Triad Conference – June 10, 2008

# Flux-Based Site Management

*Lynn Wood*

# Acknowledgements

- Mike Annable, Kirk Hatfield, Jim Jawitz - University of Florida
- Nandita Basu - Purdue University
- Carl Enfield - Enfield Environmental Research
- Mark Goltz - Air Force Institute of Technology
- SERDP

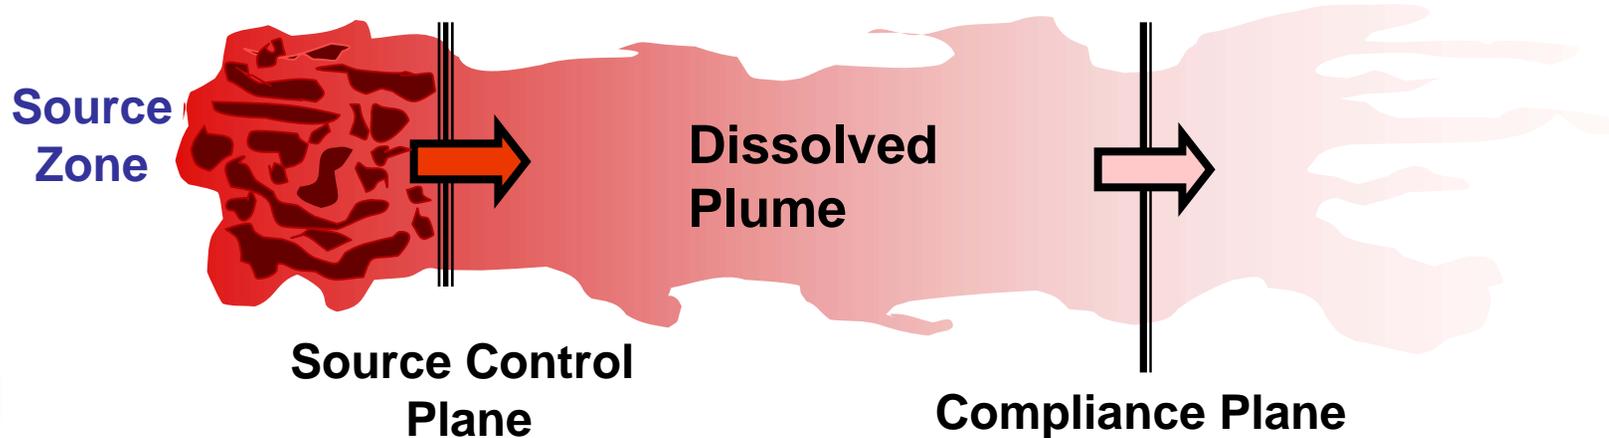

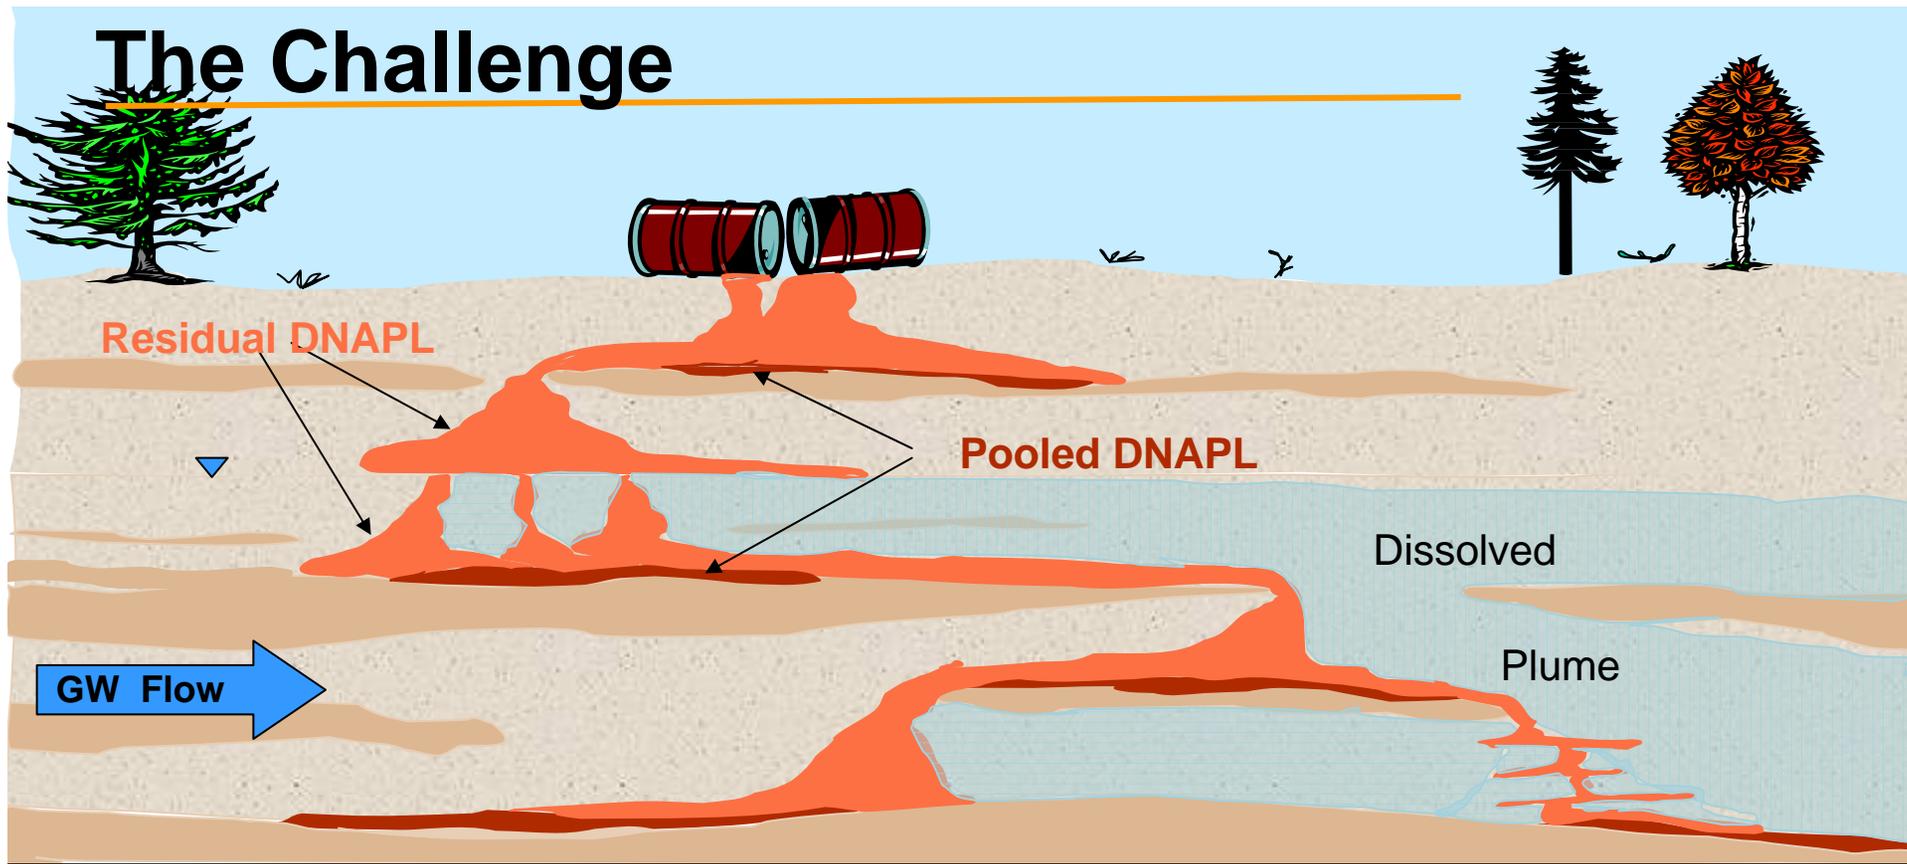

# Workshop Objectives

- Show by principle and practice the importance and utility of flux-based data for characterizing, managing, and remediating contaminated sites
- Present state-of-the-science information on measurement of reliable mass flux and mass discharge data
- Examine flux-based remedial design and assessment tools and demonstrate their application

# Workshop Agenda

- I. Linkage between Triad and flux-based site management**
- II. Flux-based site management – what is it? why use it?**
- III. Numerical and management tools to facilitate data application and enhance data utility [REMChlor]**
- IV. Field measurement of mass flux and mass discharge**
- V. Application of flux-based site management – Case Studies**

# The Challenge

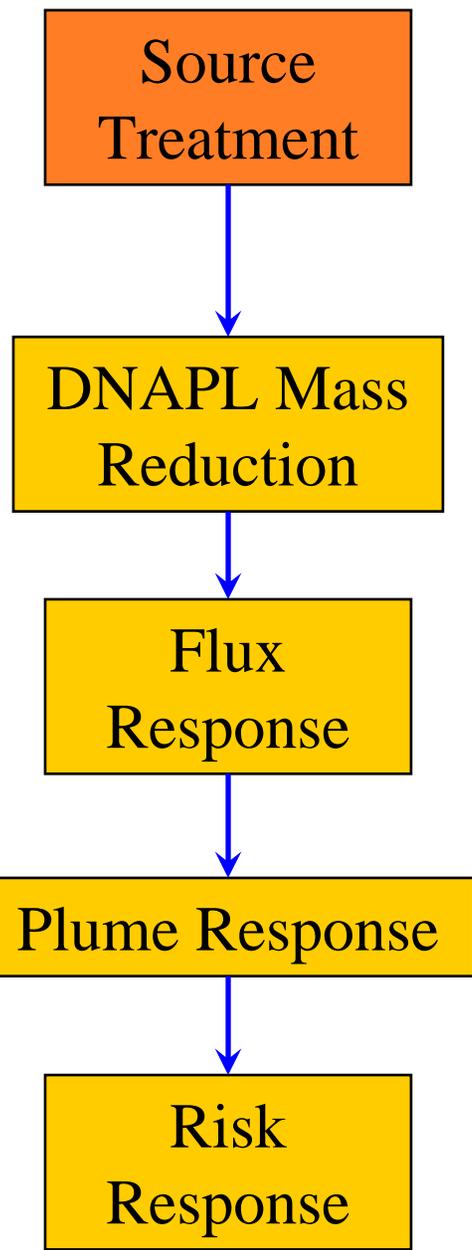

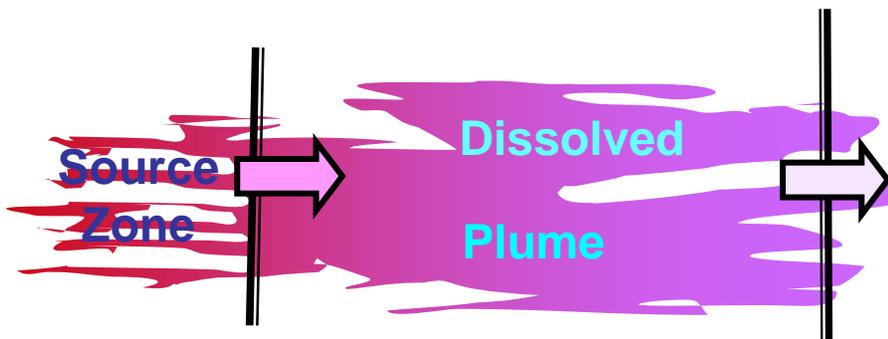

# Why Flux-Based Approach

**Pre-Remediation:**

*Source Treatment*

## Flux-Based Concepts, cont'd

United States  
Environmental Protection  
Agency

**Flux measurements provide quantitative information about:**

- Source Strength
  - $M_D$  at the source control plane
- Source-Plume Dynamics
  - Dynamics = f (Source strength + plume degradation)
- Contaminant Degradation
  - Based on one or more downgradient control planes
- Spatial Flux Distribution

## Flux-Based Concepts, cont'd

This information can be used to:

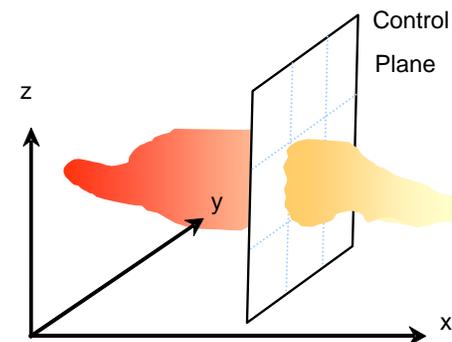

- **Prioritize Sources by Strength**
  - ✓ Between sites
  - ✓ Within sites
- **Focus Source Treatment**
  - ✓ Based on flux distribution at source control plane
- **Optimize Resource Allocation**
  - ✓ Between source and plume
  - ✓ Based on source strength/longevity & contaminant degradation
- **Monitor Remedial Performance & Effectiveness**
  - ✓ Shorter time scale
  - ✓ More reliable projections

Optimize Remedial Selection, Design, Implementation

# Flux-Based Concepts

## ➤ Control Planes

- Transect of multiple wells (typically)
- Perpendicular to mean groundwater flux direction

- **Mass Flux** ( $J$ ,  $ML^2T^{-1}$ ) - mass of contaminant per unit area per unit time
- **Mass Discharge** ( $M_D$ ,  $MT^{-1}$ ) - integration of mass flux across control plane area
- **Source Strength** - contaminant  $M_D$  at source control plane
- **Source Mass** – contaminant mass within the source zone ( $M$ )
- **Source Architecture** – contaminant distribution and morphology and its relationship to the flow field
