3072													
3073	**Gamma ROS Statistics using Imputed Non-Detects**												
3074	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs												
3075	GROS may not be used when kstar of detected data is small such as < 0.1												
3076	For such situations, GROS method tends to yield inflated values of UCLs and BTVs												
3077	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates												
3078	Minimum					0.0033	Mean					0.0824

363	Note: Data have multiple DLs - Use of KM Method is recommen									Number treated as Non-Detect		18
364	For all methods (except KM, DL/2, and ROS Methods),									Number treated as Detected		0
365	Observations < Largest ND are treated as NDs									Single DL Non-Detect Percentage		100.00%
366												
367	**Warning: Data set has only 2 Distinct Detected Values.**											
368	**This may not be adequate enough to compute meaningful and reliable test statistics and estimates.**											
369	**The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).**											
370												
371	**Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.**											
372												
373	**The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.**											
374	**Those methods will return a 'N/A' value on your output display!**											
375												
376	**It is necessary to have 4 or more Distinct Values for bootstrap methods.**											
377	**However, results obtained using 4 to 9 distinct values may not be reliable.**											
378	**It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.**

alpha-BHC

General Statistics

Number of Valid Data	25	Number of Detected Data	0
Number of Distinct Detected Data	0	Number of Non-Detect Data	25
Number of Missing Values	8	Percent Non-Detects	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable alpha-BHC was not processed!

delta-BHC

General Statistics

Number of Valid Data	25	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	24
Number of Missing Values	8	Percent Non-Detects	96.00%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
ested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BT

The data set for variable delta-BHC was not processed!

gamma-BHC

General Statistics

Number of Valid Data	25	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	24
Number of Missing Values	8	Percent Non-Detects	96.00%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
ested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BT

The data set for variable gamma-BHC was not processed!

Heptachlor

General Statistics

Number of Valid Data	25	Number of Detected Data	6
Number of Distinct Detected Data	6	Number of Non-Detect Data	19
Number of Missing Values	8	Percent Non-Detects	76.00%

Raw Statistics		**Log-transformed Statistics**	
Minimum Detected	0.0019	Minimum Detected	-6.266
Maximum Detected	0.1	Maximum Detected	-2.303
Mean of Detected	0.028	Mean of Detected	-4.352
SD of Detected	0.037	SD of Detected	1.448
Minimum Non-Detect	0.0018	Minimum Non-Detect	-6.32
Maximum Non-Detect	0.284	Maximum Non-Detect	-1.259
Note: Data have multiple DLs - Use of KM Method is recommend		Number treated as Non-Detect	25
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 6 Detected Values in this data
Note: It should be noted that even though bootstrap may be performed on this data set
the resulting calculations may not be reliable enough to draw conclusions

It is recommended to have 10-15 or more distinct observations for accurate and meaningful results.

Appendix B.6

Lead Model Calculations

TABLE B.6a.1 (RAGS D IEUBK LEAD WORKSHEET)
Site Name: Wells G&H Superfund Site OU2
Aberjona Property
Receptor: Future Recreational User -Young Child (1 to 6 years) Exposure to Media as Described

1. Lead Screening Questions

Medium	Lead Concentration Used in Model Run		Basis for Lead Concentration Used For Model Run	Lead Screening Concentration		Basis for Lead Screening Level
	Value	Units		Value	Units	
Soil (0-2 ft)	192	mg/kg	Average Detected Value	400	mg/kg	Recommended Soil Screening Level

2. Lead Model Questions

Question	Response for Residential Lead Model
What lead model (version and date) was used?	IEUBK win Model 1.1 build 11
Where are the input values located in the risk assessment report?	Located in Appendix B.6.1
What range of media concentrations were used for the model?	Refer to Table B.6.1
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Arithmetic mean concentration from Table 3.3.2
Was soil sample taken from top 2 cm? If not, why?	No
Was soil sample sieved? What size screen was used? If not sieved, provide rationale.	No
What was the point of exposure/location?	The point of exposure was the maximum mean concentration of lead in soil for the 0-2 and 2-15 foot intervals for the Aberjona, Whitney and Murphy properties.
Where are the output values located in the risk assessment report?	Located in Appendix B.6.3
Was the model run using default values only?	Yes
Was the default soil bioavailability used?	Yes
Was the default soil ingestion rate used?	Yes

1. Attach the IEUBK text output file and graph upon which the PRG was based as an appendix. For additional information, see www.epa.gov/superfund/programs/lead

Question	Response for Residential Lead Model
If non-default values were used, where are the rationale for the values located?	NA

3. Final Result

Medium	Result	Comment/PRG [1]
Soil	Input value of 192 mg/kg in soil results in 0.24% of young children above a blood lead level of 10 ug/dL. Geometric mean blood lead = 2.657 ug/dL. This is below the blood lead goal as described in the 1994 OSWER Directive of no more than 5% of children exceeding 10 ug/dL blood lead.	Based on site conditions, a PRG calculation is not necessary.

1. Attach the IEUBK text output file and graph upon which the PRG was based as an appendix. For additional information, see www.epa.gov/superfund/programs/lead

TABLE B.6a.2 (RAGS D IEUBK LEAD WORKSHEET)
Site Name: Wells G&H Superfund Site OU2
Murphy Wetland
Receptor: Future Recreational User -Young Child (1 to 6 years) Exposure to Media as Described

1. Lead Screening Questions

Medium	Lead Concentration Used in Model Run		Basis for Lead Concentration Used For Model Run	Lead Screening Concentration		Basis for Lead Screening Level
	Value	Units		Value	Units	
Sediment	554	mg/kg	Average Detected Value	400	mg/kg	Recommended Soil Screening Level

2. Lead Model Questions

Question	Response for Residential Lead Model
What lead model (version and date) was used?	IEUBK win Model 1.1 build 11
Where are the input values located in the risk assessment report?	Located in Appendix B.6.1
What range of media concentrations were used for the model?	Refer to Table B.6.1
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Arithmetic mean concentration from Table 3.3.3
Was soil sample taken from top 2 cm? If not, why?	No
Was soil sample sieved? What size screen was used? If not sieved, provide rationale.	No
What was the point of exposure/location?	The point of sediment exposure was the mean concentration of lead in sediment.
Where are the output values located in the risk assessment report?	Located in Appendix B.6.3
Was the model run using default values only?	Yes
Was the default soil bioavailability used?	Yes
Was the default soil ingestion rate used?	Yes

1. Attach the IEUBK text output file and graph upon which the PRG was based as an appendix. For additional information, see www.epa.gov/superfund/programs/lead

Question	Response for Residential Lead Model
If non-default values were used, where are the rationale for the values located?	NA

3. Final Result

Medium	Result	Comment/PRG [1]
Sediment	Input value of 554 mg/kg in soil results in 11.647% of young children above a blood lead level of 10 ug/dL. Geometric mean blood lead = 5.708 ug/dL. This is above the blood lead goal as described in the 1994 OSWER Directive of no more than 5% of children exceeding 10 ug/dL blood lead.	Based on site conditions, a PRG calculation is necessary.

1. Attach the IEUBK text output file and graph upon which the PRG was based as an appendix. For additional information, see www.epa.gov/superfund/programs/lead

B.6.1 Time Weighted Average Concentration - IEUBK Parameter Inputs for Soil and Sediment

Future Recreational Child (1 - 6 yrs)

Soil

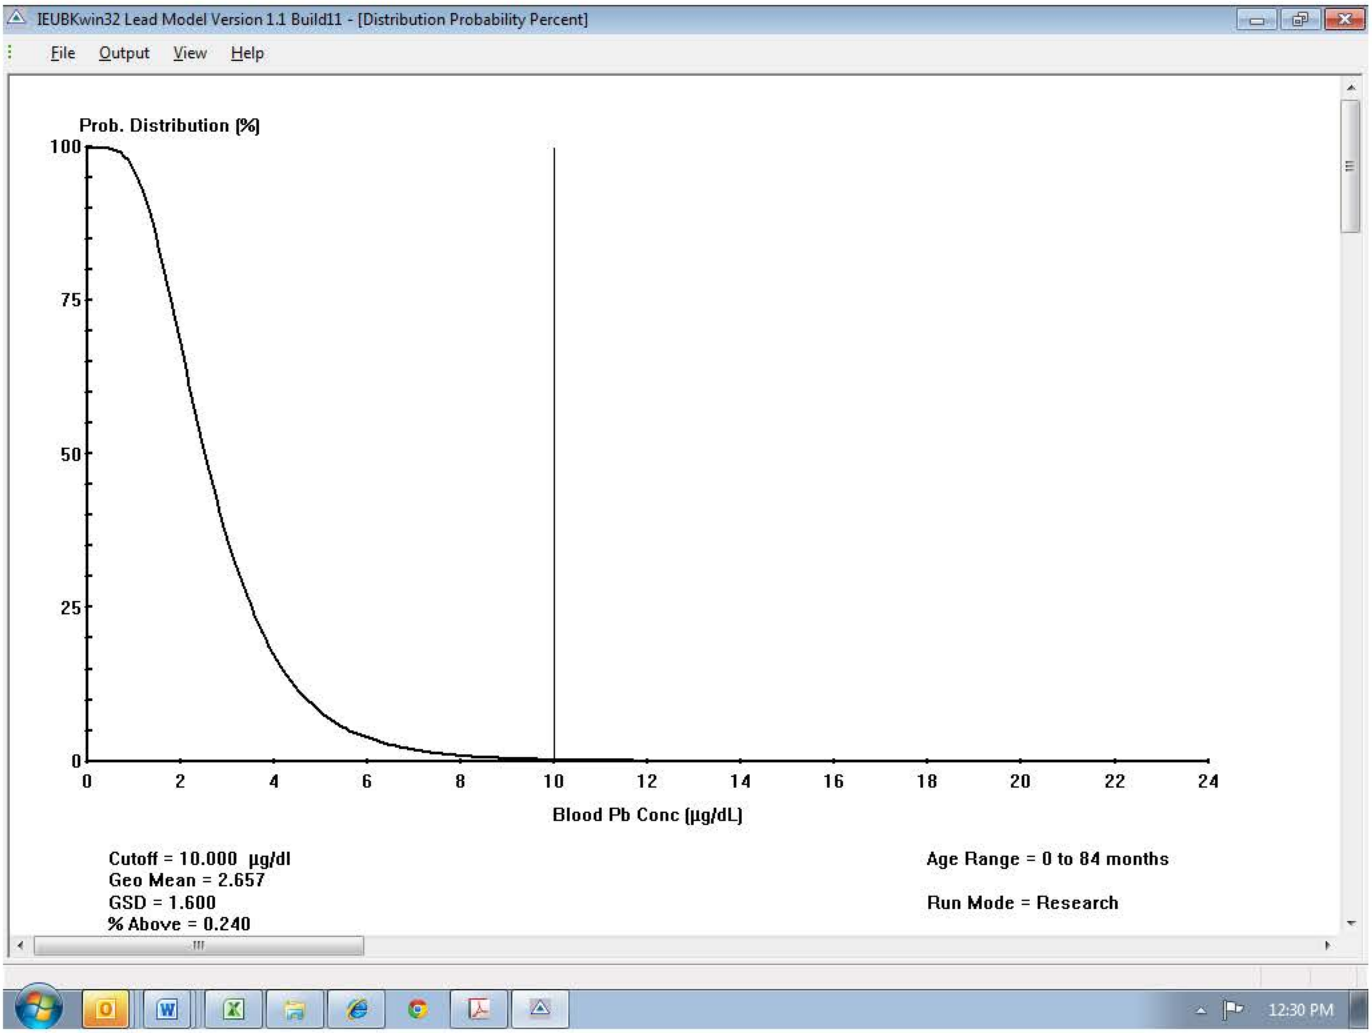
	Average Concentration (mg/kg)		RME Exposure Frequency (days/week)		Time-weighted conc. (mg/Kg)	
Exposure Point	Current	Future	Current	Future	Current	Future
Aberjona (0-2 feet)	--	315	--	3	--	192
Aberjona (2-15 feet)	--	28	--	3	--	69
Whitney (0-2 feet)	--	203	--	3	--	144
Whitney (2-15 feet)	--	85	--	3	--	94
Murphy (0-2 feet)	--	219	--	3	--	151
Murphy (2-15 feet)	--	240	--	3	--	160

Sediment

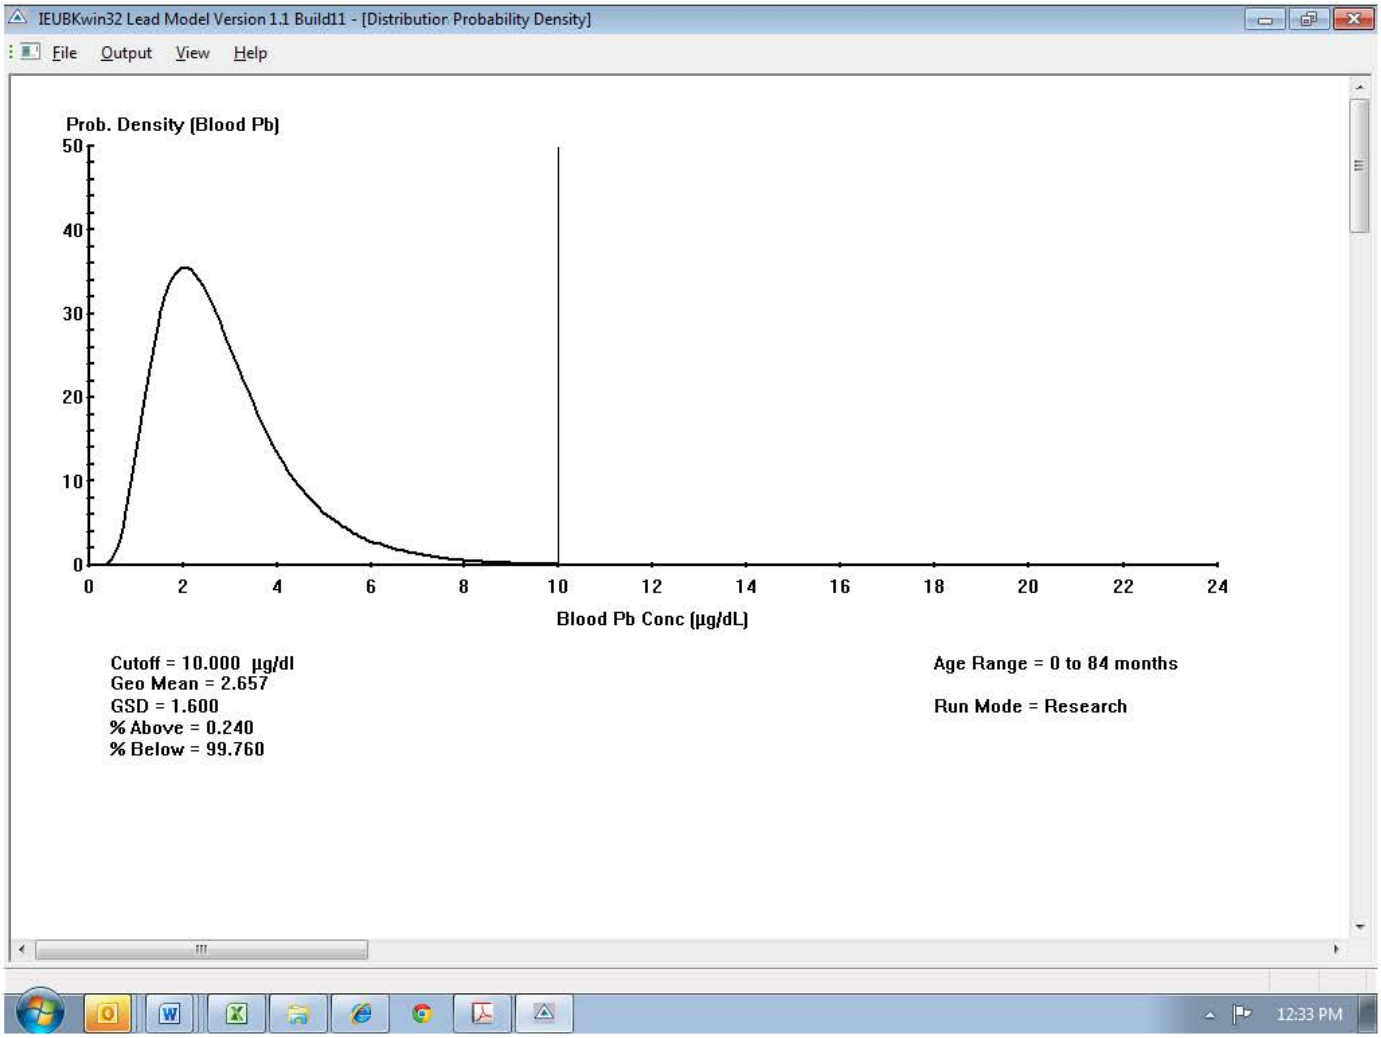
	Average Concentration (mg/kg)		RME Exposure Frequency (days/week)		Time-weighted conc. (mg/Kg) (1)	
Exposure Point	Current	Future	Current	Future	Current	Future
Murphy Wetlands	--	2450	--	3	--	554

Notes:
Time-weighted over one week using MassDEP background value (MADEP, 2002) of 100 mg/Kg.
Time weighted concentration = (((Average Conc. * Exposure Freq. in days/week) + (Bkgd. Conc. * (7-Exposure Freq. in days/week)/7)
(1) The calculation includes a fraction ingested term of 0.5 for sediment.

B.6.2.1 Future Child Recreational User – Aberjona Soil 0-2 feet – Probability Distribution



B.6.2.2 Future Child Recreational User – Aberjona Soil 0-2 feet - Probability Density



B.6.3.1 Soil Test Output – Future Child Recreational (Aberjona Property)

TABLE B.6b.1 (RAGS D ADULT LEAD WORKSHEET)
Site Name: Wells G&H Superfund Site OU2
Aberjona Property
Receptor: Adult Non-Resident – Future Adult Recreational, Exposure to Media as Described

1. Lead Screening Questions

Medium	Lead Concentration used in Model Run		Basis for Lead Concentration Used For Model Run	Lead Screening Concentration		Basis for Lead Screening Level
	Value	Units		Value	Units	
Soil (0-2 ft)	192	mg/kg	Average Detected Value	750	mg/kg	Recommended Soil Screening Level

2. Lead Model Questions

Question	Response
What lead model was used? Provide reference and version	Adult Lead Model OSWER 9200.2-82, June 2009
If the EPA Adult Lead Model (ALM) was not used provide rationale for model selected.	N/A
Where are the input values located in the risk assessment report?	Located in Appendix B.6.7
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Arithmetic mean concentration from Table 3.3.2
What was the point of exposure and location?	The point of exposure was the maximum mean concentration of lead in soil for the 0-2 and 2-15 foot intervals.
Where are the output values located in the risk assessment report?	Located in Appendix B.6.7
What GSD value was used? If this is outside the recommended range of 1.8-2.1), provide rationale in Appendix <Y>.	1.8 - 2.1
What baseline blood lead concentration (PbB_0) value was used? If this is outside the default range of 1.7 to 2.2 provide rationale in Appendix <Y>	1.0 – 1.5, new baseline per revised ALM model
Was the default exposure frequency (EF; 219 days/year) used?	No
Was the default BKSF used (0.4 ug/dL per ug/day) used?	Yes
Was the default absorption fraction (AF; 0.12) used?	Yes
Was the default soil ingestion rate (IR; 50 mg/day) used?	No
If non-default values were used for any of the parameters listed above, where are the rationale for the values located?	Located in Appendix B.6.7

3. Final Result

Medium	Result	Comment/RBRG [1]
Soil	Input value of 192 ppm in soil results in 0.008 – 0.6% of receptors above a blood lead level of 10 ug/d and geometric mean blood lead = 1.0 – 1.5 ug/dL. This does not exceed the blood lead goal as described in the 1994 OSWER Directive of no more than 5% of children (fetuses of exposed women) exceeding 10 ug/dL blood lead.	Based on site conditions, a RBRG calculation is not necessary.

1. Attach the ALM spreadsheet output file upon which the Risk Based Remediation Goal (RBRG) was based and description of rationale for parameters used. For additional information, see www.epa.gov/superfund/programs/lead

1. Lead Screening Questions

Medium	Lead Concentration used in Model Run		Basis for Lead Concentration Used For Model Run	Lead Screening Concentration		Basis for Lead Screening Level
	Value	Units		Value	Units	
Soil (0-2 ft)	144	mg/kg	Average Detected Value	750	mg/kg	Recommended Soil Screening Level

2. Lead Model Questions

Question	Response
What lead model was used? Provide reference and version	Adult Lead Model OSWER 9200.2-82, June 2009
If the EPA Adult Lead Model (ALM) was not used provide rationale for model selected.	N/A
Where are the input values located in the risk assessment report?	Located in Appendix B.6.7
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Arithmetic mean concentration from Table 3.3.2
What was the point of exposure and location?	The point of exposure was the maximum mean concentration of lead in soil for the 0-2 and 2-15 foot intervals.
Where are the output values located in the risk assessment report?	Located in Appendix B.6.7
What GSD value was used? If this is outside the recommended range of 1.8-2.1), provide rationale in Appendix <Y>.	1.8 - 2.1
What baseline blood lead concentration (PbB_0) value was used? If this is outside the default range of 1.7 to 2.2 provide rationale in Appendix <Y>	1.0 – 1.5, new baseline per revised ALM model
Was the default exposure frequency (EF; 219 days/year) used?	No
Was the default BKSF used (0.4 ug/dL per ug/day) used?	Yes
Was the default absorption fraction (AF; 0.12) used?	Yes
Was the default soil ingestion rate (IR; 50 mg/day) used?	No
If non-default values were used for any of the parameters listed above, where are the rationale for the values located?	Located in Appendix B.6.7

3. Final Result

Medium	Result	Comment/RBRG [1]
Soil	Input value of 144 ppm in soil results in 0.006 – 0.5% of receptors above a blood lead level of 10 ug/d and geometric mean blood lead = 1.0 – 1.5 ug/dL. This does not exceed the blood lead goal as described in the 1994 OSWER Directive of no more than 5% of children (fetuses of exposed women) exceeding 10 ug/dL blood lead.	Based on site conditions, a RBRG calculation is not necessary.

	Value	Units		Value	Units	
Soil (0-2 ft)	170	mg/kg	Average Detected Value	750	mg/kg	Recommended Soil Screening Level

2. Lead Model Questions

Question	Response
What lead model was used? Provide reference and version	Adult Lead Model OSWER 9200.2-82, June 2009
If the EPA Adult Lead Model (ALM) was not used provide rationale for model selected.	N/A
Where are the input values located in the risk assessment report?	Located in Appendix B.6.7
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Arithmetic mean concentration from Table 3.3.2
What was the point of exposure and location?	The point of exposure was the mean concentration of lead in soil for the 0-2 foot interval.
Where are the output values located in the risk assessment report?	Located in Appendix B.6.7
What GSD value was used? If this is outside the recommended range of 1.8-2.1), provide rationale in Appendix <Y>.	1.8 - 2.1
What baseline blood lead concentration (PbB_0) value was used? If this is outside the default range of 1.7 to 2.2 provide rationale in Appendix <Y>	1.0 – 1.5, new baseline per revised ALM model
Was the default exposure frequency (EF; 219 days/year) used?	No
Was the default BKSF used (0.4 ug/dL per ug/day) used?	Yes
Was the default absorption fraction (AF; 0.12) used?	Yes
Was the default soil ingestion rate (IR; 50 mg/day) used?	No
If non-default values were used for any of the parameters listed above, where are the rationale for the values located?	Located in Appendix B.6.7

3. Final Result

Medium	Result	Comment/RBRG [1]
Soil	Input value of 170 ppm in soil results in 0.003 – 0.4% of receptors above a blood lead level of 10 ug/d and geometric mean blood lead = 1.0 – 1.5 ug/dL. This does not exceed the blood lead goal as described in the 1994 OSWER Directive of no more than 5% of children (fetuses of exposed women) exceeding 10 ug/dL blood lead.	Based on site conditions, a RBRG calculation is not necessary.

1. Attach the ALM spreadsheet output file upon which the Risk Based Remediation Goal (RBRG) was based and description of rationale for parameters used. For additional information, see www.epa.gov/superfund/programs/lead

Exposure Point	Current	Future	Current	Future	Current	Future
Murphy Wetlands	--	2450	--	3	--	554

Future Construction Worker

Soil

	Average Concentration (mg/kg)		RME Exposure Frequency (days/week)		Time-weighted conc. (mg/Kg)	
Exposure Point	Current	Future	Current	Future	Current	Future
Aberjona (0-2 feet)	--	315	--	5	--	253
Aberjona (2-15 feet)	--	28	--	5	--	49
Whitney (0-2 feet)	--	203	--	5	--	174
Whitney (2-15 feet)	--	85	--	5	--	89
Murphy (0-2 feet)	--	219	--	5	--	185
Murphy (2-15 feet)	--	240	--	5	--	200

Notes:
Exposure to sediment only evaluated for Future Older Child Trespasser and Future Adult Recreational User
Time-weighted over one week using MassDEP background value (MassDEP, 2002) of 100 mg/Kg.
Time weighted concentration = (((Average Conc. * Exposure Freq. in days/week) + (Bkgd. Conc. * (7-Exposure Freq. in days/week))/7)
(1) The calculation includes a fraction ingested term of 0.5 for sediment.

Notes:

mg/kg - milligrams per kilogram (dry weight)
B - Compound detected in associated method blank
E - Value exceeds calibration range.
J - Estimated value.
NA - Sample not analyzed for the listed analyte.
R - Rejected data point.
U - Compound was not detected at quantitation limit.
UJ - Estimated non-detect.
Values in **Bold** indicate the compound was detected.
PCBs - Polychlorinated Biphenyls.

(1) J = Estimated Value
(2) Maximum concentration used for screening.
(3) ORNL Regional Screening Levels for residential air (adjusted to an hazard quotient = 0.1 for noncarcinogens), November 2013.
Screening level for trans-1,2-dichloroethene used for cis-1,2-dichloroethene
(4) Rationale Codes:
Selection Reason: Above Screening Levels (ASL)
No Screening Level (NSL)
Deletion Reason: No Toxicity Information (NTX)
Below Screening Level (BSL)
Not present as a result of vapor intrusion pathway (NVI)

Definitions:
COPC = Chemical of Potential Concern
N/A = Not Applicable or Not Available
C = Carcinogenic
N = Non-Carcinogenic

TABLE 3.1.RME

EXPOSURE POINT CONCENTRATION SUMMARY

REASONABLE MAXIMUM EXPOSURE

Southwest Properties - Wells G&H Superfund Site

Operable Unit 2

Woburn, Massachusetts

Scenario Timeframe: Current
Medium: Air
Exposure Medium: Indoor Air

Exposure Point (1)	Chemical of Potential Concern	Units	Arithmetic Mean (1)	95% UCL (Distribution) (2)	Maximum Concentration (Qualifier) (3)	Exposure Point Concentration			
						Value	Units	Statistic (4)	Rationale (5)
Existing Aberjona Residence (1st Floor)									
	Chloroform	ug/m^3	2.5E-01	N/A	3.8E-01	3.8E-01	ug/m^3	Maximum Concentration	(a)
	Naphthalene	ug/m^3	3.4E-01	N/A	5.5E-01	5.5E-01	ug/m^3	Maximum Concentration	(a)
	Trichloroethene	ug/m^3	6.6E-01	N/A	1.3E+00	1.3E+00	ug/m^3	Maximum Concentration	(a)

Notes:

(1) Arithmetic means were calculated assuming 1/2 the detection limit for non-detects. N/A = Not applicable.

(2) UCL calculations were performed using ProUCL software version 4.1.01, developed by Lockheed-Martin for USEPA.
NP = Non-parametric; N = Normal; LN = Lognormal; G = Gamma; N/A = Not applicable.

(3) J = The compound was positively identified; however, the associated numerical value is an estimated concentration only.

(4) 95% Student's-t UCL = Calculated using a normal Student's t approximation procedure.
95% Modified-t UCL = Calculated using a modified Student's t approximation procedure.
95% Approx. Gamma UCL = Calculated using an Approximate Gamma distribution procedure.
95% H-UCL = Calculated using Land's H-stat for lognormal distributions.
95% Chebyshev (Mean, Sd) UCL = Calculated using Chebyshev inequality non-parametric procedure.
95% KM (t) UCL = Calculated using 95% Kaplan Meier (Student's t approximation) non-parametric procedure.
95% KM (BCA) UCL = Calculated using 95% Kaplan Meier (Bias-corrected accelerated bootstrap) non-parametric procedure.
95% KM (Chebyshev) UCL = Calculated using 95% Kaplan Meier (Chebyshev inequality) non-parametric procedure.
95% KM (% Bootstrap) UCL = Calculated using 95% Kaplan Meier (Percentile Bootstrap) non-parametric procedure.
97.5% KM (Chebyshev) UCL = Calculated using 97.5% Kaplan Meier (Chebyshev inequality) non-parametric procedure.
99% KM (Chebyshev) UCL = Calculated using 99% Kaplan Meier (Chebyshev inequality) non-parametric procedure.

(5) For data sets with multiple detection limits for non-detects, the use of the Kaplan Meier non-parametric test procedure is recommended and used to calculate an appropriate UCL. For the Kaplan Meier test procedure, the type of data distribution was determined using a series of tests (Shapiro-Wilk, Kolmogorov-Smirnov, Anderson-Darling) for normal, lognormal, or gamma data distributions. The results of these distribution tests determined which UCL calculation was performed.
(a) Due to small sample size, the maximum detected concentration is used.
(b) Maximum detected concentration used for EPC due to the low number of detections.

ND = Non-detect
NC = Not calculated
N/A = Not Applicable
UCL = Upper Confidence Limit
EPC = Exposure Point Concentration
RME = Reasonable Maximum Exposure
CT = Central Tendency

Operable Unit 2
Woburn, Massachusetts

Chemical of Potential Concern	Unit Risk		Inhalation Cancer Slope Factor		Weight of Evidence/ Cancer Guideline Description	Unit Risk : Inhalation CSF	
	Value	Units	Value	Units		Source(s)	Date(s) (MM/DD/YYYY)
Chloroform	2.3E-05	$(ug/m^3)^{-1}$	N/A	N/A	B2	IRIS	03/01/14
Naphthalene	3.4E-05	$(ug/m^3)^{-1}$	N/A	N/A	C	CalEPA	03/01/14
Trichloroethene	4.1E-06	$(ug/m^3)^{-1}$	N/A	N/A	Carcinogenic to Humans	IRIS	03/01/14

IRIS = Integrated Risk Information System

N/A = Not Applicable

CalEPA = California Environmental Protection Agency

EPA Group:

A - Human carcinogen

B1 - Probable human carcinogen - indicates that limited human data are available

B2 - Probable human carcinogen - indicates sufficient evidence in animals and inadequate or no evidence in humans

C - Possible human carcinogen

D - Not classifiable as a human carcinogen (by the oral route)

E - Evidence of noncarcinogenicity

Trichloroethene unit risk from MassDEP = 1.7E-06 $(ug/m^3)^{-1}$

Tetrachloroethene unit risk from MassDEP = 1E-05 $(ug/m^3)^{-1}$

The unit risk presented for trichloroethene is the adult-based value. For early-life exposures, tumor-specific unit risk values of 1E-06 $(ug/m^3)^{-1}$ for kidney tumors and 3.1E-06 $(ug/m^3)^{-1}$ for combined liver tumors and non-Hodgkins lymphoma (NHL) are used in conjuction with age-dependent adjustment factors, as appropriate.

Notes

Early-life cancer risk calculations for TCE calculated by multiplying the intake/exposure concentration by the default age-dependent adjustment factor (ADAF) of 3 for 10/24 of the result (ages 7-16) and by the default ADAF of 1 for 14/24 of the result (ages 17-30), but only for exposures associated with the production of kidney tumors. This requires splitting the unit risk by tumor effects [kidney = 1E-06 (ug/m^3)$^{-1}$ and non-Hodgkins lymphoma (NHL)/liver = 3.1E-6 (ug/m^3)$^{-1}$].

Inhalation early-life cancer risk = [intake/exposure concentration (ug/m^3) x kidney Unit Risk (ug/m^3)$^{-1}$ x 3 + intake/exposure concentration (ug/m^3) x NHL/liver Unit Risk (ug/m^3)$^{-1}$] x 10/24 +
[intake/exposure concentration (ug/m^3) x kidney Unit Risk (ug/m^3)$^{-1}$ x 1 + intake/exposure concentration (ug/m^3) x NHL/liver Unit Risk (ug/m^3)$^{-1}$] x 14/24

										Total of Receptor Risks Across All Media	N/A			Total of Receptor Hazards Across All Media		N/A

Notes

Early-life cancer risk calculations for TCE calculated by multiplying the intake/exposure concentration by the default age-dependent adjustment factor (ADAF) of 10 for 2/6 of the result (ages 1-2) and by the default ADAF of 3 for 4/6 of the result (ages 3-6), but only for exposures associated with the production of kidney tumors. This requires splitting the unit risk by tumor effects [kidney = 1E-06 (ug/m^3)$^{-1}$ and non-Hodgkins lymphoma (NHL)/liver = 3.1E-6 (ug/m^3)$^{-1}$].

Inhalation early-life cancer risk = [intake/exposure concentration (ug/m^3) x kidney Unit Risk (ug/m^3)$^{-1}$ x 10 + intake/exposure concentration (ug/m^3) x NHL/liver Unit Risk (ug/m^3)$^{-1}$] x 2/6 +
[intake/exposure concentration (ug/m^3) x kidney Unit Risk (ug/m^3)$^{-1}$ x 3 + intake/exposure concentration (ug/m^3) x NHL/liver Unit Risk (ug/m^3)$^{-1}$] x 4/6

TRC Field Oversight Summary Report for Whitney Property

TRC Field Oversight Summary Log

Site Name: Whitney Barrel
Site Address: Woburn, Massachusetts
Type of Work: Sewer Pipe Excavation

Work Dates: 12/2/10 through 4/8/11
Contractor(s): AECOM and Earthwork
TRC Staff: J. McRobbie, Geologist

Work Plan: "*Supplemental Remedial Investigation Work Plan, Southwest Properties, Wells G&H Superfund Site, Woburn, Massachusetts"* prepared by AECOM, dated November 9, 2010.

Purpose: The work objective was to assess and evaluate the integrity of an abandoned 9-inch sewer pipe which exits the northwest end of the Whitney Barrel building and connects to the municipal storm sewer system located approximately 175 feet to the north. The pipe is suspected to have historically served as a contaminant disposal conduit for past property tenants. Data collected during the investigation will be used toassess the pipe as a source area for soil and groundwater contamination.

Work Summary: Under the supervision of AECOM, Earthwork excavated and exposed a total of 92 feet of sewer pipe for visual inspection and sample collection. Prior to sample collection, AECOM personnel evaluated soils for physical characteristics and inspected for visual and/or olfactory evidence of contamination. Samples were then screened in the field for the presence of volatile organic compounds (VOCs) using a PID. Elevated PID readings and any visual or olfactory indications of contamination were used as a guide for the selection of soil samples for laboratory analysis. Soil samples were submitted for VPH, VOCs, EPH, PCBs, metals, and pesticides analyses.

Work Plan Deviations: Because the depth to groundwater (~4-4.5 ft) generally coincided with the top of sewer pipe, and because work personnel were not allowed in the excavation, AECOM's level of inspection was limited.

Health & Safety: AECOM, Earthwork, and TRC personnel were certified in HAZWOPER training and followed strict health and safety protocols with particular focus on trench work heavy equipment safety. During excavation work, upwind and downwind air monitoring for total VOCs was completed by AECOM to monitor hazardous concentrations of airborne contaminants potentially migrating offsite.

During initial investigation activities in December 2010, PID readings within 15 feet of exposed sewer pipe ranged from approximately 1,340 to over 9,999 ppm. As necessary, field staff personnel were subsequently equipped with half-faced respirators with organic vapor cartridges. PID readings of ambient air during remaining excavation events generally ranged from 0 to 4 ppm with occasional non-sustained readings up to 10 ppm. No audible alerts were noted on the downwind detector. Further supporting documentation of the downwind monitoring is expected from AECOM.

Inspection Findings: Overall, observed portions of the sewer pipe appeared to be intact and in good condition; however, black staining and/or elevated PID readings (up to 2,249 ppm) were observed at multiple locations along excavated segments adjacent to the sewer line and in the vicinity of two metal cylindrical cleanout structures which the line ran through. The pipe is of 9-inch ID transite (asbestos-cement) construction with dry-jointed belled end fittings.

Photographs taken during oversight activities between December 2, 2010 and April 8, 2011 are provided on the following pages.

1. View of the mini excavator used to begin initial excavation work in locating the sewer pipe to the immediate north of the Whitney Barrel building.

2. Once soil at approximately 4-foot depth was encountered ambient air PID readings within 15 feet of trench ranged from 1,340 to over 9,999ppm. Consequently, work personnel utilized half-faced respirators with organic vapor cartridges.

3. Impacted soil was temporarily stockpiled on polyethylene sheeting to the north of the building.

4. Hand tools were used to reduce potential for accidental pipe damage.

5. A dry-jointed belled-end fitting on the sewer pipe was identified at approximately 4 feet 4 inches depth. The 9-inch (inner diameter) pipe was inadvertently cracked in-place during excavation work.

6. Soil sample L2 (4.5ft) was collected adjacent to the pipe joint and water sample was collected from within the pipe. A snake test performed indicated that no obstruction was present to the north within 50 feet. Following sample collection, the excavation was backfilled in sequence. Planned efforts to further evaluate the pipe integrity consisted of a video survey with access provided from the sewer manhole to the north.

7. After failed attempts to conduct a video survey of the pipe, a second day of excavation work was scheduled to expose and inspect the remaining portions of the sewer line. Once the pipe was identified at location L2, the line was traced southerly towards the building foundation.

8. View of AECOM personnel setting up and calibrating equipment downwind of the excavation to monitor air quality.

9. Excavation efforts to the immediate north of the building were halted early due to water entering the trench at approx. two feet bgs from a suspected faulty water main. Consequently, AECOM was unable to inspect portions of the pipe within 15 feet of the building.

10. View of the exposed sewer line approx. 25 ft of the northwestern façade of the building. Due to the shallow groundwater table (4.5-5 ft), AECOM pumped groundwater into drums and used soil dams to allow for inspection of the pipe. The pipe appeared to be set in 15-ft lengths with dry-jointed belled-end fittings.

11. The top and sides of the pipe appeared to be intact and free of cracks and punctures. AECOM's primary challenge during the pipe inspection was dewatering. Due to the pipe's dip in angle, this challenge grew more difficult as work progressed northerly.

12. A metal cylindrical cleanout structure was observed 34 ft NW of the building. Headspace readings from soil collected adjacent to the structure/pipe juncture were: 34ppm (0-1'); 1,138-1,352ppm (2-4'); 2,249ppm (4-4.5'); and 184ppm (4.5-5'). Soil sample L5 (4.5) was collected here.

13. The top of the structure was approx 3 ft below grade and measured approx. 3.75 ft in diameter. A 9-in diameter 1-ft deep hole was observed in the top of the structure. This depth appeared to be coincident with the top of pipe.

14. An area of black stained soil was observed at approx. 4- to 4.5-ft depth adjacent to a pipe joint to the immediate north of the cleanout structure. Soil headspace readings from this area were approx. 250 ppm. Soil sample L7 was collected at this location.

15. Pipe inspection in the vicinity of L8 and L9 was limited due to groundwater influx and the depth of excavation

16. View of the exposed sewer pipe at L9. Due to the presence of stored machinery and heavy equipment to the north of L9, AECOM was forced to schedule a third day of excavation to allow for these items to be relocated.

17. View of excavation backfilling activities.

18. View of final grading activities.

19. View of excavation work beginning at location L9 during the April 8, 2011 inspection event.

20. The use of hand tools allowed for soil to be carefully removed from around the pipe and provided for adequate line assessment.

21. Areas of black staining were observed at several locations adjacent to the sewer line during the April 2011 inspection. These areas were located between 80 feet (L10) and 107 feet (L13) from the building.

22. PID readings of soil collected from the stained areas ranged from 74 to 280 ppm. Soil samples were collected by AECOM following field screening procedures.

23. A second metal cleanout structure was identified approximately 146 feet from the building. A metal lid to the structure was not present, and the structure appeared to be filled with earthen material. Soil collected adjacent to the structure exhibited a PID reading of 146 (5-6ft).

24. Following inspection and sampling activities, AECOM geolocated the sewer line and sample points via GPS. The excavation was then backfilled in sequence.

Memorandum

To	Pete Cox/Chelmsford	Page	1
Subject	Tier II Data Validation VOC, VPH, EPH , and TPH Analyses Southwest Properties Woburn, Massachusetts TestAmerica SDG 680-86087-1 and Alpha Analytical SDG L1223380		
From	Paula DiMattei/Chelmsford		
Peer Review	Lori Herberich/Chelmsford		
Date	March 7, 2013	60156125.710	

U.S. EPA Region 1 Tier II data validation was performed on the analytical data for two light non-aqueous liquid (LNAPL) samples as tabulated below. These samples were collected by AECOM on December 21, 2012 at the Southwest Properties site located in Woburn, MA. The samples were submitted to Alpha Analytical (Alpha) in Westborough, MA for analysis. The data were processed and reported in sample delivery group (SDG) L1223380. The samples were analyzed for volatile petroleum hydrocarbons (VPH) using “MA DEP Method for the Determination of Volatile Petroleum Hydrocarbons (VPH)" (Revision 1.1, May 2004) and for extractable petroleum hydrocarbons (EPH) using "MA DEP Method for the Determination of Extractable Petroleum Hydrocarbons (EPH)" (Revision 1.1, May 2004). Additionally, the samples were submitted to TestAmerica in Savannah, GA for analysis. The data were processed and reported in SDG 680-86087-1. The samples were analyzed for volatile organic compounds (VOCs) using SW-846 Method 8260B and for total petroleum hydrocarbons (TPH) using SW-846 Method 8015B.

The analytical data were evaluated with reference to the "Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses” (December 1996 and updates) and the quality control (QC) criteria specified in the analytical methods. Modification of the Functional Guidelines was performed to accommodate the non-CLP methodologies, as appropriate.

DATA REVIEW ELEMENTS

The data were evaluated based on the following review elements, where applicable to the method:

- * Data Completeness
- * Chain-of-custody (COC)/sample integrity
- * Holding times and sample preservation
- * GC/MS tuning

- Initial and continuing calibrations
- * Laboratory method blanks
- NA Trip blanks/equipment blanks
- * Surrogate percent recoveries (%Rs)
- * Fractionation results
- NA Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- * Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- NA Field duplicate results
- * Internal standard results
- * Quantitation limits and sample results

NA indicates that the parameter was not included as part of this data set, and therefore not reviewed.

The symbol (*) indicates that no qualifications were required for these parameters. The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were qualified (see Table 1) due to non-conformances of certain QC criteria (see discussion below).

Chain-of-custody (COC)/Sample Integrity

Alpha Analytical received a trip blank that was not indicated on the COC. The AECOM project manager notified the laboratory that analysis of the trip blank was not required.

The laboratory noted that the TPH method blank and LCS were incorrectly spiked with a spiking solution that was 10x the normal concentration. The method blank and LCS were diluted by a factor of 10 prior to analysis. No data validation actions were required other than this notation.

Initial and Continuing Calibrations

VOCs

The percent relative standard deviations (%RSDs), the percent differences or percent drifts (%Ds), and/or the relative response factors (RRFs) were all within the QC acceptance criteria in the initial and continuing calibrations (ICAL and CCALs) with the following exceptions summarized in the table below. Sample results were qualified as indicated.

Calibration	Compound	%D	Actions (Detects/Nondetects)
ICAL 12/6/2012	1,2-Dibromo-3-chloropropane	17.0	J/UJ
	1,2,3-Trichlorobenzene	31.0	J/UJ
Associated Sample: All LNAPL samples			
CCAL 1/3/2013	1,2-Dibromo-3-chloropropane	22.2	J/UJ
	Naphthalene	24.1	J/UJ
	1,2,3-Trichlorobenzene	27.4	J/UJ

Calibration	Compound	%D	Actions (Detects/Nondetects)
Associated Sample: All LNAPL samples			

Quantitation Limits and Sample Results

TPH

The laboratory noted that the majority of the material detected within the sample eluted within the C20-C38 oil range organic (ORO) range. The pattern of the material detected closely resembled the motor oil ORO standard used for calibration. There was a smaller amount of material detected within the C10-C28 range; however, the amount of material present in the ORO range overlaps and interferes with an evaluation of a possible DRO match.

Executive Summary

Laboratory performance issues and other factors affecting data quality are discussed in the text above. Qualified data is presented in Table 1.

The analytical data were evaluated with reference to the "Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses" (December 1996 and updates) and the quality control (QC) criteria specified in the analytical methods. Modification of the Functional Guidelines was performed to accommodate the non-CLP methodologies, as appropriate. The text of this report has been formulated to address only those problem areas affecting data quality.

Notes:

- Refer to Attachment A for validation qualifier definitions.
- Refer to Attachment B for validation reason code definitions.

Attachment A

Qualifier Codes and Explanation

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Boston, MA 02203

RE: Groundwater Use and Value Determination
Wells G + H Superfund Site (MAD #980732168, RTN#3-0479)

Dear Mr. Cianciarulo:

Enclosed please find the Groundwater Use and Value Determination prepared by the Department (DEP) for the Wells G + H Superfund Site (the Site). This Determination was conducted by the DEP pursuant to the Memorandum of Agreement (1998) between the U.S. Environmental Protection Agency and the DEP.

In determining the use and value of the groundwater in the vicinity of the Wells G + H Site, we referred to the aquifer classification system in the Massachusetts Contingency Plan (MCP). The classification in the MCP gives consideration to all of the factors in the Use and Value Guidance. Enclosed with the Use and Value Determination is a copy of the GIS map used to determine the aquifer classification. This map provides a variety of information, including the USGS yield classification, the presence of public water supplies and zones of protection, surface water bodies, wetlands, protected open space areas, and drainage basin boundaries.

If you have any questions regarding this letter, please don't hesitate to contact me at 617-654-6651.

Sincerely,

Richard Chalpin
Assistant Commissioner, Bureau of Waste Site Cleanup

GROUNDWATER USE AND VALUE DETERMINATION
Wells G + H Superfund Site
Woburn, MA

June 2004

Consistent with the Environmental Protection Agency's (EPA) 1996 Final Ground Water Use and Value Determination Guidance, the Department has developed a "Use and Value Determination" of the groundwater beneath the Wells G + H Superfund Site (the "Site"). -The purpose of the Use and Value Determination is to identify whether the aquifer at the site should be considered of "High", "Medium", or "Low" use and value. In the development of its Determination, the Department has applied the criteria for groundwater classification as promulgated in the Massachusetts Contingency Plan (MCP). The classification contained in the MCP considers criteria similar to those recommended in the Use and Value Guidance as agreed to in the Memorandum of Agreement (MOA) between EPA and DEP. The Department's recommendation supports a medium use and value for the Site Area groundwater. A brief background of the Site, an explanation for the determination, and a table listing the criteria that facilitated the determination are outlined below.

The Site covers approximately 330 acres in eastern Woburn, Massachusetts. The Site is bounded by Route 128/95 to the north, Route 93 to the east, the Boston and Maine railroad to the west, and Salem Street to the south. The groundwater under evaluation for this determination is within the boundaries of the Site as shown on the attached Figure.

The Site is almost entirely within the Interim Wellhead Protection Area (IWPA) of the two municipal wells G + H. The two wells reside near the center of the Site as shown on the Figure. The aquifer within the Site is classified as medium and high yield by the United States Geological Survey (USGS). Combined, the wells had a pumping capacity of approximately 1.73 million gallons of water per day (MGD). Wells G + H were shut down in May of 1979 when high levels of chlorinated organics were discovered in both wells. Since that date the wells have not been used. However, the City has not formally abandoned the wells in accordance with the DEP's regulations; therefore, at this time the DEP Drinking Water Program has classified the wells as inactive.

Approximately two thirds of the water currently used by the City is from seven groundwater wells in a separate aquifer under Horn Pond, and the remainder is supplied by the Massachusetts Water Resources Authority. There have been problems with TCE contamination from an unknown source in the aquifer at Horn Pond, as well as bacterial contamination from a nearby Combined Sewage Overflow (CSO), but these have been stabilized and controlled. City engineers have indicated to the DEP's Drinking Water Program that the stability of the current water supply and the expression of public opinion against the use of the G + H wells for drinking has meant that the likelihood of using the inactive wells in the near future is very low. However, they have also expressed to DEP that they do not want to eliminate the possible future use of the resource. Water usage has increased tenfold since the City's water system became operational in 1873, and is now at least 6 million gallons of water per day.

With regard to the cleanup of the Site, an intensive remedial investigation was conducted through the 1980s following the shut down of the wells. A Record of Decision issued by EPA in September of 1989 required the remediation of the sources of the contamination to the wells, and

the investigation of the Central Area groundwater and the Aberjona River. To date, contaminated soil at the Site has been remediated at three of the source areas known as Wildwood Conservation Trust (also known as Beatrice Food Corporation), New England Plastics, Inc., and W.R. Grace. Contaminated soils remain at the Unifirst Corporation and the Olympia Nominee Trust properties. The remaining contaminants include chlorinated organics, heavy metals, polychlorinated biphenyls (PCBs), and other wastes.

The investigation of the Aberjona River, which flows through the center of the site, has indicated that contaminants are present in both sediment and surface water. The sediment of the Aberjona River contains elevated levels of metals including arsenic, chromium, mercury, copper and lead, volatile and semi-volatile organics, pesticides, and PCBs. The surface water contains volatile organics, pesticides, semi-volatile organics, and metals. The groundwater within the Central Area, i.e., the area downgradient of the source area properties, contains a broad mix of inorganic and organic contaminants, including nitrates, sodium, chloride, barium, arsenic, chromium and lead, chlorinated organics consisting primarily of trichloroethylene and tetrachloroethylene, other volatile organics, poly-aromatic hydrocarbons (PAHs), and other semi-volatile organic compounds.

Because the Site is within the IWPA of a current drinking water supply, and also because the aquifer is medium and high yield, the Site Area aquifer is classified under the MCP as GW-1 meaning a current or potential drinking water source area. The one-mile diameter IWPA default zone supercedes any of the areas excluded as non-drinking water source areas under the MCP. The GW-2 classification applies to areas where there is potential migration of vapors from groundwater to occupied structures; specifically, where groundwater has an average annual depth of 15 feet or less and where the structure is within a 30 foot surface radius of that groundwater. Since much of the site is developed with commercial, industrial and residential structures, GW-2 potentially applies to the majority of the aquifer. An exception to the developed areas is the land surrounding the wells owned by the City that is vacant. Potential uses for this land are being examined under a Superfund Redevelopment Grant by the EPA. So far all of the plans created under the grant have included various scenarios of recreational use.

Lastly, at a minimum, all groundwater is considered as GW-3, which considers the ecological and human health impacts and risks associated with the discharge of groundwater to surface water. The aquifer discharges into the Aberjona River and its associated wetlands.

Considering these classifications, exposure scenarios for the groundwater risk evaluation should include, but not be limited to: ingestion and exposures from other domestic uses; inhalation of vapors from seepage into buildings; use of the water in industrial processes and other potential exposures to the use of the water in industrial and residential activities; worker exposure during excavation into groundwater; and exposures resulting from discharge to surface water.

Overall, the aquifer has significant current ecological value for its contribution to the River and the associated wetlands; however, the groundwater and the sediment of the River and its wetlands are contaminated. The full ecological value of the groundwater won't be realized until it and the sediment of the area have been remediated, which is most likely several years away. Its potential human value is significant, but only in the far future. In light of these and other criteria established in the MCP that were examined in this determination, the Department supports a medium use and value for the Site Area aquifer.

Groundwater Use and Value Considerations				
Factors	High	Medium	Low	Comments
1. Quantity	X			Aquifer is high-yield (1.75 million gal/day) The aquifer is alluvial, highly porous sand and gravel.
2. Quality			X	Aquifer is contaminated throughout (upper aquifer into the bedrock) with a broad variety of contaminants above drinking water standards. Many of the contaminants are organic and volatile and therefore are expected to eventually breakdown or volatilize upon eventually reaching surface water. Main sources of anthropogenic contamination of the aquifer appear to have been identified, and most are being or have been removed.
3. Current Public Water Supply Systems		X		There are two public supply wells on site. Both are inactive due to the presence of contamination. The City uses groundwater from another aquifer (Horn Pond Aquifer) and supplements the lost supply from Wells G&H with MWRA water. The City experiences regular water shortages and voluntary and required reduction efforts during the summer months.
4. Current Private Drinking Water Supply Wells			X	No known private drinking water wells within the study area. The City does not allow private wells to be tied into the municipal drinking water system at any point.
5. Likelihood and I.D. of Future Drinking Water Use		X		There are no other potential water supply development areas in the City that we are aware of. It is unlikely that the Wells G&H will be used in the near future, but possibly in the longer term as demand increases.
6. Other Current or reasonable Expected Groundwater Use(s) in Review Area		X		There are industrial wells used for processing and irrigation, and commercial wells also used for irrigation in the area. It is reasonable to expect similar uses to continue.
7. Ecological Value	X			Groundwater in the study area discharges directly to the Aberjona River.
8. Public Opinion		X		Public opinion has been opposed to utilizing the Wells G&H for water supply. The City has expressed an interest in having the source available for the future.

Please find attached letters outlining the United States Environmental Protection Agency (EPA), in consultation with Massachusetts Department of Environmental Protection (MassDEP), review and comments of the Source Area Properties Annual Reports, Central Area, and Southwest Properties at the Wells G&H Superfund Site. EPA would like to work together with all the parties and move the Site forward. In that spirit, the agency is providing these letters as draft under this cover letter to permit sufficient time for review, and would like to schedule informal

technical meetings with each of the parties and chart a course forward for Source Area Properties, Central Area and Southwest Properties.

Please contact me at your earliest convenience to schedule technical meetings in June 2009. I may be reached at (617) 918-1323. Please also find attached a compact disc containing electronic versions of the letters.

Sincerely,

Re: Southwest Properties at the Wells G&H Superfund Site

Dear Mr. Cox:

Considering some of the activities (outlined below) related to the Southwest Properties (SWP) since the RETEC Group's submission of the Supplemental Remedial Investigation (Supplemental RI) in August 2003, including the Environmental Protection Agency's (EPA) Revised February 2006 Baseline Human Health and Ecological Risk Assessment (BRA) performed by Metcalf and Eddy, EPA believes the SWP may proceed separately from the larger Wells G&H Central Area RI. Under the 1991 Consent Decree, the Settling Defendants have agreed to implement the RI and FS, while EPA performs the baseline risk assessment. EPA would like to discuss with you moving the SWP forward under an FS, as well as the potential of performing an Engineering Evaluation/Cost Analysis (EE/CA), considering the risks identified under the BRA. If an EE/CA and removal action were performed at the SWP, then the removal action results may be considered in the FS.

Some of the activities related to the SWP include:

- EPA (2003) Action Memorandum for Olympia Nominee Trust Property within the Wells G&H Superfund Site, and subsequent Administrative Order by Consent (AOC) with the Olympia Nominee Trust property to address significant trichloroethene (TCE) contamination in saturated soils through In-Situ Chemical Oxidation (ISCO).
- EPA (2006b) Action Memorandum for John J. Riley Site, Woburn, Massachusetts, and subsequent AOC with Organix to address significant chromium contamination along a drainage channel flowing towards the Southwest Properties.
- EPA (2007) Action Memorandum for the Murphy Property, 263 Salem Street, Woburn Massachusetts, and subsequent removal action by EPA to address polychlorinated biphenyl (PCB) contamination in soils.
- Wells G&H Five Year Review (2004).
- M&E (2006) Baseline Risk Human Health and Ecological Risk Assessment for the Southwest Properties (BRA).

- Tetra Tech NUS, Inc. MSGRP Remedial Investigation Report (2005a) and Feasibility Study (2005b) for Industri-plex Superfund Site, Operable Unit 2, Woburn, Massachusetts.
- EPA (2006) Record of Decision for Industri-plex Superfund Site Operable Unit-2 (and including Wells G&H Superfund Site Operable Unit-3, Aberjona River Study), Woburn, Massachusetts.
- United States (2008) Consent Decree with Bayer CropScience, Inc. and Pharmacia Corporation for Industri-plex Superfund Site Operable Unit-2 (and including Wells G&H Superfund Site Operable Unit-3, Aberjona River Study).

EPA recognizes that RETEC coordinated and performed additional sampling with EPA oversight to support the Supplemental RI for the SWP. However, after performing the BRA and further reviewing operational histories associated with the SWP and some adjacent properties, some comments and recommended additional data needs have been identified regarding the evaluation of potential sources and the nature and extent of contamination contributing to the unacceptable risks documented in the BRA. These comments and additional data needs are outlined in Attachment 1 and 2, respectively.

An initial component of the FS or potential EE/CA is conducting a focused investigation (Attachment 2 – Recommended Additional Data Needs) to address these comments in Attachment 1 at each property, as well as the collection of any other data that will facilitate and expedite the evaluation of remedial alternatives. The results of the data collection can be applied in the initial portions of the FS or EE/CA to update the nature and extent and fate and transport of the contaminants of concern contributing to unacceptable risks, including contaminant concentration isopleths. EPA will coordinate closely with AECOM regarding the focused data collection and preparation of the FS or EE/CA.

Please be advised that EPA is also transmitting draft comment letters to each Source Area Property (WR Grace, Unifirst, NEP and Wildwood) regarding their annual reports, and a comment letter to the Central Area coordinator regarding the Central Area Operable Unit 2. EPA's Wildwood Property Source Area property and Central Area comment letters recommend additional investigations including the installation of a multi-level cluster well at shallow monitoring well location AB1 situated along the bedrock valley depression within the southeast corner of the Aberjona Auto Parts property and investigation of historical VOC soils by the entrance to the Wildwood Property. The information gathered from this recommended work may also be applicable to hydrological and water quality conditions at the Southwest Properties.

EPA would like to discuss with you the attached comments and recommended additional data needs, and the approach for moving the SWP forward. Please contact me at (617) 918-1323 to schedule a meeting.

Sincerely,

Comments

Groundwater Contours/Pontentiometric Surface Maps:

The groundwater contours and pontentiometric figures in the Supplemental RI are based upon limited groundwater monitoring data at the SWP. Groundwater elevation and potentiometric data from a broader set of monitoring wells to the north, east and south of the SWP would provide a more accurate representation of local groundwater flow conditions. The Central Area Phase 1A (1993) contains bedrock contour maps illustrating a bedrock valley centered along the eastside of the Aberjona Auto Parts Property, with regional groundwater flowing from the west side of bedrock valley generally to the southeast, and from the eastside to the southwest. This information, in addition to historical groundwater elevation data collected during the Central Area Phase 1A (1993) RI and Wildwood Source Area Property Pump Test (1995) suggests the bedrock valley has a significant influence on groundwater flow directions. See attached Figures 1 through 3. Although groundwater elevations adjacent to the Aberjona River may be periodically influenced by the precipitation events and accompanying fluctuations in surface water elevations, collectively, these flows combine and carry flow towards the south along the valley. The collection of groundwater elevation data from a wider network would help illustrate these flow phenomena more accurately.

Murphy Waste Oil:

Former "Oil Pit"- The former "Oil Pit" received waste oil and oil filters since early operations at the property. See attached Figure 4. During Clean Harbors' development of the property in the late 1980s, a building was constructed over the Oil Pit. Some of the underlying soils containing waste oils were removed at the time of construction; however, a majority of the waste oil soils appear to remain under the building. CARP Reports I and II prepared by Clean Harbors in the 1990s illustrate the extent of underlying soils containing Total Petroleum Hydrocarbons (TPH) greater than 2,000 parts per million (ppm) under the building. See attached Figures 5 through 7. EPA estimates approximately 1,600 cubic yards of TPH-contaminated soil at concentrations greater than 2,000 ppm remain under the building. Unacceptable risks have been documented in groundwater on the Murphy Waste Oil property, as well as the other Southwest Properties. Immediately downgradient of the Former Oil Pit, Light Non-Aqueous Phase Liquid (LNAPL) is observed and periodically removed from monitoring well MW-7, and unacceptable risks have been documented in sediments/soils within the "Murphy Wetland". See attached Figure 8. The waste oil contaminated soils have not been sufficiently characterized relative to the risks observed in groundwater and wetland sediments/soils.

Former "Oil Yard" - The former "Oil Yard" contained various above ground storage tanks. Some of the underlying soils contain waste oils. The CARP Reports illustrate the extent of underlying waste oil soils containing TPH at concentrations greater than 2,000 ppm. The waste oil soils extend from the Oil Yard area into Murphy Wetlands. Within and downgradient of the

Oil Yard, shallow groundwater is contaminated with chlorinated volatile organic compounds (VOCs) and LNAPL has been observed and periodically removed from various monitoring wells (MW-16, MW-24, MW-25). Unacceptable risks have been documented in groundwater on the Murphy Waste Oil property, as well as the other Southwest Properties. Unacceptable risks have also been documented in sediments/soils at the "Murphy Wetland". These waste oil soils have not been sufficiently characterized relative to the risks observed in groundwater and wetland sediments/soils.

Other Fate & Transport Concerns - The historical and current migration of groundwater contamination and LNAPL, as well as waste oil soils (e.g. erosion), from the Murphy Waste Oil property have impacted the Murphy Wetlands.

Whitney Barrel Company:

Former Operations and Potential Sources within Building - Platform(s) for storing drums to be cleaned, series of drum wash basins/troughs/tanks, steam drying, drum top removal, drum straightening, spray booth, and paint and cleanser solutions storage occurred within the northern portion of the main building. A floor drain was situated five feet inside the north side of the main building. The 1988 GHR Report collected a sediment sample from the former basin and detected elevated levels of VOCs and pesticides. See attached Figures 9, and 10 (Sanborn Map). None of these potential sources were investigated as part of the Supplemental RI.

TP-12 and Drum Transfer/Storage by the North End of the Building - Drums were stored outside the northern and eastern portion of the property. At the northern end of the main building, it appears trucks would back up against the northern portion of the building and drop-off/transfer drums into the building for cleaning/reconditioning. Within the 1988 GHR Report, results are reported for a composite soil sample (TP12) collected from this location, just north of the main building, which contained the highest concentrations of chlorinated solvents detected in soils on the Whitney Property (TCE at 330 ppm, tetrachloroethene [PCE] at 320 ppm). See attached Figure 11. In addition, based upon the GHR Report and Supplemental RI, the highest concentrations of PCBs and pesticides in soils on the Whitney Property were located around the northern end of the building. These areas (e.g., TP 12/north of the main building, and eastside of main building) should be investigated further.

Access Pathway and Sewer Man Hole - Based upon historical aerial photographs and descriptions of barrel operations, an access pathway is situated to the north/northeast corner of the property which leads directly to the Massachusetts Water Resources Authority (MWRA) sewer man hole along the MWRA access road. The MWRA access road continues to the north through the Wildwood Property. See attached Figure 12. Drums were also periodically stored within the access pathway. See attached Figure 13. In 1979, Whitney Barrel Company was cited by the Commonwealth relative to industrial wastewater discharge into MDC manhole just beyond the northeast corner of the property, and paid a $5,000 civil penalty. In 1979, the Commonwealth inspected the facility and found conditions unsatisfactorily and potential source of pollution. These conditions include areas where oil and various chemicals have either leaked

or spilled on the ground from the tanks and barrels being stored on the property, and an area at the rear of the building where the waste water, grease etc. were spilled from the wash basin. During preliminary assessment perimeter inspections in 1980 by Ecology and Environment, many containers were stacked 3 or 4 high and severely rusted; and the sewer man hole at the rear of the property was accessible for dumping waste. Hence, it is likely that the sewer man hole was historically used for the periodic disposal of waste, and the access pathway periodically stored drums/containers, as well as other drum/container storage areas on the property, and potentially leaked. The sewer man hole and access pathway have not been investigated.

Other Fate and Transport Concerns - Contaminated soils (e.g., PCBs) from the Whitney Barrel property have impacted (e.g. erosion) the Murphy Wetlands. The Whitney Barrel property appears to also be a source of VOC groundwater contamination considering historical operations and data (e.g., historically high TCE and PCE concentrations in soil at TP12). However, insufficient soil and groundwater data were collected at and immediately downgradient of the Whitney Barrel property to fully evaluate the potential impact of historical operations and source releases on groundwater quality at the Whitney Barrel and Aberjona Auto Parts properties. As part of additional investigations at the Whitney Barrel Property, additional monitoring wells are recommended at and immediately downgradient of the property. Although monitoring wells AB3M and AB5M were installed by RETEC during the RI, representative groundwater samples have not been collected and analyzed from these wells. The collection of groundwater samples from these wells, and newly-installed wells as part of additional investigations, is recommended to further understand groundwater quality conditions. Please also see EPA's comment letters on the Wildwood Property Source Area and Central Area Operable Unit 2 which also recommends the installation of a multi-level cluster well at shallow monitoring well location AB1 situated along the bedrock valley depression within the southeast corner of the Aberjona Auto Parts property and an investigation of historical VOC soils by the entrance to the Wildwood Property. The information gathered from this recommended work may also be applicable to hydrological and water quality conditions at the Southwest Properties.

Aberjona Auto Parts:

Vehicle Dismantling Operations - Vehicle dismantling occurred in the dismantling bay or in the driveway. Fluids were removed from the vehicles at the dismantling bay and either recycled/reused on the property (e.g., oil burner to heat building, recycled anti-freeze) or stored in 55-gallon drums and reportedly removed by Cyn Oil. A waste oil tank was located east side of the building. Some parts were cleaned in the Engine Room/Back Garage using cleaning fluid (brand name ZEP). The Sales Area Building (built 1978) has 3 floor drains leading to an oil water separator. Prior to the installation of floor drains and oil/water separator, it appears waste oil was contained in a tank. Unusable waste fluids stored in drums were reportedly removed by Cyn Oil (over 50 drums). During a 1980 inspection, 10 empty 55-gallon drums were found reportedly resulting from 2 to 3 years use of degreasing solvent. See attached Figure 14 illustrating a sketch of building, including three garage areas highlighted in yellow, and the years of building construction.

Former Dismantling Area/ Shed - During the junk yard/used automotive parts operations (1960 – 1980s), vehicles were dismantled at the facility for the resale of parts. The parts were cleaned before resale with a degreaser (e.g., ZEP), reportedly within the Engine Room or Back Garage. Based upon a sketch of the facility drawn by the former owner/operator (Clifford Boutwell), a shed was situated to the north of the original building. See attached Figure 15. The specific location of the dismantling and degreasing operations is unclear, as well as the storage location of degreasing fluids/chemicals. Considering Figures 14 and 15 and historical aerial photographs, as well as TCE groundwater concentrations at AB-2 and AB-1, it appears that the garage areas, oil/water separator, waste oil tank (east of building along driveway), former shed and area just north of the existing building, are all potential release and/or source locations, and should be investigated further.

Monitoring Well AB-2 - TCE groundwater concentrations at monitoring well cluster AB-2 have varied with the highest concentrations found within the deeper intervals. In 1993 and 2002, the highest concentrations were found in the intermediate overburden, as illustrated in the following table.

TCE (ppb)				
Date	AB-2SS	AB-2M	AB-2R	AB-1 (shallow)
1993	<2	363	144	62
2001/2002	16	41	160	2

Based upon Figure 15 and historical aerial photographs (e.g. 1954, 1965), monitoring well cluster AB-2 is situated immediately northwest of what appears to be the historical "shed" location. Based upon aerial photographs, there also appear to be trailers at the north end of building near AB-2 (e.g. 1971), and potentially a horseshoe shaped dismantling area by AB-2 (e.g. 1981). See attached Figures 16 and 17. The purpose of the trailers is currently unknown; although, waste fluids removed from vehicles may also have been stored outside the building and in trailers.

Shallow groundwater elevation contours may be periodically influenced by rising surface water levels attributed to precipitation events. The intermediate groundwater pontentiometric surface figures may more accurately depict groundwater flow direction in the area. As such, these potential sources by the northern portion of the building and the waste oil tank (along the eastside of the original building's driveway) may have contributed to shallow groundwater contamination detected at AB-1 in 1993.

Post-1978 Sales Building Construction - Historically, three (3) floor drains were installed within the building leading to an oil water separator. In addition, a diesel UST was situated at the northwest corner of the Sales Building (north of the oil water separator). A soil sample was collected along the north side of the UST (AB-102) and analyzed for Volatile Petroleum Hydrocarbons and Extractable Petroleum Hydrocarbons (VPH/EPH). The sample contained C9-

C10 Aromatic Hydrocarbons at 177 milligrams per kilogram (mg/kg) and C9-C18 Aliphatic Hydrocarbons at 2,430 mg/kg. These locations (floor drains, oil water separator and UST) may have also contributed to a release.

The sewer man hole connecting Whitney Barrel's sewer drain along the MWRA access road is situated on the Aberjona Auto Parts property. However, investigating the sewer man hole is discussed above under the Whitney Barrel Property.

Wildwood Source Area Property:

Since the Riley Well has been turned off (1989), groundwater contamination from the Wildwood Property may have migrated southeast and impacted portions of the Aberjona Auto Parts Property. See Figures 1 through 3. Some of this migration may also have occurred while Riley's production well was pumping (after wells G and H were shut down), based upon the Whitney Barrel GHR Report (1988) which illustrates groundwater flow direction and a groundwater divide location at the northern portion of the Whitney Barrel property. See attached Figure 18. EPA's 1993 TCE concentration map illustrates elevated levels of TCE within the central/southern portions of Wildwood migrating toward the Aberjona Auto Parts property. Since the 1998 implementation of the Wildwood Air Sparging/Soil Vapor Extraction and bedrock pump and treatment systems, 2002 TCE groundwater concentrations have reduced at the B8, B16 and S77 monitoring well clusters.

Date	BSSW17	BMW17	BW17R	BOW8	BW8(R)	BSSW16	BOW16	B16R	S77SS	S77D
1993	2,500	170	480	490	101	1,100	47	180	10	403
2002	No Data	No Data	200	8	14	1	10	11	2	15

This pathway of migration and chlorinated volatile organic contamination (e.g., TCE) from the southern portion of the Wildwood property toward the Aberjona Auto Parts property may have contributed to unacceptable ecological risk in the SWP BRA and needs to be evaluated in future contaminant fate and transport analyses and Feasibility Study/other remedial action reports.

John J. Riley Tannery/ Beatrice Foods operations:

Historical operations at the tannery resulted in various disposal activities on the property. Under the Commonwealth's Massachusetts Contingency Plan (MCP), MassDEP required action to address arsenic contaminated soils at the John J. Riley property. Within the MCP documentation, chromium was also observed on the property. No further action was implemented. After preparing the initial BRA for the SWP and further reviewing historical John J Riley information, EPA conducted an Expanded Trip Report (2004) and Removal PA/SI Report (2006) on the former John J. Riley Property. See attached Figure 19. Exposed gray/blue tannery waste was observed along the drainage swale which flows towards the SWP. These reports collected soil samples along the property's drainage swale and low lying areas, and total chromium concentrations were found up to 86,000 mg/kg. Some of the soil boring collected

along low-lying areas near the drainage swale, former Riley production well #1, and west of the railroad tracks contained total chromium concentrations which increased with depth. Along the drainage swale, a removal action was implemented along the drainage swale by the property owner with EPA oversight to remove some of the chromium waste and stabilize the slope. The remaining chromium waste on the property is being investigated under the MCP.

Chromium waste has migrated from the former John J. Riley Tannery/Beatrice Foods property along the drainage channel and contributed to the chromium concentrations found at the "Murphy Wetland" within the SWP. This pathway of migration and chromium's contribution to unacceptable ecological risk in the BRA for the SWP needs to be evaluated in future contaminant fate and transport and Feasibility Studies, and other remedial actions. Note: there may have also been other pathways of chromium migration to the SWP including the sewer connecting John J. Riley to the MWRA sewer line, and periodic sewer over flows/ blockages.

Attachment 2
Southwest Properties
Recommended Additional Data Needs

Murphy Wetlands:

- Approximately 7 soil boring locations within high TPH areas related to "Oil Pit" and "Oil Yard" leading to wetland (see attached Figure 20 regarding recommended soil boring locations in red).
- Monitoring wells at these soil boring locations may be necessary for groundwater sampling.
- Sample MW-2SS, MW-7, MW-16 & MW-24 for LNAPL and groundwater samples.

Whitney Barrel Property:

- Conduct an initial visual investigation inside the existing building regarding the location of wash trough/basin, paint booth, other areas of interest within the building during drum recycling operations, appropriate drum storage areas inside/outside the building, and location of chemicals and paints stored inside the building.
- Conduct VOC soil gas sampling at appropriate areas within the building, immediately north of building (e.g., TP12), and around the sewer man hole. Results will be considered for locating soils borings.
- Approximately 13 soil boring locations at wash basin and paint booth areas, sewer line, man hole, and drum storage areas to the north and east of the building (see attached Figure 20 regarding recommended soil boring locations in red).
- Where appropriate, install groundwater monitoring points/wells at these soil boring locations (shallow, medium and possibly deep overburden) and collect representative groundwater samples.

Aberjona Auto Parts:

- Conduct an initial visual investigation inside the existing building regarding the engine room, dismantling area, floor drains, and any other areas of interest within the building during parts cleaning operations and auto motive repair.
- Conduct VOC soil gas investigation at appropriate areas inside and outside the building by engine room, dismantling area, sheds and former waste oil storage tank area, around AB-2. Results will be considered for locating soils borings.
- Approximately 12 soil boring locations by/downgradient of former oil water separator and UST, three garages, floor drains, dismantling area, engine room, waste oil tank, former back garage/shed area, and around AB-2 (see attached Figure 20 regarding recommended soil boring locations in red).
- Where appropriate, collect groundwater samples at these soil boring locations (shallow, medium and possibly deep overburden).
- Collect sample(s) from Oil Water Separator.

Groundwater Elevation/Potentiometric Measurements:

Collect groundwater elevation/pontentiometric surface measurements from existing on-site monitoring wells, select monitoring wells to the north on the Wildwood Property, select monitoring wells to the south is Salem Street (e.g., historical S10 and S11 and others wells such as CD1, GZ1, GZ3), and any appropriate monitoring wells to the west to further understand local groundwater flows by the SWP.

Analyses:

Soil, NAPL and groundwater comprehensively analyzed for PCBs (both congeners and aroclors), pesticides, EPH/VPH, VOC, SVOCs and metals. For wells with LNAPL, groundwater samples should be collected via low

flow sampling methods after the NAPL sample has been collected and all NAPL removed from the well. The appropriate analytical method specifications for these analyses are as follows:

- PCB Congeners: EPA 1668, Revision B
- PCB Aroclors: SW-846 8082A
- Pesticides: SW-846 8081B
- VOCs: SW-846 8260B
- SVOCs: SW-846 8270D
- Metals: 6010C/7470A
- EPH: MassDEP, 2004
- VPH: MassDEP, 2004.

STAFF GAUGE	River	47.26	3.45	43.81			4.18	43.08			4.13	43.13		

Notes:
ft BMP - feet below measuring point
ft msl - feet above mean sea level
NA - not available or not applicable
[1] - Well was installed in December 2012.
[2] Wells recently resurvyed. Revised MP elevations shown.
SO = shallow overburden T = till
IO = intermediate overburden SR = shallow bedrock
DO = deep overburden DR = deep bedrock

NM - Not measured

Formation:

U - center of screen in unconsolidated deposits

RS - center of screen in upper 100 feet of bedrock

RD - center of screen >100 feet below top of bedrock

Monitoring well recently resurveyed, revised measuring point elevation listed.

Updated elevation for consistency with Supplemental RI values (See Table 1-2)

Notes:

ug/L - micrograms per liter.

J - Estimated value.

NA - Sample not analyzed for the listed analyte.

N/A - Not available/specified.

U - Compound was not detected at specified quantitation limit.

UJ - Estimated non-detect.

Values in **Bold** indicate the compound was detected.

Values shown in Bold and shaded type exceed RSLs.

VOCs - Volatile Organic Compounds.

* – EPA Regional Screening Levels for Tapwater, November 2011;

RSLs based on noncarcinogenic effects were divided by 10 to adjust for a hazard index of 0.1.

Well Types:

U - Center of screen in unconsolidated deposits;

RS - Center of screen in upper 100 feet of bedrock;

RD - Center of screen >100 feet below top of bedrock.

Notes:

ug/L - micrograms per liter.

J - Estimated value.

NA - Sample not analyzed for the listed analyte.

N/A - Not available/specified.

U - Compound was not detected at specified quantitation limit.

UJ - Estimated non-detect.

Values in **Bold** indicate the compound was detected.

Values shown in Bold and shaded type exceed RSLs.

VOCs - Volatile Organic Compounds.

* – EPA Regional Screening Levels for Tapwater, November 2011;

RSLs based on noncarcinogenic effects were divided by 10 to adjust for a hazard index o

Well Types:

U - Center of screen in unconsolidated deposits;

RS - Center of screen in upper 100 feet of bedrock;

RD - Center of screen >100 feet below top of bedrock.

Notes:

ug/L - micrograms per liter.

J - Estimated value.

NA - Sample not analyzed for the listed analyte.

N/A - Not available/specified.

U - Compound was not detected at specified quantitation limit.

UJ - Estimated non-detect.

Values in **Bold** indicate the compound was detected.

Values shown in Bold and shaded type exceed RSLs.

VOCs - Volatile Organic Compounds.

* – EPA Regional Screening Levels for Tapwater, November 2011;

RSLs based on noncarcinogenic effects were divided by 10 to adjust for a hazard index o

Well Types:

U - Center of screen in unconsolidated deposits;

RS - Center of screen in upper 100 feet of bedrock;

RD - Center of screen >100 feet below top of bedrock.

Notes:

ug/L - micrograms per liter.

J - Estimated value.

NA - Sample not analyzed for the listed analyte.

N/A - Not available/specified.

U - Compound was not detected at specified quantitation limit.

UJ - Estimated non-detect.

Values in **Bold** indicate the compound was detected.

Values shown in Bold and shaded type exceed RSLs.

VOCs - Volatile Organic Compounds.

* – EPA Regional Screening Levels for Tapwater, November 2011;

RSLs based on noncarcinogenic effects were divided by 10 to adjust for a hazard index o

Well Types:

U - Center of screen in unconsolidated deposits;

RS - Center of screen in upper 100 feet of bedrock;

RD - Center of screen >100 feet below top of bedrock.
