CASE NARRATIVE
Alpha Analytical

ETR: 1204035
Project: Enbridge Line 6B MP 608

All analyses were performed according to the Alpha Analytical quality assurance program and documented Standard Operating Procedures (SOPs). The analytical results contained in this report were performed within holding time, and with appropriate quality control measures, except where noted. A summary of all state and federal accreditations is provided within this report. Blank correction of results is not performed in the laboratory for any parameter. Alpha Analytical certifies that the test results within meet all of the requirements of NELAC, for all NELAC accredited parameters.

Sample Receipt

Samples (1204035-01 through -12) were received in good condition, between 2° and 6°C, and without discrepancies.

Samples were released for analysis on 4-20-2012. Samples were frozen until scheduled for analysis. Per the customer's request, all samples (1204035-01 through -12) were analyzed for PAH/BIO and SHC.

Sample Preparation and Extraction

Samples 1204035-01 through -04 (GLOB) and -08 through -12 (Sheen) were extracted on 5-01-2012 (prep batch 1204031_35sheen) underwent similar preparation procedures and shared the same quality control samples (method blank, laboratory control sample and laboratory control sample duplicate). The extraction and preparation procedure was performed according to the Alpha Analytical SOP (stated below) with no significant deviation.

Samples 1204035-05 through -07 were extracted on 4-30-2012 (prep batch 1204031_35SED). The extraction and preparation procedure was performed according to the Alpha Analytical SOP (stated below) but with the following deviations:

1. For samples 1204035-05, -06, and -07, the extraction was performed on a smaller sample size than the method specified representative aliquot due to a strong hydrocarbon odor. In addition, these samples were spiked with five times the procedural amount of surrogate due to the potentially high levels of petroleum present.

2. Matrix spike performance (MS/MSD) was measured with this batch but associated and reported with a sample from another ETR, 1204031.

The observations noted on the *Forensic Preparation Checklist* should neither have any adverse affect on the analysis nor should they impact data quality for samples in this ETR.

Alkylated Polynuclear Aromatic Hydrocarbons, Steranes, Triterpanes, and Triaromatic Steroids - Sediments

Polynuclear aromatic hydrocarbons and geochemical biomarkers were analyzed following Alpha Analytical SOP *Analysis of Parent and Alkylated Polynuclear Aromatic Hydrocarbons, Selected Heterocyclic Compounds, Steranes, Triterpanes, and Triaromatic Steroids by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (SOP O-008, Issue No. 7, 07/07/2011).* Sediment samples are spiked with surrogate compounds and extracted by *Shaker Table Extraction (SOP OP-013, Issue No. 5, 07/14/2011).* Solvent extracts are dried over sodium sulfate and concentrated to a 4mL volume. An aliquot of the extract based on *Gravimetric Determination (SOP OP-017, Revision No. 3, 07/06/2011)* is processed through an alumina column (*Alumina Column Cleanup of Organic Extracts, SOP OP-009, Issue No. 3, 07/14/2011),* concentrated to a

900uL volume and spiked with internal standard for instrument analysis. The average weight of all samples included in the extraction batch is used as the weight for the blank, laboratory control sample, and laboratory control sample duplicate. The final value is rounded accordingly. Qualitative identifications are confirmed by analyzing standards under the same conditions used for samples, comparing mass spectra, GC retention times, and patterns generated from reference oils. Quantification is based on response factors derived from a multi-level initial calibration using internal standard techniques. Alkyl homologues are quantified using the response factor of the parent PAH compound. Target triterpane biomarker concentrations are quantified using the response factor of Hopane and the steranes and steroids are quantified using the response factor of 5β(H)Cholane. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific method detection limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

1. The method blank S043012B07 contained low-level target compounds. The single component compounds were detected at less than 5x the sample specific method detection limit (MDL), the multi-component compounds were below the detection limit. The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

3. The relative percent difference (RPD) between the sample 1204035-07 and its duplicate (1204035-07D) exceeded the limit (30%) for forty six (46) compounds with reported concentrations that are greater than the QL in either the native or duplicate extract. The RPDs for the LCS/LCSD and MS/MSD met the criteria for all monitored analytes showing that precision of the method was established. Two RPDs were not reported due to the compound not being detected in either the native or duplicate extract and are "X" qualified. The samples were re-analyzed with confirming results. Only the original analyses are reported. No further corrective action was taken. See Duplicate Summary Report for individual compounds affected.

4. The standard reference material (SRM) 1941b was inadvertently not extracted with the sediment samples; therefore no SRM is included in this data package.

Alkylated Polynuclear Aromatic Hydrocarbons, Steranes, Triterpanes, and Triaromatic Steroids - GLOB/Sheen

Polynuclear aromatic hydrocarbons and geochemical biomarkers were analyzed following Alpha Analytical SOP *Analysis of Parent and Alkylated Polynuclear Aromatic Hydrocarbons, Selected Heterocyclic Compounds, Steranes, Triterpanes, and Triaromatic Steroids by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (SOP 2247, Rev. 2, 04/02/2012).* GLOB and sheen samples are spiked with surrogate compounds and extracted by *Shaker Table Extraction (SOP OP-013, Issue No. 5, 07/14/2011).* Solvent extracts are dried over sodium sulfate and concentrated to an appropriate volume based on *Gravimetric Determination (SOP OP-017, Revision No. 3, 07/06/2011).* The total extract oil weight as determined by gravimetric weighing is used as the weight for the GLOB samples. The average weight of all samples included in the extraction batch is used as the weight for the blank, laboratory control sample, and laboratory control sample duplicate. The final value is rounded accordingly. Qualitative identifications are confirmed by analyzing standards under the same conditions used for samples, comparing mass spectra, GC retention times, and patterns generated from reference oils. Quantification is based on response factors derived from a multi-level initial calibration using internal standard techniques. Alkyl homologues are quantified using the response factor of the parent PAH compound. Target triterpane biomarker concentrations are quantified using the response factor of Hopane and the steranes and steroids are quantified using the response factor of 5β(H)Cholane. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific reporting limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

1. Sheen samples are reported, using an initial amount of one, as ng (per sample).

2. The method blank SO050112B01 contained low-level target compounds. The single component compounds were detected at less than the sample specific reporting limit (RL), the multi-component compounds were below the detection limit. The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no

corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

4. For the Alaska North Slope Crude reference oil (SO050512ANS02) analyzed with the samples, Benzo[g,h,i]perylene recovered high and above the acceptance criteria (65-135%) at 143%. Since this was the only compound outside criteria no further corrective action was taken.

Total Saturated Hydrocarbons and Total Petroleum Hydrocarbons by GC/FID - Sediments

Samples for total saturated hydrocarbons and total petroleum hydrocarbons were analyzed following the procedures in Alpha Analytical SOP *Total Petroleum and Saturated Hydrocarbons by Gas Chromatography/Flame Ionization Detector (SOP O-003, Issue No.7, 08/15/2011)* Method 8100/8015mod. Samples were prepared as stated above for the PAH analysis. A portion of the final extract was analyzed for GC/FID (gas chromatography with flame ionization detection). A multi-level initial calibration over the n-alkane range from C9-C40 was evaluated and quantified using internal standard techniques prior to sample analysis. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific method detection limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

The following compounds co-elute with PAH surrogates and/or internal standards which potentially bias the results high: n-Octadecane (Cl8) - Phenanthrene-d10 and n-Pentacosane (C25) - Chrysene-d12. If a positive bias is determined to be present the compounds will be reported with a "C" qualifier.

1. The method blank SS043012B07 contained low-level target compounds detected at less than 5x the sample specific method detection limit (MDL). The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. The relative percent difference (RPD) for sample 1204035-07 and its duplicate 1204035-07D exceeded the limit (30%) for five compounds with reported concentrations that are greater than the QL in either the native or duplicate extract potentially due to matrix heterogeneity. The RPD's for the LCS/LCSD and MS/MSD met the criteria for all monitored analytes showing that precision of the method was established. No further corrective action was taken. See Duplicate Summary Report for individual compounds affected.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

The following compounds co-elute with PAH surrogates and/or internal standards which potentially bias the results high: n-Octadecane (Cl8) - Phenanthrene-d10 and n-Pentacosane (C25) - Chrysene-d12. If a positive bias is determined to be present the compounds will be reported with a "C" qualifier.

1. Sheen samples are reported, using an initial amount of one, as ug (per sample).

2. The method blank SO050112B01 contained low-level target compounds detected at less than the sample specific reporting limit (RL). The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.
