SVOC TICS							
9H-Fluorene, 4-methyl-	- -	µg/kg dry wt					
9-Octadecenamide, (Z)-	- -	µg/kg dry wt					
9-Tricosene, (Z)-	- -	µg/kg dry wt					
Acetic acid, 3,7,11,15-tetramethyl-hexadecyl ester	- -	µg/kg dry wt					
Acridine	- -	µg/kg dry wt					
Androst-7-en-3-ol	- -	µg/kg dry wt					
Anthracene, 1,4-dimethyl-	- -	µg/kg dry wt					
Anthracene, 1-methyl-	- -	µg/kg dry wt					
Anthracene, 2-methyl-	- -	µg/kg dry wt	96 NJ		510 NJ		
Anthracene, 9-methyl-	- -	µg/kg dry wt					
Aspidospermidin-17-ol, 1-acetyl-19,21-epoxy-15,16-dimethoxy-	- -	µg/kg dry wt					
Benz(A)anthracene-7,12-dione	- -	µg/kg dry wt					
Benz[a]anthracene, 12-methyl-	- -	µg/kg dry wt					
Benz[a]anthracene, 1-methyl-	- -	µg/kg dry wt					
Benz[a]anthracene, 2-methyl-	- -	µg/kg dry wt					
Benzaldehyde, 2-hydroxy-	- -	µg/kg dry wt					
Benzaldehyde, 3,5-dichloro-2-hydroxy-	- -	µg/kg dry wt					
Benzaldehyde, 4-hydroxy-	- -	µg/kg dry wt					
Benzenamine, 4-octyl-N-(4-octylphenyl)-	- -	µg/kg dry wt					
Benzene, 1,1'-(1,3-butadiyne-1,4-diyl)bis-	- -	µg/kg dry wt					
Benzene, 1,2-dichloro-4-isocyanato-	- -	µg/kg dry wt					
Benzene, 1-chloro-2-isocyanato-	- -	µg/kg dry wt					
Benzene, 1-chloro-3-isocyanato-	- -	µg/kg dry wt					
Benzeneacetic acid	- -	µg/kg dry wt					
Benzenesulfonamide, 4-methyl-	- -	µg/kg dry wt					
Benzo(b)fluoranthene	620	µg/kg dry wt					
Benzo(e)pyrene	- -	µg/kg dry wt					
Benzo[b]naphtho[2,1-d]thiophene	- -	µg/kg dry wt					
Benzo[b]naphtho[2,3-d]furan	- -	µg/kg dry wt	110 NJ				
Benzo[b]triphenylene	- -	µg/kg dry wt					
Benzo[j]fluoranthene	- -	µg/kg dry wt					
Benzoic acid	- -	µg/kg dry wt			170 NJ		
Benzothiazole	- -	µg/kg dry wt					
beta-Sitosterol	- -	µg/kg dry wt					
Bicyclohexyl, 4-phenyl-	- -	µg/kg dry wt					
Butanoic acid	- -	µg/kg dry wt					
Bycyclo [2.2.1] heptan-2-ol,	- -	µg/kg dry wt					
Camphene	- -	µg/kg dry wt					
Camphor	- -	µg/kg dry wt					
Chloroacetic acid, dodecyl	- -	µg/kg dry wt					
Cholest-5-en-3-ol, 4,4-dimethyl-, (3.beta.)-	- -	µg/kg dry wt					
Cholesta-3,5-dien-7-one	- -	µg/kg dry wt					
Cholesta-4,6-dien-3-ol, benzoate,	- -	µg/kg dry wt					
Cholestan-2-one	- -	µg/kg dry wt					
Cholestan-3.beta.-ol	- -	µg/kg dry wt					
Cholestan-3-ol	- -	µg/kg dry wt					
Cholestan-3-ol, (3.beta., 5.beta.)-	- -	µg/kg dry wt					
Cholestane isomer	- -	µg/kg dry wt					
Cholestanol	- -	µg/kg dry wt		1,200 NJ			
Cholesterol	- -	µg/kg dry wt					
Chrysene, 1-methyl-	- -	µg/kg dry wt					
Chrysene, 4-methyl-	- -	µg/kg dry wt					
Chrysene, 6-methyl-	- -	µg/kg dry wt					
Chrysin	- -	µg/kg dry wt		500 NJ			
Curan-19,20-diol, 16,17-did	- -	µg/kg dry wt					
Cyclohexane, hexaethylidene-	- -	µg/kg dry wt

Lanost-8-en-3-one	- -	µg/kg dry wt				1,600 NJ	
Lup-20-(29)-en-3-one	- -	µg/kg dry wt	4,600 NJ				
Lupeol	- -	µg/kg dry wt					
Methyldibenzothiophene	- -	µg/kg dry wt					
Naphthalene, 1,2,3,4,-tetrahydro-1,1,6-trimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,2,3,5,6,7,8,8a-octahydro-	- -	µg/kg dry wt					
Naphthalene, 1,2-dihydro-1,	- -	µg/kg dry wt					
Naphthalene, 1,3-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,4-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,5-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,6,7-trimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,6-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,7-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1-methyl-	- -	µg/kg dry wt					
Naphthalene, 1-phenyl-	- -	µg/kg dry wt					
Naphthalene, 2,3-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 2,6-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 2-Ethenyl-	- -	µg/kg dry wt					
Naphthalene, 2-phenyl-	- -	µg/kg dry wt					
Nonadecene, 1-chloro-	- -	µg/kg dry wt					
Nonanal	- -	µg/kg dry wt					
Octadecanal	- -	µg/kg dry wt					
Octadecanoic acid	- -	µg/kg dry wt		81 NJ			
Octadecanoic acid, 2-methylpropyl ester	- -	µg/kg dry wt					
Octadecanoic acid, butyl ester	- -	µg/kg dry wt		130 NJ			

TABLE 4-25
SEDIMENT RESULTS FOR SVOC TICs (ug/kg dry wt)

REMEDIAL INVESTIGATION REPORT
PETERON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

SVOC TICS							
Cyclohexane, isothiocyanato-	- -	µg/kg dry wt					
Cyclohexasiloxane, dodecamethyl-	- -	µg/kg dry wt					
Cyclopenta(def)phenanthrenone	- -	µg/kg dry wt	720 NJ				
Cyclopentasiloxane, decamethyl-	- -	µg/kg dry wt					
Cyclopropanenonanoic Acid, 2	- -	µg/kg dry wt					
Decahydro-4,4,8,9,10-pentamethylnaphthalene	- -	µg/kg dry wt					
D-Friedoolean-14-en-3-one	- -	µg/kg dry wt					
Dibenzothiophene	- -	µg/kg dry wt	580 NJ				
Diphenyl ether	- -	µg/kg dry wt					
di-p-Tolyacetylene	- -	µg/kg dry wt					
Docosanoic acid	- -	µg/kg dry wt					
Dodecanoic acid	- -	µg/kg dry wt					
Dodecyl acrylate	- -	µg/kg dry wt					
E-15-Heptadecenal	- -	µg/kg dry wt					
E-7-Octadecene	- -	µg/kg dry wt					
Epicholestanol	- -	µg/kg dry wt					
Ethanol, 2-(tetradecyloxy)-	- -	µg/kg dry wt					
Gamma-Sitosterol	- -	µg/kg dry wt				780 NJ	
Heptadecanoic acid	- -	µg/kg dry wt					
Hexadecane, 1-chloro-	- -	µg/kg dry wt			290 NJ		
Hexadecane, 1-iodo-	- -	µg/kg dry wt					
Hexadecanoic acid	- -	µg/kg dry wt			1,100 NJ		550 NJ
Hexadecanoic acid, 1,1-dimethylethyl ester	- -	µg/kg dry wt					
Hexadecanoic acid, butyl ester	- -	µg/kg dry wt					
Hexadecenoic acid, Z-11-	- -	µg/kg dry wt					
Hexathiepane	- -	µg/kg dry wt					
Hop-22(29)-en-3.beta.-ol	- -	µg/kg dry wt					
hopane isomer	- -	µg/kg dry wt					
Indene	- -	µg/kg dry wt					
Lanost-8-en-3-ol, (3.beta.)-	- -	µg/kg dry wt					
Lanost-8-en-3-one	- -	µg/kg dry wt					
Lup-20-(29)-en-3-one	- -	µg/kg dry wt					
Lupeol	- -	µg/kg dry wt					
Methyldibenzothiophene	- -	µg/kg dry wt					
Naphthalene, 1,2,3,4,-tetrahydro-1,1,6-trimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,2,3,5,6,7,8,8a-octahydro-	- -	µg/kg dry wt					
Naphthalene, 1,2-dihydro-1,	- -	µg/kg dry wt					
Naphthalene, 1,3-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,4-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,5-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,6,7-trimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,6-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1,7-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 1-methyl-	- -	µg/kg dry wt					
Naphthalene, 1-phenyl-	- -	µg/kg dry wt					
Naphthalene, 2,3-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 2,6-dimethyl-	- -	µg/kg dry wt					
Naphthalene, 2-Ethenyl-	- -	µg/kg dry wt					
Naphthalene, 2-phenyl-	- -	µg/kg dry wt					
Nonadecene, 1-chloro-	- -	µg/kg dry wt					
Nonanal	- -	µg/kg dry wt					
Octadecanal	- -	µg/kg dry wt					560 NJ
Octadecanoic acid	- -	µg/kg dry wt					
Octadecanoic acid, 2-methylpropyl ester	- -	µg/kg dry wt					
Octadecanoic acid, butyl ester	- -	µg/kg dry wt

TABLE 4-59
SUMMARY OF WASTE INVENTORY AT THE NUNES PARCEL - NOVEMBER 2006

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2
CUMBERLAND AND LINCOLN, RHODE ISLAND

Surface Debris Item	Approximate Location	Quantity	Comments
Liquids (oils, fuels, sludges, etc) Debris			
Drums	drums/fragments reported at scattered locations across the parcel; several inside main building; several inside trailers; soil cuttings near well 109; IDW drum storage area	exact total difficult to quantify; 43 were in RI IDW storage area along access road towards landfill	unknown drums in various states, many appeared to be empty, IDW drums labeled and intact (IDW drums removed after November 2006)
Fuel tanks on trucks	attached to or nearby trucks and carcasses	unknown	
Propane tanks	north central portion adjacent to Blackstone River adjacent to roll-offs; sw-most corner, behind trailers	12-15 of various sizes in north central area, unknown quantity of smaller tanks in sw corner	contents unknown, most filled with holes and appear to be empty in both areas
Large storage tanks	one adjacent to main building, and two adjacent to propane tanks, near access road in sw corner	3 larger volume tanks	unknown volume or contents, 1 estimated to be 1,000-2,000 gallon AST behind trailers
Non-Liquid Debris			
Tires	along sw boundary near Blackstone River	unknown quantity - two piles - likely in hundreds	the more northern pile also contains rubber, wood, and foam debris
Trucks	central portion, few along northeastern portion near the main building	2 garbage trucks, several truck carcasses adjacent to the garbage trucks, old transfer facility truck and camper near main building	unknown quantity of truck carcasses
Trailers	sw corner - west of access road (6), along rail road (2)	8 flat bed or box trailers	various conditions - 5 in the SW area labeled T-1 through T-5; box trailers contain other metal and paper debris including drums
Roll-offs	north central portion within 30 feet of Blackstone River, 1 small additional roll-off approximately 100 feet west of main building	(19) larger roll-off boxes, (1) smaller	
Storage batteries	inside building	one specifically identified	
Electrical ballasts	along concrete wall in nw area	approximately 250 (estimated)	also described as capacitors in field notes
Possible Asbestos-Containing Materials			
Pipe (3" PVC)	near river bank between tire piles	small pile - few yards - unknown quantity	
Concrete blocks	approximately 30 feet from river adjacent to piping pile - in sw corner	up to few hundred standard blocks	
Shingles	corner of Bay-01 in north central portion along concrete wall	several yards in one large pile	may contain transite
Miscellaneous			
Building	one small shed in sw corner along access road, one enclosed building adjacent to roll-off boxes in north central portion, one main building in central ne portion of parcel		wood debris in old shed, old animal pens and few drums inside enclosed building, general debris and interior walls and building materials inside main building

TABLE 5-1
CHEMICAL-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OU2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
Chemical-Specific ARARs			
Federal Requirements			
Clean Water Act Federal Water Quality Criteria, Section 304(a) 40 CFR 131.11	R & A	Ambient Water Quality Criteria (AWQC) are provided by EPA for chemicals for both the protection of human health and the protection of aquatic life.	Exceedances of AWQC are present in Blackstone River and Ponds.
Guidelines for Carcinogenic Risk Assessment, EPA/630/P-03/001F	TBC	These guidelines provide guidance on conducting risk assessments involving carcinogens.	Guidelines used to evaluate all risk assessments on carcinogenicity.
Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens, EPA/630/R-03/003F	TBC	This provides guidance on assessing risk to children from carcinogens.	Guidance used to evaluate all risk to children from carcinogens.
EPA Risk Reference Doses (RfDs)	TBC	RfDs are estimates of a daily exposure concentration that is likely to be without appreciable risk of deleterious effects during a lifetime exposure.	RfDs used to characterize human health risks due to non-carcinogens in site media.
Human Health Assessment Cancer Slope Factors (CSFs)	TBC	CSFs are estimates of the upper-bound probability of an individual developing cancer as a result of a lifetime exposure to a particular concentration of a potential carcinogen.	CSFs used to compute the individual incremental cancer risk resulting from exposure to carcinogens in site media.
EPA Carcinogenic Assessment Group Potency Factors	TBC	These factors are used to evaluate an acceptable risk from a carcinogen.	Used to evaluate carcinogenicity of dioxin.
EPA Health Advisories	TBC	EPA publishes contaminant-specific health advisories that indicate the non-carcinogenic risks associated with consuming contaminated drinking water.	EPA may use Health Advisories to establish criteria in the absence of other criteria.
Safe Drinking Water Act Maximum Contaminant Levels (MCLs), 40 CFR 141.11-141.13	R & A	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to Maximum Contaminant Levels Goals (MCLGs) as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.	MCLs are relevant and appropriate as the groundwater is a source/potential federal drinking water source.
EPA Guidance on	TBC	Describes the recommended approach to	This guidance will be considered when establishing remediation goals for PCB contaminated media.
Remedial Actions for		evaluating and remediating	
Superfund Sites with		Sites with PCB contamination.	
PCB Contamination			

TABLE 5-1
CHEMICAL-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OU2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
Federal Requirements Cont.			
Safe Drinking Water Act Maximum Contaminant Levels Goals (non-zero MCLGs), 40 CFR 141.50-141.51	R & A	The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.	Non-zero MCLGs are relevant and appropriate as the groundwater is a source/potential federal drinking water source.
State Requirements			
Rhode Island Water Quality Regulations	Applicable R & A	Classifies water use and defines water quality goals to protect public health and welfare, enhance the quality of state water. These rules set ambient water quality criteria (AWQCs) applicable to surface waters in Rhode Island. These AWQCs may include numeric limits for chronic exposures to aquatic life, acute exposures to aquatic life, human consumption of water and aquatic organisms, and human consumption of aquatic organisms only.	Exceedances of AWQC are present in River and Ponds.
RIDEM Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (i.e., Remediation Regulations)	Applicable	Unless otherwise specified, soil contaminated as a result of a release of hazardous materials shall be remediated in a manner which meets the direct exposure and leachability criteria for each hazardous substance listed in Rule 8.02.B (Method 1 Soil Objectives). Similarly, groundwater objectives established in Rule 8.03 shall be applied to contaminated sites.	Soil at the site contains contaminants subject to the Rule 8.02B soil objectives. Groundwater at the site contains contaminants subject to the Rule 8.03B GA groundwater objectives.
RIDEM Rules and Regulations for Groundwater Quality	Applicable	Establishes state MCLs, limits, and requirements for current and future public water supply systems. These rules set numerical criteria for contaminants in certain aquifers classified as potential drinking water sources (such as the aquifer at the Site.	State MCLs are applicable to the groundwater at the site.

TABLE 5-2
LOCATION-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
Location-Specific ARARs			
Federal Requirements			
Fish and Wildlife Coordination Act 16 U.S.C. 661, Fish and Wildlife Protection (40 CFR Section 6.302(g))	Applicable	Requires that a federal agency involved in actions that will result in the control or structural modification of any stream or water body to take action to prevent, mitigate, or compensate for project-related losses of fish and wildlife resources. Encourages any federal agency proposing to modify a body of water to consult with the U.S. Fish and Wildlife Service, National Marine Fisheries Service, and other related state agencies.	On-site remediation activities may include modifications to the River or Ponds.
Clean Water Act, Section 404(b)(1) Guidelines for specification of disposal sites for dredged or fill material, 40 CFR Part 230, 231 and 33 CFR Parts 320-323 and Guidelines for Compensatory Mitigation for Losses of Aquatic Resources, 33 CFR Part 332	Applicable	Outlines requirements for the discharge of dredged or fill materials into surface waters, including wetlands. Such discharges are not allowed if there are practicable alternatives with less adverse impact. Sets standards for restoration and mitigation required as a result of unavoidable impacts to aquatic resources.	On-site remediation activities may include discharge of dredged or fill material into the wetlands/water bodies.
National Historic Preservation Act, 16 USC 470 36 CFR Part 800	Applicable	A federal agency must take into account the project's effect on properties included or eligible for inclusion in the National Register of Historic Places.	A federal agency must take into account the project's effect on properties included or eligible for inclusion in the National Register of Historic Places.
Rivers and Harbors Act Section 10 (33 U.S.C. Section 403)	Applicable	Prohibits unauthorized obstruction or alteration of navigable waters of the U.S.	Remediation activities may involve obstruction or alteration of the River.
Protection of Wetlands (Executive Order 11990)	TBC	Federal agencies are required to avoid adversely impacting wetlands unless there is no practicable alternative and the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use.	Some wetlands are located within the site boundaries. Any activities in wetland areas will need to comply with this order.
Floodplain Management (Executive Order 11988)	TBC	Federal agencies are required to avoid occupancy and modification of a floodplain unless there is no practicable alternative and avoid support of floodplain development wherever there is a practicable alternative.	The site is partially located in a 100-yr floodplain. If no practicable alternative, any activity will be designed to minimize such impacts.
Endangered Species Act of 1973, 16 USC 1531 et seq. 50 CFR 402	Potentially Applicable	Establishes requirements to protect species threatened by extinction and habitats critical to their survival.	There requirements must be addressed if there are habitats for threatened or endangered species.

TABLE 5-2
LOCATION-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
Federal Requirements Cont.			
Archaeological and Historical Preservation Act of 1974 Public Law 93-291	Potentially applicable	When a Federal agency finds, or is notified, that its activities in connection with a Federal construction project may cause irreparable loss or destruction of significant scientific, pre-historical, historical, or archeological data, such agency shall notify DOI. Such agency may request DOI to undertake the preservation of such data or it may undertake such activities.	If during remedial design or remedial action, it is determined that this alternative may cause irreparable loss or destruction of significant scientific, pre-historical, historical, or archaeological data, EPA will notify DOI and comply with the processes in this statute.
State Requirements			
RIDEM Rules and Regulations for Hazardous Waste Management – Section 8 Location Standards for Hazardous Waste Facilities	Potentially Applicable	Rhode Island is delegated to administer the federal RCRA statute through its state regulations. The standards of 40 CFR 264.18(b), with some exceptions, are incorporated by reference. Certain facilities located in 100-yr floodplain must be designed, constructed, operated and maintained to prevent washout of any hazardous waste by 100-yr flood, unless demonstrate no adverse effects on human health or environment will result from washout.	Treatment, disposal, and/or storage of hazardous materials may take place at the site, which is partially located within the 100-yr floodplain.
RIDEM Rules and Regulations Governing the Enforcement of the Freshwater Wetlands Act	Applicable	Sets requirements to prevent the undesirable drainage, excavation, filling, alteration, encroachment, or any other form of disturbance or destruction to a wetland.	Some wetlands are located within the site boundaries.
RIDEM Rules and Regulations for Groundwater Quality	Applicable	Sets forth policy to protect future and present sources of drinking water by protection of the groundwater, aquifers, recharge areas, and watersheds.	Groundwater at and near the site is a source/potential source of drinking water.
Rhode Island Endangered and Threatened Species Act; RIGL 20-37	Potentially applicable	Regulations address any plants or animals of special concern.	To be considered if remedial alternative affects any plants or animals of special concern
Rhode Island Historic Preservation Action – Rhode Island General Laws 42-45 et seq.	Applicable	Regulations that address the project's effect on properties included or eligible for inclusion in the Register of Historic Places.	Project must take into account the effect on properties included or eligible for inclusion in the Register of Historic Places.

Key:
TBC - to be considered

TABLE 5-3
ACTION-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

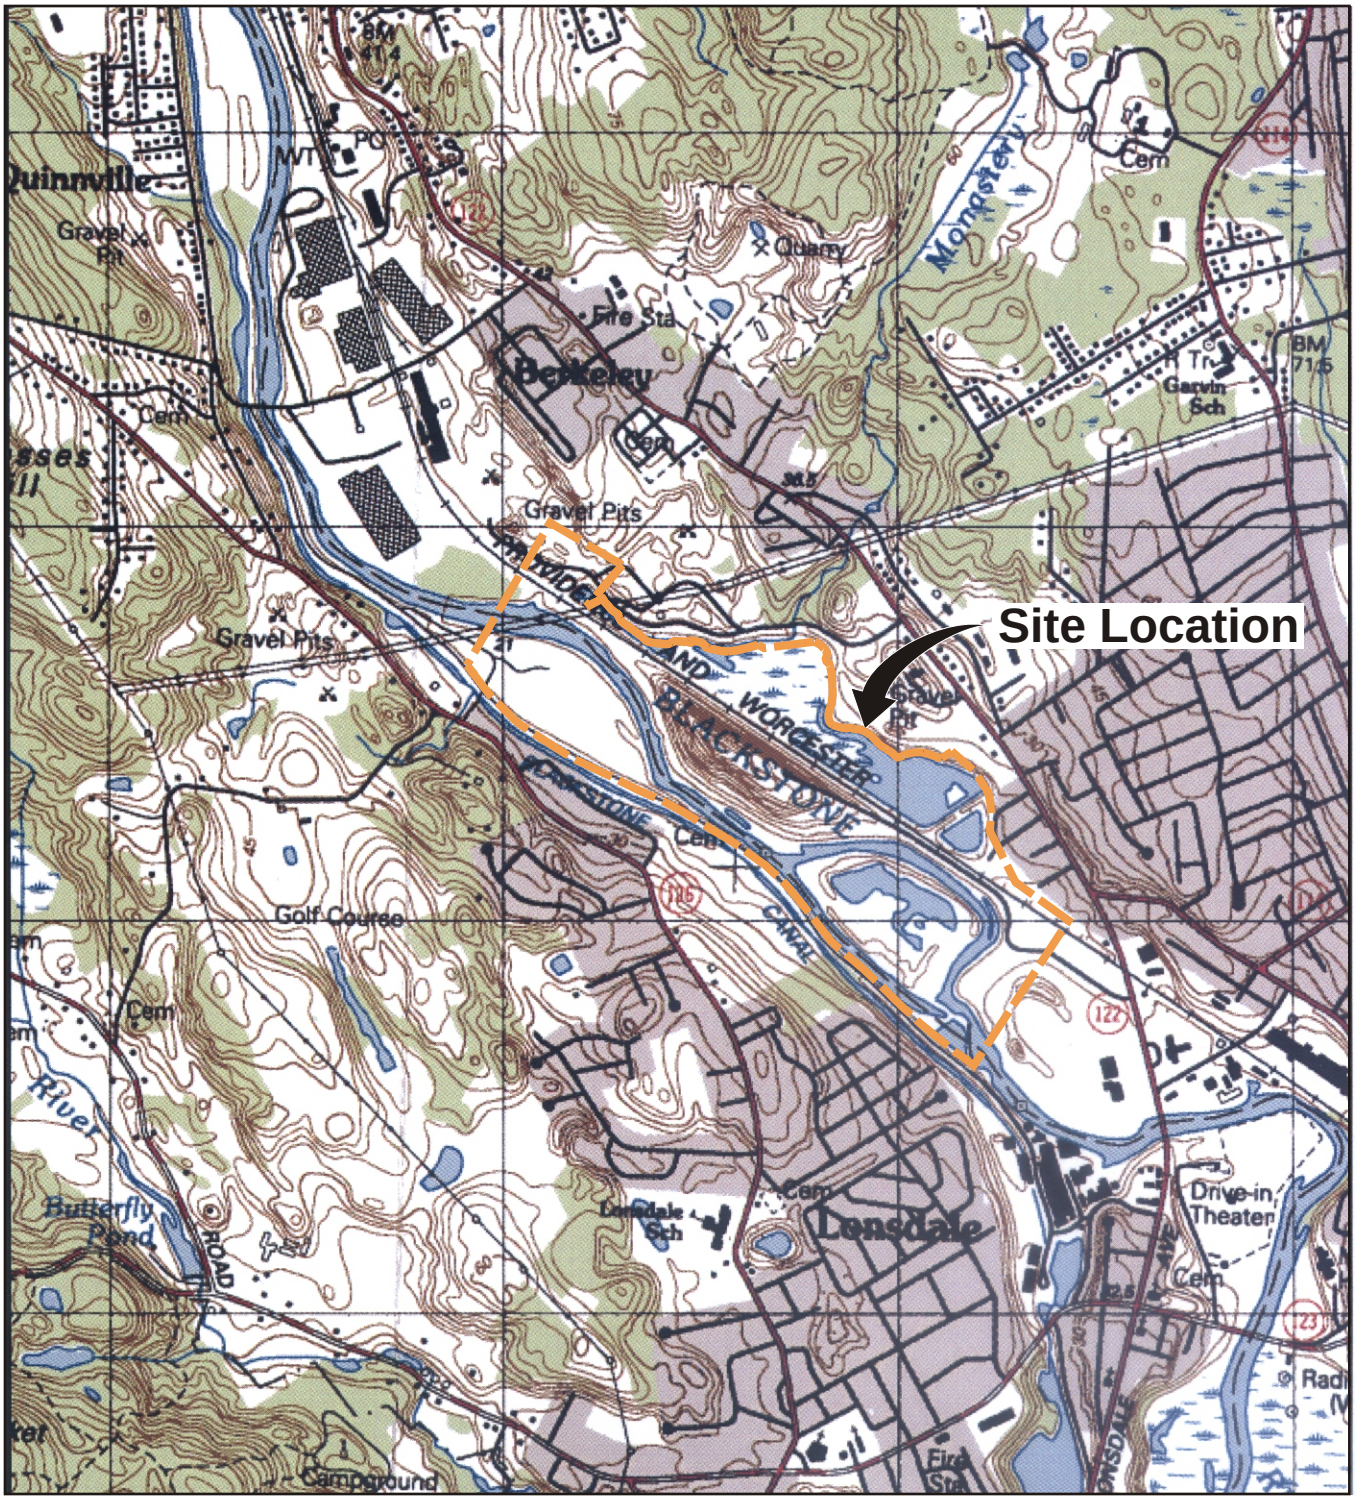
Requirement	Status	Synopsis	Potential Application
Action-Specific ARARs			
Federal Requirements			
TSCA PCB regulations (40 CFR 761, Subparts B and C)	Applicable	Establishes requirements for addressing PCB-contaminated remediation waste.	PCBs are present at the site.
Safe Drinking Water Act Maximum Contaminant Levels (MCLs), 40 CFR 141.11-141.13	R & A	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.	MCLs are relevant and appropriate as the groundwater at the site is a source/ potential federal drinking water source. These standards would be used to evaluate the effectiveness of alternatives in reducing/preventing migration of contaminants from soil to groundwater.
Safe Drinking Water Act Maximum Contaminant Levels Goals (non-zero MCLGs), 40 CFR 141.50-141.51	R & A	The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.	Non-zero MCLGs are relevant and appropriate as the groundwater at the site is a source/potential federal drinking water source. These standards would be used to evaluate the effectiveness of alternatives in reducing/preventing migration of contaminants from soil to groundwater.
EPA Groundwater Protection Strategy	TBC	Guidelines for consistency in groundwater protection programs focus on the highest beneficial use of the groundwater aquifer and define three classes of groundwater.	Groundwater at the Site is classified as a drinking source/potential drinking water source under the federal classification system.
Invasive Species (Executive Order 13112)	TBC	Federal agencies are directed to prevent the introduction of invasive species and provide for their control and to minimize the economic, ecological, and human health impacts that invasive species cause when requiring actions that impact the environment.	Actions that may be taken in the river, wetlands and/or floodplains could result in the introduction of invasive species.
RCRA (40 CFR 264, Subpart AA)	Potentially Applicable	Air emission standards for process vents apply to process vents that manage hazardous wastes with organic concentrations of at least 10 parts per million by weight (ppmw).	Should operations manage hazardous wastes with organic concentrations of at least 10 ppm by weight, system vents will comply with these requirements.
RCRA (40 CFR 264, Subpart BB)	Potentially Applicable	Air emission standards for equipment leaks apply to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight.	Should equipment contain or come into contact with hazardous wastes containing organic concentrations of at least 10% by weight, these regulations will be followed.
Emission Guidelines (40 CFR Part 60, Subpart Cc) NSPS (40 CFR Part 60 Subpart	R & A	Air emission standards for municipal solid waste landfills.	Site remediation activities may require vents as part of landfill closure.
RCRA (40 CFR 264, Subpart CC)	Potentially Applicable	Air emission standards for tanks, surface impoundments, and containers used to manage hazardous waste. Emission controls required if tanks, surface impoundments, and containers used to manage hazardous waste have more than 500 ppmw of volatile organics.	If tanks, surface impoundments, and containers used to manage hazardous waste have more than 500 ppmw of volatile organics, then these requirements will be met.

TABLE 5-3
ACTION-SPECIFIC ARARs

REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
Federal Requirements Cont.			
National Emission Standards for Hazardous Air Pollutants for MSW landfills (40 CFR Part 63 Subpart AAAA)	Potentially Applicable or R & A	Air emission standards for hazardous air pollutants from municipal solid waste landfills.	Site remediation activities may require vents as part of landfill closure.
RCRA Land Disposal Restrictions (40 CFR 268)	Potentially Applicable or R & A	Treatment standards are identified for hazardous wastes and specify requirements that generators, transporters, and owners/operators of treatment, storage, and disposal facilities that manage wastes destined for land disposal must meet.	Material subject to these regulations must be treated to meet these requirements.
State Requirements			
RIDEM Rules and Regulations for Hazardous Waste Management, Sections 1-5	*Potentially Applicable or R & A*	Outlines requirement for general waste analyses, security procedures, inspections, safety, etc.. Sets design, construction, and operational requirements for hazardous waste containers and tanks, and closure requirements for hazardous waste facilities.	If remediation at the site includes any of these activities, substantive requirements must be met.
RIDEM Rules and Regulations for Hazardous Waste Management, Section 8 – Operation Requirements for Treatment, Storage, and Disposal Facilities	Potentially Applicable or R & A	Outlines operational requirements for all hazardous waste treatment, storage, and disposal facilities.	If remediation at the site includes any of these activities, substantive requirements must be met.
Rhode Island Rules and Regulations for Solid Waste Management, Regulations Nos. 1, 2 and 4	Potentially Applicable or R & A	Outlines requirements for operation of solid waste facilities including construction of final covers and leachate collection systems; monitoring plans and waste incineration.	Some solid waste has been disposed of at the site.
Rhode Island Rules and Regulations for Hazardous Waste Management, Section 9	Potentially Applicable or R & A	Outlines operational requirements for all hazardous waste treatment, storage, and disposal facilities.	If remediation at the site includes any of these activities, substantive requirements must be met.
Rhode Island Rules and Regulations for Hazardous Waste Management, Section 10	Potentially Applicable or R & A	Outlines design, operational, and closure requirements for new hazardous waste landfills.	If remediation at the site includes any of these activities, substantive requirements must be met.
RIDEM Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (i.e., Remediation Regulations), Section 8.0 (Risk Management)	Applicable	These rules establish criteria for cleanup of contamination caused by a release of hazardous material. This section regulates impacted media (soil and groundwater only) at contaminated sites and sets risk standards under state law. (1×10^{-5}).	This section would be used to develop cleanup goals for the site.
RIDEM Closure Policy for Inactive or Abandoned Solid Waste Landfills, 3/1/2007	Applicable	Provides alternative closure options for solid waste landfills which ceased operation prior to April 1992 and have not received a Certificate of Closure.	Presents alternate standards for closure of qualifying landfills

TABLE 5-3
ACTION-SPECIFIC ARARs



REMEDIAL INVESTIGATION REPORT
PETERSON PURITAN SITE - OPERABLE UNIT 2, CUMBERLAND AND LINCOLN, RHODE ISLAND

Requirement	Status	Synopsis	Potential Application
State Requirements Cont.			
RIDEM Water Quality Regulations	Applicable	Provides water classification for surface waters in Rhode Island and sets ambient water quality criteria for toxic substances and governs water quality impacts associated with site activities.	Remediation activities may affect water quality.
RIDEM Regulations for the Rhode Island Pollutant Discharge Elimination System (RIPDES)	Potentially Applicable	Sets requirements for discharges to surface waters and to protect waters from discharges of pollutants.	Remediation activities may require discharge of water to the River.
RIDEM Rules and Regulations for Groundwater Quality	Applicable	Establishes construction standards for permanent monitoring wells and abandonment procedures (Appendix 1).	The site contains monitoring wells.
Protection of Public Drinking Water	Potentially Applicable	Applicable to remedial alternatives that affect public drinking water supplies.	Remedial activities could impact public water supply.
RIDEM Pretreatment Regulations	Potentially Applicable	Applicable for any remedial action where treated or untreated liquids are discharged to a Publically Owned Treatment Works (POTW) facility.	Remedial activities could include discharge to a POTW.
RI Air Pollution Control Regulation #1: Visible Emissions	Applicable	Establishes opacity limitations for contaminant emissions.	Remediation activities could potentially result in visible emissions. If these standards are exceeded, emissions would need to be managed through engineering controls.
RI Air Pollution Control Regulation #5: Fugitive Dust	Applicable	Requires that reasonable measures be taken to prevent particulate matter from becoming airborne.	Remediation activities could potentially result in fugitive dust. Appropriate measures would need to be taken to prevent particulate matter from becoming airborne.
RI Air Pollution Control Regulation #7: Emissions Detrimental to Persons or Property	Applicable	Prohibits emissions of contaminants that may be injurious to human, plant, or animal life or cause damage to property or which unreasonably interfere with the enjoyment of life and property.	Remediation activities may result in emissions.
RI Air Pollution Control Regulation #15: Control of Organic Solvent Emissions,	Potentially Applicable	Limits the amount of organic solvents emitted to the atmosphere.	Remediation activities could result in emission of organic solvents to the atmosphere.
RI Air Pollution Control Regulation #22: Air Toxics Air Toxics Guideline, and Air Modeling Guidelines	Potentially Applicable	Prohibits the emissions of specified contaminants that result in ground level concentrations greater than ambient level concentrations.	Remediation activities could result in emission of toxics to the atmosphere.

NOTES:

1. SAMPLE LOCATIONS AND BASEMAPPING ARE IN THE COORDINATE SYSTEM: STATE PLANE RHODE ISLAND NAD 83 FEET. LOCATIONS RECORDED IN THE FIELD USING GPS.
2. LOCATIONS WITH MULTIPLE LABELS (E.G., SO-023-LF AND LOU-001) REPRESENT STATIONS WHERE SAMPLING RETURNED TO THE SAME LOCATION IN 2005 DURING THE PHASE IB INVESTIGATION AND COLLECTED AN ADDITIONAL SURFACE SOIL SAMPLE TO BE ANALYZED FOR DIOXIN/FURANS.
3. SUBSURFACE SOIL LOCATIONS CAN HAVE MULTIPLE DEPTH INTERVALS COLLECTED. SAMPLE IDs FOR SOIL SAMPLES COLLECTED AT DEPTH DIFFER FROM THEIR SAMPLE STATION ID.

NOTES:
1) SAMPLE LOCATIONS ARE IN THE COORDINATE SYSTEM STATE PLANE RHODE ISLAND NAD 83 FEET. LOCATIONS RECORDED IN THE FIELD USING GPS.
2) RESULTS REPRESENT THE CUMULATIVE SURFACE SOIL (0-1' INTERVALS DEPTHS ONLY) SAMPLES COLLECTED FROM THE BEGINNING OF PHASE 1A IN 2003 THROUGH THE SUPPLEMENTAL UNNAMED ISLAND INVESTIGATION IN 2009. THE PAHs SELECTED REPRESENT THOSE MOST FREQUENTLY DETECTED AND EXCEEDING THEIR RESPECTIVE PALs.
3) PALs ARE TAKEN DIRECTLY FROM THE 2009 QAPP REVISION COMPLETED AND APPROVED PRIOR TO THE 2009 UNNAMED ISLAND SUPPLEMENTAL SAMPLING EVENT.
4) ALL RESULTS ARE IN (µg/kg).

NOTES:
1) SAMPLE LOCATIONS ARE IN THE COORDINATE SYSTEM STATE PLANE RHODE ISLAND NAD 83 FEET. LOCATIONS RECORDED IN THE FIELD USING GPS.
2) RESULTS REPRESENT THE CUMULATIVE SURFACE SOIL (0-1' INTERVALS DEPTHS ONLY) SAMPLES COLLECTED FROM THE BEGINNING OF PHASE 1A IN 2003 THROUGH THE SUPPLEMENTAL UNNAMED ISLAND INVESTIGATION IN 2009. THE PAHs SELECTED REPRESENT THOSE MOST FREQUENTLY DETECTED AND EXCEEDING THEIR RESPECTIVE PALs.
3) PALs ARE TAKEN DIRECTLY FROM THE 2009 QAPP REVISION COMPLETED AND APPROVED PRIOR TO THE 2009 UNNAMED ISLAND SUPPLEMENTAL SAMPLING EVENT.
4) ALL RESULTS ARE IN (mg/kg).

Plates (originally prepared by Shield)

No.	Revision/Issue	Date
1	ORIGINAL SUBMITTAL	1/2005
2	EPA REQUESTED REVISIONS	2/2006

General Notes

DO NOT SCALE DRAWINGS

Use given dimensions only. If not shown, verify, and document correct dimensions with the engineer. Contractor shall check and verify all dimensions and conditions at the job site.

All distances and elevations are to be field checked.

All pipings and fittings shall conform to and be installed as per ANSI/AWWA standards.

ALL RIGHTS RESERVED

This drawing is the property of Shield Environmental Associates, Inc. and shall not be reproduced in whole or in part. This drawing shall not be used for construction of any other project without the written consent of Shield Environmental Associates, Inc.

The contractor shall hold harmless and indemnify the engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for or on account of any personal injury or property growing out of, occuring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the contractor, any subcontractor, any employee, agent or representative.

General Notes

DO NOT SCALE DRAWINGS

Use given dimensions only. If not shown, verify, and document correct dimensions with the engineer. Contractor shall check and verify all dimensions and conditions at the job site.

All distances and elevations are to be field checked.

All pipings and fittings shall conform to and be installed as per ANSI/AWWA standards.

ALL RIGHTS RESERVED

This drawing is the property of Shield Environmental Associates, Inc. and shall not be reproduced in whole or in part. This drawing shall not be used for construction of any other project without the written consent of Shield Environmental Associates, Inc.

The contractor shall hold harmless and indemnify the engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for or on account of any personal injury or property growing out of, occuring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the contractor, any subcontractor, any employee, agent or representative.

SW-014-WT	9/4/2003	351040	305533	Surface Water	WT-C, north shore near PZ-13
SW-015-WT	9/4/2003	351365	305705	Surface Water	WT-C, Monastery Brook just downstream of road
SW-016-WT	9/4/2003	349270	306035	Surface Water	WT-D, north end near PZ-15
SW-017-WT	9/5/2003	350890	305078	Surface Water	WT-C, southwest shore along RR, near PZ-12
SW-018-WT	9/5/2003	350496	305336	Surface Water	WT-C, southwest shore along RR, northwest of PZ-12
SW-019-WT	9/5/2003	351002	304113	Surface Water	Pond B near PZ-03
SW-020-LF	9/5/2003	351481	303930	Surface Water	Pond C, close to PZ-02
SW-021-WT	9/5/2003	353121	303354	Surface Water	Inlet off Blackstone River adjacent to Nunes Property
SW-022-BR	9/5/2003	345490	312537	Surface Water	Blackstone River 250 ft upstream of Ashton Dam
SW-023-BR	9/6/2003	352567	302605	Surface Water	Back channel, downstream end, neashore location (subsample A)
SW-024-BR	9/6/2003	352135	302922	Surface Water	Back channel, off of UI bank
SW-025-BR	9/6/2003	351456	303575	Surface Water	Back channel, middle, upstream end
SW-026-BR	9/8/2003	352690	302735	Surface Water	Main channel upstream of Pratt Dam, subsample A location close to PZ-06
SW-FD-02	9/8/2003	352690	302735	Surface Water	Main channel upstream of Pratt Dam, same as SE-026-BR
SW-027-BR	9/8/2003	352779	303669	Surface Water	Main channel near MW-111
SW-028-BR	9/8/2003	352320	303984	Surface Water	Main channel off landfill bank, near PZ-01
SW-029-BR	9/9/2003	351551	303889	Surface Water	Main channel off landfill bank, near Pond C
SW-FD-03	9/9/2003	351551	303889	Surface Water	Main channel near Pond C, same as SE-029-BR
SW-030-BR	9/9/2003	350958	304015	Surface Water	Main channel off landfill bank, near Pond B
SW-031-BR	9/9/2003	350323	304420	Surface Water	Main channel off landfill bank, near P-8
SW-032-BR	9/10/2003	349117	305833	Surface Water	Main channel just downstream of North Inlet
SW-033-BR	9/10/2003	347976	306035	Surface Water	Main channel near P-5
SW-034-BR	9/10/2003	347020	307232	Surface Water	Main channel downstream of Martin Street
SW-049-BR	8/30/2004	346826	310413	Surface Water	North bank downstream of Owens Corning plant
SW-045-BR	8/30/2004	346903	309018	Surface Water	North bank between OC plant and Roger Williams
SW-044-BR	8/30/2004	347061	307158	Surface Water	Near AD+05550 (SE-034-BR), end of peninsula
SW-043-BR	8/30/2004	350184	304781	Surface Water	Near SEA-602A/B, off of LF bank
SW-047-BR	8/30/2004	350628	304243	Surface Water	Near SEA-603, off of LF bank

Boring Location/Sample ID	Date Collected	Easting	Northing	Sample Matrix	Comments
SW-041-BR	8/30/2004	351597	303879	Surface Water	Near Pond C, off of opposite (UI) bank
SW-046-BR	8/30/2004	352890	303046	Surface Water	Between Nunes Inlet and Pratt Dam, off of NP bank
SW-FD-11	8/30/2004	352890	303046	Surface Water	Main channel off of NP bank, FD of SW-046-BR
SW-050-BR	8/31/2004	345403	312315	Surface Water	Immediately upstream of Ashton Dam, south bank off dam
SW-051-DF	8/31/2004	349116	305924	Surface Water	Inlet off of Blackstone River north of LF, near DF1-3
SW-055-WT	8/31/2004	349320	306016	Surface Water	WT-D, southeast of PZ-15
SW-048-BR	8/31/2004	349566	305538	Surface Water	Downstream of North Inlet, off of QW bank
SW-042-BR	8/31/2004	352690	302735	Surface Water	Middle of main channel, same as SW-026-BR
SW-054-BR	9/1/2004	345628	312400	Surface Water	Immediately upstream of Ashton Dam, north bank
SW-052-WT	9/1/2004	349324	306113	Surface Water	Ditch draining sand and gravel pit, north of WT-D
SW-059-WT	9/1/2004	351440	305562	Surface Water	Mouth of Monastery Brook downstream of road
SW-062-WT	9/1/2004	351508	305289	Surface Water	WT-C, mid-pond, northeast area, north of MW-EA-2
SW-061-WT	9/1/2004	352372	304608	Surface Water	WT-B, off-shore, west of MW-EA-1
SW-058-WT	9/1/2004	352774	304071	Surface Water	WT-A, middle, deepest part
SW-070-LF	9/2/2004	350926	304138	Surface Water	Pond B, middle, northwest of PZ-03
SW-064-BR	9/2/2004	351791	303170	Surface Water	Middle of back channel off of UI bank
SW-060-WT	9/2/2004	351895	304852	Surface Water	WT-B, northeast shore
SW-057-WT	9/2/2004	352084	304607	Surface Water	WT-B, off-shore, middle
SW-065-BR	9/2/2004	352478	302602	Surface Water	Back channel off of canal bank, southeast end
SW-069-NP	9/2/2004	353122	303341	Surface Water	Inlet off BR main channel next to NP, close to SE-021-NP
SW-FD-12	9/2/2004	353122	303341	Surface Water	PDI-02-NP, same as SW-069-NP
SW-073-LF	9/3/2004	350848	304184	Surface Water	Pond B, northwest end
SW-067-BR	9/3/2004	352007	302937	Surface Water	Back channel off of canal bank
SW-066-BR	9/3/2004	352272	302718	Surface Water	Back channel off of canal bank
SW-076-UI	9/3/2004	352313	303353	Surface Water	Pond D, north shore
SW-075-UI	9/3/2004	352417	303137	Surface Water	Pond D, middle off south shore
SW-063-WT	9/6/2004	350942	305250	Surface Water	WT-C, off-shore, north of PZ-12
SW-072-BR	9/6/2004	351393	303624	Surface Water	Back channel off of canal bank, northwest end
SW-071-BR	9/6/2004	351567	303403	Surface Water	Back channel off of canal bank
SW-077-UI	9/6/2004	351696	303493	Surface Water	Small pool northwest of Pond A on UI
SW-068-BR	9/6/2004	351730	303184	Surface Water	Back channel off of canal bank
SW-078-UI	9/6/2004	352438	303325	Surface Water	Pond E, north shore
SW-083-BR	9/6/2004	352717	302444	Surface Water	Pond F, northwest area, near-shore
SW-082-BR	9/6/2004	352820	302413	Surface Water	Pond F, northeast area, near-shore
SW-080-UI	9/7/2004	351994	303594	Surface Water	Pond A, middle (west end)
SW-084-UI	9/7/2004	352049	303465	Surface Water	Pond A, west shore
SW-086-UI	9/7/2004	352149	303734	Surface Water	Pond A, northeast shore
SW-085-UI	9/7/2004	352447	303427	Surface Water	Pond A, southwest shore
SW-079-UI	9/7/2004	352447	303531	Surface Water	Pond A, middle (deepest part)
SW-FD-13	9/7/2004	352447	303531	Surface Water	Pond A, middle, same as SW-079-UI
SW-056-UI	9/7/2004	352447	303531	Surface Water	Pond A, middle, same location as SW-079-UI, near bottom
SW-087-UI	9/7/2004	352478	303603	Surface Water	Pond A, east shore
SW-081-BR	9/7/2004	352703	302372	Surface Water	Pond F, southwest area (deepest part)
SW-053-WT	9/9/2004	352950	304500	Surface Water	WT-B, on northeast shore below Panda Culvert
SW-074-LF	9/10/2004	351471	303952	Surface Water	Pond C, northwest of PZ-02

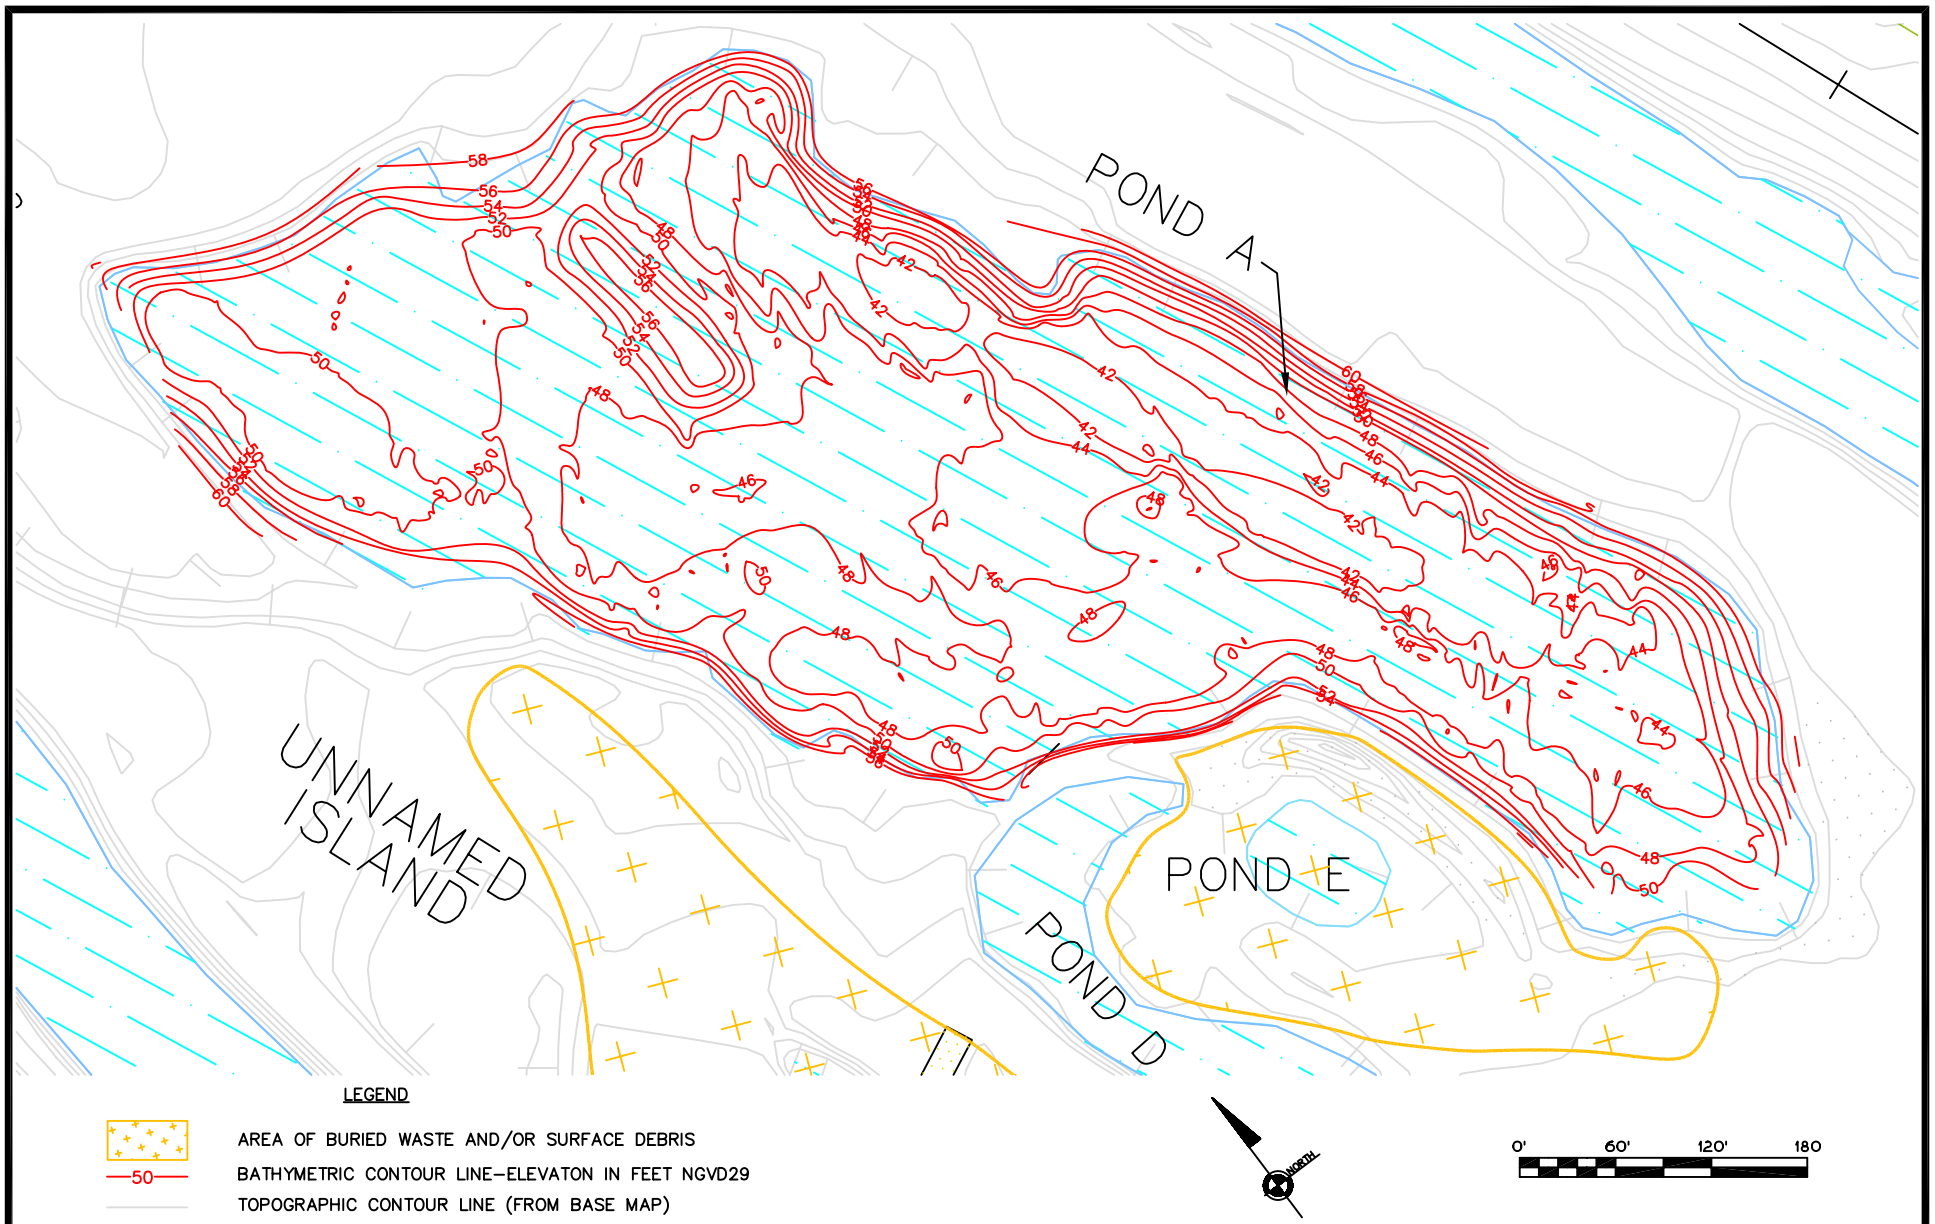
Notes:

Measuring point (MP) is the top of the inner casing (riser) for wells and piezometers (PZ), or a notch in the concrete headwall above the culvert for the headwall (HW) points.



All elevations are reported in this table relative to NGVD29 datum. All elevations were originally surveyed relative to NAVD88, and converted to NGVD29 by adding 0.79 ft.

All elevations surveyed by Tilton & Associates, Inc. of North Attleboro, Massachussetts, in August-September 2003, and September-October 2004.

Shaded values were reported as different values in 2003. They have been corrected after verification surveying performed in October 2004. Values reported prior to October 2004 should be disregarded.

Subject: Geophysical Investigation at the Peterson / Puritan OU-2 Facility
Cumberland, Rhode Island

Dear Ms. Dunn:

In accordance with your authorization, Weston Geophysical Engineers conducted a geophysical investigation at the above referenced site. The purpose of the geophysical survey is to provide electromagnetic earth conductivity information on possible zones of leachate downgradient from the landfill and to assist in the delineation of the boundary of landfill material.

The enclosed report documents our findings and provides recommended locations for further investigation. The field effort was completed on August 13th, 2003 and preliminary results were submitted to Shield on August 18th, 2003.

We appreciate this opportunity to provide you with our services, please call the undersigned if you have any questions.

Sincerely,

WESTON GEOPHYSICAL ENGINEERS

APPENDIX A – Electromagnetic Induction Standard Operating Procedure

Introduction

The purpose of this investigation was to locate possible leachate conditions downgradient of the landfill between the toe of the landfill and the Blackstone River through the implementation of an electromagnetic induction survey (EMI). The EMI method is capable of detecting electrical conductivity contrasts between contaminated and uncontaminated soils and other earth materials. This information is anticipated to help support the Remedial Investigation/Feasibility Study (RI/FS) activities at the site by providing possible leachate locations to focus further intrusive investigations at the site.

Prior to the geophysical investigation, three survey line paths were established to provide easy access and to clear a majority of the surface metal debris from the survey area. The extent of the vegetation and the debris encountered along the proposed profile line locations prohibited the creation of three continuous parallel survey lines. Shield environmental established the lines throughout the survey area. The geophysical field effort was completed on August 12th and 13th, 2003.

Geophysical Survey Methodology

The area investigated included an approximate 2,900-foot by 100-foot area between the toe of the landfill and the Blackstone River. One continuous EMI profile line (2,900 feet) along the recently constructed road was acquired as well as two other profile lines; one along the southern portion starting near Station 600 continuing along the river bank, the other profile line started adjacent to Station 2000 and continued on part of the landfill slope while remaining parallel to the longer continuous profile line.

Survey control points were established at 50-foot increments for each profile line; with wooden survey stakes placed at 200-foot increments, survey lines end points and corners, 50-foot points were marked with plastic pin flags. Field notes were recorded to indicate the location of the survey lines relative to existing cultural features.

The area of geophysical investigation is shown on Figure 1. The point locations indicated on the plan map correspond to geophysical profile line stationing at every 200 feet. These points were placed in the field by measured distances along the line and later located relative to the site coordinates by differentially corrected GPS measurements provided by Shield Environmental.

An EMI survey was conducted along each of the survey lines. EMI data were processed by custom designed software that converts the raw EMI data to user specified coordinate data with in-phase and quadrature component electromagnetic conductivity values. The data were organized for import into commercially available contour software packages through the use of command language processing routines. Preliminary profile data was available for examination at the conclusion of each survey line. Color-coded conductivity profile lines of the various EMI components were generated for inclusion in this report.

A Geophex GEM-2 multifrequency electromagnetic induction instrument was used because it offers increased detection and characterization capabilities over other, commercially available EMI instruments. This multi-frequency and high speed data acquisition system provides higher resolution data than the other systems, enabling additional data on possible depth parameters and closer spaced sampling. The GEM-2 multifrequency electromagnetic instrument is a self-contained lightweight programmable digital recording system capable of recording EMI response data at up to 10 transmitter frequencies (270 to 18,210 Hz) and at a sampling rate of 0.2 second.

The optimum EMI frequency settings for this investigation were determined through a test profile along the centerline path prior to the acquisition of the EMI data. Five frequencies were selected from this test because of their low signal to noise ratio. The five frequencies (330, 930, 2,790, 8,190, and 15,150 Hz) were then programmed into the GEM control unit set to record at 0.2 second intervals). Normal walking speed translates this sampling rate to a sample rate of approximately 1 sample every 1.5-foot.

Additionally, when configured with a low frequency (330Hz), the signal response at this low frequency is equivalent to the magnetic susceptibility for each of the data samples. This data can be useful in discriminating the leachate from possible buried metal objects.

The procedure for this investigation is further detailed in Appendix A – EMI Standard Operating Procedure.

Results

The results of this investigation can be shown through a number of presentation methods. The presentation used by Weston to indicate the possible leachate locations is best described as a composite graph indicating the summation of all of the inphase and quadrature components. Figure 2 shows this composite profile with all three profiles shown relative to each other as well as the indicated recommended locations for further intrusive investigation. This figure was submitted in a preliminary format on August 18th, 2003.

The profile data shown on Figure 2 are the “weighted-average” smoothed profile data. The weighted-average processing removed most of the high frequency noise generated by the abundant surface and near surface metallic debris.

Significant observations can be made from the interpretation of this figure; specifically, the near flat signal along Line 2 which is closer to the river bank, and where Line 1 is closest to the river shoreline, show that both of these areas have very little conductivity changes, indicating that the data are not indicative of landfill material and that there are no indications of zones of significant leachate contamination.

Additionally, the EMI profile data in the areas along the beginning of Line 1 and all of Line 3 are consistent with results anticipated for landfill material. This was visually confirmed while acquiring the data in these areas. Line 2 intersects a portion of an area described on the plan map as Pond B. The EMI signal in this area indicates a lower conductivity than that of the surrounding area; this may be an indication of concentration of leachate in the pond area.

Recommendations

The recommended locations for further investigation are shown on Figure 2. This figure includes station locations for each of the three profile lines that we would recommend for further investigation to confirm the presence of higher concentrations of leachate or some other cause. The recommended locations typically are locations where the quadrature component is anomalously lower or higher than the adjacent areas. The anomalous quadrature areas were then compared to the inphase component to provide an indication of the source of the anomalous conductivity.

The following table summarizes the location shown on Figure 2:

Line 1 Station 0125	Confirmation of Debris Field 4
Line 1 Station 0250	Low Quadrature – Low Inphase
Line 1 Station 0550	Low Quadrature – High Inphase
Line 1 Station 1125	Low Quadrature
Line 1 Station 1400	Lowest Quadrature Component Values
Line 1 Station 1725	High Quadrature – Low Inphase
Line 2 Station 0350	Low Quadrature at Pond B
Line 3 Station 0350	Low Quadrature – High Inphase

APPENDIX A

Electromagnetic Induction Standard Operating Procedure

Application

This Scope of Work (SOP) is provided as a guide for conducting a geophysical electromagnetic induction (EMI) survey using a Geophex GEM-2 Conductivity Meter. A surface EMI survey can be conducted to locate buried materials or anomalies and/or to identify ground water plumes with elevated electrical conductivity characteristics.

Equipment and Supplies

The following equipment and supplies will be available for conducting an EMI survey:

- Project Scope of Work and Health and Safety Plan (HASP) as provided by SHIELD
- Geophex GEM-2 Conductivity Meter
- Personal protective equipment (PPE), as appropriate
- Field logbook
- Site map
- Camera
- Measuring tape(s)
- Global Positioning System (GPS) equipment
- Survey flags and other marking materials

Procedures

The following procedures will be adhered to when conducting an EMI survey:

1. The Scope of Work will be reviewed to determine survey parameters and location.

2. The required equipment will be assembled and tested in accordance with normal operating procedures.

3. The appropriate PPE will be donned. The appropriate level will be determined prior to arrival at the site.

4. Proposed EMI grid pattern traverses will be positioned by taped distance measurements relative to a pre-determined starting location relative to the toe of the slope of the landfill and further reference to roads, buildings, or other semipermanent features and the existing site coordinate system, if appropriate.

5. Bush cutting, if needed, will be performed by others before geophysical data collection to enable the field geophysicist to walk at a uniform pace.

6. Uniform (every 50-feet) traverse stations will be marked on the ground surface using chalk, spray paint, or labeled pin flags or stakes, as appropriate. At this time the individual traverse line spacing is determined to be 40-feet. It is anticpated that the traverse lines may be separated into 3 sections to facilitate stationing around the three sides of the landfill. The traverse stations will be determined with a fiberglass measuring tape or distance-measuring wheel, as appropriate. Traverse deviations (i.e., obstacles or traverse bends) will be noted in the field logbook or data sheet. Traverse orientations will be recorded in the field logbook or data sheet, or on a plan map (if available).

7. Site conditions will be observed for power lines or aboveground metal objects within approximately 20 feet of a survey traverse since they may adversely affect EMI conductivity measurements. Anomalies caused by buried metal objects within those regions may be difficult to distinguish from anomalies caused by aboveground objects or subsurface lines or utilities.

8. The Geophex GEM-2 instrument will be assembled and functionally checked in accordance with the manufacturer's instructions prior to a survey.

9. The instrument will be set to record data in the vertical dipole mode.

10. The instrument will be set to record both inphase and quadrature components of the EMI field data. The instrument will be configured to record each of these components at 4 separate transmitter frequencies. Typically, one at a very low frequency for magnetic susceptibility, and the other three to cover a wide range of frequencies (1,000 to 15,000 Hz).

11. The traverse will be walked at a steady pace with the instrument held approximately 3 feet above the ground. Data values are recorded at 0.2-second time intervals (approximately 1-foot distance intervals at an ordinary walking pace). The beginning and end of each traverse will be denoted as well as intermediate distance marks at periodic intervals appropriate to the survey scale.

12. A field logbook or data sheet will be maintained during each survey to record EMI traverse positions and nearby features such as monitoring wells, surface metal, or other field observations.

Quality Assurance/Quality Control (QA/QC)

The following QA/QC procedures will be adhered to:

1. The Geophex GEM-2 instrument is calibrated at the time of manufacture and does not require additional calibration. The instrument however can be tuned to a site-specific conductivity. The Geophex GEM-2 instrument is tuned at the start of each day by recording the effect of a ferrite rod placed over the receiving coil. The deviation of the quadrature and inphase measurement can then applied to the field data prior to final presentation of the data.

2. EMI data values are visible on a digital screen as the data are acquired. The operator will observe the values as they are acquired to confirm proper functioning of the EMI instrument.

3. Digitally recorded EMI data will be transferred in the field to a laptop computer for contouring or plotting. Draft EMI contour maps of each component as well as a sum of all the quadrature components and magnetic susceptibility are typically prepared on the site using Golden Software Surfer contouring program with a Kriging grid algorithm. These contour maps (if prepared) will be examined for EMI anomalies that resemble metallic objects, areas of elevated conductivity, or other conditions judged to be relevant to the client's survey objectives. A second geophysicist will check all preliminary EMI interpretations prior to determining final interpretations.

Subject: Geophysical Investigation at the Un-named Island
Peterson / Puritan OU-2 Facility, Cumberland, Rhode Island

Dear Ms. Dunn:

In accordance with your authorization, Weston Geophysical Engineers conducted additional geophysical investigation at the above referenced site, specifically around the perimeter of the Un-named Island. The field effort was completed on October 7th, 2003. The purpose of the geophysical survey was to provide electromagnetic earth conductivity information on the extent of possible buried debris zones around the "Pond A" area.

The attached summary and figures documents our findings and provides recommended locations for further investigation. The summary and figures were prepared with the same criteria as our report for the landfill investigation. This submission can be inserted as an addendum to the landfill report.

We appreciate this opportunity to provide you with our additional services, please call the undersigned if you have any questions.

Sincerely,

WESTON GEOPHYSICAL ENGINEERS

Peter B. Hubbard
Project Geophysicist

pbh:W351: attachment

Raleigh, North Carolina

Introduction

The purpose of this investigation was to locate possible buried debris around the perimeter of the Un-named Island adjacent to the OU-2 facility through the implementation of an electromagnetic induction survey (EMI). The EMI method is capable of detecting electrical conductivity contrasts between contaminated and uncontaminated soils and other earth materials. This information is anticipated to help provide additional subsurface information in the areas where additional buried debris was found on the island.

Prior to the geophysical investigation, a survey line path was established to provide easy access to the survey area. The geophysical field effort was completed on October 7th, 2003.

Geophysical Survey Methodology

The area investigated included an approximate 2,870-foot continuous profile line around the island starting in the southeast continuing counter clockwise around the island and ending in the southwest. One continuous EMI profile line (2,900 feet) was acquired as well as an additional 200-foot line extending from the gravel road to a point believed to be off the buried debris material.

Survey control points were established at 100-foot increments for each profile line; with wooden survey stakes placed at 300-foot increments, survey lines end points and corners, 100-foot points were marked with plastic pin flags. Field notes were recorded to indicate the location of the survey lines relative to existing cultural features.

The wooden stake points will be surveyed using GPS. These points were placed in the field by measured distances along the line and later located relative to the site coordinates by differentially corrected GPS measurements provided by Shield Environmental.

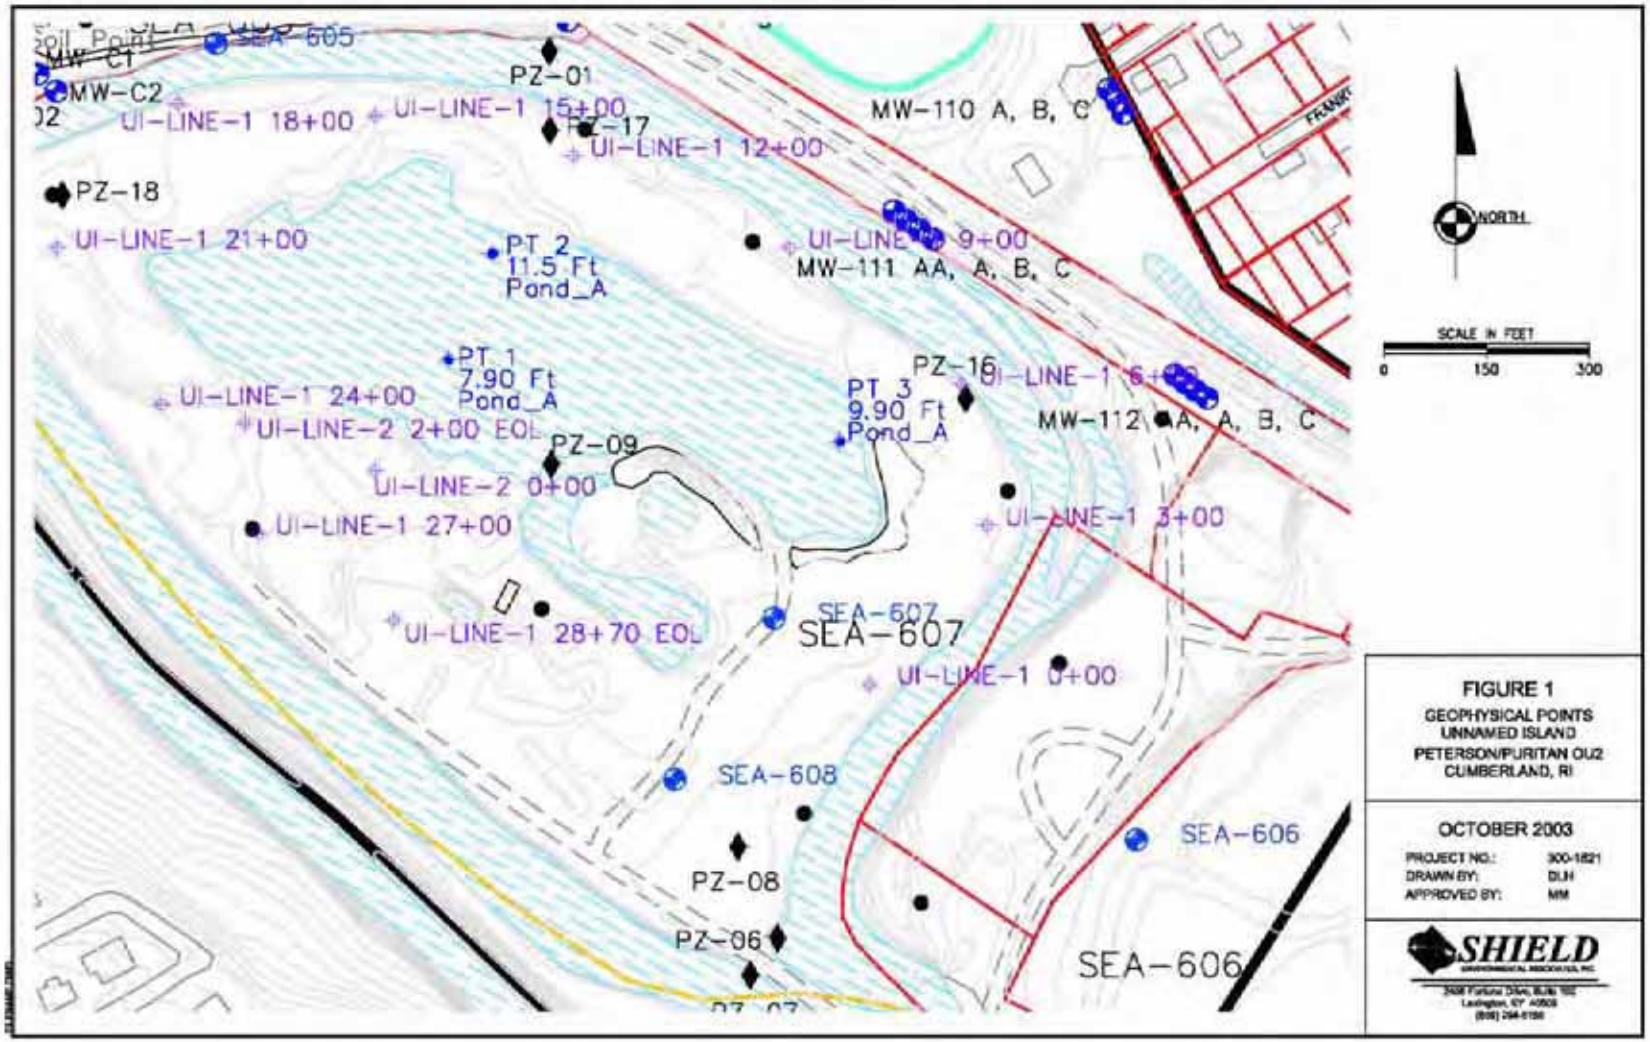
An EMI survey was conducted along each of the survey lines. EMI data were processed by custom designed software that converts the raw EMI data to user specified coordinate data with in-phase and quadrature component electromagnetic conductivity values as well as apparent conductivity and magnetic susceptibility. The data were organized for import into commercially available contour software packages through the use of command language processing routines. Preliminary profile data was available for examination at the conclusion of each survey line. Color-coded conductivity profile lines of the various EMI components were generated for inclusion in this report.

A Geophex GEM-2 multifrequency electromagnetic induction instrument was used because it offers increased detection and characterization capabilities over other, commercially available EMI instruments. This multi-frequency and high speed data acquisition system provides higher resolution data than the other systems, enabling additional data on possible depth parameters and closer spaced sampling. The GEM-2 multifrequency electromagnetic instrument is a self-contained lightweight programmable digital recording system capable of recording EMI response data at up to 10 transmitter frequencies (270 to 18,210 Hz) and at a sampling rate of 0.2 second.

The optimum EMI frequency settings for this investigation were determined through a test profile along the centerline path prior to the acquisition of the EMI data. Five frequencies were selected from this test because of their low signal to noise ratio. The five frequencies (330, 930, 2,790, 8,190, and 15,150 Hz) were then programmed into the GEM control unit set to record at 0.2 second intervals). Normal walking speed translates this sampling rate to a sample rate of approximately 1 sample every 1.5-foot.

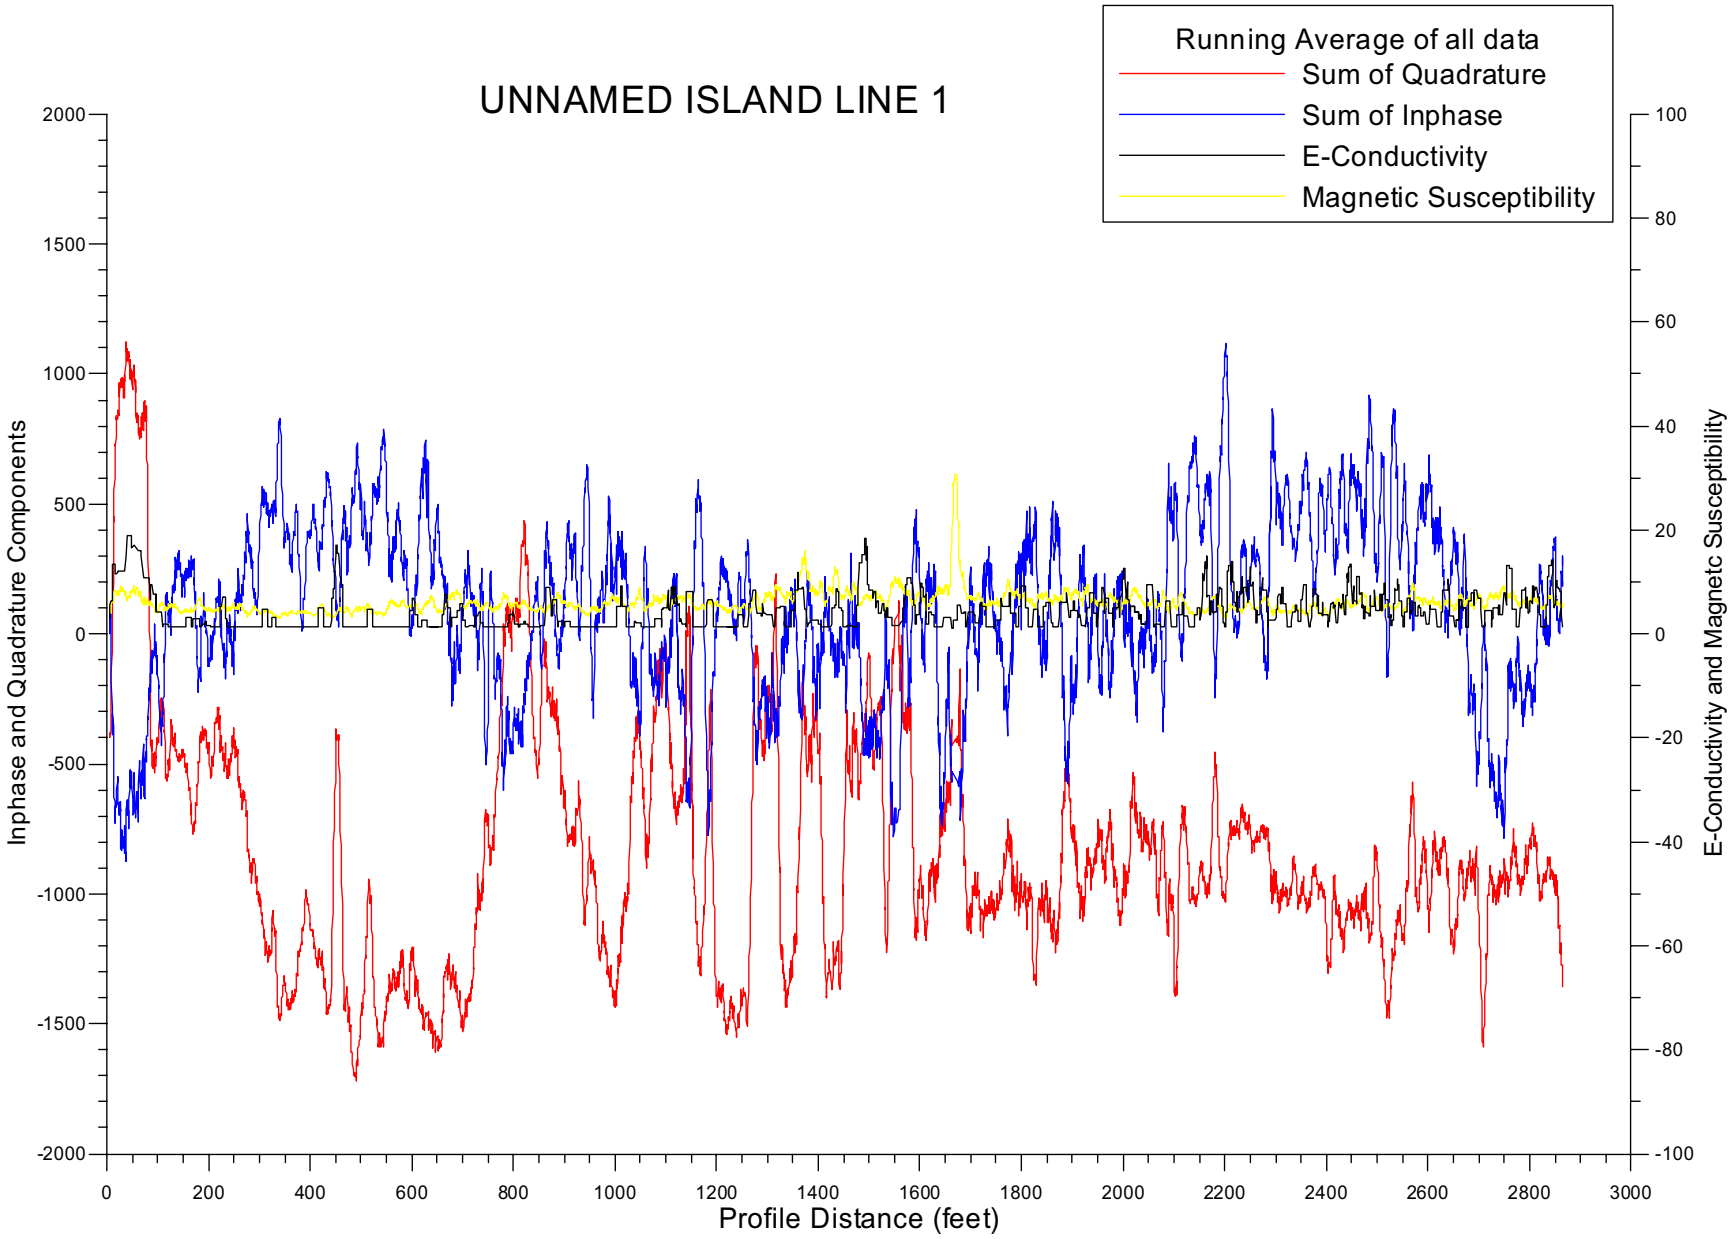
Additionally, when configured with a low frequency (330Hz), the signal response at this low frequency is equivalent to the magnetic susceptibility for each of the data samples. This data can be useful in discriminating the leachate from possible buried metal objects.

Results



The results of this investigation can be shown on the composite graph indicating the summation of all of the inphase and quadrature components. Figure 1 shows this composite profile for the perimeter Line 1. Figure 2 show the results of the profile along Line 2. Additional figures are provided of Line 1 in more detail showing 300-foot sections of the line.

The profile data shown on Figures 1 and 2 are the “weighted-average” smoothed profile data. The weighted-average processing removed most of the high frequency noise generated by the abundant surface and near surface metallic debris.



The following table summarizes the anomalous location shown on Figure 1 and 2:

Line 1 Stations 0700 to 1700	High Frequency – High Conductivity signal
Line 2 Stations 0000 to 0120	High Frequency – High Conductivity signal

RE: Summary Report for Direct Sensing Services
J. M. Mills Landfill
Cumberland, Rhode Island
ZEBRA Proposal #: DS07230

Dear Ms. Dunn:

The following is a summary of site activities performed by ZEBRA Environmental at the J.M. Mills Landfill, Cumberland, Rhode Island. The work was performed on August 19 –28, 2003.

PROJECT PERSONNEL ON SITE:
Mr. Mike Morris, Shield Environmental
Mr. Chad Veller, Shield Environmental
Mr. Joseph Sakellis, ZEBRA Environmental
Mr. Daryl VanVranken, ZEBRA Environmental

SUMMARY OF SITE ACTIVITIES

ZEBRA mobilized a fully equipped Electrical Conductivity/Membrane Interface Probe System (EC/MIP) mounted in a 4x4 GMC Van to the site. The "data acquisition vehicle" carried the system controller unit, notebook computer, printer, O.I. Analytical Model 4430 Photoionization Detector (PID) and Flame Ionization Detector (FID), Hewlett Packard Model G1223A, Electron Capture Detector (ECD), generator and all required compressed gases, two (2) complete assemblies of MIP probes, probe rods and trunk lines, as well as all the tools and supplies needed for the EC/MIP logging. The ZEBRA field team utilized a truck mounted Model 5400 Geoprobe unit to advance the EC/MIP probes into the subsurface.

The project involved collecting EC/MIP logs at forty-five (45) locations identified by the representatives of Shield Environmental Associates. Shield Environmental Associates recorded the location of the logging/sampling locations on a site plan.

At each location the EC/MIP probe was advanced to the target depth in 1 foot intervals. As the probe was being driven to depth, the electrical conductivity data and detector responses were being continuously recorded by the system's data acquisition hardware and software. Upon completion of the logging, the probe rod assembly was extracted form the ground and cleaned, and the borehole filled with Portland grout.

The Membrane Interface Probe (MIP) is a percussion tolerant VOC sensor that can continuously log volatile organics that diffuse through a semi-permeable membrane. Using a carrier gas, the VOC's are brought to the surface through tubing, which is connected to a laboratory grade Photoionization Detector (PID), and Electron Capture (ECD), Flame Ionization Detector (FID) for immediate screening. All three of these detectors are mounted in a Hewlett Packard 5890 Series II Gas Chromatograph cabinet.

An integral part of the MIP system is the direct sensing soil conductivity system. This system utilizes a specially designed probe that will withstand the rigors of percussion probing while taking continuous measurements of soil conductivity as it is being driven into the ground. The sensing probe is linked to a control box where the signal is received by a lap top computer. The signal from the probe is matched with precise depth measurements and logged on the screen. The consultant is able to read real time data showing changes in soil conductivity/resistivity. These changes can be used to identify lithology, contaminant plumes, salt-water intrusion, or any other subsurface condition that displays a change in conductivity/resistivity.

A summary of the logging point name and the terminal depth achieved is included below:

Point Name	**Final Depth**	**Point Name**	**Final Depth**	**Point Name**	**Final Depth**
L12895 MIP1	13.39'	L12650 MIP9	30.27'	L12100 MIP17	10.36'

Data Presentation

A Summary Log displaying four channels of data for each location has been prepared for each location. The channels include the soil conductivity log measured in mS/M, the PID, ECD, and FID detector response reported in uV. The Summary Log has been presented in a horizontal format with four channels. The depth below grade is depicted on the X - axis with 0 feet (land surface) located at the bottom left of the page. The maximum depth logged below grade is at the bottom right of the page. Regarding electronic data transfer, all data collected on site has been compiled in an Excel spread sheet and submitted to you.

All logs were left in the custody of Shields on site representative and all drilled holes were sealed and prior to leaving the site.

Data Interpretation

For this project the detectors were run using the highest sensitivity settings. The logs show a negligible response above the baseline for the PID and ECD detectors. If there are volatile organic compounds (VOCs) present, they are below the MIP systems detection limits. Below is a brief overview of the PID and ECD’s operation:

Photo Ionization Detector (PID)

Highly sensitive detector used to detect Hydrocarbons (ionization potential < 10.6 eV)
Compounds of Interest: Volatile Organic Hydrocarbons (Aromatic)
Detection Sensitivity: > 250 PPB
Detection Range: approximately 10^5

The Photo Ionization Detector (PID) responds to molecules whose ionization potential is below 10.6eV, including aromatics and molecules with carbon double bonds. The PID is nondestructive, so the sample can be routed through the PID and passed on, in series, with the FID.

Electron Capture Detector (ECD)
Highly sensitive detector used to detect Halogenated Solvents
Compounds of Interest: Volatile Halogenated Compounds (F, Cl, Br, and I)
Detection Sensitivity: > 100 PPB
Detection Range: approximately 10^5

The ECD detector consists of a sealed stainless steel cylinder containing radioactive Nickel-63. The Nickel-63 emits beta particles (electrons) which collide with the carrier gas molecules, ionizing them in the process. This forms a stable cloud of free electrons in the ECD cell. When electro-negative compounds (especially chlorinated, fluorinated or brominated molecules) such as carbon tetrachloride, PCE, TCE or Vinyl Chloride enter the cell, they immediately combine with some of the free electrons, temporarily reducing the number remaining in the electron cloud. The detector electronics maintain a constant current (of about 1 nanoampere) through the electron cloud, are forced to pulse at a faster rate to compensate for the decreased number of free electrons. The pulse rate is converted to an analog output that is connected to the data system.

The FID did however respond, although at very low levels, to compounds at a depth of about 4 – 5 feet below ground surface. Given that the investigation was performed in a landfill area and ruling out the presence of aromatic and halogenated compounds (PID and ECD) it may be assumed that the FID was indicating the presence of natural gases created by the decomposition of landfill materials. Landfill gas may contain up to 30-40% carbon dioxide (CO_2), and small amounts of non-methane volatile organic compounds such as Hydrogen Sulfide (H_2S). These gases are denser than air and tend to sink. Combining this information with the EC logs one can see a nice correlation to back up this hypothesis. The EC log shows thin clay lenses near the surface. The FID traces for the same locations indicate the presence of compounds lying directly on top of these lenses, as a denser than air landfill gas might behave. When analyzing the more interesting scans the L1 0000 – L1 1800 and the L2 1000 – L2 0715 transects, the pattern that we see is natural gas overlying thin, near surface clay lenses which in turn overlay somewhat silty to clean sands.

Below is a brief overview of the FID and EC:

Flame Ionization Detector
Highly sensitive detector used to detect Hydrocarbons
Compounds of Interest: Volatile Organic Hydrocarbons
Detection Sensitivity: > 200 PPB
Detection Range: approximately 10^7

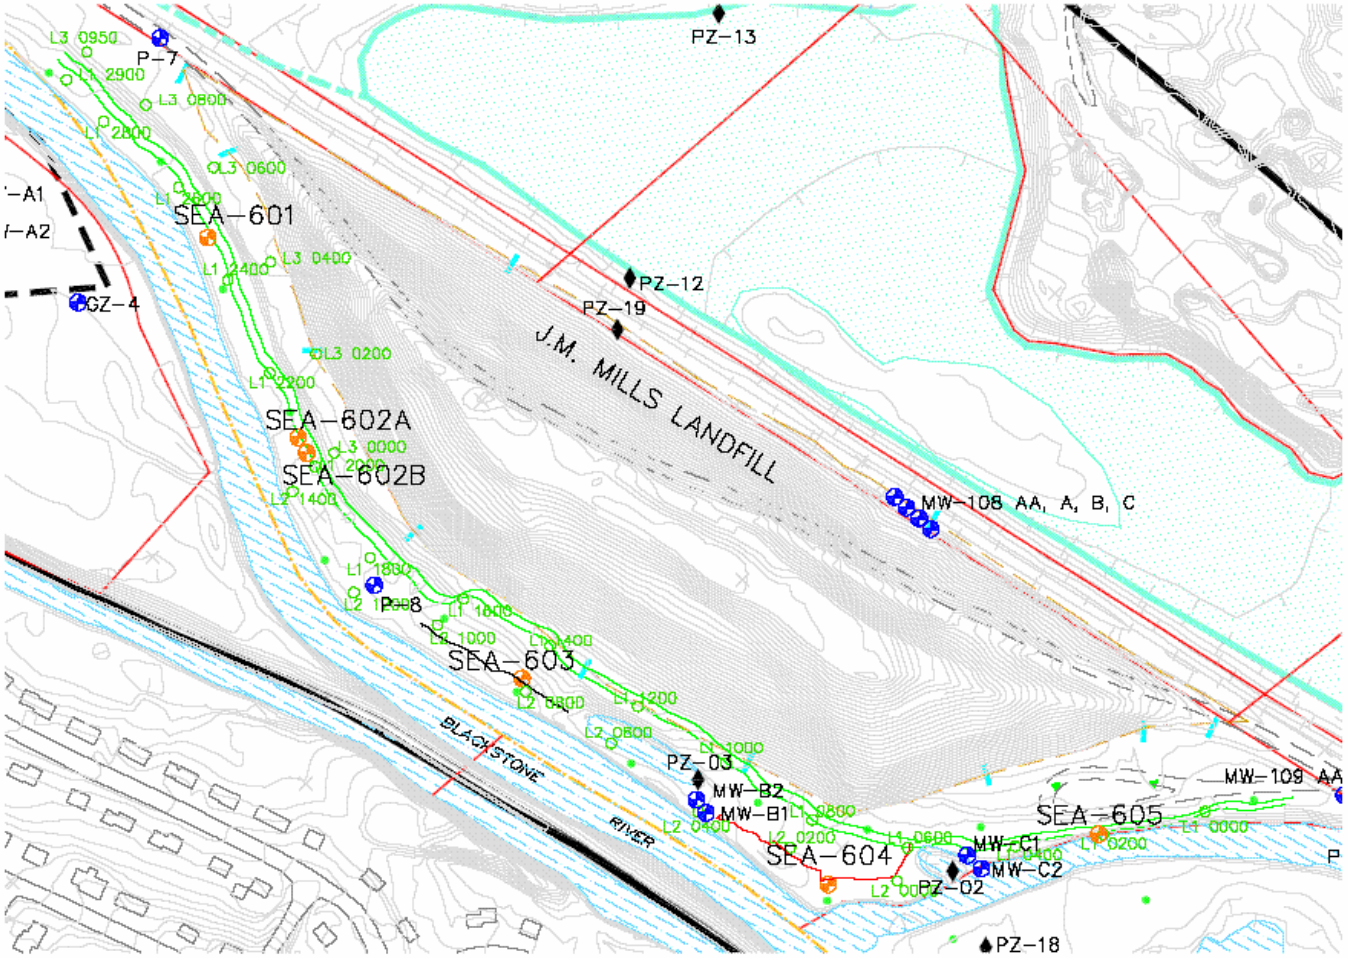
The FID responds to carbon and therefore produces a signal for all carbon containing compounds. The linear response of the detector is 10^7 and it responds to compounds with

concentrations in the nanogram range depending on the compound. The FID responds to any molecule with a carbon-hydrogen bond, but its response is either poor or nonexistent to compounds such as CCl_4 or NH_3. Since the FID is mass sensitive, and not concentration sensitive, changes in the carrier gas flow rate have little effect on the detector response. It is preferred for general hydrocarbon analysis, with a detection range from 0.2 ppm to almost 100%. The FID response is stable from day to day. It is generally robust and easy to operate. But because it uses a hydrogen diffusion flame to ionize compounds for analysis, it destroys the sample in the process.

Electrical Conductivity (EC) - Overview

Soil conductivity and resistivity (the inverse of conductivity) have long been used as tools to classify soils. Higher electrical conductivities are representative of finer grained sediments, such as silts or clays, while sands and gravels are characterized by distinctly lower electrical conductivities. A few site-specific core samples, either from discrete depths or a continuous core, can be used to verify the lithology represented by electrical conductivity values at a site. The electrical logs are then correlated across the site to show changes in thickness or elevation of lithologic units of interest.

EC logs are used to define zones of lower conductivity, equivalent to coarser grained, more permeable sediments, which will allow the movement of contaminants (hydrocarbons, chlorinated VOC's, or metals) in the subsurface. This information will also assist in the proper placement of monitoring, sparging, or extraction wells.



ZEBRA appreciates the opportunity to provide these services and looks forward to working with Shield Environmental Associates in the future. Should there be any questions regarding this project or our other services, please do not hesitate to contact us.

Sincerely yours,

Joseph G. Sakellis

Notes:

Temperature and specific conductance in May 2002 measured with a Solinst Reelogger mutiparameter data logging system

Temperature, specific conductance, pH, ORP/Eh and dissolved oxygen in August-October 2003 measured with a YSI 6820/650 or 600XL/650 multiparameter sonde and datalogger

Turbidity in August-October 2003 measured with a LaMotte 2020 turbidity meter

--- Information not available (no reading taken).

NS No surface water sample collected for laboratory analysis.

Values in shaded/stippled cells should be disregarded (instrument malfunction).

Notes:

Temperature and specific conductance in May 2002 measured with a Solinst Reelogger mutiparameter data logging system under static conditions.
Temperature, specific conductance, pH, ORP/Eh and dissolved oxygen in Aug-Oct 2003 and Sep-Oct 2004 measured with a YSI 6820/650 or 600XL/650 multiparameter sonde and datalogger. Turbidity in August-October 2003 measured with a LaMotte 2020 turbidity meter. Values shown are the last three sets of readings made during low-flow purging prior to sampling.

* Indicates that pumping rate was measured previously during purging, not during the last three readings.

NS No sample collected for laboratory analysis.

--- Information not available (no reading taken).

Values in the shaded cells are the target stabilization limits for low-flow purging prior to sampling.

Values in shaded/stippled cells should be disregarded (instrument malfunction).

Subject: Geophysical Survey Report
Peterson/Puritan OU2 Site
Cumberland, Rhode Island

Dear Mr. Wagner:

In accordance with your authorization, Geophysical Applications has performed a geophysical survey to help delineate a suspected bedrock valley in the vicinity of the Blackstone River.

The geophysical survey methods used were seismic refraction and microgravity profiling, as described below. A brief seismic reflection profiling test was also performed.

METHODS OF INVESTIGATION

Survey Control

All seismic refraction traverses were marked with labeled stakes, pin flags, or spray paint at each shot point. BBL hired licensed land surveyors to locate the seismic refraction traverses. A base map showing these traverses was provided by BBL.

Ground elevations between seismic refraction shot points and gravity stations were measured with an electronic theodolite. These elevations were referenced to ground surface elevations provided by BBL at wells SEA-607, SEA-608, and MW12AA.

Seismic Refraction Profiling

Refraction data were acquired along approximately 2,000 feet of traverse using an ABEM Terraloc Mark 6 seismograph with 20-foot geophone spacings. Small buried explosive charges were used as the seismic energy source. A licensed explosive-handling contractor obtained the required permits and tamped these charges in 2 to 3 foot deep shot holes driven with a steel bar and sledgehammer. Each shot consisted of a single electric blasting cap and less than one-half pound of dynamite, and was fired using a portable blaster's shot box.

Refraction seismograms were recorded using 0.25 millisecond sampling intervals, with record lengths of 256 milliseconds. Seismograms were reviewed in the field, and stored on the ABEM's internal hard drive and on floppy diskette for backup data storage.

Seismic shot points were located at the ends and at several locations along each 24-channel geophone spread. Additional offset shots were placed approximately 190 to 230 feet beyond each array endpoint, to help profile bedrock near the endpoints, where permitted by site conditions.

Refraction data analysis was generally performed by measuring first-arrival times with Rimrock Geophysics' ASIPIK module followed by modeling with Rimrock Geophysics' SIPT2 delay-time interpretation software. This software uses a ray-tracing algorithm, in which calculated layer thickness beneath each geophone is varied to obtain good agreement between observed and modeled arrival times. Selected time-distance plots were reviewed and layer depths manually calculated with the crossover-distance technique as a quality assurance check.

Microgravity Profiling

Gravity prospecting is based upon the premise that subsurface density contrasts between natural or man-made structures can be detected using gravimeters at the ground surface. The earth's normal gravity acceleration is approximately 980 gals (a unit honoring the scientist Galileo).

Microgravity data collection requires careful leveling and balancing of a beam within an extremely delicate instrument. Data collection must be performed in a relatively vibration-free environment, to obtain the most reliable measurements.

We utilized the LaCoste & Romberg model G meter, with electronic-level readouts (to speed physical leveling of the instrument case) and model Aliod 100 electronic beam-nulling. This instrument is capable of approximately one microgal resolution, with ten-microgal repeatability in controlled conditions.

The operator recorded raw gravity data observations in a field notebook. The operator also recorded measurements at a reference base station at approximately one-hour intervals during the fieldwork. The purpose of these base station readings was to measure ordinary instrument and tidal drift.

During each "loop", or group of stations occupied between base station readings, one station measured during a prior loop was re-occupied. The meter was zeroed in Lancaster, MA before beginning the survey. The meter is capable of readings up to +50 or –50 milligals from the zero reference, which proved to be adequate for the actual range of data values observed during this survey.

Gravity data reduction steps included the following:

- Adjusting the data values obtained with the instruments, during multiple survey days, to a common reference to account for instrument drift and tidal drift,
- Correcting for variations caused by observation-station latitude,
- "Free-air" corrections, to account for each observation's elevation above or below the reference elevation,
- "Bouguer" corrections, to account for the effect of the earth mass between the observation and reference stations. An assumed earth density of 2.5 grams per cubic centimeter was utilized during these corrections.

Numerous geophysical textbooks (e.g. Telford, et al.) describe these corrections in detail.

Note that these microgravity measurements are all relative to the referenced base station. A survey referenced to a different location would show similar variations, but the actual numbers would be higher or lower than those reported during this survey.

Terrain corrections (to adjust for topographic variations adjacent to an observation station) were not performed during this survey. They require accurate ground elevations at numerous radial distances from each data station. This elevation requirement was well beyond the scope of this project.

Tidal and drift corrections, latitude, free-air, and Bouguer corrections were performed in an Excel spreadsheet. Corrections calculated for selected data stations were computed manually, to check the formulas utilized in each of the correction steps.

The corrected data values are presented using x-y plots, to depict gravity variations versus distance along traverse segments.

The horizontal position of a possible bedrock trough beneath the valley was the objective of this survey and would be represented by locally low gravity values. These gravity lows would be caused by lower density material (soil) within the bedrock trough, compared to higher density material (bedrock) along the valley walls.

"Tares" are gravity survey errors caused by inadvertently jarring a gravimeter (particularly if the internal measurement beam and spring are not locked). Tares can be produced by subtle impacts, e.g. scuffing an instrument's leveling leg on the edge of the base plate or transport case, when moving a meter into or out of the case. Geophysical Applications, Inc.'s field personnel performed tare checks, by re-surveying stations where an abrupt increase or decrease in data values was observed. No tares were detected.

Seismic Reflection Profiling

A brief test of the seismic reflection profiling technique was initially performed, to help determine whether it might be useful in delineating the suspected bedrock valley.

This test consisted of a "walkaway" survey, where geophones are moved out in short distance increments from a fixed shot point. In this case, geophones were placed along seismic Line 2 at 2-foot distance increments, between stations 22 through 164. Seismograms were recorded in groups of 24, i.e. initially between stations 22 through 68. The 24-channel geophone array was then moved 48 feet further from the shot point, and another seismogram recorded using the initial shot point.

Seismic energy during this survey was generated with a 16 pound sledge hammer hitting a strike plate lying on the ground. Seismograms were recorded using the ABEM Terraloc Mark 6 seismograph, with sampling intervals of one millisecond and record lengths of 1,028 milliseconds.

The resulting 24-channel seismograms were collated onto a single page using Kansas Geological Survey's WinSeis software package, for presentation in this report.

Based on the relatively low-frequency signals and lack of confident reflections identified during this initial test, the reflection technique was judged unlikely to produce superior results than the

refraction or microgravity survey methods. Consequently detailed seismic reflection profiling was not performed along Lines 1 or 2.

SURVEY LIMITATIONS

Seismic survey depth calculations are typically accurate within ± 10% (or ± 3 feet, whichever is larger) for cross sections presented in this report.

The seismic refraction method assumes that seismic velocities of subsurface layers increase with depth. If this assumption is not true, then calculated rock depths may be erroneous.

Landfill materials and organic peat contain trapped gases. These gases can absorb seismic energy, preventing that energy from reaching the bedrock surface and returning to the geophones. Therefore refracted seismic signals are not detected, and bedrock depths may not be calculated in areas where peat or landfill materials are present.

Seismic velocity values shown on the cross sections were calculated over 24-channel geophone arrays, and therefore represent averaged subsurface conditions. Localized low-velocity zones (e.g. discrete bedrock joints or fractures) occur naturally and may be present at this site.

Low microgravity anomalies can be caused by both underground and aboveground density variations. For example, low anomalies can be caused by both: a) missing earth mass beneath a gravity station, and b) a large hill adjacent to a gravity station. Gravity interpretations are therefore non-unique, and should be confirmed by other direct means (test borings, etc.).

RESULTS

Figure 1 shows seismic refraction lines and microgravity stations performed during this survey. Seismic refraction survey results are depicted in profile form on Figures 2 and 3. These profiles show calculated depths to the various layers detected as well as their compressional seismic velocity values in units of feet per second (ft/sec). Gravity Simple Bouguer data are shown in profile form on Figure 4. The seismic reflection walkaway test is shown in Figure 5. Note that only the first 300 milliseconds of the recorded signals are displayed, the time period during which rock reflectors were expected.

Line 1

Seismic Lines 1A and 1B were located southeast of the island, on top of landfill materials at a former waste transfer area. Due to the poor seismic data quality caused by the landfill conditions, only seismic Line 1A is shown in profile form; Line 1B could not be reliably interpreted. The water table and bedrock surface are dashed due to uncertainty in the depth computations.

Seismic Line 1A disclosed dry, unsaturated soil or backfill approximately 23 to 30 feet thick. The seismic velocity value calculated for this unconsolidated overburden layer is approximately 1,540 ft/sec.

Below the unsaturated soil is higher-velocity saturated overburden. This layer's calculated average seismic velocity is approximately 5,670 ft/sec. The average seismic velocity value calculated for bedrock is approximately 11,200 ft/sec.

Due to the uncertainty of the seismic refraction interpretations, a bedrock trough was not confidently identified. However, the gravity data shows low values between gravity stations 720 to 840 and a less pronounced gravity low at station 450. These lows may represent bedrock troughs, with the deepest point near gravity station 750 feet.

Line 2

Seismic Lines 2A and 2B were located on the island. These seismic lines were of the best data quality due to shallower saturated layer, and sufficient space for long offset shots to help profile bedrock. These seismic traverses disclosed dry, unsaturated soil or backfill averaging approximately 10 feet thick. The seismic velocity values calculated for this unconsolidated overburden layer range from approximately 800 to 1,140 ft/sec.

Below the unsaturated soil is higher-velocity saturated overburden. This layer's calculated seismic velocity is approximately 5,340 to 5,480 ft/sec.

The seismic velocity values calculated for bedrock range from approximately 15,000 to 17,300 ft/sec. Bedrock velocities above 13,000 ft/sec typically represent relatively competent rock (not highly weathered or fractured). Bedrock beneath these traverses is therefore likely to be competent.

A bedrock trough inferred from the Line 2B seismic data is located approximately between gravity stations 560 to 720. The gravity data indicates the deepest portion of a bedrock trough between stations 760 to 840. Both methods therefore indicate the bedrock trough is towards the northeast side of the island. The bedrock trough may be even slightly further northeast if the gravity low is north of station 840. Note that the gap in gravity measurements between stations -120 to 0 and 820 to 1020 is due to the river.

Table H3-1
Historic Records, Blackstone River at Woonsocket, Rhode Island

General Information:
USGS 01112500 BLACKSTONE RIVER AT WOONSOCKET, RI

source: http://waterdata.usgs.gov/ri/nwis/uv?01112500

LOCATION.--Lat 42° 00'22", long 71° 30'13", Providence County, Hydrologic Unit 01090003, on right bank 50 ft upstream from Peters River pressure conduit at Woonsocket. Records include flow of Peters River.
DRAINAGE AREA.--416 mi^2.
PERIOD OF RECORD.--Discharge: February 1929 to current year.
Water-quality records: Water years 1952–53, 1957–58, 1962–67.
REVISED RECORDS.--WSP 756: Drainage area. WSP 781: 1931(M). WSP 871: 1938. WSP 1051: 1931.
GAGE.--Water-stage recorder. Datum of gage is 107.42 ft above sea level.
REMARKS.--Records good. Flow regulated by powerplants, by West Hill Reservoir since May 1961, and by other reservoirs upstream. Extremes and figures of daily discharge include flow diverted from Nashua River basin and, at times since January 1966, from Quabbin Reservoir for supply of Worcester, MA, and, prior to July 1964, flow diverted around station in Hamlet Trench. Telephone and satellite gage-height telemeters at station.
COOPERATION BY.-- Ocean State Power.

Test Pit Log

Test Pit ID: TP-1

Client:	Peterson Puritan	**Date/Day:**	10/31/06
Project:	Nunes Parcel	**Weather:**	Sunny
Location:	Cumberland, RI	**Temperature:**	40's A.M., Low 70's P.M.
Project #:	37902	**Wind:**	Light
Logged By:	Shawn Wolf	**Subcontractor:**	MARCOR
Coordinates:	See Survey Data	**Equipment:**	John Deere 200C Excavator

Sketch of Test Pit Layout:

Plan View	Profile View

Test Pit Dimensions:	12' L x 10' D x 3' W	**Total Depth:**	10'	**Depth to Water:**	N/A

Depth Interval (feet)	PID Screening Result (ppm)	Description of Soil/Material	Samples Collected
0 - 0.5		Br. VF-M Sand, some f-SR Gravel, trace rootlets, dry. Surface debris in vicinity of TP (Steel Scrap, old metal drum).	N/A
0.5 - 3.0	0.0	Drk. Br. Soil mixed w/ wood chips, little metal scrap.	
3.0 - 10.0'	N/A	Drk Br. to Br. VF-M SAND mixed w/ rubber matting, foam, cloth/fabric.	
		12" Diam Concrete culvert encountered Running 11 to TP. Pipe filled in at least 3/4 of sediment although some H_2O did come out of pipe when it was inadvertantly disconnected. Possible old Stormwater pipe which is inactive.	
		* Hard to tell if H_2O coming in TP is from GW or the Gravel around the PVC pipe. - will confirm @ TP-5	

Notes:

① Debris appeared to be at least as deep as the 12" pipe encountered. Could not see definite bottom since TP filled in w/ H_2O

Photograph Summary:

#1	#1 Concrete Pipe (12")

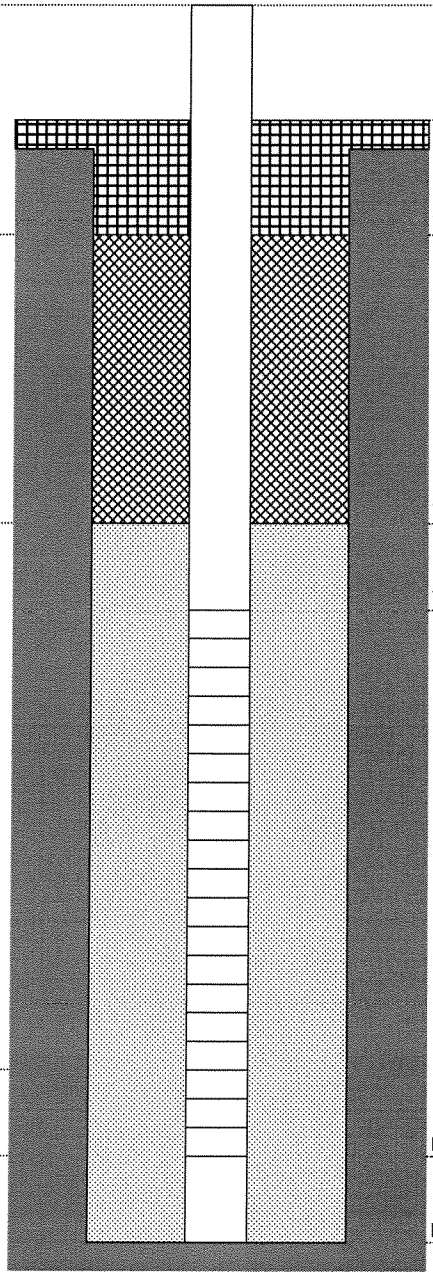
WELL INSTALLATION LOG
MONITORING WELL SEA-601

PROJECT/CLIENT:	Peterson/Puritan OU2 Superfund Site	DATE COMPLETED:	9/15/2003
SHIELD PROJECT NO:	300-1821	DRILLING COMPANY/OPERATOR:	GeoSearch/Dave Crawford
SITE NAME/LOCATION:	J. M. Mills Landfill	RIG TYPE/METHOD:	Truck Mounted Mobile Drill B-59; 4.25" ID Hollow Stem Augers
WELL LOCATION	Cumberland, RI	GROUND SURFACE (GS) ELEVATION:	60.41 feet
LOGGED BY:	M. Morris/S. Scheidt	TOP OF CASING (TOC) ELEVATION:	63.47 feet
SIGNATURE:		DEPTH OF WELL FROM TOC:	23.5 feet

Materials	Construction Diagram	Dimensions (Feet)	Depth (Ft Below GS)	Elevations (Ft Above Datum)
		Top of Riser	-3.1	63.47
Surface Materials: Above ground , steel, 6" diameter stand pipe with a locking cap in a 2.5' by 2.5' concrete pad. Water tight expansion plug cap at top of riser.		Ground Surface	0.0	60.41
		Top of Seal	1.5	58.9
Annular Seal: Hydrated Pure Gold® Medium Bentonite Chips				
		Top of Sandpack	3.5	56.9
Filter Pack: #2 Quartz Filter Sand				
		Top of Screen	10.2	50.2
Well Riser: 2" Diameter PVC Schedule 40				
Well Screen: 10 Slot (0.010 inch) 2" Diameter PVC Schedule 40				
Bottom Cap: 2" PVC End Cap		Bottom of Screen	20.2	40.2
Borehole Diameter: 8.5 Inches		Bottom of Well	20.4	40.0



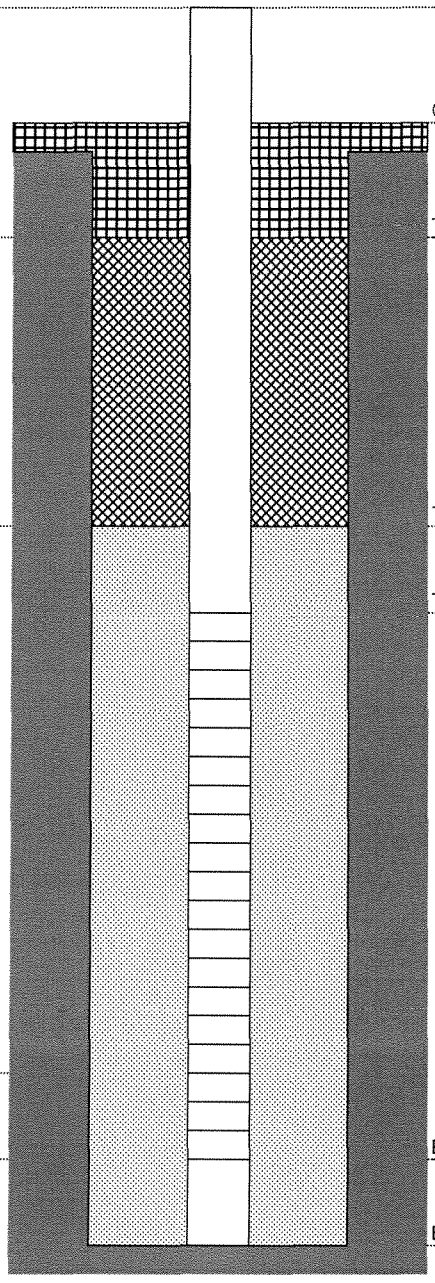
Comments:
Well developed on 9/22/03 by surging and pumping 60 gallons of water.

SHIELD
Environmental Associates, Inc.
2456 Fortune Drive, Lexington KY 40509

WELL INSTALLATION LOG
MONITORING WELL SEA-602A

PROJECT/CLIENT:	Peterson/Puritan OU2 Superfund Site	DATE COMPLETED:	9/17/2003
SHIELD PROJECT NO:	300-1821	DRILLING COMPANY/OPERATOR:	GeoSearch/Dave Crawford
SITE NAME/LOCATION:	J. M. Mills Landfill	RIG TYPE/METHOD:	Truck Mounted Mobile Drill B-59; 4.25" ID Hollow Stem Augers
WELL LOCATION	Cumberland, RI	GROUND SURFACE (GS) ELEVATION:	59.75 feet
LOGGED BY:	M. Morris/S. Scheidt	TOP OF CASING (TOC) ELEVATION:	62.51 feet
SIGNATURE:		DEPTH OF WELL FROM TOC:	23.21 feet

Materials	Construction Diagram	Dimensions (Feet)	Depth (Ft Below GS)	Elevations (Ft Above Datum)
		Top of Riser	-2.7	62.51
Surface Materials: Above ground , steel, 6" diameter stand pipe with a locking cap in a 2.5' by 2.5' concrete pad. Water tight expansion plug cap at top of riser.		Ground Surface	0.0	59.75
		Top of Seal	2.5	57.3
Annular Seal: Hydrated Pure Gold® Medium Bentonite Chips		Top of Sandpack	7.0	52.8
Filter Pack: #2 Quartz Filter Sand		Top of Screen	10.3	49.5
Well Riser: 2" Diameter PVC Schedule 40				
Well Screen: 10 Slot (0.010 inch) 2" Diameter PVC Schedule 40				
Bottom Cap: 2" PVC End Cap		Bottom of Screen	20.3	39.5
Borehole Diameter: 8.5 Inches		Bottom of Well	20.5	39.3



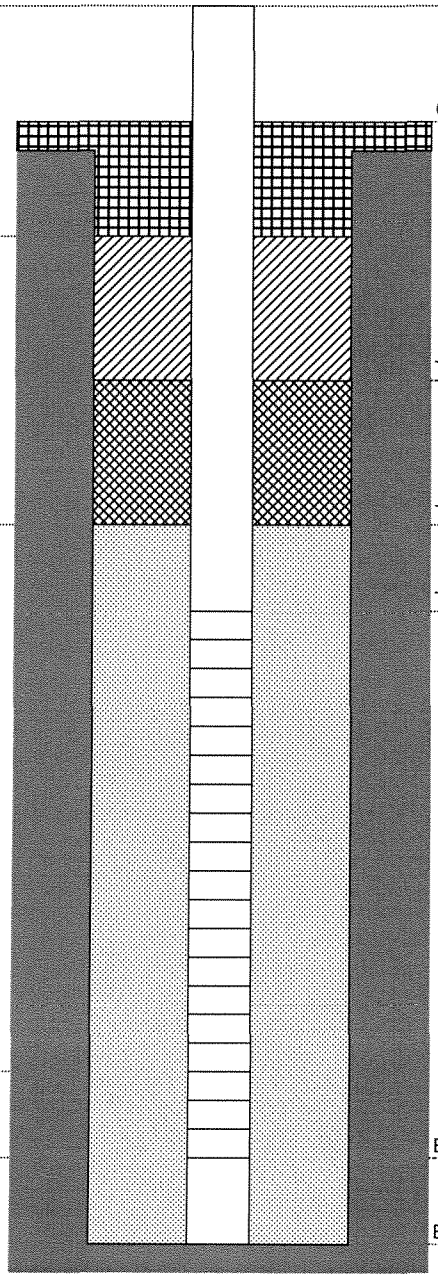
Comments:
Well developed on 9/22/03 by surging and pumping 65 gallons of water.

SHIELD
Environmental Associates, Inc.
2456 Fortune Drive, Lexington KY 40509

WELL INSTALLATION LOG
MONITORING WELL SEA-605

PROJECT/CLIENT:	Peterson/Puritan OU2 Superfund Site	DATE COMPLETED:	9/18/2003
SHIELD PROJECT NO:	300-1821	DRILLING COMPANY/OPERATOR:	GeoSearch/Dave Crawford
SITE NAME/LOCATION:	J. M. Mills Landfill	RIG TYPE/METHOD:	Truck Mounted Mobile Drill B-59; 4.25" ID Hollow Stem Augers
WELL LOCATION	Cumberland, RI	GROUND SURFACE (GS) ELEVATION:	62.32 feet
LOGGED BY:	M. Morris/S. Scheidt	TOP OF CASING (TOC) ELEVATION:	65.20 feet
SIGNATURE:		DEPTH OF WELL FROM TOC:	23.2 feet

Materials	Construction Diagram	Dimensions (Feet)	Depth (Ft Below GS)	Elevations (Ft Above Datum)
		Top of Riser	-2.9	65.20
Surface Materials: Above ground , steel, 6" diameter stand pipe with a locking cap in a 2.5' by 2.5' concrete pad. Water tight expansion plug cap at top of riser.		Ground Surface	0.0	62.32
		Top of Seal	3.6	58.7
Annular Seal: Hydrated Pure Gold® Medium Bentonite Chips		Top of Sandpack	6.5	55.8
Filter Pack: #2 Quartz Filter Sand		Top of Screen	10.1	52.3
Well Riser: 2" Diameter PVC Schedule 40				
Well Screen: 10 Slot (0.010 inch) 2" Diameter PVC Schedule 40				
Bottom Cap: 2" PVC End Cap		Bottom of Screen	20.1	42.3
Borehole Diameter: 8.5 Inches		Bottom of Well	20.3	42.1



Comments:
Well developed on 9/23/03 by surging and pumping approximately 60 gallons of water using an electric submersible pump.

SHIELD
Environmental Associates, Inc.
2456 Fortune Drive, Lexington KY 40509
