**FOR MORE INFORMATION CALL:**

**RCRA Hotline**

U.S. Environmental Protection Agency  
800 424-9346 or TDD 800 553-7672.  
In the Washington, D.C., area: 703 412-9810 or TDD 703 412-3323.
Whether you are a screen printer, lithographer, flexographer, or other printer, your printing processes probably generate hazardous waste. That means you are regulated by the U.S. Environmental Protection Agency (EPA) under a federal law called the Resource Conservation and Recovery Act (RCRA). Under RCRA, you are required to follow certain procedures when generating, storing, transporting, treating, or disposing of hazardous waste. RCRA in Focus provides an overview of the federal regulations you are required to follow and the wastes that are likely to be hazardous in your business. It also provides federal recycling and pollution prevention options to help you decrease the amount of hazardous waste you generate.
FREQUENTLY ASKED QUESTIONS ABOUT RCRA

What Is RCRA?

RCRA is a federal law that encourages environmentally sound methods for managing commercial and industrial waste as well as household and municipal waste. It regulates facilities that generate, transport, treat, store, or dispose of hazardous waste. The vast majority of printers are considered hazardous waste generators, rather than treatment, storage, and disposal facilities (TSDFs), which are subject to more rigorous regulations.

The term “RCRA” is often used interchangeably to refer to the law, the regulations, and EPA policy and guidance. The law describes the waste management program mandated by Congress that gave EPA authority to develop the RCRA program. EPA regulations carry out the Congressional intent by providing explicit, legally enforceable requirements for waste management. EPA guidance documents and policy directives clarify issues related to the implementation of the regulations.

All the RCRA hazardous waste regulations can be found in the Code of Federal Regulations (CFR), Title 40, Parts 260 to 279. The CFR can be purchased through the U.S. Government Printing Office (GPO).

Who Is Regulated?

Any printer that generates hazardous waste is potentially subject to RCRA. You must conduct tests required by the regulations or use your knowledge of and familiarity with the waste you generate to determine whether it is hazardous waste (as opposed to other types of waste). You might be subject to substantial civil and criminal penalties if you fail to properly or completely identify hazardous waste generated by your business.

What Is Hazardous Waste?

To be considered hazardous waste, a material first must be classified as a solid waste. EPA defines solid waste as garbage, refuse, sludge, or other discarded material (including solids, semisolids, liquids, and contained gaseous materials). If your waste is considered solid waste, you must then determine if it is hazardous waste. Wastes are defined as hazardous by EPA if they are specifically named on one of four lists of hazardous wastes (listed wastes), or if they exhibit one of four characteristics (characteristic wastes). Each type of RCRA hazardous waste is given a unique hazardous waste code using the letters D, F, K, P, or U and three digits (e.g., D001, F005, or P039). See pages 8 to 10 for additional information on printing waste codes.

Listed Wastes. Wastes are listed as hazardous because they are known to be harmful to human health and the environment when not managed properly, regardless of their concentrations. The lists include the following three types of waste:

- **Non-Specific Source Wastes.** These are material-specific wastes, such as solvents, generated by several different industries. Waste codes range from F001 to F039. Potential printing wastes include F001 to F005 (solvents).

- **Specific Source Wastes.** These are wastes from specifically identified industries. Waste codes range from K001 to K161.

- **Discarded Commercial Chemical Products.** Off-specification products, container residuals, spill residue runoff, or active ingredients that have spilled or are unused and that have been, or are intended to be, discarded. Examples of printing wastes include U019 (benzene), U056 (cyclohexane), and U220 (toluene). Waste codes range from P001 to P205 and U001 to U413.

RCRA IN FOCUS
Questions

Characteristic Wastes. Even if your waste does not appear on one of the hazardous waste lists, it still might be regulated as hazardous waste if it exhibits one or more of the following characteristics:

- **Ignitability.** Ignitable wastes create fires under certain conditions or are spontaneously combustible, and have a flash point less than 60 °C (140 °F). Examples include used solvents, which have a waste code of D001.

- **Corrosivity.** Corrosive wastes are acids or bases that are capable of corroding metal containers, such as storage tanks, drums, and barrels. Acid or alkaline process baths are a good example. The waste code for these materials is D002.

- **Reactivity.** Reactive wastes are unstable under “normal” conditions. They can cause explosions, toxic fumes, gases, or vapors when mixed with water. The waste code for these materials is D003.

- **Toxicity.** Toxic wastes are harmful or fatal when ingested or absorbed. When toxic wastes are disposed of on land, contaminated liquid may drain (leach) from the waste and pollute ground water. Toxicity is defined through a laboratory procedure called the Toxicity Characteristic Leaching Procedure. Printing wastes include D011 (silver), D019 (carbon tetrachloride), and D040 (trichloroethylene). Waste codes for toxic materials range from D004 to D039.

**How Are Generators Regulated?**

If your business generates hazardous waste, you must manage it according to regulations for your specific generator type. Hazardous waste generators are divided into three categories, according to how much they generate in a calendar month:

- **Large Quantity Generators (LQGs).** LQGs generate greater than or equal to 200 gallons of hazardous waste per month (equivalent to 1,000 kg or approximately 2,200 lb), or greater than 0.02 gallons (approximately 1 kg or 2.2 lb) of acutely hazardous waste per month.

- **Small Quantity Generators (SQGs).** SQGs generate more than 25 gallons (equivalent to 100 kg or approximately 220 lb), but less than 200 gallons (1,000 kg or 2,200 lb) of hazardous waste per month.

- **Conditionally Exempt Small Quantity Generators (CESQGs).** CESQGs generate less than 25 gallons of hazardous waste per month (or equal to 100 kg or 200 lb), and less than or equal to 0.02 gallons (1 kg or 2.2 lb) of acutely hazardous waste per month.

Some states do not recognize the CESQG class. Contact your state environmental agency to find out if the CESQG class is recognized. To find your appropriate state contact, call the RCRA Hotline at 800-424-9346.

Under the federal RCRA requirements, your generator status might change from one month to the next as the quantity of waste you generate changes. State requirements vary widely. You must comply with whichever standard is applicable for a given month. In many cases, small businesses that fall into different generator categories at different times choose to always satisfy the more stringent requirements (usually state requirements) to simplify compliance. Generators must “count” the amount of waste generated, which involves adding up the total weight of all quantities of characteristic and listed waste generated at a particular facility. Certain wastes, such as those that are reclaimed or recycled continuously on site, are not counted under the federal regulations.

**AM I REGULATED BY RCRA OR SUPERFUND?**

**RCRA** regulates the treatment, storage, and disposal of hazardous waste being generated now and in the future. Superfund was created to pay for the identification, inspection, investigation, ranking, and cleanup of abandoned or uncontrolled hazardous waste sites that people responsible for contamination are unable or unwilling to clean up. Call the RCRA Hotline for more information.

**HOW IS USED OIL HANDLED?**

RCRA contains special provisions for the management of used oil destined for recycling or reuse. These management standards apply to oil refined from crude oil or any synthetic oil that has become contaminated through use by chemical or physical impurities. Used oil that will be recycled or reused is subject to special management standards, rather than the hazardous waste standards, unless it is treated as a waste (i.e., you decide to send the used oil for treatment and disposal rather than recovery or recycling).
THE LIFE CYCLE OF A TYPICAL PRINTING WASTE

You've just cleaned off the press with solvents and wiped it down. Now you have liquid solvent waste that must be managed. You own a small business that produces a wide variety of hazardous wastes. You know it is time to investigate and follow the RCRA regulations.

This example details one typical printing waste life cycle for an SQG that is sending solvent waste off site for treatment, and it illustrates the most common scenario of activities. Other life cycles could apply depending on the waste, whether onsite treatment will occur, the type of waste management units used, and your generator status.

IDENTIFY WASTE

By running tests or using your knowledge of the waste, identify whether your solvent waste is hazardous. Based on these analyses, determine the appropriate waste code for your solvents; in this case, for example, it is F001. File all records of test results, waste analyses, and other determinations made in the hazardous waste identification process and keep them for at least 3 years.

COUNT WASTE

As a second step, determine how much solvent waste you have produced in a calendar month. Do not count solvent placed directly into a solvent recovery still. Count the solvent still bottoms when they are removed from the still, however.

SEND WASTE OFF SITE FOR TREATMENT, STORAGE, OR DISPOSAL

Using a registered hazardous waste transporter, send the waste to a RCRA hazardous waste TSDF accompanied by the appropriate manifest and land disposal restrictions notifications and certifications. You can choose from any permitted or interim status TSDF. Optional destinations for solvents include a hazardous waste incinerator that will landfill the incinerator ash, a hazardous waste fuel blender who will blend the solvents with other wastes and then burn them for energy recovery in a boiler or industrial furnaces, or a facility that will recycle the solvents.

PREPARE APPROPRIATE NOTIFICATION AND CERTIFICATION

Ensure that all hazardous waste sent off site for treatment, storage, or disposal is accompanied by appropriate notifications and certifications (initial shipments only).

PREPARE HAZARDOUS WASTE MANIFEST

Send a manifest along with all hazardous waste sent off site to a TSDF, and keep your copy on site for 3 years. The manifest contains a certification stating that you have a program in place to reduce the volume and toxicity of waste generated to the degree economically practicable, and that you have selected a treatment, storage, or disposal method currently available that minimizes current and future threats from the waste.
DETERMINE GENERATOR STATUS

Based on waste counting, determine your generator status. In this case, you have produced more than 25 gallons, but less than 200 gallons, of hazardous waste in the past month, which means you are an SQG in this calendar month period.

OBTAIN EPA IDENTIFICATION NUMBER

To identify your business as a hazardous waste generator, obtain an EPA identification number by submitting Form 8700-12 (Notification of Regulated Waste Activity), which is obtained from your state hazardous waste agency. Remember, your state requirements might be different.

PLACE WASTE IN ACCUMULATION UNIT

When the waste is generated, place it in an accumulation unit. Mark accumulation tanks and containers with the date the waste was placed in the unit as well as mark the words “Hazardous Waste.” Ensure that containers are not rusty or leaking, are stored in areas with adequate ventilation and drainage, and are kept closed except to add or remove waste.

IMPLEMENT LQG PREPAREDNESS AND PREVENTION REQUIREMENTS

Check to be sure that emergency preparedness and prevention requirements are met. These include adequate emergency response systems and notification to local emergency response authorities.

PREPARE CONTINGENCY PLAN

Next, ensure that a contingency plan is prepared in accordance with standards. The contingency plan is designed to minimize hazards from fires, explosions, and unplanned releases. Keep a copy of the contingency plan on site, and assign a facility emergency coordinator to be on site or on call at all times.

FOLLOW U.S. DEPARTMENT OF TRANSPORTATION (DOT) PACKAGING STANDARDS

Before shipping waste off site for treatment, storage, or disposal, package, label, and mark waste containers in accordance with all applicable DOT requirements. Call the DOT hotline at 800 467-4922.

CONTRACT WITH HAZARDOUS WASTE TRANSPORTER

To send waste off site to a TSDF, contract with a registered hazardous waste transporter. To locate a reliable transporter, contact a colleague to obtain a reference.
The following table presents an overview of the federal RCRA regulatory requirements for printers that are either LQGs, SQGs, or CESQGs. As noted, your state might have different or more stringent requirements.

**RCRA REGULATORY REQUIREMENTS**

**Used Oil Standards**

- **LQGs** must comply with state or local regulations for used oil management.
- **SQGs** and CESQGs must comply with state and federal regulations for used oil management, including the following:
  - A written used oil management plan.
  - A written spill control and emergency response plan.
  - A written oil recycling plan.
  - A written recordkeeping plan.

**DOT Packaging**

- LQGs must report hazardous waste shipments to the EPA. SQGs and CESQGs must report hazardous waste shipments to the EPA and the state(s) where the hazardous waste is transported.

**Hazardous Waste Management Plan**

- LQGs and SQGs must keep records of test results, waste analyses, and other hazardous waste determinations for 3 years.

**Corrective Action**

- LQGs and SQGs must keep records of test results, waste analyses, and other hazardous waste determinations for 3 years.
- CESQGs must keep copies of each test report for 5 years.

**Resource Conservation and Recovery Act (RCRA)**

- LQGs must retain current records of waste generation and management activities for a minimum of 3 years.
- EPA, other agencies, and the public use this information to track hazardous waste management.
The following examples show hazardous wastes typically generated by the printing industry and provide suggestions for how to recycle, treat, or dispose of them according to federal regulations.

REduce OR MINimize THE hazARDOUS WAstES yoU GeNERate

Recycling and pollution prevention measures can significantly reduce your regulatory burden and may save your business considerable money. This section presents information on hazardous wastes typically generated by various printing processes and provides suggestions for how to recycle them or implement pollution prevention measures. This list might not cover all chemicals used or wastes produced by the printing industry. Consult the hazardous waste lists and characteristics to determine if you generate other hazardous wastes.

Only the federal hazardous waste codes are provided here. Your state might have different codes for some waste streams. You should check with your state hazardous waste authority for additional waste codes and requirements.

**PROCESS**

**Wastes Generated**

Using ink in lithography, letterpress, screen printing, flexography, and gravure

- Waste ink with chromium, barium, and lead content; and waste ink contaminated with cleaning solvents, such as trichloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, 1,1,2-trichloroethane, 1,2,3-trifluoroethane, chlorobenzene, xylene, acetone, methanol, methyl ethyl ketone (MEK), toluene, carbon disulfide, or benzene.

**Possible RCRA Waste Codes**

- D005 (barium), D007 (chromium), D008 (lead), F001 to F005 (listed solvents), D001 (ignitable waste), D018 (benzene), D019 (carbon tetrachloride), D021 (chlorobenzene), and D040 (trichloroethylene).

**Potential Recycling, Treatment, and Disposal Methods**

- Recycle inks to make black ink. Reformulated black ink is comparable to lower quality new black inks such as newspaper ink.
- Dispose of inks by sending them to a fuel blending service that combines these and other wastes for burning at industrial boilers or kilns.
- Ship waste using a registered hazardous waste transporter to a hazardous waste TSDF.

**Potential Pollution Prevention Methods**

- Dedicate presses to specific colors or special inks to decrease the number of cleanings required for each press.
- Clean ink fountains only when changing colors or when there is a risk of ink drying.
- Run similar jobs simultaneously to reduce waste volume.
- Isolate inks contaminated with hazardous cleanup solvents from noncontaminated inks.
- Use organic solvent alternatives wherever possible, such as detergent or soap, nonhazardous blanket washes, and less toxic acetic acid solvents.

**PROCESS**

**Wastes Generated**

Cleaning printing equipment

- Spent organic solvents might include trichloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, 1,1,2-trichloroethane, 1,2,3-trifluoroethane, chlorobenzene, xylene, acetone, methanol, MEK, toluene, carbon disulfide, or benzene.
### Possible RCRA Waste Codes

<table>

<tbody>
<tr>
<td>F001 to F005 (listed solvents), D001 (ignitable waste), D018 (benzene), D019 (carbon tetrachloride), D021 (chlorobenzene), D040 (trichloroethylene), D005 (barium), D007 (chromium), D008 (lead), D018 (benzene), and D019 (carbon tetrachloride).</td>
<td></td>
</tr>
<tr>
<td>D011 (silver) and D002 (corrosive waste).</td>
<td></td>
</tr>
</tbody>
</table>

### Potential Recycling, Treatment, and Disposal Methods

- Find a legitimate reuse for spent solvents on site. If reused, the solvents are not considered to be wastes and, therefore, are not regulated. Examples include reusing solvents in a parts-cleaning unit that is used to clean dirty press parts.
- Dispose of solvents by sending them to a fuel blending service, which combines these and other wastes for burning at industrial boilers or kilns.
- Recycle spent solvents in an onsite solvent still.
- Contract with a solvent recycler or supplier to take the spent solvent away and replace it with fresh solvent.
- Ship waste using a registered hazardous waste transporter to a hazardous waste TSDF. Most solvents will be recycled or incinerated.
- Appropriate management techniques for rags and disposable wipers contaminated with solvents are at the discretion of your state or EPA regional office. A wide variety of options are available including sending them to laundry services after wringing out excess solvent, disposing of them as hazardous waste, treating them to recover the solvents, or incinerating them as hazardous waste. To obtain your appropriate state or regional contact, call the RCRA Hotline at 800 424-9346.

### Potential Pollution Prevention Methods

- Print lighter colors first.
- Squeegee or wipe surfaces clean before washing with solvent.
- Dedicate presses to specific colors or special inks to decrease the number of cleanings required for each press.
- Run similar jobs simultaneously to reduce cleanup waste volume.
- Use organic solvent alternatives wherever possible, such as detergent or soap, nonhazardous blanket washes, and less toxic acetic acid solvents.

### PROCESS

- Developing negatives and prints
- Waste photochemical solutions from fixer and rinsewater and from alkaline or acid process baths.
- Ship silver waste using a registered hazardous waste transporter to a hazardous waste TSDF.
- Recover silver from fixing baths using chemical recovery cartridges, electrolytic recovery cells, or ion exchange resins, and have a commercial recycler pick it up.
- Neutralize waste on site in an exempt elementary neutralization unit.
- Eliminate silver waste by using silver-free films such as vasicular, diazo, electrostatic, and photopolymer.
- Add ammonium thiosulfate to silver-contaminated baths to extend the allowable buildup of silver.
- Use an acid stop bath prior to fixing bath to reduce effect of alkaline developer on fixing bath pH.
- Install waterless paper and film developing units to reduce volume of fixer waste.
- Employ countercurrent (using water from previous rinsings in initial film washing stage) rather than parallel rinse techniques.
- Containerize process baths to keep them from spoiling.

OTHER ENVIRONMENTAL LAWS AFFECTING THE PRINTING INDUSTRY

THE CLEAN WATER ACT

The Water Pollution Control Act, commonly known as the Clean Water Act (CWA), is the federal program designed to restore and maintain the integrity of the nation’s surface waters. CWA controls direct discharges to surface waters (e.g., through a pipe) from industrial processes or stormwater systems associated with an industrial activity. It also regulates indirect discharges, or discharges to publicly owned treatment works (POTW) through a public sewer system, by requiring industrial facilities to pretreat their waste before discharging to a public sewer. Industrial pollutants from the printing industry that the CWA may regulate include organics, such as solvents, and metals such as lead, silver, mercury, copper, chromium, zinc, nickel, and cadmium. A serious concern with wastewater discharges from print shops is the high level of silver contained in photographic fixer solutions and rinsewaters. These solutions will not meet wastewater treatment plant discharge limits unless the silver is removed.

CWA Resources:
- 40 CFR Parts 100 to 129 and 400 to 503
- EPA Office of Water home page: http://www.epa.gov/OW
- EPA Office of Water: 202 260-5700
- Your state water authority, regional EPA office, and your local POTW

Oil Pollution Prevention Under the CWA

The Oil Pollution Prevention regulations were promulgated under the authority of the CWA. These regulations establish requirements for facilities to prevent oil spills from reaching the navigable waters of the United States or adjoining shorelines. The regulations apply to non-transportation-related facilities with a specific aboveground or underground oil storage capacity that, because of their location, can reasonably be expected to discharge oil into the navigable waters of the United States.

Oil Pollution Prevention Regulation Resources:
- 40 CFR Part 112
- Internet access: http://www.epa.gov/

THE CLEAN AIR ACT

The Clean Air Act (CAA) regulates air pollution. It includes national emission standards for new stationary sources within particular industrial categories. It also includes national emission standards for hazardous air pollutants, which are designed to control the emissions of particular hazardous air pollutants (HAPs). Printers generate some HAPs, including benzene, cadmium compounds, carbon tetrachloride, chromium compounds, cobalt compounds, glycol ethers, perchloroethylene, vinyl chloride, and xylene. The CAA also seeks to prevent the accidental release of certain hazardous chemicals and to minimize the consequences of such releases.

CAA Resources:
- 40 CFR Parts 50 to 99
- Control Technology Center, Office of Air Quality Planning, and Standards, EPA, general information: 919 541-0800, publications 919 541-2777
- Internet access: http://www.epa.gov/oar/oaqps/ctc

To review the RCRA regulations referred to in this document, consult the following citations in 40 CFR:
- Part 261—Identification and listing of hazardous waste.
- Part 262—Standards applicable to generators of hazardous waste.
- Part 263—Standards applicable to transporters of hazardous waste.
- Part 264—Standards for owners and operators of hazardous waste management facilities.
- Part 265—Interim status standards for owners and operators of hazardous waste TSDFs.
- Part 266—Standards for the management of specific hazardous wastes and specific types of hazardous waste management facilities.

continued
Laws Affecting Printing

**COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT (CERCLA OR SUPERFUND)**

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, commonly known as Superfund, authorizes EPA to respond to releases, or threatened releases, of hazardous substances that might endanger public health, welfare, or the environment, that might come from any source. Superfund also grants EPA the authority to force parties responsible for environmental contamination to clean it up or to reimburse response costs incurred by EPA. The person in charge at your business must report to the National Response Center (phone: 800 424-8802) any release of a hazardous substance that exceeds a designated “reportable quantity” for that substance within a 24-hour period.

**Superfund Resources:**
- Internet access: [http://www.epa.gov/superfund](http://www.epa.gov/superfund)

**THE EMERGENCY PLANNING AND COMMUNITY RIGHT-TO-KNOW ACT**

The Superfund Amendments and Reauthorization Act (SARA) of 1986 created the Emergency Planning and Community Right-to-Know Act (EPCRA). This law was designed to improve community access to information about potential chemical hazards and to facilitate the development of chemical emergency response plans by state and local governments. The EPCRA regulations establish several types of reporting obligations for facilities that store or manage specified chemicals. Printers are likely to use some of the specific chemicals such as ammonia, formaldehyde, hydroquinone, propylene oxide, sulfuric acid, and 2,4-toluene diisocyanate. Many of the chemicals used by printers, such as phosphoric acid, lead, perchloroethylene, and fuel oil, may be considered hazardous chemicals by the Occupational Safety and Health Administration as well. These are subject to additional requirements under EPCRA.

**EPCRA Resources:**
- 40 CFR Parts 350 to 372
- The State Emergency Response Commission (contact available from the RCRA Hotline)
- Internet access: [http://www.epa.gov/opptintr/tri/index.htm](http://www.epa.gov/opptintr/tri/index.htm) and [http://www.epa.gov/swercepp](http://www.epa.gov/swercepp)

**SAFE DRINKING WATER ACT**

The Safe Drinking Water Act (SDWA) mandates that EPA establish regulations to protect human health from contaminants present in drinking water. Under the authority of the SDWA, EPA developed national drinking water standards and created a joint federal-state system to ensure compliance with these standards. EPA also regulates underground injection of liquid wastes under the SDWA to protect underground sources of drinking water.

**SDWA Resources:**
- 40 CFR Parts 141 to 148
- SDWA Hotline: 800 426-4791
- Internet access: [http://www.epa.gov/ogwdw](http://www.epa.gov/ogwdw)

**TOXIC SUBSTANCES CONTROL ACT**

The Toxic Substances Control Act (TSCA) allows EPA to collect data on chemicals to evaluate, assess, mitigate, and control risks that might be posed by their manufacture, processing, and use. Printing facilities may be affected by some of the TSCA requirements.

**TSCA Resources:**
- 40 CFR Parts 702 to 799
- TSCA Hotline: 202 554-1404

HOTLINES AND INFORMATION CENTERS

RCRA Hotline
U.S. Environmental Protection Agency
Phone: 800 424-9346 or TDD 800 424-9347
In the Washington, DC, area, 703 426-5600 or TDD 703 426-5601
H ome page: http://www.epa.gov/rcra/events/ hotline
Answers questions on matters related to RCRA solid waste, hazardous waste, and underground storage tanks, EPCRA, and CERCLA.

RCRA Information Center
U.S. Environmental Protection Agency
RCRA Information Center (5305W
401 M Street SW
Washington, DC 20460
Phone: 703 603-9200
Fax: 703 603-9234
E-mail: rcra-docs@epamail.epa.gov
Helps and provides public access to all regulatory materials on RCRA and distributes technical and nontechnical information on RCRA issues.

Small Business Ombudsman/Clearinghouse/Hotline
U.S. Environmental Protection Agency
Small Business Ombudsman (2131C)
401 M Street SW
Washington, DC 20460
Phone: 703 603-9200
Fax: 703 603-9234
E-mail: rcra-docs@epamail.epa.gov
Tips and resources for small businesses.

Clearinghouse/Hotline
Small Business Ombudsman
and nontechnical information on RCRA issues.

Fax: 703 305-6462
Washington, DC 20460

OTHER INDUSTRY CONTACTS

Screenprinting and Graphics Imaging
Association International
10015 M Street
Fairfax, VA 22033-3489

OTHER INDUSTRIES

Pollution Prevention at Custom Print (EPA744-F-96-008) describes the activities among 206 lithographers that reduced chemical usage. These lithographers provide suggestions for pollution prevention that are cost-effective and improve processes.

Substitute Blanket Washes: Making Them Work (EPA744-F-96-001) is a case study that highlights the experiences of one print shop.

Screen Printing Project: Publications List (EPA744-F-96-002) is a document produced by EPA’s Design for the Environment (DfE) program. The DfE Screen Printing Project is a voluntary effort between representatives of the screen printing industry and EPA. The goal of the project is to provide screen printers with information that can help them design operations that are more environmentally sound, specifically regarding screen reclamation.

Reducing VOCs in Flexography (EPA744-F-96-013) is a fact sheet that highlights the experiences of one flexographic printer that successfully reduced volatile organic compound emissions and hazardous waste by switching to a water-based ink system.

Vegetable Ester Blanket Washes (EPA744-F-96-014) highlights vegetable esters as an alternative blanket wash. DfE’s study of 22 commercially available blanket washes revealed that vegetable blanket washes have more environmentally sound properties than other blanket washes, including reduced use of reclamation chemicals in screen printing and reduced use of solvents in screen reclamation as well as videos on pollution prevention for screen printers.

Vegetable Blanket Washes: Making Them Work (EPA744-F-96-002) describes substitute blanket washes that reduce volatile organic compound pounds and hazardous air pollutants.
