CASE NARRATIVE
Alpha Analytical

ETR: 1205027
Project: Enbridge Line 6B MP 608

All analyses were performed according to the Alpha Analytical quality assurance program and documented Standard Operating Procedures (SOPs). The analytical results contained in this report were performed within holding time, and with appropriate quality control measures, except where noted. A summary of all state and federal accreditations is provided within this report. Blank correction of results is not performed in the laboratory for any parameter. Alpha Analytical certifies that the test results within meet all of the requirements of NELAC, for all NELAC accredited parameters.

Sample Receipt

Samples (1205027-01 through -08) were received in good condition, between 2° and 6°C, and without discrepancies. Samples were released for analysis on 5-23-2012. Per the customer's request, all samples were analyzed for PAH/BIO and SHC.

Sample Preparation and Extraction

Samples were extracted on 5-23-2012 (prep batch 1205027). The extraction and preparation procedure was performed according to the Alpha Analytical SOP (stated below) but with the following deviations:

1. The pre-RIS archive of sample 1205027-04 was copper cleaned and submitted for PAH analysis due to sulfur interference in the original extract. Only the re-cleaned analysis is reported for PAH.

2. The extraction for samples 1205027-05 through -08 was performed on a smaller sample size than the method specified representative sample due to the limited sample volumes provided.

The observations noted on the *Forensic Preparation Checklist* should neither have any adverse affect on the analysis nor should they impact data quality for samples in this ETR.

Alkylated Polynuclear Aromatic Hydrocarbons, Steranes, Triterpanes, and Triaromatic Steroids - Sheen

Polynuclear aromatic hydrocarbons and geochemical biomarkers were analyzed following Alpha Analytical SOP *Analysis of Parent and Alkylated Polynuclear Aromatic Hydrocarbons, Selected Heterocyclic Compounds, Steranes, Triterpanes, and Triaromatic Steroids by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (SOP O-008, Issue No. 7, 07/07/2011).* Sheen samples are spiked with surrogate compounds and extracted by *Shaker Table Extraction (SOP OP-013, Issue No. 5, 07/14/2011).* Solvent extracts are dried over sodium sulfate and concentrated to an appropriate volume based on *Gravimetric Determination (SOP OP-017, Revision No. 3, 07/06/2011).* Qualitative identifications are confirmed by analyzing standards under the same conditions used for samples, comparing mass spectra, GC retention times, and patterns generated from reference oils. Quantification is based on response factors derived from a multi-level initial calibration using internal standard techniques. Alkyl homologues are quantified using the response factor of the parent PAH compound. Target triterpane biomarker concentrations are quantified using the response factor of Hopane and the steranes and steroids are quantified using the response factor of 5β(H)Cholane. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific reporting limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

1. The method blank SO052312B08 contained Unknown Sterane (S18) detected above the sample specific reporting limit (RL) which is "B" qualified on the Quantitation Report. The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. The continuing calibration verification (CCV), C305241208, had the percent deviation for Retene above the 25%D acceptance criteria at 27.7%D. This value was below 35%D and represents less than 10% of all compounds, therefore the calibration is deemed acceptable and no corrective action was taken.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

4. Samples are reported, using an initial amount of one, as ng (per sample).

Total Saturated Hydrocarbons and Total Petroleum Hydrocarbons by GC/FID - Sheen

Samples for total saturated hydrocarbons and total petroleum hydrocarbons were analyzed following the procedures in Alpha Analytical SOP *Total Petroleum and Saturated Hydrocarbons by Gas Chromatography/Flame Ionization Detector (SOP 2246, Rev. 4, 04/11/2012)* Method 8100/8015mod. Samples were prepared as stated above for the PAH analysis. A portion of the final extract was analyzed for GC/FID (gas chromatography with flame ionization detection). A multi-level initial calibration over the n-alkane range from C9-C40 was evaluated and quantified using internal standard techniques prior to sample analysis. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific reporting limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

The following compounds co-elute with PAH surrogates and/or internal standards which potentially bias the results high: n-Octadecane (Cl8) - Phenanthrene-d10 and n-Pentacosane (C25) - Chrysene-d12. If a positive bias is determined to be present the compounds will be reported with a "C" qualifier.

1. The method blank SO052312B08 contained low-level target compounds detected at less than the sample specific reporting limit (RL). The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. The continuing calibration verification (CCV), C605241204R, had the percent deviations for ortho-terphenyl (15.2%) and d50-Tetracosane (15.3%) above the 15%D acceptance criteria. Since, these values are below 20%D and represent less than 10% of all compounds the calibration is deemed acceptable and no corrective action was taken.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

4. Samples are reported, using an initial amount of one, as µg (per sample).

Alkylated Polynuclear Aromatic Hydrocarbons, Steranes, Triterpanes, and Triaromatic Steroids - Sediments

Polynuclear aromatic hydrocarbons and geochemical biomarkers were analyzed following Alpha Analytical SOP *Analysis of Parent and Alkylated Polynuclear Aromatic Hydrocarbons, Selected Heterocyclic Compounds, Steranes, Triterpanes, and Triaromatic Steroids by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (SOP O-008, Issue No. 7, 07/07/2011)*. Sediment samples are spiked with surrogate compounds and extracted by *Shaker Table Extraction (SOP OP-013, Issue No. 5, 07/14/2011)*. Solvent extracts are dried over sodium sulfate and concentrated to a 4mL volume. An aliquot of the extract based on *Gravimetric Determination (SOP OP-017, Revision No. 3, 07/06/2011)* is processed through an alumina column (*Alumina Column Cleanup of Organic Extracts, SOP OP-009, Issue No. 3, 07/14/2011)*, concentrated to a 900uL volume and spiked with internal standard for instrument analysis. The average weight of all samples included in the extraction batch is used as the weight for the blank, laboratory control sample, and laboratory control sample duplicate. The final value is rounded accordingly. Qualitative identifications are confirmed by analyzing standards under the same

conditions used for samples, comparing mass spectra, GC retention times, and patterns generated from reference oils. Quantification is based on response factors derived from a multi-level initial calibration using internal standard techniques. Alkyl homologues are quantified using the response factor of the parent PAH compound. Target triterpane biomarker concentrations are quantified using the response factor of Hopane and the steranes and steroids are quantified using the response factor of 5β(H)Cholane. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific method detection limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

The results for standard reference material 1941b have been surrogate corrected as follows: Naphthalene for the recovery of Naphthalene-d8; Fluorene through Chysene/Triphenylene for the recovery of Phenanthrene-d10; Benzo[b]fluoranthene through Benzo[g,h,i]perylene for the recovery of Benzo[a]pyrene-d12.

1. The method blank SS052312B03 contained low-level target compounds. The single component compounds were detected at less than 5x the sample specific method detection limit (MDL), the multi-component compounds were below the detection limit. The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

3. The relative percent difference (RPD) between sample 1205027-06 and its duplicate 1205027-06D exceeded the limit (30%) for 13a,17b-20S-Ethyldiacholestane (34%) with reported concentrations that are greater than the QL in either the native or duplicate extract. The RPDs for the LCS/LCSD and MS/MSD met the criteria for all monitored analytes showing that precision of the method was established. No corrective action was taken.

Total Saturated Hydrocarbons and Total Petroleum Hydrocarbons by GC/FID - Sediments

Samples for total saturated hydrocarbons and total petroleum hydrocarbons were analyzed following the procedures in Alpha Analytical SOP *Total Petroleum and Saturated Hydrocarbons by Gas Chromatography/Flame Ionization Detector (SOP O-003, Issue No.7, 08/15/2011)* Method 8100/8015mod. Samples were prepared as stated above for the PAH analysis. A portion of the final extract was analyzed for GC/FID (gas chromatography with flame ionization detection). A multi-level initial calibration over the n-alkane range from C9-C40 was evaluated and quantified using internal standard techniques prior to sample analysis. All enclosed data was evaluated below the reporting limits to three times signal to noise. The sample specific method detection limit is the value reported for all compounds which are not detected ("U" qualified). Any sample preparation method deviations can be found in the "Sample Preparation and Extraction" section of this document or noted on the *Forensics Preparation Checklist* located in the sample preparation document.

The following compounds co-elute with PAH surrogates and/or internal standards which potentially bias the results high: n-Octadecane (C18)- Phenanthrene-d10 and n-Pentacosane (C25)- Chrysene-d12. If a positive bias is determined to be present the compounds will be reported with a "C" qualifier.

1. The method blank SS052312B03 contained low-level target compounds. The single component compounds were detected at less than 5x the sample specific method detection limit (MDL), the multi-component compounds were detected at less than 10x the MDL of the associated single component compound. The method blank met the acceptance criteria (with no more than two compounds outside criteria) therefore no corrective action was required. Associated field sample results are flagged with "B" qualifiers if the concentration of the analyte in the sample is less than 10x the concentration in the blank.

2. The matrix spike and matrix spike duplicate for sample (1205027-05) recovered low and outside the acceptance criteria (50-125%) for n-Nonane (41% each), n-Decane (41% each) and n-Dodecane (49% each). The integrations and calculations were reviewed and found to be accurate. The LCS/LCSD recoveries passed acceptance criteria demonstrating accuracy of the method. No further corrective action taken.

3. Concentrations for compounds flagged with "G" qualifiers may be biased high due to matrix interference included in the quantitation.

The enclosed results of analyses are representative of the samples as received by the laboratory. Alpha Analytical makes no representations or certifications as to the method of sample collection, sample identification, or transporting/handling procedures used prior to the receipt of samples by Alpha Analytical.
