Enbridge Energy, Limited Partnership

Oil Recovery Estimation Report

Enbridge Line 6B MP 608

9/24/2012

Executive Summary

In accordance with an August 7, 2010 letter from the U. S. EPA, Enbridge Energy, Limited Partnership developed the attached Oil Recovery Estimation Report with support and review by the EPA. The report estimates recovered oil from the Line 6B leak site near Marshall, Michigan. This includes recovered free oil and the three major waste streams being generated as a result of remediation activities. The waste streams consist of soil, debris (e.g., impacted sorbents, boom, pads, plastic, PPE, vegetation), and water. Oil recovery and oily debris disposal is outlined in a supplement to the Waste Treatment, Transportation and Disposal Plan dated August 2, 2010 and revised August 9, 2010. An additional procedure, TPH Data Collection and Reporting, was developed to further describe the methods used to collect waste stream samples, waste stream volumes, Total Petroleum Hydrocarbon analytical data, reporting and associated recordkeeping.

There are many sources of uncertainty in the calculations used to estimate oil recovery from the various waste streams. Sources of uncertainty associated with the waste stream calculations include the following:

1. The analytical methods for Oil and Grease (O&G) and TPH quantify organic constituents that include materials from the Line 6B spill, other organic constituents released into the watershed, and naturally occurring organic constituents in the sampled material. Forensic chemical analysis now being performed and evaluated will provide more detail on the ratio of compounds related to the Line 6B release in the river sediment and these analysis are expected to further separate both natural and anthropogenic background inputs to these analyses from the Line 6B release. Therefore, the use of O&G and TPH to quantify the amount of recovered oil will overestimate the actual amount recovered, and the forensic analysis being performed will assist in documenting other sources of O&G and TPH present in the sediment.
2. Soil shipments prior to August 10, 2010 were not analyzed for TPH or O&G, therefore, the maximum TPH result from August 17, 2010 was applied to the weight of loads in an effort to estimate the amount of oil recovered in these shipments.
3. The geometric mean of the TPH results was applied across all shipments of debris due to a gap in sample collection from August 7, 2010 – September 4, 2010 when the waste stream moved from hazardous to non-hazardous.
4. The heterogeneous nature of debris is difficult to accurately characterize.
5. The heavier fraction of the crude type spilled at the Line 6B site may not be captured by TPH analysis while the O&G analysis has been shown to capture more of the heavy fraction of the crude oil. To account for variations between the two test methods, a correction factor was developed and applied to the recovery calculations. Refer to Addendum 1.0 of the TPH Data Collection and Reporting procedure.
6. A volatilization factor of 1.075 is multiplied by the oil and grease results to account for loss of volatile fraction of the crude type spilled at the Line 6B site. This factor is already included in the 7.6 correction factor for the TPH results referenced above.
7. Soil data for August 9, 2010 – August 20, 2010. Based on the existing data, there is not enough information on a manifest to match it to a sample number on an analytical report during the aforementioned time frame. Given this, Enbridge calculated the geometric mean of all analytical samples taken from August 9, 2010 – August 20, 2010 and applied that geometric mean to all manifests in that time range.

8. Non hazardous water: Enbridge does not have pre-bag influent TPH data for the carbon filtration system at Frac Tank City until 8/21/2010. Prior to that, all non-hazardous water had been going to Battle Creek POTW (8/7-8/20). Enbridge does have influent data, but not pre-bag influent data for that time range, so those analytical results do not truly represent the water going into the carbon filtration system. In looking at the pre-bag influent data that Enbridge does have, the highest Estimated % Crude Oil per Water (v/v) calculated in the Draft Enbridge Totals Report 09/13/10 Rev 1 is 0.3611% (8/25/10 sample). EPA agreed that this estimated % crude oil of 0.3611% will be applied to the non-hazardous water generated prior to having pre-bag influent TPH results. When a better or more accurate estimated % Crude Oil for that data is calculated, the table will be updated to use the new percentage. This information will be footnoted.
9. On 9/2/10, the non-hazardous water generated from activities at the Wildlife Recreation Center started shipping directly to the waste disposal vendor in lieu of Frac Tank City. At the time of this report, only one laboratory report with TPH and O&G results is available, so the results have been applied to all shipments. The data will be updated as results are received. This information is footnoted.
10. As per Recovered Oil Tracking Supplemental Rev August 9_10, "The oily water collected from the animal recovery facility is not included in this report due to the relatively low volume."
11. Per EPA request, the geometric mean of analytical results for geotubes 1 through 9 was applied.
12. The pre-treatment system located at Frac Tank City was decommissioned on 10/30/10.
13. The precipitation sampling frequency for O&G analysis was increased to every 100,000 gallons from 50,000 gallons effective on February 15, 2012 with acceptance from both The City of Battle Creek's Publically Owned Treatment Works (POTW) and the U.S. EPA.
14. In response to the U.S. EPA request dated March 13, 2012, the Enbridge Monday Totals Report or Oil Recovery Estimate Report has been modified to summarize the 2010 and 2011 totals, a waste stream summary column with total volumes or weights for all waste streams is incorporated, an additional column with the lab order number for 2012 shipments is inserted and the unit of measure column is consistent throughout each waste stream.
