

US EPA ARCHIVE DOCUMENT

This PDF file is an excerpt from the EPA sampling report entitled *Sampling Episode Report - Princess Cruise Lines - Island Princess - Sampling Episode 6505* (March 2006). The full report can be downloaded from http://www.epa.gov/owow/oceans/cruise_ships/island.html

Sampling Episode Report Princess Cruise Lines Island Princess Sampling Episode 6505

Chapter 4 Results and Discussion

March 2006

4.0 RESULTS AND DISCUSSION

This section presents the data collected during this sampling episode. Section 4.1 presents the analytical results and discussion; Section 4.2 presents interview results for activities that impact wastewater generation; and Section 4.3 presents flow data and analysis. Analytical results for field measurements performed onboard are presented in Appendix A-3. Note that anomalous analytical results were obtained for available and total cyanide; these data have not been excluded from the data set, but the results are presented in and discussed in Section 5.1.1 (in the data quality section of this report) and not in the current section.

4.1 Laboratory Analytical Results and Discussion

4.1.1 Graywater

Tables 4-1 through 4-3 present analytical results for galley, laundry, and accommodations wastewater, respectively, which were collected for five consecutive 24-hour sampling periods during the sampling episode. Table 4-4 presents average analytical concentrations for these three graywater sources. Only those analytes detected at least once in any of the wastewater samples (i.e., graywater sources, influent to treatment system, or effluent from treatment system) are included in this table. Appendices A-1 and A-2 present results for both detected and nondetected analytes.

Of the 295 analytes tested for in the graywater sources, 64 were detected in the graywater waste streams. Thirteen of these 64 analytes were also detected at some level in the equipment blank (flagged by an “e” in Tables 4-1 through 4-5; see Table 5-2 for equipment blank results), meaning that the sampling equipment may have contributed some or all of these analytes to the samples. EPA will consider the impact of possible contamination from sampling equipment in a future analysis. Twenty-one of these 64 detected analytes were also detected at some level in the potable water used as source water for all graywater systems (flagged by an “s” in Tables 4-1 through 4-5; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of these analytes to the samples.

Chart 1 presents the number of analytes detected in each graywater source (see Table 4-4).

Chart 1. Number of Analytes Detected in Graywater Sources

Analyte Group (a)	Number of Analytes Detected		
	Galley	Laundry	Accommodations
Pathogen Indicators	3	3	3
Classical Pollutants	15	15	15
Total and Dissolved Metals	40	31	34
Volatile and Semivolatile Organics	3	3	2
Total	61	52	54

(a) See Table 3-3 for information on analyte groups.

Chart 2 presents the number of analytes that were detected in each graywater source at the highest average concentration. For example, the highest average detected concentrations for all three pathogen indicators were found in the galley wastewater. Note that a graywater source that has the highest concentration of an analyte will not necessarily contribute the greatest amount of that analyte to the wastewater treatment system or overboard discharge. The total amount of an analyte contributed by a particular graywater source also will depend on that source's volume compared to the volumes of the other sources. Flow (and thus volume) information was not able to be collected for all graywater sources (see Table 2-1).

Chart 2. Number of Analytes Detected at Highest Average Concentration in Graywater

Analyte Group (a)	Number of Analytes Detected in Graywater	Number of Analytes Detected at the Highest Average Concentration		
		Galley	Laundry	Accommodations
Pathogen Indicators	3	3	0	0
Classical Pollutants	15	14	1	0
Total and Dissolved Metals	43	34	4	5
Volatile and Semivolatile Organics	3	2	1	0
Total	64	53	6	5

(a) See Table 3-3 for information on analyte groups.

Galley wastewater contained a total of 61 analytes and showed the second highest average concentrations for 53 analytes, including all pathogen indicators, most classical pollutants, and most organics. Galley wastewater showed the highest average concentration of several analytes commonly used to measure wastewater strength: all 3 pathogen indicators, biochemical oxygen demand (BOD₅), chemical oxygen demand (COD), hexane extractable material (HEM), and total suspended solids (TSS). The galley wastewater was the only graywater source that was analyzed for pesticides because this was the most likely possible source of these analytes; none were detected.

Laundry wastewater contained a total of 52 analytes and showed the highest average concentrations for 6 analytes, including nitrate/nitrite, total silver, total and dissolved lead, total titanium, and chloroform. The laundry wastewater was the only graywater source that was analyzed for dioxins and furans because this was the most likely possible source of these analytes; none were detected.

Accommodations wastewater contained a total of 54 analytes and showed the highest average concentrations among the graywater sources for 5 analytes, including total aluminum, total beryllium, total and dissolved mercury, and total vanadium.

Galley, laundry, and food pulper wastewaters are collected into holding tanks and held for discharge untreated outside of 12 nm from shore. Table 4-5 presents analytical results for galley, laundry, and food pulper overboard discharge samples, which were collected as one-time grab samples as these wastewaters were discharged overboard. In general, the same pollutants were detected in the wastewaters as generated and during overboard discharge for both the galley and laundry wastewater. (System piping precluded collection of samples of food pulper wastewater as generated.) Variability in pollutant concentrations is likely caused by variations in wastewater generation over time rather than by changes in wastewater characteristics during wastewater storage.

4.1.2 Influent to Treatment System

Table 4-6 presents analytical results for the influent to the treatment system, which was sampled for five consecutive 24-hour sampling periods. Only those analytes detected at least once in any of the wastewater samples (i.e., graywater sources, influent to treatment system, or effluent from treatment system) are included in this table. Appendices A-1 and A-2 present results for both detected and non-detected analytes.

Pathogen Indicators and Classical Pollutants

All 3 pathogen indicators and all 16 classical analytes were detected in the influent to treatment samples. Three of these detected analytes were also detected at some level in the potable water used as source water for all graywater and sewage systems (flagged by an “s” in Table 4-6; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of these analytes to the samples. None of these analytes were detected in the equipment blank.

Wastewater conservation practices used onboard, such as use of vacuum toilets, result in highly concentrated wastewater. Chart 3 compares the influent to the Island treatment system to typical domestic wastewater for selected pathogen indicators and classical pollutants. Fecal coliform and enterococci concentrations in the influent to the Hamworthy treatment system were two or more orders of magnitude greater than in typical untreated domestic wastewater. Key analytes commonly used to assess wastewater strength, such as BOD₅, TSS, and COD, were detected at concentrations two or more times greater than typical domestic wastewater.

Chart 3. Comparison of Influent to Island Treatment System to Untreated Domestic Wastewater

Parameter	Untreated Island Wastewater	Untreated Domestic Wastewater (a)
Enterococci	10^6 to 10^7 MPN/100 mL	10^2 to 10^3 number/100 mL
Fecal Coliform	10^7 to 10^8 CFU/100 mL	10^4 to 10^5 number/100 mL
Ammonia	69.6 to 139 mg/L	12 to 50 mg/L
Biological Oxygen Demand (BOD ₅)	224 to 409 mg/L	110 to 400 mg/L
Chemical Oxygen Demand (COD)	546 to 1,560 mg/L	250 to 1,000 mg
Nitrate/Nitrite	ND to 0.1 mg/L	0 mg/L
Oil and Grease	59.2 to 269 mg/L	50 to 150 mg/L
Total Phosphorus	16.6 to 71.6 mg/L	4 to 15 mg/L
Total Suspended Solids (TSS)	860 to 1,560 mg/L	100 to 350 mg/L

(a) Source: Metcalf & Eddy, *Wastewater Engineering*, Third Edition, 1991.

ND - Not detected.

Total and Dissolved Metals

Of the 35 metal analytes detected in the influent to treatment samples, 27 were detected in every influent to treatment sample (Table 4-6). Ten of these 35 metal analytes were detected at some level in the equipment blank (flagged by an “e” in Table 4-6; see Table 5-2 for equipment blank results), meaning that the sampling equipment may have contributed some or all of these analytes to the samples. EPA will consider the impact of possible contamination from equipment in a future analysis. Seventeen of these detected metal analytes were also detected at some level in the potable water used as source water for all graywater systems (flagged by an “s” in Table 4-6; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of these analytes to the samples.

The 10 metal analytes detected at the highest concentrations were: total and dissolved sodium, total and dissolved magnesium, total and dissolved calcium, total aluminum, total copper, total iron, and total zinc. Total chromium, total and dissolved copper, total lead, total mercury, total and dissolved nickel, total and dissolved selenium, and total and dissolved zinc are priority pollutant metals (designated by EPA in 40 CFR Part 423, Appendix A) that were detected in every influent to treatment sample. Some metals may result from contact with carbon steel and stainless steel pipes and tanks in the ship.

Volatile and Semivolatile Organics, Pesticides, PCBs

Among the 365 target analytes for volatile and semivolatile organics, pesticides, and polychlorinated biphenyls (PCBs), 42 were detected in any Island influent to treatment samples: 2 semivolatile organics, 3 volatile organics, 1 pesticide, and 36 PCBs (Table 4-6). Neither of the 2 detected semivolatile organics were detected in the equipment blank (see Table 5-2 for equipment blank results; volatile organics, pesticides, and PCBs were not analyzed for in the equipment blank). EPA will consider the impact of possible contamination from equipment in a future analysis.

Two semivolatile organics were detected in the influent to treatment: bis(2-ethylhexyl)phthalate and phenol. Bis(2-ethylhexyl)phthalate is used as a plasticizer (a chemical added to plastics to make them flexible) and is commonly detected in environmental samples (ATSDR, 2002). Cruise ships use a wide variety of plastic products (e.g., floor tiles, shower curtains, hoses, packaging materials and containers, PVC piping) that may result in the presence of bis(2-ethylhexyl)phthalate in the influent to treatment.

Phenol is both man-made and produced naturally. It is found in human wastes (urine), which is the most likely source for phenol's presence in the influent to the Island treatment system. It is also found in some foods (smoked summer sausage, fried chicken, mountain cheese, some species of fish). Man-made sources include the use of phenol as a slimicide, as a disinfectant, and in medicinal preparations such as ointments, ear and nose drops, and antiseptic wipes. (ATSDR, 1998) All of these are possible sources for the presence of phenol in cruise ship wastewater. Phenol was also detected in the source water (see Table 4-12 for source water results), meaning that the source water may have contributed some or all of this analyte to the samples.

Three volatile organics were detected in the influent to treatment: methylene chloride, toluene, and tetrachlorethene. Methylene chloride and toluene were each detected just above their respective detection limits in one of five influent to treatment system samples during the sampling episode. Methylene chloride is an industrial solvent commonly used in paint removers and degreasing agents; other uses include the production of photographic films,

pharmaceuticals, inks, and adhesives. Methylene chloride can also serve as a propellant for insecticides, air fresheners, and paints. (ATSDR, 2001) Toluene is a component of fuels made from crude oil; it is also a solvent used in the production of paints, paint thinners, adhesives, and rubbers (ATSDR, 2001). Methylene chloride and toluene were not detected in any of the accommodations wastewater samples; therefore, the source of these analytes may be the sewage CHT system.

Tetrachloroethene was detected in three of five influent to treatment system samples. Tetrachloroethene is a solvent used in metal cleaning and dry cleaning (ATSDR, 1997). The Island has a dry cleaning facility. According to the ship's crew, all tetrachloroethene wastes are collected for shoreside waste disposal. Tetrachloroethene was not detected in the accommodations wastewater (or any other graywater samples); therefore, the source may be the sewage CHT system.

Thirty-six PCB congeners and co-eluting congener groups were detected in the influent to the wastewater treatment system. Total PCBs in the influent were measured at a concentration of 37,100 pg/L. Two of the detected PCBs were identified as "toxic" by the World Health Organization: PCB 105 (406 pg/L) and PCB 118 (984 pg/L). PCBs have traditionally been associated with electrical equipment, such as transformers; however, they have also been used in paint formulations, carbonless copy paper and plastics (EPA, 2005). None of the detected PCBs have any known manufacturers. (Note that PCBs were not analyzed for in source water.)

Simazine was the only pesticide detected in the influent to the treatment system. EPA lists simazine as a General Use Pesticide (GUP) that has been used to control broad-leaved weeds and annual grasses in fields, berry fruit, and vegetables. Simazine is classified by EPA to be slightly toxic to practically non-toxic. In the past, simazine has been used to control algae in swimming pools, hot tubs, and whirlpools. (Exttoxnet, 1996)

4.1.3 Influent to the Ultraviolet (UV) Disinfection Part of the Treatment System

Table 4-7 presents pathogen indicator results for the influent to UV disinfection part of the Island's wastewater treatment system. Grab samples for individual pathogen indicator analyses were collected for five consecutive 24-hour sampling periods. Pathogen indicators, which were generally in the millions at the influent to the treatment system (see Table 4-6), were generally reduced to nondetect or close to the detection limit after the bioreactor and membrane filter (i.e., before the UV disinfection step). Data for the pathogen indicators in the final effluent (i.e., after the UV disinfection step) are presented in the next section.

4.1.4 Effluent from the Treatment System

Table 4-8 presents analytical results for the effluent from treatment system, which was sampled for five consecutive 24-hour sampling periods. Only those analytes detected at least once in any of the wastewater samples (i.e., graywater sources, influent to treatment system, or effluent from treatment system) are included in this table. Appendices A-1 and A-2 present results for both detected and nondetected analytes.

Pathogen Indicators and Classical Pollutants

A total of 15 grab samples were collected for analysis of the three pathogen indicators over the five 24-hour sampling periods (results and collection times for each grab sample are presented in Appendix A-1). Pathogen indicators generally were not detected in the effluent from the treatment system; the exceptions to this were three grab samples in which *E. coli* was detected at levels close to the detection limit (one sample on Day 1 and two samples on Day 4), three grab samples in which enterococci was detected at levels close to the detection limit (Day 1, Day 4, and Day 5), and one grab sample in which fecal coliform was detected at 20 CFU/100 mL on Day 1 (detection limit is 2 CFU/100 mL).

Thirteen of the 16 classical pollutants were detected in effluent from treatment system samples; 3 classical pollutants (HEM, SGT-HEM, and settleable residue) were not

detected in any effluent samples. Three of the 13 detected classical analytes were also detected at some level in the potable water used as source water for all graywater and sewage systems (flagged by an “s” in Table 4-8; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of the analytes to the sample. None of these analytes were detected in the equipment blank.

Chart 4 shows that classical pollutant concentrations in the effluent from the Island treatment system are lower than EPA’s standards for secondary treatment.

Chart 4. Classical Pollutant Comparison of Effluent from Island Treatment System to Secondary Treatment Standards

Classical Pollutant	Average Effluent from Island Treatment System	Secondary Treatment Standards (a)
Biochemical Oxygen Demand (BOD ₅)	<3.46 mg/L	45 mg/L
Total Suspended Solids (TSS)	<7.70 mg/L	45 mg/L

(a) 40 CFR 133.102 Secondary Treatment Regulations, 7-day average.

< Average result includes at least one nondetect value (calculations uses detection limits for nondetected results).

Total and Dissolved Metals

Among the 54 total and dissolved metal analytes tested for, 31 were detected in one or more effluent from treatment samples (Table 4-8). Of these 31 detected metal analytes, 22 were detected in every effluent from treatment sample. Eight of the 31 detected metal analytes were also detected at some level in the equipment blank (flagged by an “e” in Table 4-8; see Table 5-2 for equipment blank results), meaning that the sampling equipment may have contributed some or all of this analyte to the samples. EPA will consider the impact of possible contamination from equipment in a future analyses. Seventeen of these detected metal analytes were also detected at some level in the potable water used as source water for all graywater and sewage systems (flagged by an “s” in Table 4-8; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of the analytes to the sample.

The 10 metal analytes detected at the highest concentrations were total and dissolved calcium, magnesium, sodium, zinc, and boron. Total and dissolved copper, nickel, selenium, zinc, and total mercury are priority pollutant metals (designated by EPA in 40 CRF

Part 423, Appendix A) that were detected in every effluent from treatment sample. Some metals may result from contact with carbon steel and stainless steel pipes and tanks in the ship. There are no EPA secondary treatment standards for metals.

Volatile and Semivolatile Organics, Pesticides, PCBs, Dioxins and Furans

Among the 84 target analytes for volatile and semivolatile organics analyzed, only two—phenol and bis(2-ethylhexyl)phthalate—were detected in any Island effluent samples (Table 4-8). Phenol is found in urine and bis(2-ethylhexyl)phthalate is used in plastics (see Section 4.1.2). Phenol was detected at some level in the potable water used as source water for all graywater and sewage systems (flagged by an “s” in Table 4-8; see Table 4-12 for source water results), meaning that the source water may have contributed some or all of the analyte to the sample.

Pesticides, PCBs, and dioxins and furans were not analyzed for in the effluent from the treatment system.

4.1.5 Wastewater Treatment System Performance: Comparison of Influent to Treatment System and Effluent from Treatment System

The Hamworthy treatment system successfully removed almost all pathogen indicators (>99%; Table 4-9) and most classical pollutants, metals, and organics (Tables 4-9 and 4-10).

Pathogen Indicators and Classical Pollutants

Pathogen indicators were generally removed by the bioreactor and membrane filters to levels below detection (>99% removal), while any remaining indicators were generally removed by UV disinfection (overall system efficiency >99%, see Table 4-9). Enterococci and *E. coli* were each detected in 3 of the 15 effluent from treatment samples at levels close to the detection limit; fecal coliform was detected in 1 of the 15 samples.

The treatment system removed almost all biochemical oxygen demand (BOD₅) (99%), and most chemical oxygen demand (COD) (93%) and total organic carbon (TOC) (89%) (Table 4-10). The system also removed almost all settleable residue and total suspended solids (TSS) (both 99% or greater). Oils and greases (HEM and SGT-HEM) were removed to levels below detection.

The treatment system reduced ammonia by 58%, while reducing total Kjeldahl nitrogen (TKN, which measures both ammonia and organic forms of nitrogen) and total phosphorus by approximately 75% (Table 4-10). Nitrate/nitrite levels are low and remained relatively unchanged. Nitrogen is likely taken up by the microorganisms in the bioreactor and removed from the system in the waste biosludge. It is unlikely that nitrogen is removed by nitrification (the mechanism of ammonia biodegradation) as nitrification would have resulted in an increase in nitrate/nitrite concentration, but these levels remained relatively unchanged. Phosphorus also is most likely taken up by the microorganisms in the bioreactor as evidenced by elevated total phosphorus concentrations in the waste biosludge (see Section 4.1.6 and Table 4-11).

Total and Dissolved Metals

The total metals analysis measures both the particulate and dissolved forms of metals, while the dissolved metals analysis measures only the dissolved form. The difference between the total and dissolved metals measurements is the particulate metals concentration. Metals were present in both particulate and dissolved forms in the influent to the treatment system (i.e., the total metals concentrations exceeded the dissolved metals concentrations for most metal analytes) (Table 4-6). In comparison, metals were predominantly present in the dissolved form in the effluent from the treatment system (i.e., the total and dissolved metals concentrations were similar in these samples) (Table 4-8). Furthermore, there were elevated metals concentrations in the screening solids and waste biosludge (see Table 4-11). This means that the treatment system is highly efficient in removing particulate metals, as would be expected for membrane filtration (and as supported by ≥99% removal of settleable residue and TSS, see Table 4-8). The treatment systems removed dissolved metals with an average efficiency of 37% (Table 4-10).

Volatile and Semivolatile Organics, Pesticides, PCBs, Dioxins and Furans

The treatment system was able to remove most of the volatile and semivolatile organic compounds to levels below detection (Table 4-10). Possible removal mechanisms include biological degradation, adsorption onto wastewater treatment sludge (see Table 4-11), and/or volatilization.

Simazine was the only pesticide detected in the influent to treatment, and pesticides were not analyzed for in the effluent from treatment. While PCBs were detected in the influent to treatment, they were not analyzed for in the effluent from treatment. EPA has no data regarding the performance of the Hamworthy treatment system for removing pesticides and PCBs. Dioxins and furans were not analyzed for in either the influent to or effluent from the treatment system. Dioxins and furans were analyzed for in laundry wastewater, and none were detected.

4.1.6 Screening Solids, Waste Biosludge, and Incinerator Ash

Table 4-11 presents the results for analytes detected in one-time grab samples of screening solids (from screens presses at the beginning of the treatment system), waste biosludge (excess biological mass from the treatment system's bioreactor), and incinerator ash (from incineration of trash, screening solids, and spent bag filters) collected during the sampling episode. Table 4-11 also shows the average influent to treatment analyte concentrations from Table 4-10 for comparison.

Most of the analytes detected in the screening solids and waste biosludge were also detected in the influent to treatment. For many analytes, concentrations in the screening solids and waste biosludge exceeded those in the influent to treatment, suggesting that these analytes are removed from the system in these waste streams. See Section 4.1.5 for a detailed discussion of wastewater treatment system performance.

4.1.7 Source Water

Potable water is used as source water for all ship operations that generate graywater and sewage (e.g., laundry, galley, food pulper, sinks, showers, and toilets). Potable water is produced onboard and bunkered while in port, with produced water providing approximately two-thirds of freshwater requirements and bunkered water providing approximately one-third of freshwater requirements. Seven total metals, 11 dissolved metals, 3 classical pollutants, and 1 organic were detected in the one-time grab sample of potable water collected during this sampling episode (Table 4-12). None of the analytes detected in the source water exceeded Federal drinking water standards (Table 4-12). Pathogen indicators were not detected in the source water sample.

4.2 Summary of Interviews Regarding Activities that Impact Wastewater Generation

The ship's crew was interviewed to obtain information regarding activities that impact wastewater generation (see Appendix C for detailed reports). The ship's crew provided operational, discharge, and wastewater treatment operating logs corresponding to the period of the sampling episode. These documents are included in the Cruise Ship Rulemaking Record and are available upon request.

4.2.1 Wastewater Generation

Galley

The Island has two main dining rooms, four additional restaurants, and 24-hour room service. Approximately 10,000 meals (breakfast, lunch, dinner, and snacks) are served daily. The ship's ten main automatic washing machines operate 24-hours a day. Dishes are washed using Solid Power and Super Trump (high alkaline solid automatic dishmachine detergents). Floors are washed using Encomp cleaning solution. Material Safety Data Sheets (MSDS) for these products are included in the Cruise Ship Rulemaking Record and are available upon request.

Laundry

The Island operates one large continuous tunnel washer to wash towels and linens from approximately 0800 to 1500 and 2000 to 0100 each day. Cleaning agents (Laundri SL-2000 and Eco-Star Detergent 1) are dispensed automatically using a computer-controlled menu depending on the material and degree of soiling. The Island operates two large washing machines to wash blankets (total of 10 loads per day at 300 pound capacity each) and two small washing machines (50 pound capacity) to wash passengers' personal items (operate from approximately 2000 to 0600 each day). MSDS for laundry cleaning agents are included in the Cruise Ship Rulemaking Record and are available upon request. Finally, the Island has six passenger laundrettes and six crew and officer laundrettes, processing approximately 40 pounds of laundry per load.

Photo Processing

The Island has an onboard photo processing lab with all digital photo processing equipment. All waste photographic chemicals are collected into drums for disposal onshore. The drums are stored within secondary containment to capture any spills. The sink in the photo lab drains to a drum for disposal onshore. The photo lab has two floor drains that are capped to ensure that spilled chemicals do not enter the drain system. Any spills are captured in in-room storage containers for shore disposal.

Print Shop

The Island houses a print shop. The floor drain is capped and any spills are captured in an in-room storage container for shore disposal. The print shop sink drains to a drum for onshore disposal. All print shop wastes (cleaning rags with solvents and chemical residues) are disposed of as hazardous waste onshore.

Dry Cleaning

The Island has a dry cleaning facility. One Renzacci dry cleaning machine processes approximately five loads per day using auto-distillation of solvent. This machine generated five liters of spent solvent during the first seven months of 2004; spent solvent is disposed of onshore as hazardous waste. Dry cleaning wastewater (condensate separator water) is routed to the laundry CHT system. Two Aquatex machines process approximately 15 loads per day using a water-based chemical which produces non-hazardous waste, according to the crew. Aquatex wastewater and lint waste is routed to the laundry CHT systems. No sinks or floor drains are present in the dry cleaning facility.

Chemical Storage

Any spills from the engine room storage areas are captured in the bilge and do not enter the graywater or sewage systems. See Appendix C for more information on chemicals stored in each engine room. Chemicals are also stored in other rooms of the ship as listed in Appendix C; none of the storage rooms have floor drains to ensure that spilled chemicals do not enter the graywater and sewage systems.

Medical Infirmary

The Island has a medical infirmary. Water that enters the floor drain or sinks drains to the graywater system; there is no floor drain in the digital imaging room. Sinks are used for handwashing only; the crew indicated that no chemicals are disposed of in the sinks. Any wastes are collected by the environmental officer for onshore disposal.

4.2.2 Pesticide, Fungicide, and Rodenticide Use

The Island uses Siege Gel insecticide bait (active ingredient hydramethylnon) and Maxforce bait stations (active ingredient fipronil) to control insect pests. Aerosol insecticides used onboard include Cy-kick (active ingredient cyfluthron) and 565 Plus XLO (active

ingredients pyrethrins and allethrin). MSDS for insect control agents are included in the Cruise Ship Rulemaking Record and are available upon request. The pesticide Simazine was detected in one Island influent to treatment sample. Simazine is a selective herbicide used to control weeds and grasses in food and feed crops; it is also widely used for nonselective weed control in industrial areas. In the past, Simazine was used to control submerged weeds and algae in large aquariums and swimming pools. (Exttoxnet, 1996)

Victor glue traps are set up to catch rodents. The Island does not use fungicides or rodenticides onboard.

4.3 Flow Data

Strap-on ultrasonic flow meters were used to collect flow measurements and to control automatic composite sample machines on (1) the outlet from the crew galley collection tank, (2) the outlet from one of the accommodations wastewater collection tanks, (3) the influent to wastewater treatment, (4) and the effluent from wastewater treatment (see Section 2.4 and Figures 2-1 and 2-2). The flow meters were programmed to record the instantaneous flow rate (m^3/min) and total flow (m^3) every five minutes. Flow data analyses presented in this section are based on only those flow data collected during the sampling episode of August 28 through September 2. Appendix B presents all flow data collected while onboard the Island from August 23 through September 3.

The flow meters on the outlet pipes from the galley and accommodations collection tanks recorded large negative flows when the tank discharge pumps were not operating, indicating significant backflow through these systems. Accordingly, the recorded flows do not accurately represent galley and accommodations wastewater generation at these locations and are not described further in this report.

The total daily volume of influent to and effluent from the treatment system for each 24-hour sampling period are presented in Figure 4-1. The influent to the treatment system flow was, on average, 75 percent of the flow measured from the effluent from the treatment system. One possible explanation is that the ultrasonic signal to the flow meter at the influent to

treatment system was weakened (or scattered) by the amount of solids present in the raw wastewater flowing through the pipe. A comparison of the average hourly flows indicates that the influent and effluent discharge flow rates show similar fluctuation throughout the day. Therefore, the flow measurements collected from the influent to the treatment are probably valid for qualitative use. The total daily flow from the influent remained relatively constant over the five-day sampling period, regardless of whether the ship was in port (Days 1, 4, and 5) or at sea (Days 2 and 3).

The Island discontinued discharge of effluent from the treatment system for part of Day 3 of this sampling episode (while it cruised Glacier Bay National Park) and diverted the wastewater to a holding tank for overboard discharge outside of 12 nm of shore, as can be seen by the dip in the total daily effluent discharge on Day 3. Daily effluent flow rates and flow per capita are presented in Table 4-13. Per capita flow rates were calculated based on 2,925 people (2,019 passengers and 906 crew) onboard during the sampling episode, as reported by the ship's crew. On average, each person generated approximately 41 gallons of treated wastewater per person per day. It is important to note that the treatment system treats only accommodations wastewater and sewage. The flow measurements do not reflect other activities that occur onboard such as wastewater generated by the galley (galley and food pulper wastewater) and laundry.

Figure 4-2 presents the average effluent from treatment flow for each hour interval over the five consecutive 24-hour sampling periods, calculated from data collected via the strap-on flow meter. The highest rate of overboard discharge occurs between the hours of 2100 and 0400.

Table 4-1

Galley Wastewater Analytical Results, Island Princess

Analytical results for galley wastewater for analytes detected at least once in wastewater samples during the sampling episode. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Galley wastewater samples were collected for five consecutive 24-hour periods; see Section 3.2 for the sample collection methodology. Table 2-1 lists the specific wastewater streams in galley wastewater, and Figure 2-1 identifies the sampling point location. Average galley wastewater concentrations determined from the daily results. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

(a) Sampling point location; see Figure 2-1.

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with two grab samples collected per 24-hour sampling period. Results are reported as an average for each 24-hour period, followed by an indication of the number of results included in the average (e.g.,[N=2]). See Appendix A-1 for all individual grab sample results.

(c) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

NC - Not collected.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

Table 4-2

Laundry Wastewater Analytical Results, Island Princess

Analytical results for laundry wastewater for analytes detected at least once in wastewater samples during the sampling episode. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Laundry wastewater samples were collected for five consecutive 24-hour periods; see Section 3.2 for the sample collection methodology. Table 2-1 lists the specific wastewater streams in laundry wastewater, and Figure 2-1 identifies the sampling point location. Average laundry wastewater concentrations determined from the daily results. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

(a) Sampling point location; see Figure 2-1.

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with a minimum of one and a maximum of two grab samples collected per 24-hour sampling period. Results are reported as an average for each 24-hour period, followed by an indication of the number of results included in the average (e.g., [N=2]). See Appendix A-1 for all individual grab sample results.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

NC - Not collected.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

- Average result includes at least one nondetect value (calculation uses detection limits for nondetected results) and at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

Table 4-3

Accommodations Wastewater Analytical Results, Island Princess

Analytical results for accommodations wastewater for analytes detected at least once in wastewater samples during the sampling episode. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Accommodations wastewater samples were collected for five consecutive 24-hour periods; see Section 3.2 for the sample collection methodology. Table 2-1 lists the specific wastewater streams in accommodations wastewater, and Figure 2-1 identifies the sampling point location. Average accommodations wastewater concentrations determined from the daily results. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

(a) Sampling point location; see Figure 2-1.

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with two grab samples collected per 24-hour sampling period. Results are reported as an average for each 24-hour period, followed by an indication of the number of results included in the average (e.g., [N=2]). See Appendix A-1 for all individual grab sample results.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

- Average result includes at least one nondetect value (calculation uses detection limits for nondetected results) and at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

Table 4-4

Average Graywater Analytical Results, Island Princess

Average analytical results for galley, laundry, and accommodations wastewater from results presented in Tables 4-1 to 4-3. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are listed where applicable in the left-most column.

Analyte	Unit	Priority Pollutant Code	Galley Wastewater (SP-1) (a)	Laundry Wastewater (SP-2) (a)	Accommodations Wastewater (SP-3) (a)
Pathogen Indicators					
<i>E. coli</i>	MPN/100 mL		854,000	<22.5	<17,200
Enterococci	MPN/100 mL		> 13,900	# 486	# 966
Fecal Coliform	CFU/100 mL		104,000,000	<965	<175,000
Classical Pollutants					
Alkalinity	mg/L		<107	62.2	89.8
Ammonia As Nitrogen (NH ₃ -N) (s)	mg/L		11.1	1.29	0.430
Biochemical Oxygen Demand (BOD ₅)	mg/L		1,910	100	145
Chemical Oxygen Demand (COD)	mg/L		2,630	380	492
Chloride	mg/L		406	33.4	16.2
Hardness (s)	mg/L		145	25.2	25.1
Hexane Extractable Material (HEM)	mg/L		279	7.73	16.1
Nitrate/Nitrite (NO ₂ -N + NO ₃ -N)	mg/L		<0.0840	0.150	<0.0700
Settleable residue	mL/L		16.7	<1.73	<0.533
Silica Gel Treated HEM (SGT-HEM)	mg/L		ND(4.96)	ND(4.88)	ND(4.76)
Sulfate	mg/L		95.4	20.6	17.0
Total Dissolved Solids (TDS)	mg/L		1,720	256	217

(a) Sampling point location; see Figure 2-1.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

- Average result includes at least one nondetect value (calculation uses detection limits for nondetected results) and at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

Table 4-4 (Continued)

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

Table 4-6

Influent to Treatment Analytical Results, Island Princess

Analytical results for the influent to treatment system for analytes detected at least once in wastewater samples during the sampling episode. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Influent to treatment system samples were collected for five consecutive 24-hour periods; see Section 3.2 for the sample collection methodology. Figure 2-2 identifies the sampling point location. Average influent to treatment system concentrations determined from the daily results. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

Analyte	Unit	Priority Pollutant Code	Influent to Treatment (SP-4) (a) Day 1	Influent to Treatment (SP-4) (a) Day 2	Influent to Treatment (SP-4) (a) Day 3	Influent to Treatment (SP-4) (a) Day 4	Influent to Treatment (SP-4) (a) Day 5	Average Influent to Treatment (SP-4) (a)

Settleable residue	mL/L		1.10	2.60	93.0	65.0	EXCLUDE	40.4

(a) Sampling point location; see Figure 2-2.

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with three grab samples collected per 24-hour sampling period (some fecal coliform results were excluded; see Section 5.1). Results are reported as an average for each 24-hour period, followed by an indication of the number of results included in the average (e.g., [N=3]). See Appendix A-1 for all individual grab sample results.

(c) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

NC - Not collected.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

(a) Sampling point location; see Figure 2-2.

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with three grab samples collected per 24-hour sampling period. Results are reported as an average for each 24-hour period, followed by an indication of the number of results included in the average (e.g., [N=3]). See Appendix A-1 for all individual grab sample results.

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

Table 4-8

Effluent from Treatment Analytical Results, Island Princess

Analytical results for the effluent from treatment system for analytes detected at least once in wastewater samples during the sampling episode. See Appendices A-1 and A-2 for all analytical results (detected and nondetected). Effluent from treatment system samples were collected for five consecutive 24-hour periods; see Section 3.2 for the sample collection methodology. Figure 2-2 identifies the sampling point location. Average effluent from treatment concentrations determined from the daily results. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

Analyte	Unit	Priority Pollutant Code	Effluent from Treatment (SP-6) (a) Day 1	Effluent from Treatment (SP-6) (a) Day 2	Effluent from Treatment (SP-6) (a) Day 3	Effluent from Treatment (SP-6) (a) Day 4	Effluent from Treatment (SP-6) (a) Day 5	Average Effluent from Treatment (SP-6) (a)

Silica Gel Treated HEM (SGT-HEM)	mg/L		ND(5.10)	ND(5.10)	ND(4.80)	ND(5.00)	ND(4.80)	ND(4.96)
Sulfate	mg/L		124	166	180	129	110	142
Total Dissolved Solids (TDS)	mg/L		1,750	2,300	2,600	1,690	1,580	1,980

(a) Sampling point location; see Figure 2-2

(b) Samples for pathogen indicator analyses were collected as grab samples for individual analysis, with three grab samples per 24-hour sampling period. Results are reported as an average for each 24-hour sampling period, followed by an indication of the number of results included in the average (e.g., [N=3]). See Appendix A-1 for all individual grab sample results.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetect value.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

EXCLUDE - Data excluded from the data set (see data review narratives in Appendix D for details).

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetect value.

Table 4-9

Wastewater Treatment System: Performance Data for Pathogen Indicators, Island Princess

Pathogen indicators performance data for the Island's Hamworthy wastewater treatment system. Average analyte concentrations were determined from the daily results presented in Tables 4-6 through 4-8. Percent removals were calculated using the average influent to and effluent from treatment analyte concentrations.

Analyte	Unit	Average Influent to Treatment Concentration (SP-4) (a)	Average Influent to UV Disinfection Concentration (SP-5) (a)	Average Effluent from Treatment Concentration (SP-6) (a)	Percent Removal
Pathogen Indicators					
<i>E. coli</i>	MPN/100 mL	>36,600,000	<1.00	<1.14	> 99
Enterococci	MPN/100 mL	>16,800,000	<2.80	<1.21	> 99
Fecal Coliform	CFU/100 mL	190,000,000	<2.54	<3.20	> 99

(a) Sampling point location; see Figure 2-2.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Average result includes at least one result flagged by the laboratory as ">" because the sample was not diluted sufficiently (see Appendix D).

Table 4-10

Wastewater Treatment System: Performance Data for Analytes Other Than Pathogen Indicators, Island Princess

Performance data for the Island's Hamworthy wastewater treatment system for analytes other than pathogen indicators detected in either the influent to or effluent from treatment. Range and average analyte concentrations were determined from the daily results presented in Tables 4-6 and 4-8. Percent removals were calculated using the average influent to and effluent from treatment analyte concentrations. Priority pollutants (designated by EPA in 40 CFR Part 423, Appendix A) are identified where applicable.

Analyte	Unit	Priority Pollutant Code	Average Influent to Treatment Concentration (SP-4) (a)	Influent to Treatment Concentration Range (SP-4) (a)	Average Effluent from Treatment Concentration (SP-6) (a)	Effluent from Treatment Concentration Range (SP-6) (a)	Percent Removal
Classical Pollutants							
Alkalinity	mg/L		396	293 - 580	196	150 - 219	51
Ammonia As Nitrogen (NH ₃ -N) (s)	mg/L		94.2	69.6 - 139	39.4	27.9 - 47.3	58
Biochemical Oxygen Demand (BOD ₅)	mg/L		325	224 - 409	<3.46	ND(2.00) - 7.85	99
Chemical Oxygen Demand (COD)	mg/L		956	546 - 1,560	64.4	56.0 - 73.5	93
Chloride	mg/L		938	527 - 1,530	1,040	792 - 1,320	NC
Hardness (s)	mg/L		402	258 - 573	342	274 - 437	15
Hexane Extractable Material (HEM)	mg/L		129	59.2 - 269	ND(4.96)	ND(4.80) - ND(5.10)	> 96
Nitrate/Nitrite (NO ₂ -N + NO ₃ -N)	mg/L		<0.0620	ND(0.0500) - 0.100	<0.0860	ND(0.0500) - 0.230	NC
Settleable residue	mL/L		40.4	1.10 - 93.0	ND(0.100)	ND(0.100)	> 99
Silica Gel Treated HEM (SGT-HEM)	mg/L		62.3	17.0 - 124	ND(4.96)	ND(4.80) - ND(5.10)	> 92
Sulfate	mg/L		134	93.0 - 204	142	110 - 180	NC
Total Dissolved Solids (TDS)	mg/L		1,850	1,030 - 2,880	1,980	1,580 - 2,600	NC
Total Kjeldahl Nitrogen (TKN) (s)	mg/L		181	110 - 354	43.2	27.6 - 53.2	76
Total Organic Carbon (TOC)	mg/L		140	79.4 - 250	15.5	13.9 - 17.2	89
Total Phosphorus	mg/L		28.3	16.6 - 71.6	7.26	6.20 - 8.25	74

(a) Sampling point location; see Figure 2-2.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

ND - Not detected (number in parentheses is detection limit).

NC - Percent removal not calculated because the effluent concentration was greater than the influent concentration or the analyte was not detected in the influent sample.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Indicates a minimum level of removal.

Table 4-10 (Continued)

Analyte	Unit	Priority Pollutant Code	Average Influent to Treatment Concentration (SP-4) (a)	Influent to Treatment Concentration Range (SP-4) (a)	Average Effluent from Treatment Concentration (SP-6) (a)	Effluent from Treatment Concentration Range (SP-6) (a)	Percent Removal

Nickel, Dissolved (s)	ug/L	P124	15.7	11.3 - 22.8	14.1	11.4 - 19.3	10
Selenium, Dissolved	ug/L	P125	29.8	22.6 - 42.9	41.2	28.4 - 72.1	NC
Sodium, Dissolved (s)	ug/L		464,000	269,000 - 821,000	619,000	406,000 - 990,000	NC
Vanadium, Dissolved	ug/L		ND(0.679)	ND(0.679)	<1.05	ND(0.679) - 1.90	NC
Zinc, Dissolved (e) (s)	ug/L	P128	100	83.4 - 119	205	151 - 223	NC

(a) Sampling point location; see Figure 2-2.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

ND - Not detected (number in parentheses is detection limit).

NC - Percent removal not calculated because the effluent concentration was greater than the influent concentration or the analyte was not detected in the influent sample.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Indicates a minimum level of removal.

Table 4-10 (Continued)

Analyte	Unit	Priority Pollutant Code	Average Influent to Treatment Concentration (SP-4) (a)	Influent to Treatment Concentration Range (SP-4) (a)	Average Effluent from Treatment Concentration (SP-6) (a)	Effluent from Treatment Concentration Range (SP-6) (a)	Percent Removal
Volatile and Semivolatile Organics							
Bis(2-ethylhexyl) Phthalate	ug/L	P066	31.9	22.2 - 58.1	<11.6	ND(10.0) - <14.5	64
Methylene Chloride	ug/L	P044	<10.1	ND(10.0) - 10.5	ND(10.0)	ND(10.0)	> 0.99
Phenol (s)	ug/L	P065	149	111 - 244	81.4	64.9 - 109	45
Tetrachloroethene	ug/L	P085	<17.8	ND(10.0) - 29.2	ND(10.0)	ND(10.0)	> 44
Toluene	ug/L	P086	<10.1	ND(10.0) - 10.7	ND(10.0)	ND(10.0)	> 1.4

(a) Sampling point location; see Figure 2-2.

(e) Analyte detected at some level in the equipment blank. See Section 5.2.2 and Table 5-2 for equipment blank results.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

ND - Not detected (number in parentheses is detection limit).

NC - Percent removal not calculated because the effluent concentration was greater than the influent concentration or the analyte was not detected in the influent sample.

< - Average result includes at least one nondetect value (calculation uses detection limits for nondetected results).

> - Indicates a minimum level of removal.

Table 4-11

Treatment System Residual and Incinerator Ash Analytical Results, Island Princess

Analytical results for one-time grab samples of treatment system residual (i.e., screening solids and excess biological mass from bioreactors) and incinerator ash for analytes detected at least once in these samples. See Appendix A-2 for all analytical results (detected and nondetected). Figure 2-2 identifies the sampling point locations; see Table 3-2 for sample collection methodology. Also shown are average concentrations for the influent to treatment samples (from Table 4-6) for comparison. Certain screening solids results were converted from mass to volume units; see Section 3.3. Priority pollutants (designated by EPA in 40 CRF Part 423, Appendix A) are identified where applicable.

Analyte	Priority Pollutant Code	Screening Solids (SP-11) (a) Day 3	Biosludge (SP-12) (a) Day 1	Incinerator Ash (SP-13) (a) Day 3	Average Influent to Treatment (SP-4) (a)

(a) Sampling point location; see Figure 2-2.

(s) Analyte detected at some level in the source water. See Section 4.1.7 and Table 4-12 for source water results.

NC - Not collected.

ND - Not detected (number in parentheses is detection limit).

< - Average result includes at least one nondetected value (calculation uses detection limits for nondetected results).

Table 4-12

Source Water Analytical Results, Island Princess

Analytical results for one-time grab sample of source water for detected analytes. See Appendix A-2 for all analytical results (detected and nondetected). Also shown are Federal drinking water standards for comparison. Priority pollutants (designated by EPA in 30 CFR Part 423, Appendix A) are identified where applicable.

Analyte	Unit	Priority Pollutant Code	Source Water (SP-14) (a)	Federal Drinking Water Standards (b)
Classical Pollutants				
Ammonia As Nitrogen (NH ₃ -N)	mg/L		0.0350	
Hardness	mg/L		16.9	
Total Kjeldahl Nitrogen (TKN)	mg/L		0.300	
Total and Dissolved Metals				
Calcium, Total	ug/L		6,470	
Copper, Total	ug/L	P120	412	1,300
Magnesium, Total	ug/L		191	
Mercury, Total	ug/L	P123	0.100	2.0
Selenium, Total	ug/L	P125	0.970	50
Sodium, Total	ug/L		2,110	
Zinc, Total	ug/L	P128	23.0	5,000
Calcium, Dissolved	ug/L		6,450	
Cobalt, Dissolved	ug/L		1.20	
Copper, Dissolved	ug/L	P120	479	
Iron, Dissolved	ug/L		27.9	
Magnesium, Dissolved	ug/L		197	
Manganese, Dissolved	ug/L		2.40	
Mercury, Dissolved	ug/L	P123	0.0800	
Nickel, Dissolved	ug/L	P124	2.80	
Sodium, Dissolved	ug/L		2,100	
Yttrium, Dissolved	ug/L		2.00	
Zinc, Dissolved	ug/L	P128	33.0	
Volatile and Semivolatile Organics				
Phenol	ug/L	P065	53.0	

(a) Sampling point number; see Table 2-1.

(b) 40 CFR 141.62 National Primary Maximum Contaminant Levels for Inorganic Contaminants (mercury, selenium); 40 CFR 141.51 National Primary Maximum Contaminant Level Goals for Inorganic Contaminants (copper); and 40 CFR 143.3 Secondary Maximum Contaminant Levels (zinc).

Table 4-13**Flow Data by Sampling Period, Island Princess**

Flow data collected via strap-on ultrasonic flow meters installed by the sampling team. Figures 2-1 and 2-2 show the flow meter locations. Note that the treatment system treats only accommodations wastewater and sewage. Flow per capita was calculated by dividing daily flow totals by the number of passengers and crew (2,925 people) onboard the Island during the sampling episode.

Sampling Period	Effluent from Treatment System (SP-6) (a)	
	Daily Total Flow, gallons/day (m ³ /day)	Daily Flow Per Capita, gallons/day/person (m ³ /person)
Day 1	126,000 (477)	43.1 (0.163)
Day 2	99,300 (376)	34.0 (0.129)
Day 3	53,900 (204) (b)	18.4 (0.070) (b)
Day 4	127,000 (482)	43.5 (0.165)
Day 5	126,000 (477)	43.0 (0.163)
Average (b)	120,000 (453) (b)	40.9 (0.155) (b)

(a) Sampling point location; see Figures 2-1 and 2-2.

(b) Average daily discharge flow rate for effluent from treatment system excludes data for Day 3 when the Island discontinued discharge while it cruised Glacier Bay National Park.

Figure 4-1. Total Daily Flow, Island Princess

Flow data collected via strap-on ultrasonic flow meters installed by the sampling team. Flow data are presented as daily totals for each location. Figures 2-1 and 2-2 show the flow meter locations. Note that the treatment treats only accommodations wastewater and sewage.

Figure 4-2. Average Hourly Wastewater Treatment System Flow, Island Princess

Average effluent flow for each hour interval over the five consecutive 24-hour sampling periods, calculated and plotted from the strap-on flow meters installed by the sampling team. Figure 2-2 shows the flow meter location. Bars represent the standard error of the hourly flow calculated for the five consecutive sampling days. Standards error is calculated as the standard deviation divided by the square root of the number of hourly flow measurements (five).
