Hydraulic conductivity (K) was calculated using the Hvorslev method which is valid for unconfined conditions where the length of the well screen is greater than eight times the effective radius of the well screen. K was calculated by the formula:

$$K = \frac{r^2 \ln (L/R)}{2LT_0}$$

Where:

K is hydraulic conductivity
r is the radius of the well casing = 2.54 cm
R is the effective radius of boring = 10.2 cm for soil borings
L is the average length of well screen through which water passed during the test
T_0 is the time it takes for the water level to rise to 37 percent of the initial change (corrected for test start time)

Average linear velocities were calculated using measured hydraulic conductivity, hydraulic gradients and an assumed value of effective porosity. Using the equation,

$$V_x = \frac{K\,i}{n_e}$$

Where:

V_x is average linear velocity
i is hydraulic gradient (*all gradients are horizontal except MW-5D, which is vertical)
n_e is effective porosity (assumed to be 0.25 for soil)
