot the remainder of the area. A small amount of debris, including discarded lumber, remains near the southwestern corner of the large liquid-filled excavation.

A large amount of debris remains at the southeastern end of the disposal area next to the racetrack. At least 500 drums* are scattered throughout this area.[2] A red stain* is present near one group of drums. Numerous tires* crates,* and at least four tanks* are also scattered among the debris. A tall

[1]Because the drums are widely scattered in small groups, the actual number of drums at each specific location is not annotated.

[2]Because this large number of drums is so widely dispersed throughout this area, the number of drums at each location has not been annotated. Smaller groups of drums may also not have been annotated to prevent cluttering of the overlay.

gate or wall* blocks the road that leads across the dam.* The road* leading from the road crossing the dam to the main portion of the disposal area has washed out.

Dexter Quarry/Landfill; Other

No photo coverage of these areas was available.

FRACTURE TRACE ANALYSIS

The cracks, joints, faults and other breaks in bedrock are known as fractures. These fractures or zones of fracturing represent specific pathways by which ground water may move within an aquifer, potentially increasing ground water flow rates and, in some cases, directing flow away from expected flow directions.

Fracture trace analysis involves the identification, on aerial photography, of linear features on the earth's surface that may represent the surficial expression of fractured bedrock; these linear features, called "fracture traces," are believed to be surface expressions of vertical or near-vertical fractures in underlying bedrock. Photographic signatures such as soil-tonal variations, differences in vegetation growth, offset or straight stream segments, and linear topographic depressions are identified, analyzed and compared to cultural and geologic information to determine if the signatures can be categorized as fracture traces.

Forty fracture traces were identified on 1:20,000 scale aerial photography from October 1951, and their approximate locations were annotated on the included photo enlargement (Figure 13). The following rose diagram (Diagram A) illustrates the approximate orientations of the annotated fracture traces. Two trends are apparent: (1) approximately 25% of the fracture traces are oriented between N 0-10 E; and (2) approximately 30% of the fracture traces are distributed between N 50-80 W.

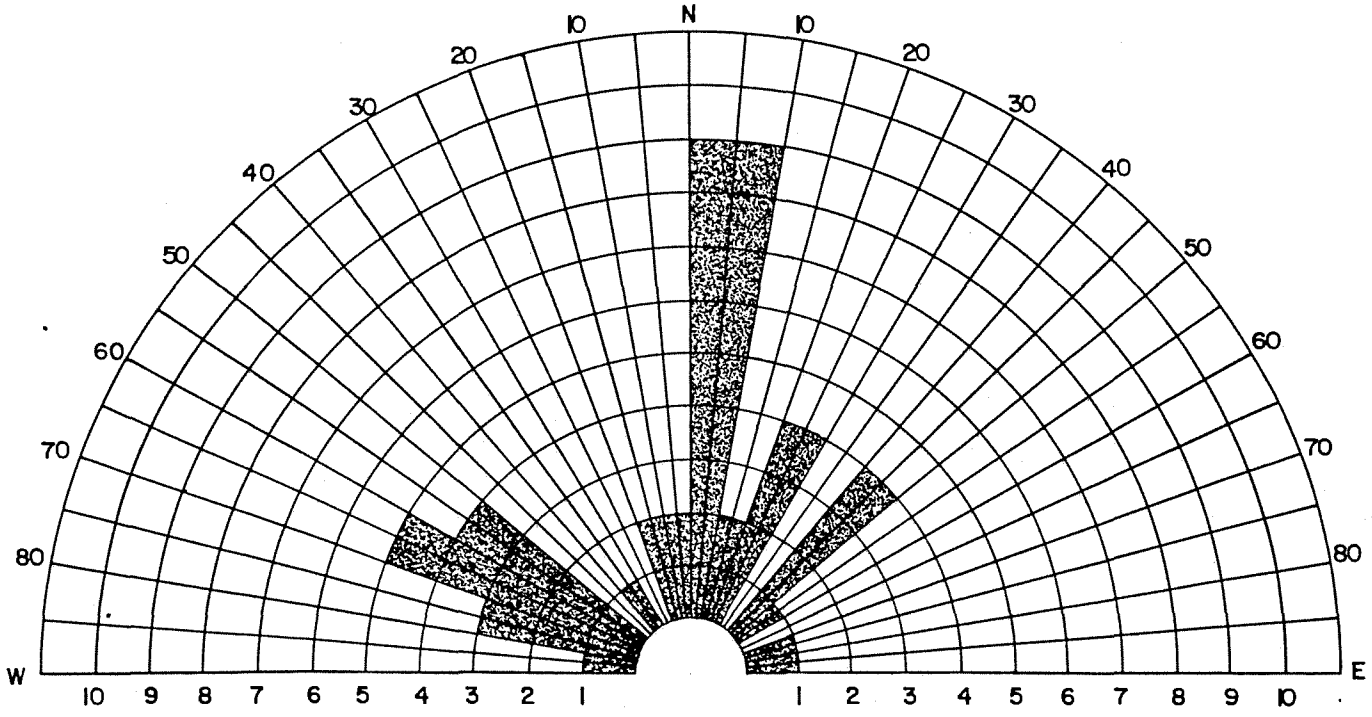

DIAGRAM A: ORIENTATIONS OF FORTY FRACTURE TRACES

Most of the study area is underlain by metamorphic rocks of the Blackstone Series, primarily quartzite, schist, and greenstone (Reference 5). The Blackstone Series in the Blackstone River Valley has northwest strikes of bedding with moderate northeast dips (Reference 4). The area was covered by broad masses of glacial ice one or more times during the Pleistocene Epoch. This ice sheet moved S 15-20 E across the Pawtucket quadrangle area. Glacial deposits in the study area include kame terraces, river-terrace alluvium, flood plain alluvium, and ground moraine (Reference 2). Only one of the forty fracture traces identified extends onto kame terrace; the remainder lie in ground moraine areas in which bedrock outcrops are also present.

A fracture pattern analysis was conducted in 1980 in the vicinity of the Dexter Quarry/Landfill by Ecology and Environment, Inc. (E&E) (Reference 6). For the purpose of comparison, the 104 field measurements which were plotted onto a stereographic net by E&E were transferred to the following Rose Diagram format (Diagram B).

Two dominant trends emerge between N 20-30 E and N 40-50 E. The majority of the measurements are distributed within a 130-degree arc between N 40 W and N 90 E. The difference in results between the fracture trace analysis and the field fracture pattern analysis may be the result of at least two factors: (1) Fracture pattern measurements taken by E&E were localized near the Dexter Quarry/Landfill and may reflect fracture systems in the local bedrock only. Fracture traces identified on the aerial photography are regional in scale, illustrating fracture systems across several bedrock terranes. (2) Fracture traces identified on aerial photography are believed to be surface expressions of vertical or near-vertical fractures in the underlying bedrock. Fracture measurements taken by E&E included non-vertical fractures.

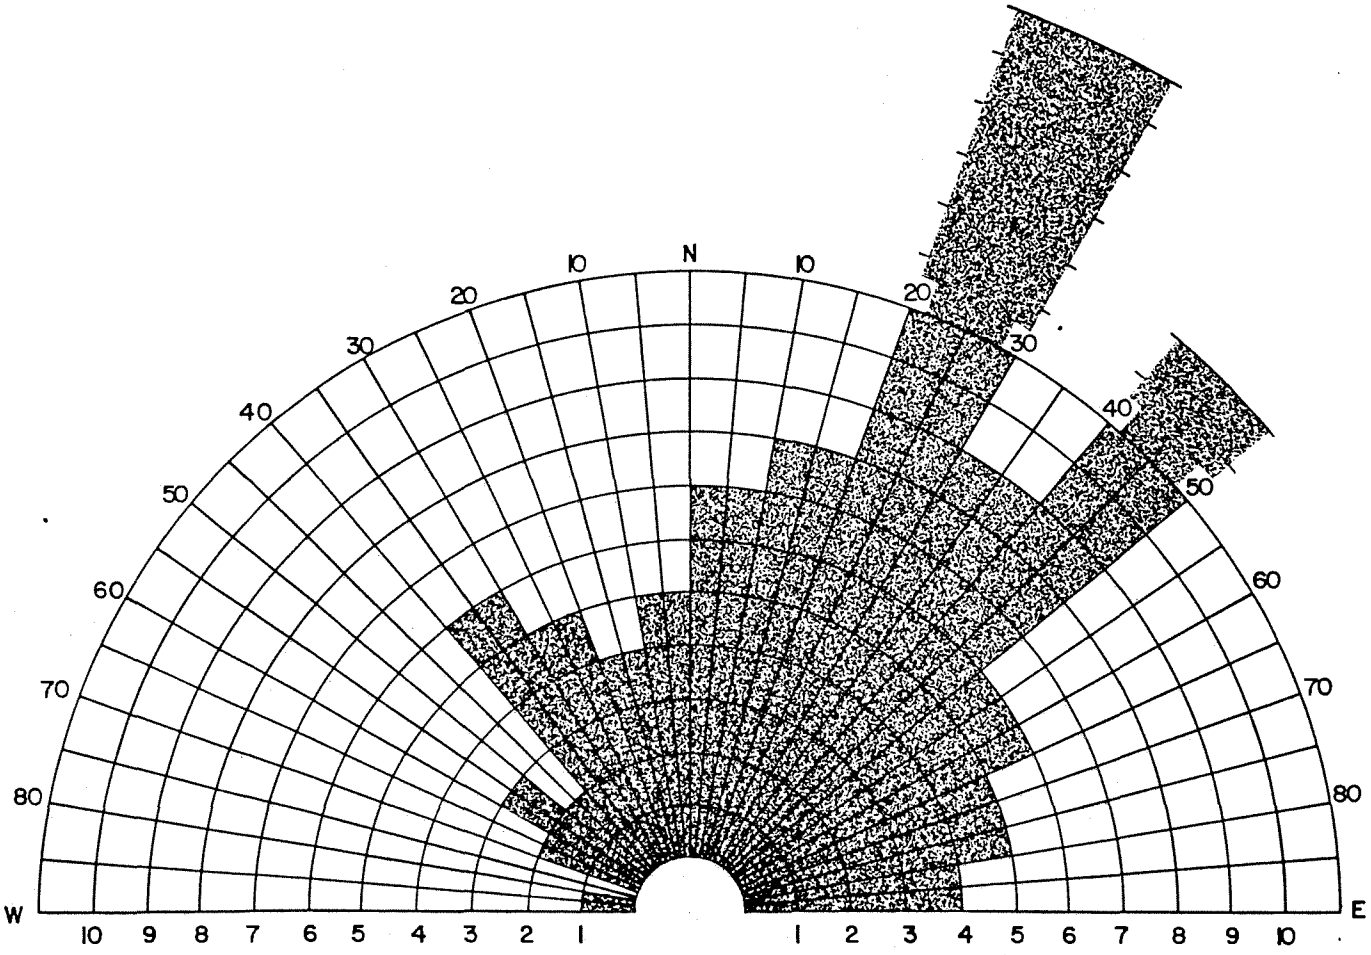

DIAGRAM B: ORIENTATIONS OF FIELD MEASUREMENTS

HISTORICAL RIVER CHANGES

A series of three overlays for the years 1951, 1956 and 1970 illustrate significant changes in the course of the Blackstone River, especially those resulting from artificial and/or natural filling activities. These overlays have been keyed to a July 23, 1983 photo (Figure 14).[1] A fourth overlay for 1983 illustrates the river in its present-day configuration. Shaded areas indicate open water. The following is a summary of the changes that occurred between 1941 and 1986:

1941 (No overlay included) - The southeast-flowing Blackstone River and Blackstone Canal bisect the study area. The canal does not change significantly throughout the course of the analysis and will not be discussed further. The river is impounded by a dam at the southeastern tip of the study area. A small channel northeast of the dam helps to drain the impounded area. An additional flooded or impounded area is separated from the main channel of the river by an elevated railroad bed.

1951 - The course of the Blackstone River and the associated flooded area has not changed significantly since 1941.

1956 - A new impoundment has been built at the northern side of the dam on the Blackstone River. A large portion of the river immediately north of the dam and impoundment has filled with sediment; the river channel bows to the northeast of the sediment-filled area, following the edge of the railroad bed. The channel that flowed northeast of the dam in 1951 and 1941 has been cut off and filled.

[1]These three overlays were traced from the 1951, 1956, and 1970 photos and mechanically transferred to the same scale as the 1983 photo.

1960 (No overlay included) - The main channel of the river has not changed significantly since 1956. Most of the flooded area between the railroad bed and the extraction area has been drained. An impoundment and two rectangular liquid-filled excavations have formed at the southern end of the flooded area.

1963 (No overlay included) - The main channel of the river has not changed significantly since 1956. The area between the railroad bed and the extraction area is once again flooded. The impoundment at the southern end of the flooded area may be used for recreation. The wall of the impoundment north of the dam has been breached.

1970 - The construction of a landfill has shifted the main channel of the river to the southwest (nearer the Blackstone Canal). The landfill has filled a former small channel of the river which flowed next to the railroad bed. The northern and southern ends of a second channel on the western side of the disposal area are dammed. The flooded area is relatively unchanged, although it is partially ice-covered.

1976 (No overlay included) - The main channel of the river is relatively unchanged since 1970. The water level is much lower than in previous years in the flooded area, and vegetation is beginning to fill the area.

1981 (No overlay included) - The main channel of the river is relatively unchanged since 1976. Most of the former flooded area has drained or sedimented and vegetated, although open water remains at its edges.

1983 - The main channel of the river and the former flooded area have not changed significantly since 1981.

1986 (No overlay included) - The main channel of the river has not changed significantly since 1983. The water level in the former flooded area is slightly higher than in 1983.

WETLANDS ANALYSIS

Historical photography from October 1951 and May 1976 (Figures 15 and 16) was analyzed to classify wetlands located within the study area and to denote significant changes in wetland areas over the 25-year period.[1] A hierarchical classification system developed by the U.S. Fish and Wildlife Service (see Reference 3) was used in this analysis. The wetlands identified on the two years of photography have been classified by SYSTEM and CLASS. The term SYSTEM refers to: "a complex of wetlands and deepwater habitats that share the influence of similar hydrologic, geomorphologic, chemical, or biological factors" (Reference 3). CLASS represents a lower taxonomic unit than SYSTEM, and: "describes the general appearance of the habitat in terms of either the dominant life form of the vegetation or the physiography and composition of the substrate" (Reference 3). The following is a list of brief definitions of the Systems and Classes identified in this analysis:[2]

SYSTEM:

Riverine (R) - "includes all wetlands and deepwater habitats contained within a channel, with two exceptions: (1) wetlands dominated by trees, shrubs, persistent emergents, emergent mosses, or lichens, and (2) habitats with water containing ocean-derived salts in excess of 0.5%."

Lacustrine (L) - "includes wetlands and deepwater habitats with all of the following characteristics: (1) situated in a topographic depression or a dammed river channel; (2) lacking trees, shrubs, persistent emergents, emergent mosses or lichens with greater than 30% areal coverage; and (3) total area exceeds 8 hectares (20 acres)."

Palustrine (P) - "includes all nontidal wetlands dominated by trees, shrubs, persistent emergents, emergent mosses or lichens."

[1]The need for vertical, conventional (9x9-inch) photography during leaf-off conditions for wetlands analysis precluded the use of the more recent (1981, 1983, and 1986) historical photography available.

[2]For a more complete definition of terms, see Reference 3.

CLASS:

Emergent Wetland (EM) - "characterized by erect, rooted, herbaceous hydrophytes, excluding mosses and lichens."[1]

Scrub-Shrub Wetland (SS) - "incudes areas dominated by woody vegetation less than 6 meters (20 feet) tall."

Unconsolidated Bottom (UB) - "includes all wetland and deepwater habitats with at least 25% cover of particles smaller than stones, and a vegetative cover less than 30%."

Unconsolidated Shore (US) - "includes all wetland habitats having three characteristics: (1) unconsolidated substrates with less than 75% areal cover of stones, boulders, or bedrock; (2) less than 30% areal cover of vegetation other than pioneering plants; and (3) any of the following water regimes: irregularly exposed, regularly flooded, irregularly flooded, seasonally flooded, temporarily flooded, intermittently flooded, saturated, or artificially flooded."

The majority of the wetlands in the study area were clustered within the flood plain of the Blackstone River. This section of the Blackstone River flood plain represents a Riverine System influenced by man's activities (e.g., damming, filling), which have allowed Palustrine and Lacustrine Systems to develop also.

OCTOBER 26, 1951 (FIGURE 15)

Damming of the river at the southern end of the study area has impounded a large amount of water, changing the system near the dam from Riverine to Lacustrine. Railroad bed filling (not annotated) northwest of the dam also appears to have isolated or impounded a portion of the river, creating a second Lacustrine area. Unconsolidated bottom (LUB) is the dominant class within these two areas, although some Emergents (LEM) are also present. Northwest of the dam, the Riverine and Palustrine Systems dominate, and primarily contain the Riverine Unconsolidated Bottom (RUB) and Palustrine Scrub-Shrub (PSS) and Emergent (PEM) classes.

[1]In this study, the presence of persistent or nonpersistent Emergents provided a critical distinction in classifying wetlands as belonging to the Riverine, Palustrine, or Lacustrine Systems.

MAY 5, 1976 (FIGURE 16)

A combination of natural and artificial filling has greatly reduced the amout of wetlands present, and changed the course of the Blackstone River. The natural filling has resulted from accumulation of river sediments in the impounded area behind the dam. The filling attributable to human activity has probably involved earthmoving to relocate naturally deposited sediments and possibly also involved import of additional fill. Furthermore, the dam may now be used to maintain a lower water level than in 1951. As a result of these factors, the dam no longer impounds a large pool; the Blackstone River is restricted to its channel and has changed from Lacustrine to Riverine classification.

Because the second Lacustrine wetland present northwest of the dam in 1951 contains less water and has probably also accumulated sediment, allowing new Scrub-Shrub and Emergent vegetation to become established, this wetland has been reclassified as Palustrine. Fewer Palustrine wetlands are present along the remainder of the river flood plain than in 1951.

WETLANDS LOSS/GAIN

A second overlay illustrating significant wetlands loss and gain from 1951 to 1976 has also been keyed to this 1976 photo enlargement (Figure 16). Since wetlands are naturally dynamic structures, small fluctuations in their shape or size have not been considered indicative of significant wetland loss or gain.

Wetland loss or gain may be induced by natural or artificial means. Wetland loss at Area A is the result of landfill encroachment. Wetland loss at Areas B and C appears related to a combination of natural and artificial filling activities and to the fact that the dam at the southeastern end of the study area no longer impounds a large pool.

Re: Transmittal of EMSL Site Analysis

Dear Chris:

Per your request, I am enclosing a copy of the two volume EMSL Site Analysis for your use. I request that upon completion of your review that you return the documents to EPA. You may also be aware that the P/P Site File contains other EPIC aerial photography which can be reviewed at your request and by appointment at the EPA Record Center located at 90 Canal St. Please call me if wish further information or assistance.

Sincerely,

David J. Newton, RPM

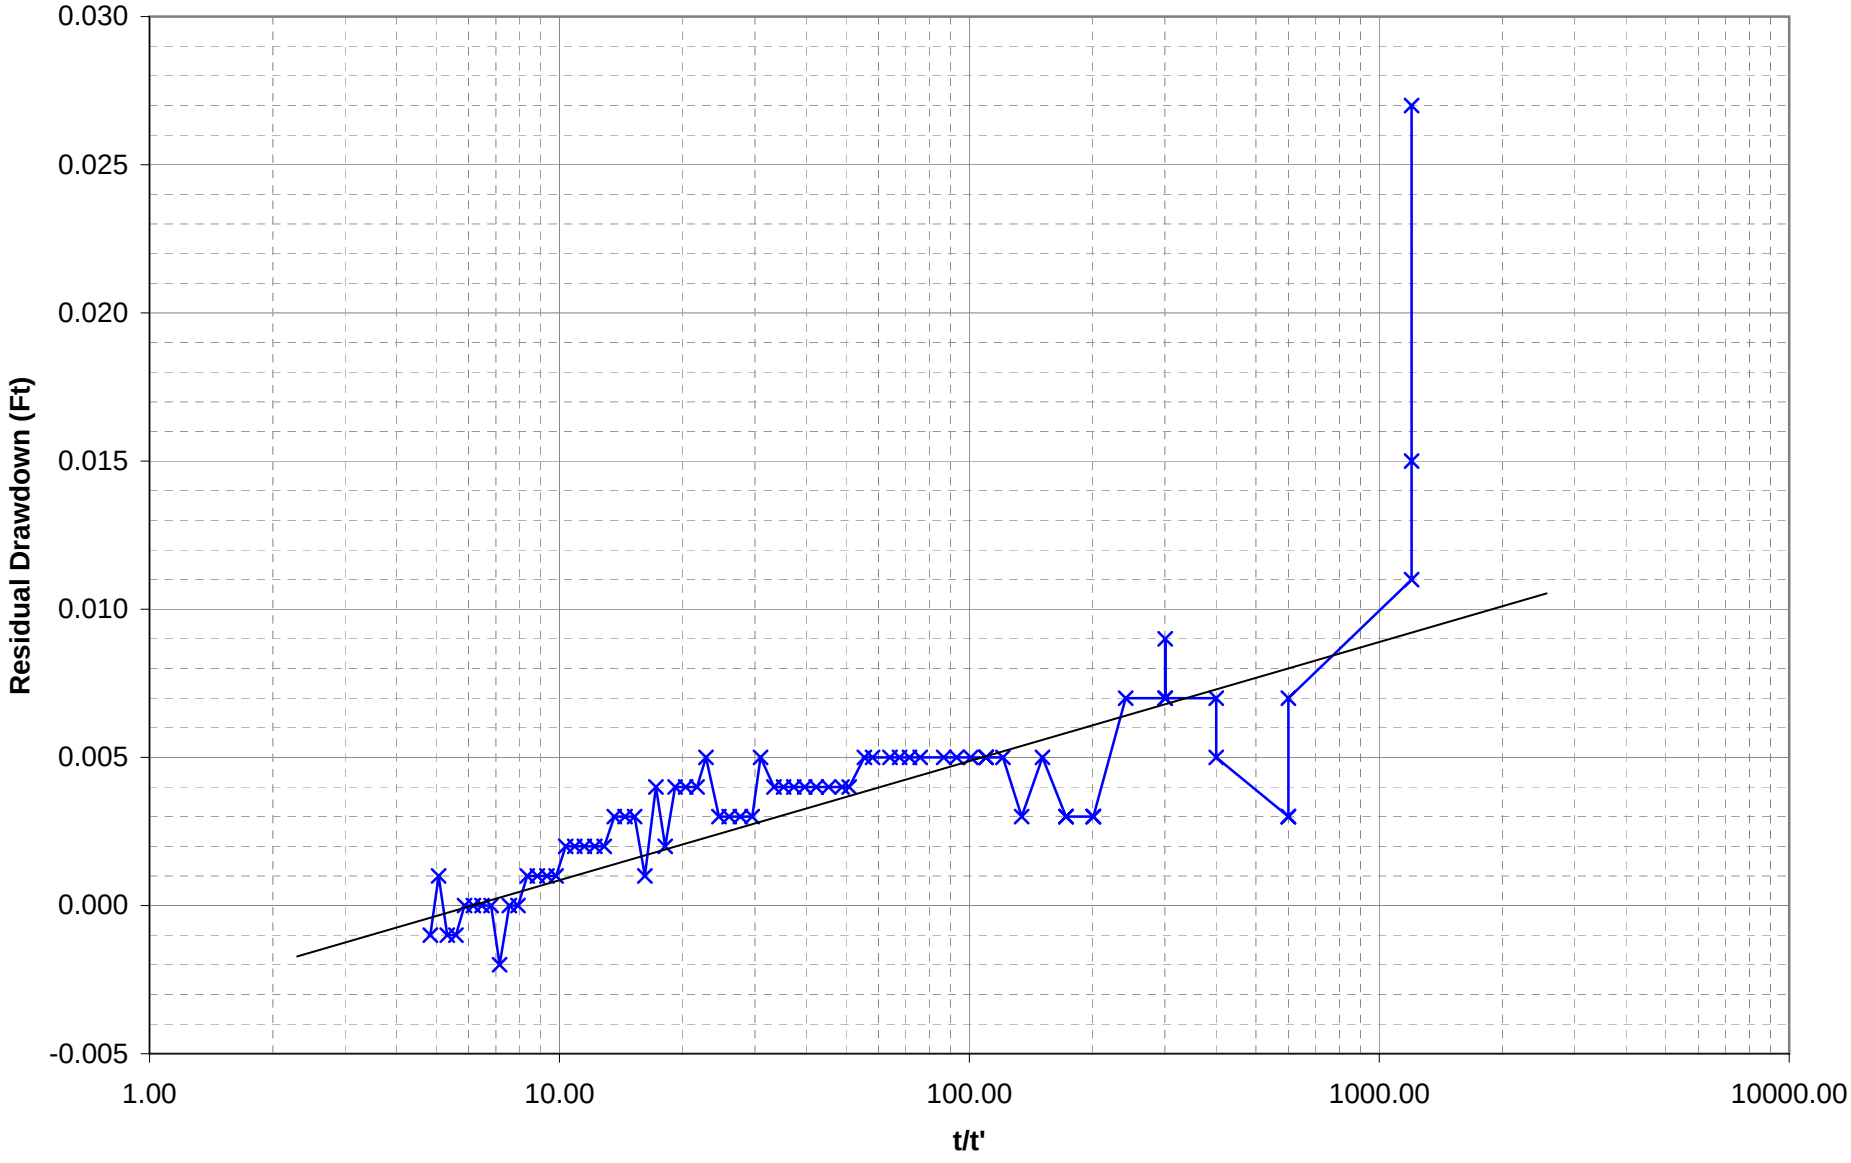
Hydraulic Conductivity Tests



Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-108AA**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/8/2003	10:44:00			
Test end date and time	10/8/2003	11:09:16			
Period of pumping	20	minutes			
Static depth to water	13.51	feet below top of casing			
Starting transducer depth	3.3	feet below static water level			
Total well depth	22.2	feet below top of casing			
Depth to top of screen	12.2	feet below top of casing			
Height of interval tested [b]	8.7	feet			
Average pumping rate [Q]	1.3	gpm, or	250	cfd	
Average drawdown [s]	0.042	ft			
Specific capacity [Q/s]	30.95	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.004	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			11,450	cfd/ft	
Hydraulic conductivity [K = T/b]			1,318	fpd, or	4.6E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-108A**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/8/2003	9:39:00			
Test end date and time	10/8/2003	10:05:16			
Period of pumping	20	minutes			
Static depth to water	13.38	feet below top of casing			
Starting transducer depth	4.271	feet below static water level			
Total well depth	45.5	feet below top of casing			
Depth to top of screen	35.5	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.48	gpm, or	285	cfd	
Average drawdown [s]	1.10	ft			
Specific capacity [Q/s]	1.35	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.76	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			68.6	cfd/ft	
Hydraulic conductivity [K = T/b]			6.9	fpd, or	2.4E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-108B**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/8/2003	11:50:00			
Test end date and time	10/8/2003	12:15:54			
Period of pumping	20	minutes			
Static depth to water	14.14	feet below top of casing			
Starting transducer depth	5.695	feet below static water level			
Total well depth	99.0	feet below top of casing			
Depth to top of screen	89.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.33	gpm, or	256	cfd	
Average drawdown [s]	0.56	ft			
Specific capacity [Q/s]	2.38	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.55	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			85.2	cfd/ft	
Hydraulic conductivity [K = T/b]			8.5	fpd, or	3.0E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-108C**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/8/2003	13:10:00			
Test end date and time	10/8/2003	13:51:51			
Period of pumping	20	minutes			
Static depth to water	14.16	feet below top of casing			
Startiing transducer depth	3.892	feet below static water level			
Total well depth	139.4	feet below top of casing			
Depth to top of screen	119.4	feet below top of casing			
Height of interval tested [b]	20.0	feet			
Average pumping rate [Q]	0.20	gpm, or	38	cfd	
Average drawdown [s]	0.23	ft			
Specific capacity [Q/s]	0.87	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.21	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			33.6	cfd/ft	
Hydraulic conductivity [K = T/b]			1.7	fpd, or	5.9E-04 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-109AA**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/2/2003	11:30:00			
Test end date and time	10/2/2003	12:20:51			
Period of pumping	30	minutes			
Static depth to water	13.48	feet below top of casing			
Starting transducer depth	5.103	feet below static water level			
Total well depth	23.3	feet below top of casing			
Depth to top of screen	13.3	feet below top of casing			
Height of interval tested [b]	9.8	feet			
Average pumping rate [Q]	1.65	gpm, or	318	cfd	
Average drawdown [s]	0.17	ft			
Specific capacity [Q/s]	9.71	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.073	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			796	cfd/ft	
Hydraulic conductivity [K = T/b]			81	fpd, or	2.9E-02 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-109A**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/2/2003	14:45:00			
Test end date and time	10/2/2003	15:37:51			
Period of pumping	30	minutes			
Static depth to water	13.65	feet below top of casing			
Starting transducer depth	5.042	feet below static water level			
Total well depth	88.7	feet below top of casing			
Depth to top of screen	78.7	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.43	gpm, or	275	cfd	
Average drawdown [s]	3.00	ft			
Specific capacity [Q/s]	0.48	gpm/ft			
Residual drawdown over one log cycle [Δs]			2.50	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			20.2	cfd/ft	
Hydraulic conductivity [K = T/b]			2.0	fpd, or	7.1E-04 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-109B**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/8/2003	14:30:00			
Test end date and time	10/8/2003	15:09:51			
Period of pumping	20	minutes			
Static depth to water	14.61	feet below top of casing			
Starting transducer depth	3.35	feet below static water level			
Total well depth	149.1	feet below top of casing			
Depth to top of screen	139.1	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	0.077	gpm, or	15	cfd	
Average drawdown [s]	0.10	ft			
Specific capacity [Q/s]	0.81	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.038	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			71.4	cfd/ft	
Hydraulic conductivity [K = T/b]			7.1	fpd, or	2.5E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-109C**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/6/2003	16:45:00			
Test end date and time	10/6/2003	17:28:21			
Period of pumping	30	minutes			
Static depth to water	14.51	feet below top of casing			
Starting transducer depth	7.028	feet below static water level			
Total well depth	180.6	feet below top of casing			
Depth to top of screen	160.6	feet below top of casing			
Height of interval tested [b]	20.0	feet			
Average pumping rate [Q]	0.055	gpm, or	11	cfd	
Average drawdown [s]	1.32	ft			
Specific capacity [Q/s]	0.042	gpm/ft			
Residual drawdown over one log cycle [Δs]			1.08	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			1.8	cfd/ft	
Hydraulic conductivity [K = T/b]			0.09	fpd, or	3.2E-05 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-110A**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/7/2003	18:37:03			
Test end date and time	10/7/2003	19:00:16			
Period of pumping	18	minutes			
Static depth to water	12.30	feet below top of casing			
Startiing transducer depth	2.748	feet below static water level			
Total well depth	18.6	feet below top of casing			
Depth to top of screen	8.6	feet below top of casing			
Height of interval tested [b]	6.3	feet			
Average pumping rate [Q]	1.58	gpm, or	304	cfd	
Average drawdown [s]	0.86	ft			
Specific capacity [Q/s]	1.84	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.50	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			111.3	cfd/ft	
Hydraulic conductivity [K = T/b]			17.7	fpd, or	6.2E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-110B**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/7/2003	17:55:00			
Test end date and time	10/7/2003	18:14:58			
Period of pumping	15	minutes			
Static depth to water	13.17	feet below top of casing			
Startiing transducer depth	4.312	feet below static water level			
Total well depth	66.0	feet below top of casing			
Depth to top of screen	56.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.67	gpm, or	321	cfd	
Average drawdown [s]	1.15	ft			
Specific capacity [Q/s]	1.45	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.70	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			84.1	cfd/ft	
Hydraulic conductivity [K = T/b]			8.4	fpd, or	3.0E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-110C**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/6/2003 15:15:00				
Test end date and time	10/6/2003 16:03:51				
Period of pumping	30	minutes			
Static depth to water	12.66	feet below top of casing			
Starting transducer depth	5.50	feet below static water level			
Total well depth	98.1	feet below top of casing			
Depth to top of screen	78.1	feet below top of casing			
Height of interval tested [b]	20.0	feet			
Average pumping rate [Q]	0.245	gpm, or	47	cfd	
Average drawdown [s]	1.80	ft			
Specific capacity [Q/s]	0.14	gpm/ft			
Residual drawdown over one log cycle [Δs]			1.10	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			7.8	cfd/ft	
Hydraulic conductivity [K = T/b]			0.39	fpd, or	1.4E-04 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-111AA**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/3/2003	12:00:00			
Test end date and time	10/3/2003	12:37:27			
Period of pumping	30	minutes			
Static depth to water	10.56	feet below top of casing			
Starting transducer depth	5.064	feet below static water level			
Total well depth	27.0	feet below top of casing			
Depth to top of screen	17.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.97	gpm, or	379	cfd	
Average drawdown [s]	1.05	ft			
Specific capacity [Q/s]	1.88	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.84	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			82.6	cfd/ft	
Hydraulic conductivity [K = T/b]			8.3	fpd, or	2.9E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **MW-111A**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/3/2003	14:00:00			
Test end date and time	10/3/2003	14:46:21			
Period of pumping	30	minutes			
Static depth to water	10.15	feet below top of casing			
Startiing transducer depth	4.996	feet below static water level			
Total well depth	74.7	feet below top of casing			
Depth to top of screen	64.7	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.82	gpm, or	350	cfd	
Average drawdown [s]	0.33	ft			
Specific capacity [Q/s]	5.52	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.02	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			2914.5	cfd/ft	
Hydraulic conductivity [K = T/b]			291.5	fpd, or	1.0E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **P-7**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/4/2003	11:15:00			
Test end date and time	10/4/2003	11:47:37			
Period of pumping	30	minutes			
Static depth to water	15.12	feet below top of casing			
Startiing transducer depth	5.013	feet below static water level			
Total well depth	39.6	feet below top of casing			
Depth to top of screen	29.6	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.36	gpm, or	262	cfd	
Average drawdown [s]	0.11	ft			
Specific capacity [Q/s]	12.4	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.032	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			1,497	cfd/ft	
Hydraulic conductivity [K = T/b]			149.7	fpd, or	5.3E-02 cm/sec

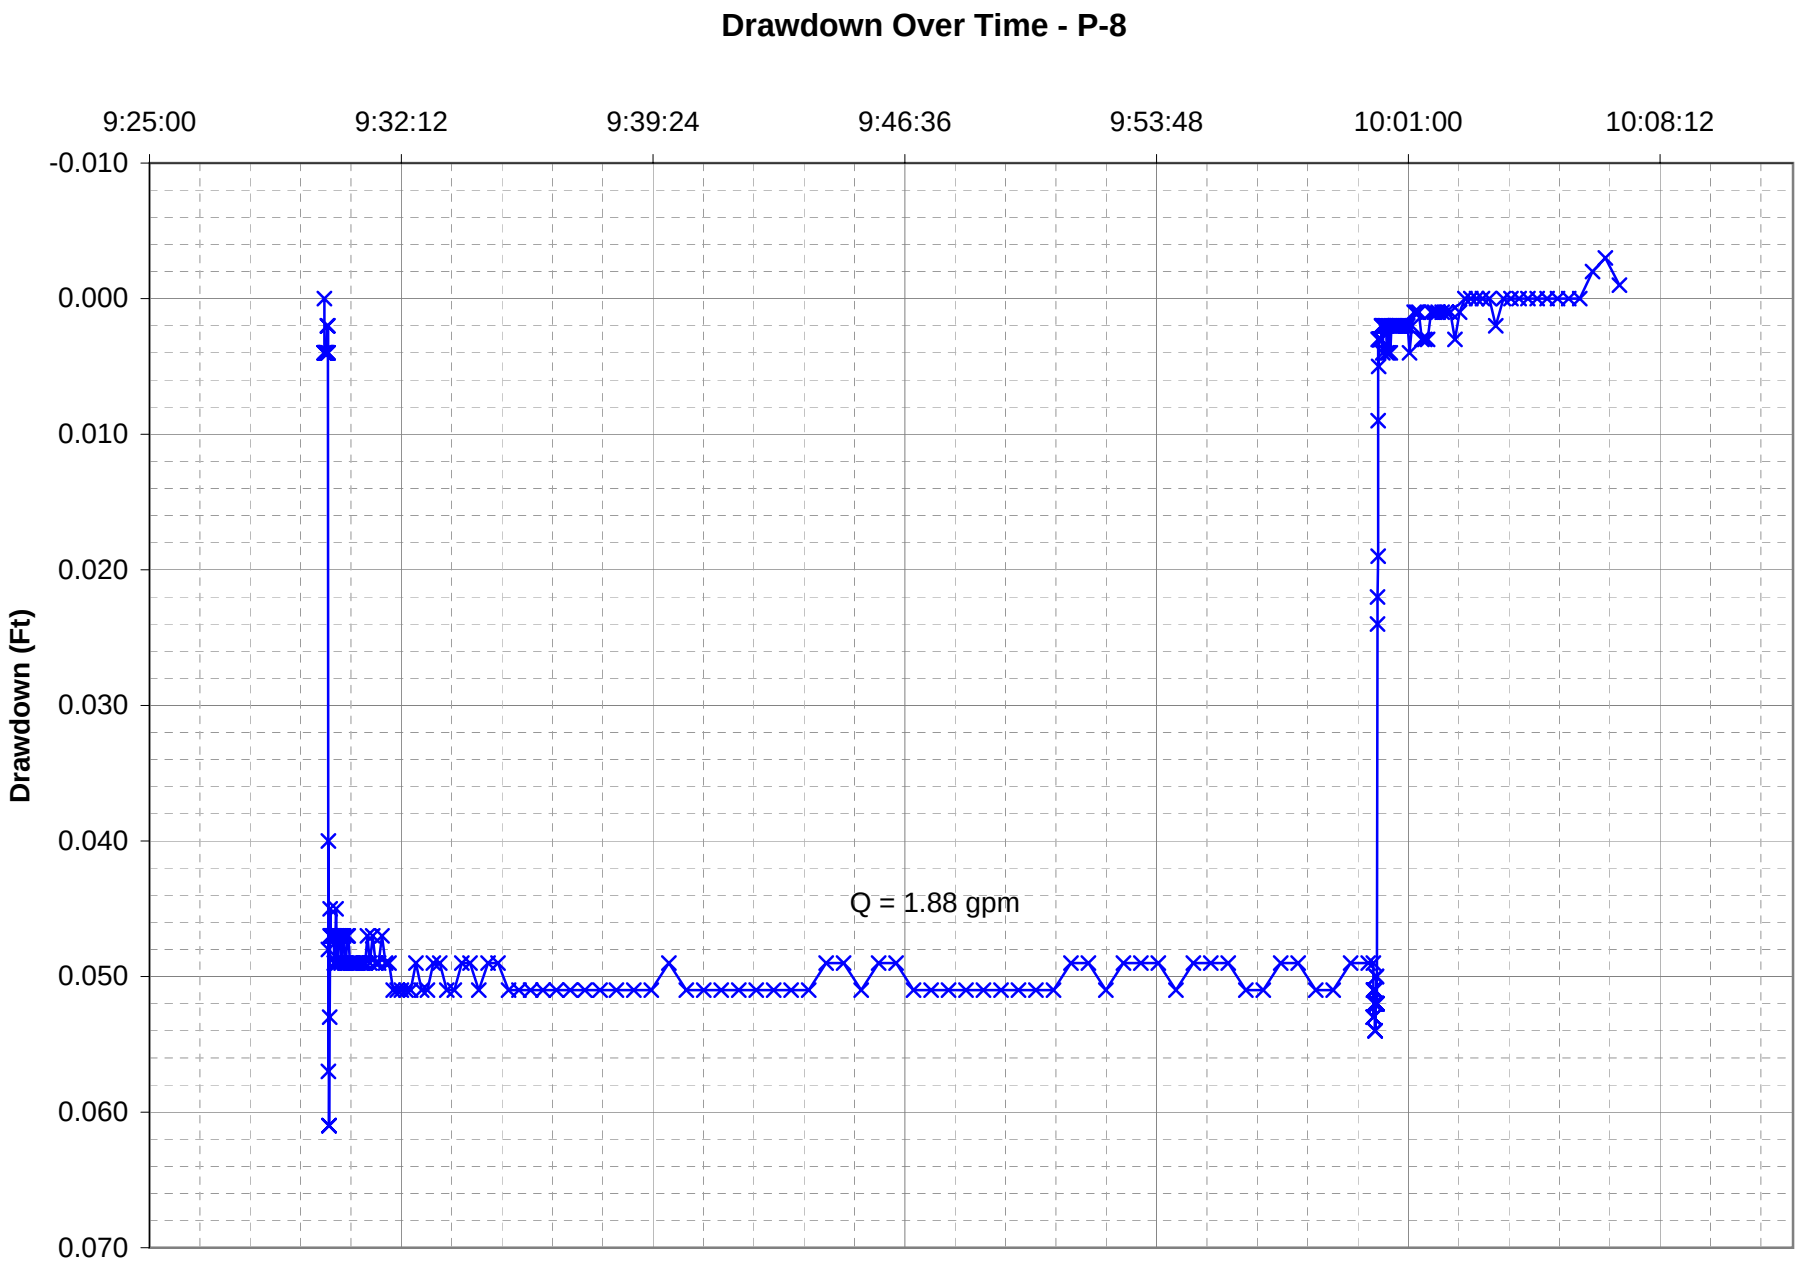
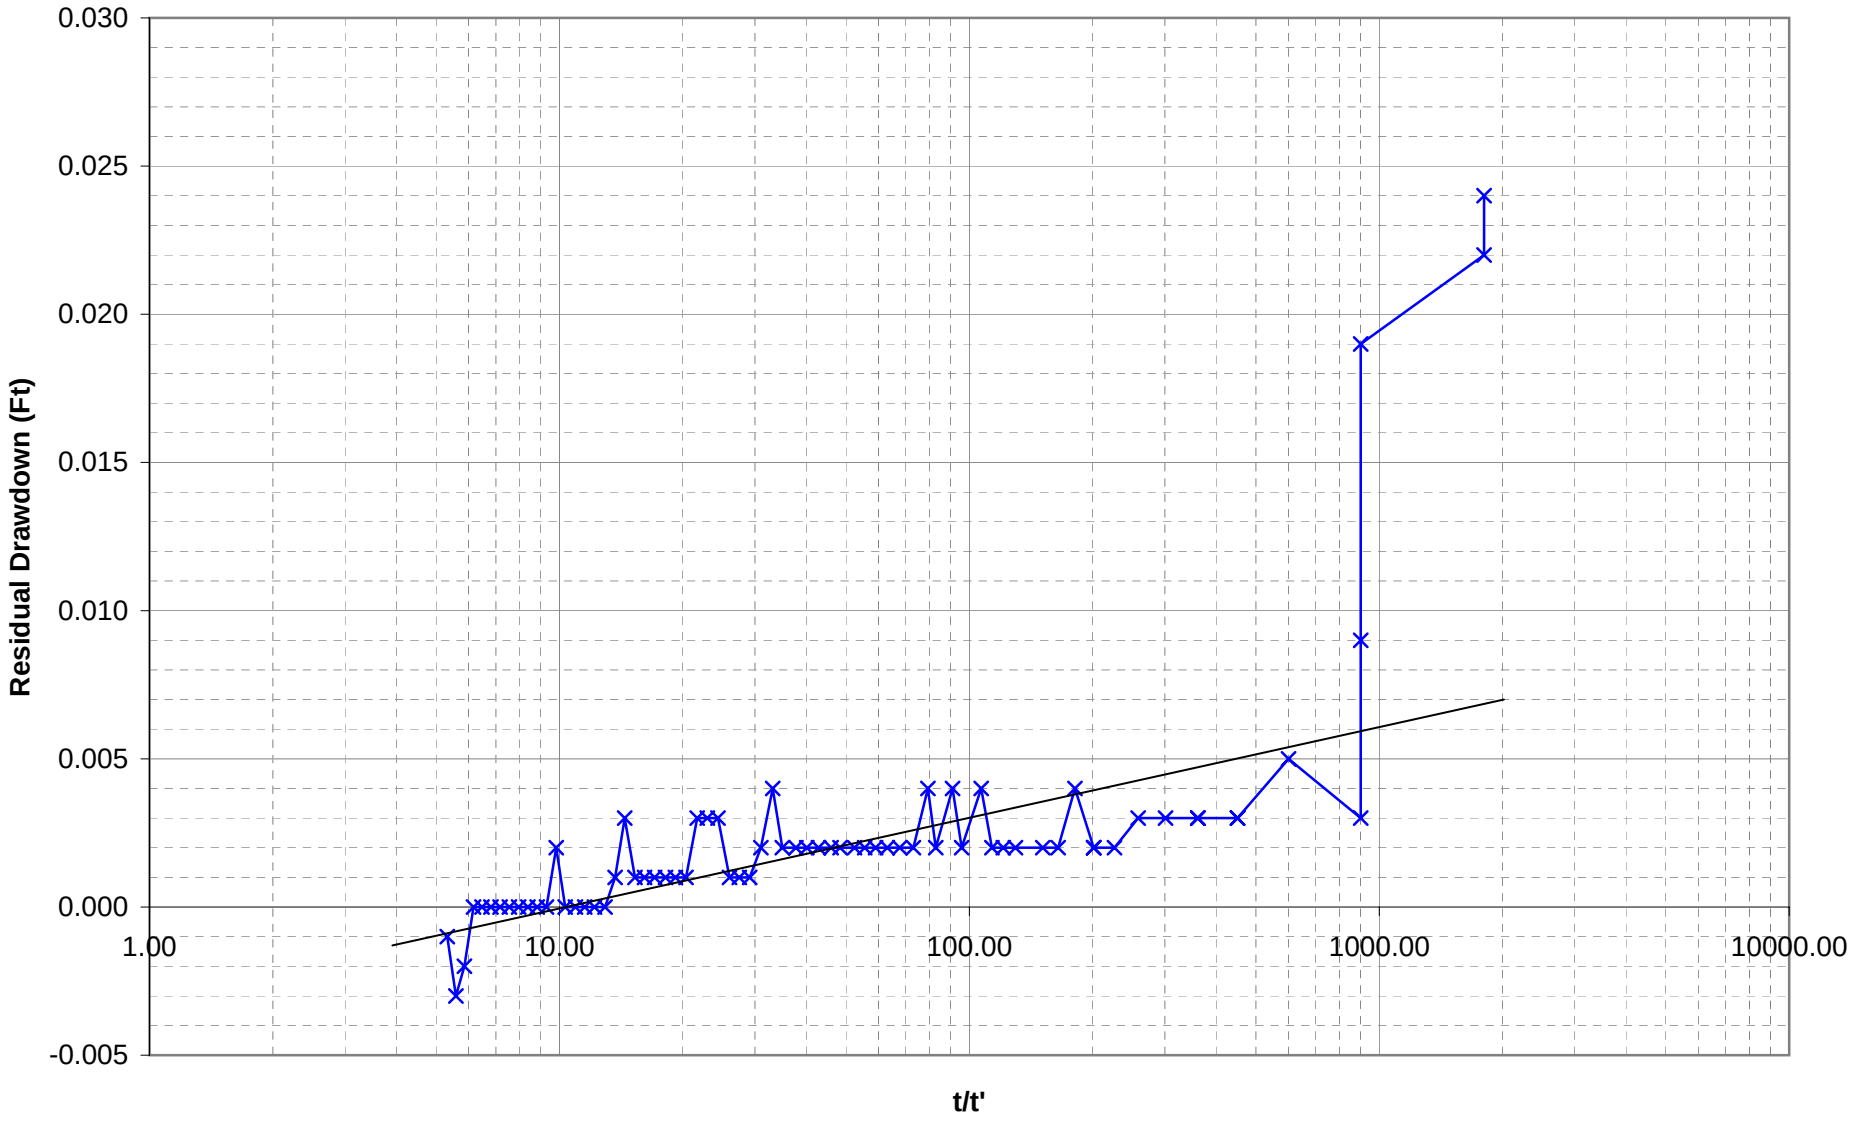
Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003



Well No. **P-8**

Equipment:	In-Situ Inc.	MiniTroll Pro
Test start date and time	10/4/2003	9:30:00
Test end date and time	10/4/2003	10:07:02
Period of pumping	30	minutes



Static depth to water	7.64	feet below top of casing
Startiing transducer depth	5.010	feet below static water level
Total well depth	21.8	feet below top of casing
Depth to top of screen	11.8	feet below top of casing
Height of interval tested [b]	10.0	feet

Average pumping rate [Q]	1.88	gpm, or	362	cfd
Average drawdown [s]	0.050	ft		
Specific capacity [Q/s]	37.6	gpm/ft		

Residual drawdown over one log cycle [Δs]	0.003	feet		
Transmissivity [T = (2.3Q)/(4*π*Δs)]	22,078	cfd/ft		
Hydraulic conductivity [K = T/b]	2207.8	fpd, or	7.8E-01	cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-601**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/6/2003 10:45:00				
Test end date and time	10/6/2003 11:20:16				
Period of pumping	30	minutes			
Static depth to water	8.66	feet below top of casing			
Starting transducer depth	5.017	feet below static water level			
Total well depth	23.5	feet below top of casing			
Depth to top of screen	13.3	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.92	gpm, or	370	cfd	
Average drawdown [s]	0.034	ft			
Specific capacity [Q/s]	56.5	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.0015	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			45,095	cfd/ft	
Hydraulic conductivity [K = T/b]			4,510	fpd, or	1.6E+00 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-602A**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/7/2003 14:00:00				
Test end date and time	10/7/2003 14:29:51				
Period of pumping	21	minutes			
Static depth to water	7.71	feet below top of casing			
Startiing transducer depth	5.851	feet below static water level			
Total well depth	23.2	feet below top of casing			
Depth to top of screen	13.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.88	gpm, or	362	cfd	
Average drawdown [s]	0.08	ft			
Specific capacity [Q/s]	23.5	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.0030	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			22077.9	cfd/ft	
Hydraulic conductivity [K = T/b]			2207.8	fpd, or	7.8E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-602B**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/7/2003	15:36:00			
Test end date and time	10/7/2003	15:59:41			
Period of pumping	19	minutes			
Static depth to water	7.02	feet below top of casing			
Starting transducer depth	5.325	feet below static water level			
Total well depth	63.7	feet below top of casing			
Depth to top of screen	53.5	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.88	gpm, or	362	cfd	
Average drawdown [s]	0.08	ft			
Specific capacity [Q/s]	23.5	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.0087	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			7613.1	cfd/ft	
Hydraulic conductivity [K = T/b]			761.3	fpd, or	2.7E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-603**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/7/2003	11:10:00			
Test end date and time	10/7/2003	11:34:25			
Period of pumping	20	minutes			
Static depth to water	7.26	feet below top of casing			
Startiing transducer depth	5.26	feet below static water level			
Total well depth	20.6	feet below top of casing			
Depth to top of screen	10.4	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.73	gpm, or	333	cfd	
Average drawdown [s]	0.061	ft			
Specific capacity [Q/s]	28.4	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.0032	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			19046.6	cfd/ft	
Hydraulic conductivity [K = T/b]			1904.7	fpd, or	6.7E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-604**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/7/2003	7:55:00			
Test end date and time	10/7/2003	8:24:25			
Period of pumping	25	minutes			
Static depth to water	10.81	feet below top of casing			
Startiing transducer depth	3.755	feet below static water level			
Total well depth	23.2	feet below top of casing			
Depth to top of screen	13.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.78	gpm, or	343	cfd	
Average drawdown [s]	0.84	ft			
Specific capacity [Q/s]	2.12	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.60	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			104.5	cfd/ft	
Hydraulic conductivity [K = T/b]			10.5	fpd, or	3.7E-03 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-605**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/6/2003 18:00:00				
Test end date and time	10/6/2003 18:45:21				
Period of pumping	30	minutes			
Static depth to water	11.03	feet below top of casing			
Starting transducer depth	5.838	feet below static water level			
Total well depth	23.2	feet below top of casing			
Depth to top of screen	13.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.61	gpm, or	310	cfd	
Average drawdown [s]	0.043	ft			
Specific capacity [Q/s]	37.4	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.009	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			6,302	cfd/ft	
Hydraulic conductivity [K = T/b]			630	fpd, or	2.2E-01 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-606**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/7/2003 16:57:00				
Test end date and time	10/7/2003 17:20:54				
Period of pumping	18	minutes			
Static depth to water	12.07	feet below top of casing			
Starting transducer depth	2.570	feet below static water level			
Total well depth	23.2	feet below top of casing			
Depth to top of screen	13.0	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.79	gpm, or	345	cfd	
Average drawdown [s]	0.22	ft			
Specific capacity [Q/s]	8.14	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.152	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			414.9	cfd/ft	
Hydraulic conductivity [K = T/b]			41.5	fpd, or	1.5E-02 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-607**

Equipment:	In-Situ Inc.	MiniTroll Pro			
Test start date and time	10/7/2003	9:25:00			
Test end date and time	10/7/2003	9:49:41			
Period of pumping	20	minutes			
Static depth to water	12.17	feet below top of casing			
Startiing transducer depth	4.255	feet below static water level			
Total well depth	23.1	feet below top of casing			
Depth to top of screen	12.9	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.62	gpm, or	312	cfd	
Average drawdown [s]	0.154	ft			
Specific capacity [Q/s]	10.5	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.040	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			1426.8	cfd/ft	
Hydraulic conductivity [K = T/b]			142.7	fpd, or	5.0E-02 cm/sec

Pump and Recovery Tests - Summary
Peterson/Puritan OU2
October 2003

Well No. **SEA-608**

Equipment:	In-Situ Inc. MiniTroll Pro				
Test start date and time	10/7/2003 10:15:00				
Test end date and time	10/7/2003 10:39:58				
Period of pumping	20	minutes			
Static depth to water	13.22	feet below top of casing			
Starting transducer depth	4.827	feet below static water level			
Total well depth	22.7	feet below top of casing			
Depth to top of screen	12.5	feet below top of casing			
Height of interval tested [b]	10.0	feet			
Average pumping rate [Q]	1.62	gpm, or	312	cfd	
Average drawdown [s]	0.104	ft			
Specific capacity [Q/s]	15.6	gpm/ft			
Residual drawdown over one log cycle [Δs]			0.006	feet	
Transmissivity [T = (2.3Q)/(4*π*Δs)]			9512.3	cfd/ft	
Hydraulic conductivity [K = T/b]			951.2	fpd, or	3.4E-01 cm/sec

1.0 INTRODUCTION

This report presents the results of a cone penetrometer testing (CPT) program carried out at the Peterson/Puritan OU2 Superfund Site located in Cumberland, RI. The work was performed for Shield Environmental Associates, Inc. The CPT program took place during a single day on September 10th, 2003, (site orientation and preparatory work were completed on September 9th) when a total of 11 soundings were completed at nine different sounding locations. The CPT testing was performed in areas near the base of the landfill as well as through the top central portion of the waste.

CPT sounding locations were selected and numbered under the direction and supervision of Shield Environmental Associates personnel (Mr. John Long). Final survey data of the CPT sounding locations were provided by Shield Environmental.

2.0 FIELD EQUIPMENT AND PROCEDURES

2.1 CONE PENETRATION TESTING

The cone penetrometer tests were carried out using an integrated electronic piezo cone manufactured by ConeTec in Vancouver, Canada. The piezo cone used was a compression model cone penetrometer with a 15 cm^2 tip and a 225 cm^2 friction sleeve. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.85. The piezo cone dimensions and the operating procedure were in accordance with ASTM Standard D-3441. A diagram of the cone penetrometer used for this project is shown as Figure 1.

Pore pressure filter elements, made of porous plastic, were saturated under a vacuum using glycerin as the saturating fluid. The pore pressure element was six millimeters thick and was located immediately behind the tip (the U_2 location) for all soundings.

The cone was advanced using a 25 ton, unitized, truck-mounted cone penetration rig. The following data were recorded onto magnetic media every five centimeters (approximately every two inches) as the cone was advanced into the ground:

- Tip Resistance (Qc)
- Sleeve Friction (Fs)
- Dynamic Pore Pressure (Ut)

The field data recorded is included on the attached diskette (appendix D).

Before each sounding a complete set of analog baseline readings are taken with a multi-meter and compared with the digitized value on the computer screen. This provides a check on the analog to digital conversion board.

Evaluation of the analog baselines is key to consistent readings. The baseline data should be stable and should not wander excessively during the course of a sounding. Baseline data can be used to apply corrections to the cone data where necessary. For this project, the baseline shift from sounding to sounding was small, typically less than 0.1% of full scale, and no data corrections were applied.

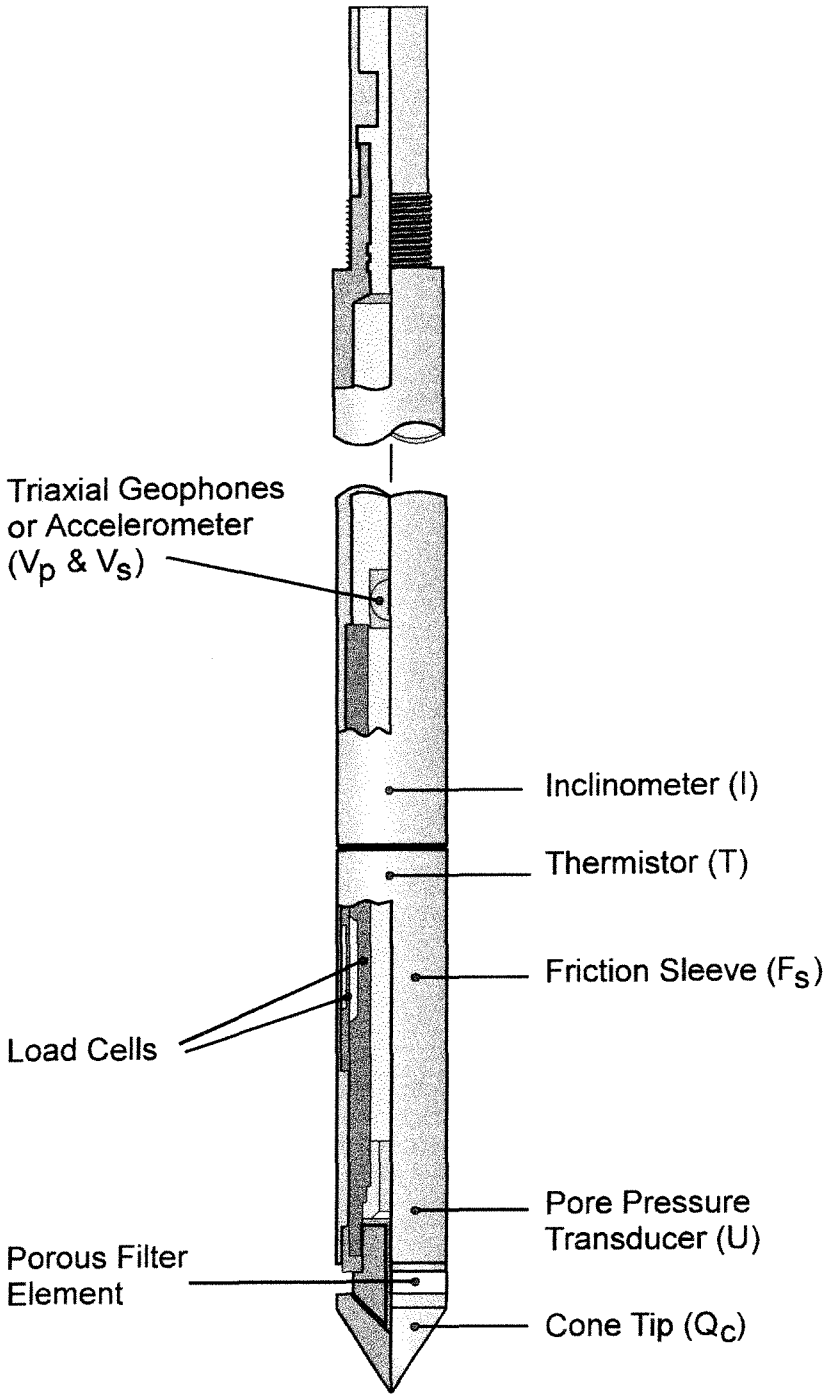

FIGURE 1 - TYPICAL CONE PENETROMETER

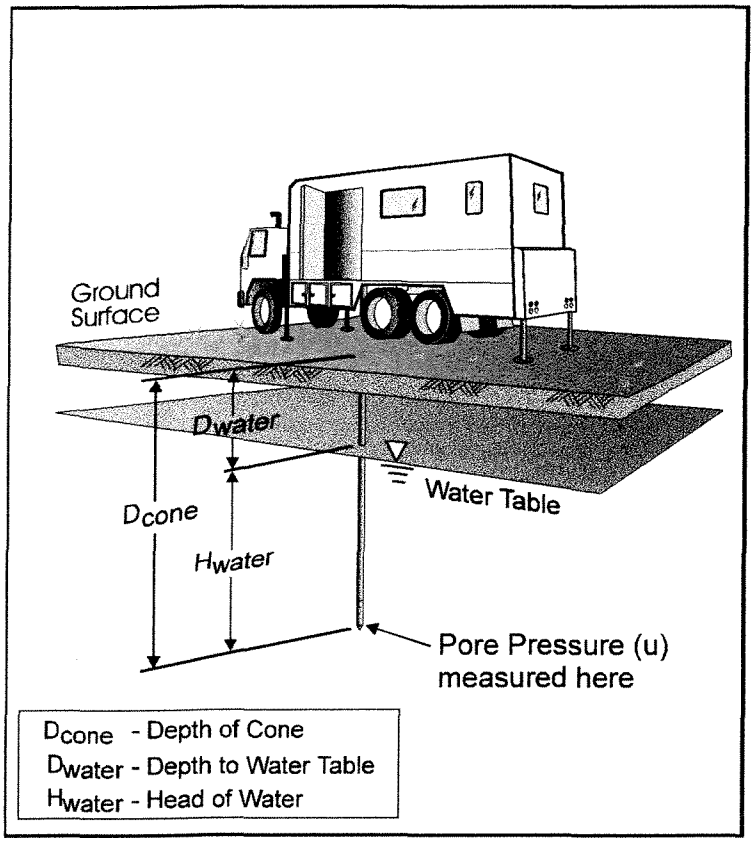
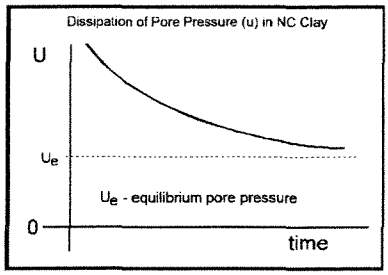
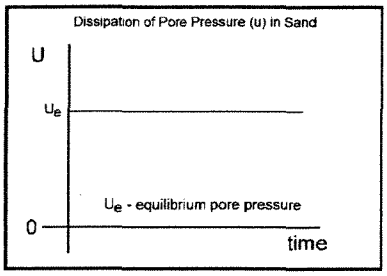
2.2 PORE PRESSURE DISSIPATION TESTS



When cone penetration is stopped, the piezo cone essentially becomes a piezometer. While stopped, pore water pressures are automatically recorded at five-second intervals and the readings are stored in a dissipation file (.ppd). Dissipation data can then be plotted onto a dissipation curve consisting of pore water pressure (U) verses time (t). The shapes of dissipation curves are very useful in evaluating soil type, drainage and in situ static water level.



A flat curve that stabilizes quickly (i.e. less than 30 seconds) is typical of a free draining sand. In this case, the final measured pore water pressure is the static in situ water pressure.



Soils that generate excess dynamic pore water pressure during penetration will dissipate this excess pressure when penetration stops. The shape of the dissipation curve and the time of dissipation can be used to estimate C_h, the coefficient of consolidation that can in turn be used to calculate K_h, the horizontal permeability.

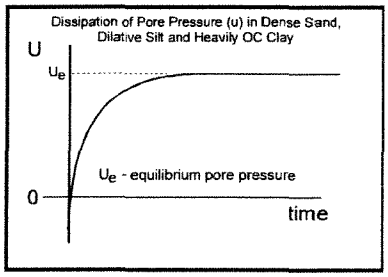


Figure 3 shows some idealized shapes of various pore water pressure dissipation curves. The reader is referred Robertson et. al., 1990 to reference dissipation test data analytical techniques.

Estimation of Ground Water Table from CPT Dissipation Tests

Water Table Calculation

$$D_{water} = D_{cone} - H_{water}$$

where $H_{water} = U_e$ (depth units)

Useful Conversion Factors:
1psi = 0.704m = 2.31 feet (water)
1tsf = 0.958 bar = 13.9 psi
1m = 3.28 feet

FIGURE 3 - TYPICAL DISSIPATION TESTS

3.0 CONE PENETRATION TEST DATA AND INTERPRETATION

3.1 ANALYSIS OF PIEZOCONE DATA - GENERAL

A total of 11 CPT soundings, involving approximately 355 feet of testing, were completed at nine locations.

The interpretation of cone data is based on the relationship between cone bearing, Qc, sleeve friction, Fs, and penetration pore water pressure, U. The friction ratio, Rf , (sleeve friction divided by cone bearing) is a calculated parameter which is used to infer soil behavior type. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

The interpretation of soils encountered on this project was carried out using correlations developed by Robertson et al., 1986. It should be noted that it is not always possible to clearly identify a soil type based on Qc, Fs and Ut. Occasionally soils will fall within different soil categories on the classification charts. In these situations, experience and judgment and an assessment of the pore pressure dissipation data should be used to infer the soil behavior type. Computer tabulations of the interpreted soil types along with certain other geotechnical parameters for each cone hole is presented in Appendix B.

Each of the parameters measured in the sounding is discussed briefly below. A detailed explanation of CPTU testing and interpretation of the results can be found in "Guidelines for Geotechnical Design Using CPT and CPTU" by P. K. Robertson and R. G. Campanella, listed in the references.

TIP RESISTANCE (Q_c): The resistance to penetration, measured at the cone tip, provides an accurate profile of subsurface strata. The recorded tip resistance is a composite of the penetration resistance of the soils located five to ten cone diameters (7 to 14 inches) in front of and behind the tip. The actual resistance "sensed" by the tip depends on the soil properties and on the relative stiffness of the layers encountered. Tip resistance is often corrected for pore pressure effects when testing in soft saturated cohesive soils.

For this project the correction was made and the tip resistance shown, Q_t is the corrected tip resistance.

The correction used is: $Q_t = Q_c + (1+a)U$

Where:
Q_t = corrected tip resistance
Q_c = measured tip resistance
a = net area ratio for cone (0.85 for this project)
U = dynamic pore water pressure measured behind tip

SLEEVE FRICTION (F_s) The resistance recorded on the friction sleeve, is a measure of the remolded strength of the soil. Values of sleeve friction in very soft soils (such as peat) may fluctuate due to the measured force being small relative to the capacity of the measuring load cell.

FRICTION RATIO (R_f) The ratio of sleeve friction to tip resistance expressed as a percentage, is an indicator of soil type. Cohesive soils generally have friction ratios that are greater than two, while sands and non-plastic silts have friction ratios that are lower than two.

PORE PRESSURE (U) Dynamic pore water pressure is measured during penetration. (dynamic pore water pressure data can be found in the .cor, .ifi (importable) and .ifp (printable) files). Static pore water pressure is measured when cone penetration is stopped (static pore water pressure data can be found in the .ppd files). The measured dynamic pore water pressure changes with the location of the porous filter and negative readings are possible when the filter is located behind the tip.

It is important to note that the CPT classifies soil by physical behavior, not by grain size; therefore, the CPT classification should be verified against samples obtained from a conventional drilling program. While the CPT soil classification may not always be accurate in terms of the actual label it applies to a particular soil, it is very accurate in grouping soils with similar mechanical properties.

Table 1 presents a summary of CPT soundings, including sounding depths.

3.2 CONE PLOTS

The data from each sounding was plotted using the computer program ScreenZ. The plots are included in Appendix A. ScreenZ was developed by ConeTec Inc. and it incorporates soil behavior type (SBT) classification as part of the plot. The soil classification is based on the classification chart reproduced chart in Appendix B.

3.3 PORE PRESSURE DISSIPATION TEST RESULTS

When conducting CPT investigations, pore water pressure dissipations are automatically recorded during pauses in penetration. The pore water pressure data is recorded at five second intervals. Dynamic and static pore pressure dissipation data for each CPT is included on the data disk. A total of eight dissipation tests, involving a total of 0.5 hours of testing, were completed during this project. These tests were performed to confirm water table depths at certain locations. The water depths were used in the data interpretations.

3.4 DATA PROCESSING

The electronic data files were processed using the program ScreenZ. ScreenZ is a program developed by ConeTec to calculate common engineering parameters from CPT data. The processed data files are attached in Appendix B. The files are also included on the data disk. For this project, the depth to ground water was determined from data provided by the dissipation test results. The exact depth used (Table 1) is noted in the header of each file.

3.5 DATA DISK

One data disk is included in Appendix C. The disk includes all of the CPT (.cor files, includes dynamic pore water pressure data), static pore water pressure (.ppd files) and tabular data (.tbl files).

12/9/06 - 70

Daily Log

WEATHER: Overcast, Periodic Rain, Low 50's

RSK; JT6 Gather Supplies (Sampling Equip, PPE, Coolers etc.) & Mobilize to Site. Arrive @ Site, Check Flow Conditions, Prepare for Sampling on 1/10/06.

1/10/06

0630 Depart Hotel

0700 On Site, Load Supplies, Sampling Equipment into Boat, Launch Boat, Safety Meeting.

0730 - 1500 Sample Monitoring Wells GW 702, 703; SEA-60 Rinse Blank Collected @ 1430

1500-1730 RSK: JT6 Evaluate Site Monitoring Wells to see which ones still exist.

1730 Done for the Day.

1/11/06

WEATHER: Overcast, 40's-50's

0630 RSK: JT6 Prep Supplies for Pickup

0700 RSK: JT6 on Site, Safety Meeting

0700-0830 RSK: JT6 Continue w/ Site Evaluation

0900-0930 Specific Capacity Test @ GWP-705B

0930 Lab Picks Samples up @ Site

1000 RSK: JT6 off Site

1500 RSK: JT6 @ Depot Road, Drop off Boat & Equipment

1600 RSK: Pick Environmental, Drop off Rental Equipment.

1/11/06 GNP-705B Specific Capacity Test (AM)

Habitat Characterization Summary

Habitat Characterization Summary

- ***Habitat locations are presented on the figure titled "Habitat Characterization Results"***

- ***A comprehensive list of vegetative and wildlife species observed during the wildlife surveys is presented on the tables titled "Vegetation Observations by Habitat" and "Wildlife Observations by Habitat"***

- ***Habitat classifications (in bold type below each habitat type) are based on the Natural Community Classification of Rhode Island (Rhode Island Natural Heritage Program [RINHP], 2005)***

Blackstone River

- **Riverine, Lower Perennial Stream/River**

The Blackstone River serves as the ecological backbone of the region. The river's conditions often dictate the conditions of the surrounding habitats. During periods of high flow, much of the Quinnville well field and Unnamed Island are inundated and/or overflowed by the waters of the Blackstone River. The Blackstone has been altered through history to suit the needs of centuries of people living along its banks.

Evidence of variability in river conditions was observed in numerous areas. Debris lines were found as high as 8 feet above the July 2005 water level. Steep banks and areas of bank scour and deposition indicated that periods of high flow occur throughout the year. River substrate ranged from boulder and cobble in high flow areas to sand and silt in the more quiescent backwaters and depositional areas. Erosion has exposed the root masses of trees along the banks, providing cover and shade for aquatic species. Similarly, banks erosion also resulted in numerous areas of downfall. Above-water portions of partially fallen trees act as perches for many species of piscivorous birds. Belted kingfisher (*Ceryle alcyon*), double-crested cormorants (*Phalarcrocorax auritus*), and great blue heron (*Ardea herodias*) were observed during field activities. Rough-winged swallows (*Stelgidopteryx semipennis*), spotted sandpiper (*Actitis macularia*), and tree swallows (*Tachycineta bicolor*) were observed foraging on aquatic invertebrates. Evidence of raccoon (*Procyon lotor*), deer (*Odocoileus virginianus*) and rat (*Rattus norvegicus*) foraging along the banks was also identified.

Riparian

- **Maple-Sycamore Floodplain Forest (numerous variations)**

National Research Council (2002) defines riparian areas as "…. transitional (areas) between terrestrial and aquatic ecosystems and are distinguished by gradients in biophysical conditions, ecological processes, and biota. They are areas through which surface and subsurface hydrology connect waterbodies with their adjacent uplands. They include those portions of terrestrial ecosystems that significantly influence exchanges of energy and matter with aquatic ecosystems (i.e., a zone of influence). Riparian areas are adjacent to perennial, intermittent, and ephemeral streams, lakes, and estuarine-marine shorelines."

The Blackstone River riparian corridor includes the transitional and floodplain habitats between the river proper and a number of other areas of the Site (i.e., J.M. Mills Landfill, Quinnville well field, Unnamed Island). The majority of the riparian corridor is densely forested, typically dominated by eastern cottonwood (*Populus deltiodes*), box-elder maple *(Acer negundo*), silver maple (*Acer saccharinum*), black willow (*Salix nigra*), green ash (*Fraxinus pennsylvanica*) and

sycamore (*Platanus occidentalis*). These species form a moderate-to-closed canopy with an average height of approximately 50 to 60 feet. In some areas the canopy's density limits the growth of the shrub and herbaceous layers. Other areas have well developed herbaceous and shrub layers. These understory layers were typically dominated by jewelweed (*Impatiens capensis*), joe-pye weed (*Eupatorium dubium*), and various species of fern (New York [*Thelypteris noveboracensis*], royal [*Osmunda regalis*], and sensitive [*Onoclea sensibilis*]). The riparian corridor functions as an important resource to avian species migrating and feeding along the Blackstone River. Many resident and migratory avian species use this corridor throughout the year. Wild turkey (*Meleagris gallopavo*), grackle (*Quiscalus quiscula*), catbird (*Dumetella carolinensis*), and robin (*Turdus migratorius*) were the more common species observed during the July 2005 habitat assessment field observation periods.

A diversion of the Blackstone River from its original path created an isolated landmass, the Unnamed Island, between the current river channel and a backwater area created by the former channel. A man-made berm now connects the Unnamed Island with the land between Pratt Dam and the Blackstone Canal Bikeway. Human earth-moving activities on the island have resulted in the creation of a number of excavations and depressions scattered among the island. The majority of the Unnamed Island is riparian in nature and heavily vegetated. Water inundation during high flow conditions in the Blackstone River has filled the excavations and depressions creating ponds, wetlands, and vernal pools.

The Quinnville well field makes up the most extensive riparian area along the Site. The gently sloping floodplain is undeveloped and heavily vegetated; however it shows some signs of historical alteration and human impact. Access roads and pump houses constructed during the period of water supply well operation have changed the natural topography of the area. A steep berm runs along the edge of the Blackstone River approximately 10-20 yards landward of the water's edge. The berm rises from fringing forested wetlands on the river's edge and is vegetated by a number of upland species. Typical low-lying, moist, floodplain species of shrubs and trees (i.e., arrowwood viburnum [*Virburnum dentatum*], meadowsweet [*Spirea latifolia*], and Allegheny blackberry [*Rubus allegheniensis*]) dominate the area within the berm. Several densely populated red maple (*Acer rubrum*) forested areas were observed within the berm. The closed canopies prevented shrub and herbaceous growth in these areas. Several wetland swales were identified cutting through the berm. These swales allow surface water from the Blackstone River to flow into the floodplain area behind the berm during periods of elevated water levels. The swales were heavily vegetated with wetland vegetation.

Wetlands

- **Palustrine, Open Mineral Soil, Semi-permanently Flooded (Deep) Emergent Marsh**
- **Palustrine, Open Mineral Soil, *Acer rubrum* – Deciduous Shrub Swamp**

The wetland community on the north side of the railroad is a mosaic of habitats. Habitat variation results from changes in hydrologic inputs and diversion of input and drainage watercourses by surrounding land uses. The railroad bounds the wetland to the west and creates a significant hydrologic barrier, only one flow through from the wetlands, at the northern extent of the wetland complex, was identified during the field work.

The southern extent of the wetland complex is open-water habitat with tree-lined banks. The wetland transitions from open water, through an emergent marsh area to a flooded forest/swamp area at its northern extent. The open water area contained dense beds of submerged aquatic vegetation and emergent vegetation grew along the banks where adequate light was available. The open water wetland is ringed by a narrow forested wetland community of 50 to 60 foot high

maples, black willow, and sycamore. The moderate canopy allowed the development of a dense shrub layer dominated with silky dogwood and poison ivy (*Toxicodendron radicans*). A tree-lined berm bisects the open water habitat, forming two individual open water areas that are hydrologically connected during periods of moderate-to-high water elevation. The emergent marsh area was predominantly cattail (*Typha latifolia*) and buttonbush (*Cephalanthus occidentialis*). This vegetation scheme transitioned into a red maple (*Acer rubrum*) dominated flooded forest/swamp with a canopy ranging from 12 to 20 feet. Stands of common reed (*Phragmites australis*) were beginning to develop around the margins of the forested wetland.

Bull (*Rana catesbeiana*) and green (*Rana clamitans melanota*) frogs were observed and heard singing throughout the wetland complex. Observations of avian species included great blue heron, double crested cormorants, mallard (*Anas platyrhynchos*) and a brood of wood ducks (*Aix sponsa*). A muskrat (*Ondatra zibethica*) was observed feeding along the edge of the wetland, and tracks of raccoon, whitetail deer and rats were also observed. Red-winged blackbirds, grackles, song sparrows (*Melospiza melodia*), yellow warblers (*Dendroica petechia*) and common yellowthroat (*Geothlypis trichas*) were observed among the vegetation in the emergent wetland and along the banks of the open water.

Ponds

- **Lacustine, Eutrophic Pond**
- **Palustrine, Open Mineral Soil, Seasonally Flooded (Shallow) Emergent Marsh**

Four distinct ponds exist on the Site. Three ponds are situated on the Unnamed Island (Pond A, Pond D, and Pond E) and the remaining pond (Pond F) is located just upstream of Pratt Dam at the southern tip of the Blackstone River backwater (former channel).

The largest pond, Pond A, retains water throughout the year. The steep banks and depth of the pond inhibit the growth of aquatic and wetland vegetation. Species common to riparian and disturbed areas, such as purple loosestrife (*Lythrum salicaria*), reed canary grass (*Phalaris arundinacea*), stinging nettle (*Urtica dioica*) and various species of goldenrod (*Solidago spp*.) dominate the vegetative communities at the highwater elevation of Pond A. Purple loosestrife covers a small island (20’ x 50’) in the northern portion of Pond A. Two smaller depressions are located just south of Pond A.

Pond D and Pond E are hydrologically connected to Pond A during times of high water and become isolated as the water levels recedes during the summer months.

The banks of Pond D are overgrown with purple loosestrife and small (<20’) black willow. Carp were observed swimming through the dense emergent vegetation. Both green and bull frogs were identified by call.

Pond E is hydrologically isolated from the Pond A to a greater degree than Pond D, only exchanging water during extreme high water events. There is dense canopy and limited understory growth in the area surrounding Pond E. Green and bull frogs were observed in the pond during the mid-day wildlife survey. During the evening event, Fowler’s toads (*Bufo woodhousei fowleri*) and Northern Gray treefrogs (*Hyla vericolor*) were identified by their call.

Pond F is located adjacent to the bridge across the top of Pratt Dam. The banks are lined with mature trees that provide shade to the pond during the day. Canada geese and a wood duck were observed feeding on the sparse aquatic vegetation in the shallows of the pond.

Landfill

- **Disturbed community – not able to classify using Rhode Island Natural Community Classification System**
- **Late successional field, transition between grassland and shrub/scrub**

The J.M. Mills Landfill is a distinctive area with the Site. The vegetative cover is a mosaic of different herbaceous, shrub, and tree communities. These community types range from grass monocultures dominating small open areas to dense stands of small trees and shrubs. The distribution and species composition of these communities are indicative of a late successional field habitat.

Staghorn sucmac (*Rhus typhina*), winged sumac (*Rhus copallinuum*), blackberry (*Rubus allegheniensis*), and meadowsweet (*Spiraea latifolia*) dominated the shrub layer, while canary reed grass, deer-tongue panicum (*Dichanthelium clandestinum*), mugwort (*Artemisia vulgaris*), goldenrods and common reed dominated the dense monoculture herbaceous stands. Many day beds, presumable used by white-tailed deer, were observed on the west side of landfill among the tall grasses. Insectivorous birds, including barn, tree, and rough-winged swallows and chimney swifts, were observed feeding above the landfill.

Human Use

- **Disturbed communities – not able to classify using Rhode Island Natural Community Classification System**

Each of the habitats identified onsite has at one time or another been influenced by anthropogenic activities. While activities have ceased in many areas; industrial, residential, and commercial activities continue to affect some areas of the Site. These human use areas consist of a quarry, Nune's parcel, recreational areas along the Blackstone River and Pratt Dam, residential development, and various commercial properties along Martin Street. A large stone/gravel quarry abuts the northern portion of the wetland complex. The Nune's parcel bounds the Blackstone River above Pratt Dam and creates the southeastern portion of the Site. Historically, this property was used as waste transfer/disposal area. Currently, a portion of the Nune's parcel is used to stage landscaping materials by the municipal park commission and the remainder of the property consists of an open lot littered with refuse and debris and a tree-lined area along the banks of the Blackstone River. The downstream section of the Blackstone River that shares a border with the southwest corner of the parcel is lined with large concrete barriers. Chain-link fence secures the landward boundaries of the parcel. The open lot is dominated by vegetative species common to disturbed areas, including various species of goldenrod and clover (*Melilotus* spp.). Barn, tree, and rough-winged swallows were observed foraging over the open lot. Whitetail deer and cottontail rabbits (*Sylvilagus floridanus*) were also observed using Nune's Parcel.

Re: Peterson/Puritan Superfund Site
Cumberland, RI

On April 22, 2005 Helen Douglas, Joseph Shisler and Scott Larew of Blasland, Bouck & Lee (BBL) performed a vernal pool survey in Operable Unit 2 (OU-2) at the Peterson/Puritan Superfund Site (the Site). The objective of the survey was to identify and document potential vernal pool habitat located on or adjacent to the Site. In general, the survey area included the Blackstone River floodplain between Martin Street and Pratt Dam, including the unnamed island in the Blackstone River.

The United States Geological Survey (USGS) defines vernal pools as "small bodies of standing water that form in the spring from meltwater and are often dry by mid-summer or may even be dry before the end of the spring growing season. May vernal ponds occur in depressions in agricultural areas, but may also be found in woodlots. Wetland vegetation may become established but are usually dominated by annuals." Vernal pools provide critical breeding habitat for many amphibians. The temporary nature of vernal pools, and lack of a hydrologic connection to permanent water bodies, isolate the pools from fish populations. The absence of these predators enable the young of many amphibian species to hatch and grow in the relative safety of the pool. In Rhode Island, and much of southern New England, many vernal pools fill with water in the fall and maintain some degree of water through spring. Wood frogs (*Rana sylvatica*), spotted salamanders (*Ambystoma maculatum*), marbled salamanders (*Ambystoma opacum*), and, to a lesser degree, gray treefrogs (*Hyla versicolor*), northern spring peepers (*Pseudacris c. crucifer)*, Eastern American toads (*Bufo a. americanus*), and red-spotted newts (*Notophthalmus v. viridescens*) rely heavily on vernal pools in Rhode Island to complete their breeding cycle (URI, 2001).

BBL scientists conducted a preliminary search and review of digital ortho-corrected aerial photographs, USGS topographic quadrangles, National Wetland Inventory (NWI) maps, and United States Department of Agriculture (USDA) soil surveys to identify potential vernal pools within the study area. The search identified several areas on the unnamed island in the Blackstone River that showed features indicative of vernal pools. These areas were not identified as wetlands on NWI maps.

The field survey primarily focused on the areas identified during the preliminary data review. Four target areas on the unnamed island in the Blackstone River identified during the review were verified as vernal pools during the field survey. The depressions appeared to be man-made excavations that retained water when the Blackstone River saturates the soils of the unnamed island during the spring high-water period. As the river receded, these depressions held water;

water levels are increased or maintained by precipitation throughout the spring. Three of the pools were similar in size, approximately 30 feet in diameter. The remaining pool was rectangular in shape, approximately 40 feet in length and 15 feet wide. Green frogs (*Rana clamitans melanota*), tadpoles (unidentified spp.), mosquito larvae, midges and daphnia were observed in the water in each depression. Fish were not observed in the depressions. Hydrologic connections to the Blackstone River or the large pond on the unnamed island were not observed. Several other depressions showing signs of hydrology were identified on the island but were completely dry at the time of the survey. Isolated pools also exist in wash channel on the unnamed island. The channel flows from the western corner of the island to the large pond in the middle, and as water recedes the ponds are created in the gentle undulations of the channel bed. Although the pools are temporarily isolated, the hydrologic connection to both the Blackstone River and the large unnamed island pond preclude them from being vernal pool habitats. Wildlife observations in these pools were limited to mosquito larvae.

Another vernal pool habitat was identified in the small forested area of the Blackstone River floodplain between the J.M. Mills Landfill and the Hope Global facility. The vernal pool appeared to form in a discharge pond associated with an abandoned stormwater outfall. This pool was approximately 50' in length and 25' in width. Wildlife observations included tadpoles (unidentified spp.), green frogs, and tubiflex worms.

Pictures of the five vernal pool habitats and a list of wildlife observations are attached.

Wildlife Observations

Ampibians
Chrysemys picta picata (Eastern Painted Turtle)
Rana clamitans melanota (Green Frog)

Mammals
Didelphis marcupialis (Opossum)
Lutra canadensis (River Otter)
Marmota monax (Woodchuck)
Mustela vison (Mink)
Odocoileus virginianus (Whitetail Deer)
Ondatra zibethica (Muskrat)
Procyon lotor (Raccoon)
Sciurus carolinensis (Gray Squirrel)
Sylvilagus floridanus (Cottontail)

Birds
Agelaius phoeniceus (Red-winged Blackbird)
Anas platyrhynchos (Mallard)
Ardea herodias (Great Blue Heron)

Branta canadensis (Canada Goose)
Butorides virescens (Green Heron)
Cardinalis cardinalis (Cardinal)
Carduelis tristis (American Goldfinch)
Charadrius vociferous (Killdeer)
Colaptes auratus (Yellow-shafted Flicker)
Corcus brachyrynochos (Common Crow)
Cyanocitta cristata (Blue Jay)
Dendrocia coronata (Yellow-rumped Warbler)
Dendroica petechia (Yellow Warbler)
Dumetella carolinensis (Gray Catbird)
Melospiza melodia (Song Sparrow)
Meleagris gallopavo (Wild Turkey)
Minus polyglottos (Northern Mockbingbird)
Parus articapillus (Black-capped Chickadee)
Sialia sialia (Eastern Bluebird)
Tachycineta bicolor (Tree Swallow)
Turdus migratorius (Robin)
Tyrannus tyrannus (Eastern Kingbird)
Zenaida macroura (Mourning Dove)
Zonotrichia albicollis (White-throated Sparrow)
