OSV BOLD SURVEY PLAN

**OSV BOLD
SURVEY PLAN**

**Skagway Harbor Dilution Study, Nutrient Study,
And
Open House**

A Collaborative Study Conducted by EPA and ADEC

July 1 – 21, 2008

1. General

Project title: Dye Dispersal and Nutrient Uptake in Skagway Harbor

Survey title: Skagway Harbor Dilution Study, Nutrient Study,
And Open House

Survey vessel: *OSV Bold*

Vessel requested by: Kennard Potts

Organization: EPA Oceans and Coastal Protection Division

EPA Work Assignment Manager: Jonathan Amson

EPA Chief Scientist: Kennard Potts

Organization: EPA Oceans and Coastal Protection Division

Address: 4504T

USEPA Headquarters

1200 Pennsylvania Ave. NW

Washington, DC 20460

Telephone: (202) 566-1267 (Kennard Potts)

(202) 566-1276 (Jonathan Amson)

Work Assignment Manager: Jonathan Amson

Organization: USEPA Headquarters

EPA Contract Number Contract No.: na

Work Assignment: na

2. Schedule of operations

Mobilization Date: July 1, 2008

Location: **Juneau, AK for Open House (July 2, 2008)**

Skagway, AK for nutrient study (July 6, 2008)

Departure Date: July 5, 2008

Planned Survey Duration (Days): 21

Allowable Weather Days: None

Maximum Duration (Days): 21 (including mobilization and demobilization)

Demobilization Date: July 21, 2008

Location: Juneau, AK

Comments: None

3. Background Information

As the cruise ship industry expands, there is increasing concern about the potential environmental impacts of cruise ship waste streams, such as sewage and graywater (waste water from showers, sinks, laundries and kitchens). EPA is engaged in a number of activities to address the potential environmental impacts of cruise ship waste streams. In particular, (1) EPA is evaluating the performance of various advanced sewage and graywater treatment systems to assess whether revised or additional standards for sewage and graywater discharges from large cruise ships operating in Alaska are warranted; (2) EPA is completing its Cruise Ship Discharge Assessment Report, which assesses five waste streams from cruise ships: sewage, graywater, oily bilge water, solid waste, and hazardous waste; and (3) EPA has conducted a survey to study the dilution of sewage and graywater discharges from cruise ships while underway.

To continue our assessment of the potential environmental impacts of cruise ships, EPA has partnered with the Alaska Department of Environmental Conservation (ADEC) to conduct three related studies in July 2008 using

EPA's Ocean Survey Vessel *Bold*. First, we will track sewage and graywater discharge plumes from cruise ships in Skagway Harbor to measure the dilution of discharges from stationary vessels. Second, we will conduct a nutrient amendment study to determine if phytoplankton growth in Skagway Harbor is limited by nutrients. Third, we will examine nitrogen uptake by primary producers in Skagway Harbor to assess the relative importance of natural and anthropogenic sources of nutrient inputs.

4. Survey Justification and Rationale

Data collected will focus on nutrient releases and discharge dispersal in Skagway Harbor. The survey data will be used to enhance our understanding of the fate and effects of nutrients released from cruise ships. In addition, the data will be used by ADEC to assess the impact of cruise ship discharges on the environment.

5. Objectives

A. Plume Dilution

The plume dilution study is designed to provide information on near-field cruise ship discharge (treated sewage and graywater effluent) plume characteristics in harbor waters, and to provide preliminary information on whether these plumes behave as predicted by modeling performed by ADEC (Assessment of Cruise Ship and Ferry Wastewater Impacts in Alaska, 2004). One of the goals of the study is to monitor dye-laden discharge plume dispersals from five large cruise ships. ADEC has used Visual Plumes to predict the dilution of discharges from both large and small vessels. The estimated dilution factor for initial dilution of discharges from stationary cruise ships in Skagway during a neap tide ranged from 5 to 60. However, the Visual Plume modeling was performed using parameters that do not necessarily match real world conditions.

Project objectives are to (1) determine the effluent dilution characteristics of discharges from stationary cruise ships; (2) track the near-field mixing dynamics of the effluent plume; and (3) provide information that can be used to validate modeling studies. To accomplish these objectives, a tracer dye, Rhodamine WT¹, will be added to vessel-effluent-discharge systems. A fluorescence sensor will be towed through the receiving waters in Skagway Harbor, providing spatial information on the plume via in-situ measurements of the Rhodamine WT dye concentration.

B. Nutrient Amendment

This survey is to determine whether dissolved nutrients released in cruise ship effluent are influencing phytoplankton growth in Skagway Harbor. Though data are limited, it is likely that dissolved nutrient concentrations are lowest in Skagway Harbor during the summer months, when cruise ship presence is at its peak. The nutrient concentrations are low during the summer due to low levels of run-off and to nutrient drawdown during the high productivity spring season. Performing nutrient addition experiments during this time will provide information on the natural phytoplankton community's ability to assimilate exogenous nutrients.

C. Nutrient Uptake

The availability of nutrients typically limits the abundance of primary producers. Anthropogenic inputs of nutrients to estuaries can stimulate an increase in productivity, possibly resulting in eutrophication and shifts in dominant flora. Natural abundance stable isotopes can be used to trace the origin and fate of nutrients. Nitrogen stable isotope signatures can be used to evaluate the input of anthropogenic wastes to receiving waters. As a result of microbial processes the isotope ratio of nitrogen in waste water tends to be isotopically more positive (enriched) in nitrogen-15 relative to the environmental background. Assimilation of anthropogenic

¹ Rhodamine WT has very low toxicity (concentrations up to 0.1 micrograms per liter are allowed in drinking water) and the initial dye concentration is sufficiently low that dye-laden discharge plumes are not anticipated to be visible to the naked eye.

nutrients by marine flora can sometimes be identified by shifts in stable isotope ratios, relative to unimpacted communities.

In order for this technique to be effective, there are a number of caveats that must be met. First, there must be good isotopic separation between sources. Thus, the shifts in stable isotope ratios of waste water effluent must be different (3 to 5 ‰) from other background sources. Second, the macroalgae must take up nutrients with no isotopic fractionation or with a constant and measured fractionation. Third, the macroalgae must be exposed long enough to acquire the isotopic signature.

There are two objectives for this study. The first is to determine the scope and extent of anthropogenically-derived nutrient uptake by indigenous macroalgae (seaweed) in the vicinity of Skagway Harbor through the use of stable nitrogen and carbon isotope measurements. Macroalgae samples will be collected within Skagway Harbor and the northern tip of Taiya Inlet, with the Taiya River estuary will serve as a reference site.

The second objective is to use nitrogen-starved macroalgae in an attempt to determine if the impact of treated cruise ship graywater/sewage effluent can be detected in Skagway Harbor via nutrient uptake. Meeting this objective will require achieving several goals. First, a stock nitrogen starved macroalgae will need to be developed. Second, stock material will need to be characterized with regard to nitrogen content and nitrogen isotope ratios. Third, macroalgae will need to be exposed in the natural environment and then processed and analyzed. Fourth, on deck incubations using known quantities of treated cruise ship graywater/sewage effluent and standards will be performed in order to verify that the bioassay is working as expected under controlled conditions.

6. Environmental management questions asked by project/survey

1. How do discharge parameters (e.g., initial velocity, depth) affect the initial dilution of discharges from stationary vessels?
2. Can a dye dispersal study that incorporates advanced monitoring techniques be used to validate hydrodynamic modeling?
3. Can the information obtained from the dilution study be used to predict the distances at which treated graywater and sewage discharges from large cruise ships will meet water quality standards?
4. Is phytoplankton growth in Skagway Harbor limited by nitrogen or phosphorus concentrations?
5. Does the form of nitrogen added (i.e., ammonium vs. nitrate vs. urea) alter the level of phytoplankton growth?
6. Does the form of nitrogen added to harbor water select for different phytoplankton species than those that typically dominate in Skagway Harbor?
7. What is the spatial extent and relative magnitude of anthropogenic nutrient uptake by primary producers in the vicinity of Skagway Harbor?
8. Can the nutrients being utilized by primary producers be linked to specific anthropogenic sources?

7.0 Survey Location and Description: (Attach detail/tables/figures if needed)

Skagway is an excellent test case location for the dilution and nutrient studies because there is the least mixing and the most cruise ship traffic of the various Alaskan ports of call. Because of this, both ADEC and EPA have focused their site-specific assessments of cruise ship discharges in Skagway, including both near-field and far-field dilution modeling.

Under Alaska's new state permit, cruise ships will not be able to discharge in general in Skagway this summer. However, ADEC could allow a variance from the permit for three weeks, allowing the cruise ships to discharge in Skagway. This situation presents a unique situation that would allow for the assessment of impacts from the

ships versus from other sources of nutrients such as the POTW outfall. In no other location in Alaska could this type of study be conducted.

8.0 SURVEY/SAMPLING METHODOLOGIES

A. Plume Dilution

The dilution characteristics of treated sewage and graywater discharge from each vessel will be characterized by in situ measurements of Rhodamine WT in the effluent plume (treated wastewater from advanced wastewater treatment systems). Data collected during the plume tracking survey will determine the location and mixing of the discharge plume. Measurements of dye concentration, as well as hydrographic measurements, are not anticipated to continue beyond a distance of 50 meters from the point of discharge. Measurements are planned to occur within 10 meter of the discharge point; however, depending upon site conditions, distances will be determined by the EPA Chief Scientist. Data will be collected on a single discharge plume, not the cumulative effect of multiple discharge plumes. The data is anticipated to be useful in the validation of hydrodynamic modeling of discharge plumes.

During this survey, the discharge plumes from several different cruise ships will be monitored. Plume dilution studies will be conducted no more frequently than once every day to help ensure adequate flushing of the Rhodamine WT from the harbor.

Each vessel is expected to be configured differently in terms of discharge port diameter, discharge rate, distance of discharge port from the waterline, discharge port location (i.e., bow, mid-ship, or aft), and graywater/sewage treatment and discharge system. A metering pump will be used to inject Rhodamine WT into the discharge line upstream of the discharge port. The pump will inject the dye at a rate sufficient to obtain a 100 µg/L Rhodamine WT solution.

Existing in-line flow meters will be used to measure flow rates during the discharge. However, if in-line meters are not present or they are significantly removed from the discharge port, an ultrasonic flow sensor will be attached to the effluent piping, as close as possible to the discharge port, to allow discharge rates to be recorded. Once the vessel begins discharging, a member of the survey team will monitor the dye-containing treated wastewater using a flow-through fluorometer that will be installed at a designated sampling point, which is located as close as possible to the discharge port. The purpose of the flow-through fluorometer is to provide dye concentration data (mean and variance) prior to plume dilution.

Plume monitoring will be conducted using a fluorometer and CDT deployed from a rigid inflatable boat (RIB). The in-situ fluorometer will be calibrated to measure concentrations of Rhodamine WT ranging from 0.1 to 100 µg/L. A cable or rope will be used to control the depth of the towed sensor package. A float will be attached to the sensor package to determine the offset of the package from the RIB.

Near-field transects will be conducted to determine plume dilution during vessel discharge. One of the key requirements of this study is to minimize perturbations to plume dispersal. The following measures will be implemented to help achieve this requirement:

Transects should be conducted during slack tide to minimize the effects of tidal currents;

The study will be conducted using a low-displacement boat moving at low speed to minimize the influence of the boat's wake;

The first transect will take place at the greatest distance from the discharge port, with subsequent transects occurring progressively closer to the discharge port (i.e., moving up-plume); and

For transects occurring at a given distance from the discharge port, the first transect will be done at the most shallow depth, with subsequent transects occurring at progressively greater depths.

While the plume is expected to be buoyant, surface measurements will not be made because of the anticipated irreproducible surface mixing effects caused by wind, precipitation, and wakes.

Prior to commencing the plume dilution studies, a salinity profile shall be collected in Skagway Harbor.

The sampling scheme assumes that the vessels are at the railway dock and discharging toward the inlet. A total of 12 transects will be conducted either perpendicular to the initial trajectory of the discharge plume or in an arc centered on the discharge port. The transects will occur at distances of 10, 7.5, 5, and 2.5 meters from the discharge port. Constant-depth profiles will be collected for each distance at three depths: 0.5 meters, the midpoint between 0.5 meters and the depth of the discharge port, and the depth of the discharge port (see Table 1). Depending upon site conditions, transect depths may change (see below). Prior to dye release, fluorescence measurements will be collected along transects 10 meters from the vessel to obtain information on background fluorescence in the environment. A differential GPS will be used to maintain a constant speed of 2 knots during the transects. At the end of sampling activities, all equipment will be cleaned and sanitized with bleach to remove any dye or pathogens.

Table 1

Vessel	Transect Depths		
<i>Millennium</i>	0.5	1.0	1.5
<i>Norwegian Star</i>	0.5	2.5	4.5
<i>Princess Star</i>	0.5	1.5	2.5
<i>Princes Coral</i>	0.5	1.5	2.5
<i>Ryndam</i>	0.5	1	1.5
<i>Volendam</i>	0.5	3.25	6.0

Current meters will be deployed to collect current data throughout the near-field transect study. The meters will be deployed in the vicinity of the discharge port. These measurements will document the ambient currents that affect the trajectory and dilution of the plume.

During the course of the sampling transects, weather conditions (e.g., temperature, wind speed, and wind direction) shall be recorded.

The sampling locations proposed in the previous paragraphs are based upon the hydrodynamic modeling studies conducted by ADEC. Under real-world conditions, the dilution and buoyancy of the plumes may differ from those predicted in the modeling study. Consequently, the first of the vessel discharge dilution studies will be used to “fine tune” the experimental conditions that will be used in subsequent studies. The first set of transects will be conducted at a distance of 10 meters from the point of discharge. These transects will begin at a depth of 0.5 meters; with subsequent transects occurring in 0.5 meter increments until a final depth of 5 meters is reached. After these ten transects are completed, the scientific crew will consult with the EPA Chief Scientist and ADEC, if available, to determine appropriate distances and depths at which subsequent transects will be conducted. As the study progresses, further refinement of the experimental conditions may be required. Such refinements will be made by direction of the EPA Chief Scientist.

A pre-survey kickoff meeting will be held on July 6th prior to commencing any activities. The meeting participants will include the EPA Chief Scientist, representative(s) of ADEC, survey technical staff, designated *OSV Bold* crew, and representatives of the vessels participating in the survey. The purpose of the meeting is to ensure that all participating organizations understand the study objectives and design, as well as their respective roles and responsibilities, and those of the other participants.

Objectives of the kickoff meeting:

1. Finalize communication logistics;
2. Coordinate the plume tracking schedule and activities; and

3. Finalize vessel positioning for the study.

In addition to the pre-survey meeting, on the morning of each plume tracking event the survey party will meet with all participants to review the plan as it applies to the vessel participating in the study that day.

B. Nutrient Amendment

Between 130 - 140 liters of water will be collected from above the halocline (middle of the mixed layer) in the central part of harbor, where cruise ship effluent is likely to flow past, using the *Bold's* conductivity, temperature, and depth (CTD) sampling rosette. Collection time will be just after dusk or prior to dawn in order to minimize photochemical effects on phytoplankton. This water will be gently homogenized in an acid-washed 55 gallon polyethylene drum and screened through a 200 μm mesh in order to exclude macrozooplankton grazers. The water will then be distributed into 32 acid-washed 4 L polyethylene cubitainers (i.e., incubation bottles).

Samples of the homogenized harbor water will also be used to determine the initial conditions (i.e., dissolved nutrients, chlorophyll, and phytoplankton community). Triplicate samples will be collected for the measurement of ammonia, total nitrogen, nitrate/nitrite, orthophosphate, total phosphorus, and silicate by the methods of Slawyk and MacIsaac (1972), Valderrama (1981), Armstrong et al. (1967), Bernhardt and Wilhelms (1967), Valderrama (1981), and Armstrong et al. (1967), respectively. Samples will be filtered, preserved, and stored as specified by their respective method.

Nutrients will be added to the incubation bottles (see below for treatment conditions), which will then be placed in on-deck water baths. The water baths will be kept at the mixed layer temperature by circulating surface seawater from *Bold's* inlet system through the baths. Circulating water will be allowed to overflow and exit the ship via the scuppers. The baths will be shaded with neutral density screening to approximate the light level in the middle of the mixed layer. In situ light levels will be measured using the *Bold's* surface and subsurface photosynthetically active radiation sensors.

Dissolved nutrient data in the Draft Cruise Ship Environmental Assessment Technical Development Document suggests the phytoplankton community may be nitrogen-limited, and is unlikely to be limited by phosphorus (the nitrogen-to-phosphorus ratio is about half that considered optimal for phytoplankton). Consequently, the following nutrient additions will be used:

1. Control (no addition)
2. Nitrogen ($35 \mu\text{mol L}^{-1}$ nitrate²)
3. Phosphorus ($2.5 \mu\text{mol L}^{-1}$ orthophosphate¹)
4. Nitrogen + Phosphorus ($35 \mu\text{mol L}^{-1}$ nitrate and $2.5 \mu\text{mol L}^{-1}$ orthophosphate)
5. Nitrogen as ammonia ($35 \mu\text{mol L}^{-1}$ ammonium chloride)
6. Nitrogen as organic nitrogen ($35 \mu\text{mol L}^{-1}$ urea)
7. Treated sewage dilution 1 (50-fold; $\sim 40 \mu\text{mol L}^{-1}$ inorganic nitrogen, $\sim 100 \text{ mg L}^{-1}$ total phosphorus)
8. Treated sewage dilution 2 (500-fold; $\sim 4 \mu\text{mol L}^{-1}$ inorganic nitrogen, $\sim 10 \text{ mg L}^{-1}$ total phosphorus)

Samples of the treated sewage will be collected to verify its nutrient concentrations. The above 8 treatment conditions will be replicated 4 times, for a total of 32 incubation bottles. Each bottle will be subsampled at 24 h for size-fractionated chlorophyll (sampling procedure is described below), placed back in the incubation bath, and re-sampled at 48 h for size-fractionated chlorophyll and dissolved nutrients (see above). Each bottle will be

² These concentrations are 10 times the average TN and TP in Skagway Harbor. They are also 10 times the total concentration in Skagway Harbor resulting from AWT operations as calculated by EPA (AWT operations adds $3.45 \mu\text{mol L}^{-1}$ N and $0.223 \mu\text{mol L}^{-1}$ P, respectively).

sampled again at 72 h for size-fractionated chlorophyll, placed back in the incubation bath and re-sampled at 96 h for size-fractionated chlorophyll and dissolved nutrients.

For the collection of chlorophyll samples, incubation bottles will be gently homogenized by inverting slowly several times. Then, a 300 mL aliquot of the incubated harbor water will be filtered through a 20 μm polycarbonate filter. The filtrate from this first step will be collected and filtered through a 5 μm polycarbonate filter. The filtrate from the second step will be collected and filtered through a 0.2 μm polycarbonate filter. Each filter will be placed in a separate labeled-microcentrifuge tube and 1 mL of 90:10 acetone:deionized water (by volume) will be added to each tube and the tubes will be sealed. The tubes will be stored in the dark at -20 °C overnight. The following morning, the 1 mL of acetone solution will be pipetted from the microcentrifuge tubes into labeled glass test tubes. The relative fluorescence of each acetone sample will be measured and recorded. Following initial measurement, 50 μL of 10% hydrochloric acid will be added to each acetone sample and then its relative fluorescence will be re-measured and recorded.

Samples collected for phytoplankton taxonomy will be fixed with Lugol's reagent. A 125 mL sample of homogenized incubated harbor water will be stored in the dark in a 4 °C fridge for approximately 12 hours after the addition of Lugol's reagent. Measured subsamples will be filtered through 1 μm polycarbonate filters and slide-mounted using immersion oil. Slides will be stored in a -20 °C freezer. The slides will be shipped to the University of Southern California for phytoplankton counting.

Upon survey demobilization, water samples for nutrient analysis are to be packed in ice-filled ice chest and shipped to University of Washington.

C. Nutrient Uptake

Municipal (sewage outfall), riverine (Skagway River), oceanic (Taiya Inlet), and vessel (blackwater and graywater) inputs are the major sources of the nutrient budget for Skagway Harbor. Stable isotope ratios are known to be indicative of nutrient sources, with anthropogenic nutrient sources being enriched in ^{15}N and depleted in ^{13}C . The relative abundance of ^{15}N versus ^{14}N , and ^{13}C versus ^{12}C are typically reported as $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$, respectively.

$$\delta^{15}\text{N} = \left[\left(\frac{^{15}\text{N}/^{14}\text{N}_{\text{sample}}}{^{15}\text{N}/^{14}\text{N}_{\text{standard}}} - 1 \right) \right] \times 1000$$

$$\delta^{13}\text{C} = \left[\left(\frac{^{13}\text{C}/^{12}\text{C}_{\text{sample}}}{^{13}\text{C}/^{12}\text{C}_{\text{standard}}} - 1 \right) \right] \times 1000$$

To obtain an isotopic signature for each of the major nutrient inputs, water samples will be collected from Taiya Inlet (approximately one kilometer southwest of Skagway Harbor, at a depth of approximately 0.5 meter), Skagway River (approximately one kilometer northeast of Skagway, at a depth of 0.5 meter [conditions permitting]), the City of Skagway wastewater treatment plant (one undiluted sample from the treatment plant and a second from the zone of initial dilution of the municipal sewage outfall [i.e., 59° 26' 54.8"N, 135° 19' 36.6W at a depth of 25 meters], and the treated graywater and sewage effluent from each cruise ship that participates in the study (see Table 1).

A water sample will be collected at each site and each vessel using Niskin or acid-cleaned HDPE bottles (2L or larger), and the date, time, and location at which the samples are collected will be recorded. After the bottles are returned to the *Bold*, within 2 hours of collection, each sample will be split for ammonia, nitrate/nitrite, and $\delta^{15}\text{N}$ analysis. Ammonia and nitrate/nitrite analysis will be performed as described in section B. $\delta^{15}\text{N}$ analysis for dissolved ammonia and nitrate will be performed per USGS 2898 and 2899, respectively, at the Reston Stable Isotope Laboratory. Samples will be filtered, preserved, and stored as specified by their respective method.

Naturally abundant macroalgae (e.g., *Fucus*, *Ulva*) are assumed to be representative of primary producers in the Taiya Inlet. Samples will be collected along the eastern coast line from Nahku Bay, through Skagway Harbor, and south to Sturgills Camp (approx. 59° 28' 41.65" N, 135° 20' 11.20" W to 59° 25' 17.10 N, 135° 20' 22.30 W) at approximately 1 km intervals. See the areas marked in red in Figure 1.

Figure 1

Figure 2

Additionally, samples will be collected from the western coastline of the Taiya Inlet from the mouth of the Taiya River to the intersection of the Lutak Inlet (approx. 59° 28' 41.65" N, 135° 20' 11.20" W to 59° 25' 17.10" N, 135° 20' 22.30" W) at approximately 4 km intervals. See the areas marked in red in Figure 2.

At each sample collection site, the date, time, and location are to be recorded. Only macroalgae growing on rocks should be collected. If available, samples of both *Fucus* and *Ulva* macroalgae shall be collected. Six replicate samples (approximately 3-5 gww per sample) shall be collected of each type of macroalgae found at a site. Upon collection, all samples will be immediately placed in individually labeled plastic bags and stored at 4 °C.

Upon returning to the *Bold*, samples shall be washed to remove epiphytic material. If washing does not adequately remove the epiphytic material (to be determined by the EPA Chief Scientist), samples can be gently scraped with a stainless steel blade. After cleaning, samples are to be placed in pre-labeled envelopes and oven dried.

Samples will be collected from both locations (Figures 1 and 2) on two separate occasions. The first set of samples will be conducted on July 6th and 7th. A second set of samples will be conducted on July 27th and 28th.

Upon survey demobilization, the dried macroalgae samples are to be shipped to EPA's Western Ecology Division in Portland, Oregon for $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ isotope analysis. Water samples are to be packed in dry-ice-filled chest and shipped to University of Washington for nutrient analysis and Reston Stable Isotope Laboratory for $\delta^{15}\text{N}$ analysis.

Part 2

A stock of nitrogen starved algae will be developed using facilities at the Pacific Coastal Ecology Branch (PCEB). Green macroalgae (*Ulva* spp.) will be collected from Yaquina Bay, OR brought into the lab, rinsed in flowing seawater to remove epiphytes and invertebrates. Algal material will then be spun in a salad spinner for 1 min. and 100 gww will be added to a clear polycarbonate Nalgene carboy (20 l). Ten liters of artificial seawater (AFSW) media (~450 g red sea salt (RSS) mixed to volume with Milli-Q water) will be added to the carboy. Previous work has shown that this AFSW media has less than 5 μM nitrate and undetectable ammonium. Six replicate Nalgene carboys will be stocked in this manner. Plants will be supplied with saturating irradiance (1000 W metal halide lamps) on a 14:10 light:dark cycle. Temperature will be maintained by running flowing seawater around the carboys. These techniques have been used in several experiments conducted at PCEB. Plants will be cultured under these low nutrient conditions for two to three weeks in order to deplete internal N reserves. Subsequent to culture, plants will be transported to the field site for use in bioassays and incubations. After transport, stock algal material will be held under analogous AFSW media conditions on the *Bold* until deployed as bioassays.

At the field site, immediately prior to field deployment of the bioassay material – five replicate sub-samples of green macroalgae will be collected and dried for subsequent analysis. Bioassay deployment will consist of placing 3-5 gww of stock algae into 400 μ mesh bags, closed with a plastic clip and attached using plastic zip-ties to buoys. Fifteen bioassay bags will be attached to each deployment buoy allowing for five replicate samples to be collected at each three incubation times (48, 96, and 144 h). Five bioassay buoys will be constructed and deployed throughout the study area. At least one bioassay buoy will be deployed directly adjacent to a cruise ship effluent plume “epi-center”, while other buoys will be placed at varying distances from the region thought to be most impacted by treated graywater/sewage effluent. Exact locations for deployments will be determined by the EPA Chief Scientist. Buoys will be anchored in place or tied off to near-by objects (e.g. bulkheads, pilings, screw anchors in intertidal, etc.). After incubation, plants will be rinsed on site in harbor water, and agitated lightly to remove any epiphytes. Samples will be placed in labeled plastic bags and stored on ice during transport to the *Bold*. At the *Bold*, samples will be rinsed with minimal Milli-Q or de-

ionized water and dried. Dried samples will be transported to PCEB where they will be lyophilized, pulverized and analyzed for $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$.

During the field bioassay deployments, short term incubations will be conducted on deck using AFSW media amended with KNO_3 or NH_4Cl of known isotope ratios and treated cruise ship graywater/sewage effluent, which has been amended with RSS to adjust salinity. Replicate sub-samples of stock algal material (3-5 gww) will be incubated at varying nitrogen (as nitrate or ammonium) concentrations for 48h. The treated cruise ship graywater/sewage effluent concentrations will be made using serial dilutions; actual nitrogen concentrations will subsequently be determined by analytical analysis. Isotopic analysis of these samples should indicate the potential isotopic shift expected under field conditions. Short term incubations will also be conducted using a gradient of concentrations of KNO_3 or NH_4Cl of known isotopic composition in order to verify that nitrogen uptake is occurring without fractionation.

Additional water and plant samples may be obtained for analysis of either isotope ratios or nutrient concentrations. Water samples will be filtered through 0.45μ GFF filters and frozen for transport and analysis. Filters will be retained in order to assess the $\delta^{15}\text{N}$ of the particulates.

9.0 SEQUENCE OF SURVEY TASKS/EVENTS

Daily operations are described in Appendix A.

10. Navigation and Positioning Control

Navigation and position determinations will be accomplished through the use of differential GPS.

11.0 Equipment and Supplies

A. Dilution Study

Equipment from OSV *Bold* (Attach *Bold* check list if appropriate):

- Positioning equipment on bridge
- 2 small boats operational and deployed
- Hand held radios
- GPS units for RIBs

Equipment from EPA: None

Equipment from Contractor:

- Rhodamine WT dye
- Five 1 L sample bottles
- Bottle labels
- Bench-top fluorescence spectrometer (two)
- Hand deployable CTD (two)
- Hand deployable flow-through fluorescence meter
- Ice chests
- Current meters (six – three for deployment and three back-ups)
- Ultrasonic flow sensors (two)
- Metering pump (two)

Expendable Supplies from *Bold*:

NONE

B. Nutrient Amendment Study

Plastic incubation bottles (1 or 2 L acid-washed polycarbonate bottles or cubitainers)

Plastic sample bottles (50 mL acid-washed polyethylene bottles)

Plastic bottles for nutrient stocks (100 mL acid-washed polyethylene bottles)

Plastic tubing for transferring water (25 ft ½ inch diameter flexible tubing – acid washed)

Volumetric flask (100 mL) for making up stocks

Graduated cylinder (500 mL)

Shading for water baths (neutral density window screening from hardware store)

Filter towers (25 and 47 mm), including catches for filtrate

Pipette tips

Microcentrifuge tubes

Glass test tubes

Racks to hold microcentrifuge tubes and glass test tubes

microscope slides

Salts to make up nutrient stocks (plant cell culture grade of: sodium nitrate, sodium phosphate dibasic, ammonium chloride, and urea)

Hydrochloric acid (10% high grade) for bottle cleaning and chlorophyll analysis

spinach extract for calibrating fluorometer

Acetone (90%) for chlorophyll analysis

Lugol's reagent for phytoplankton counts

Immersion oil for phytoplankton counts

Safety goggles

Styrofoam shipping cooler

Blue ice packs

Filters: GF/F (25 mm), 0.2 µm polycarbonate (47 mm), 5 µm polycarbonate (47 mm), and 20 µm polycarbonate (47 mm)

Equipment from BOLD:

Surface PAR Sensor (QSR-240 Surface PAP Sensor)

C. Nutrient Uptake Study

Equipment from *Bold*:

Niskin/Ocean Test Bottles – 10 L or larger

2 small boats operational and deployed

Hand held radios

Differential GPS units for small boats

Equipment from Contractor:

Part 1

Fourteen 1 L sample bottles

Twenty Eight 60 mL sample bottles

Glass fiber filters

Filter equipment (funnel, flasks, pump, etc.)

Bottle labels
Ice chests
Dry ice
Shipping material
Plastic bags
Paper towels

Part 2

Cultured macroalgae
Graduated cylinders
Plastic bags
Sharpies
Gloves
Nalgene carboys (20 liter)
Cubitainers (4 liter)
400 μ mesh bags (100)
Plastic clips and zip-ties
Line, floats/buoys, and screw anchors/sand-bags
Filters (47 mm, 0.45 μ GFF), filter holders, filter forceps, vacuum pump, filter flasks, and vacuum tubing
Centrifuge tubes, brown bottles, and Petri dishes,
KNO₃ ($\delta^{15}\text{N-KNO}_3 = 0.5\text{‰}$), NH₄Cl ($\delta^{15}\text{N-NH}_4\text{Cl} = 0.5\text{‰}$), HCL, and Red Sea Salt (RSS)
Balance and weigh boats,
LI-COR 1400 data logger, 20 m cable, spherical quantum sensors (2), and lowering frame,
YSI Sonde or mini-CTD

Expendable Supplies from *Bold*:

Other:

The OSV *Bold* will be used as a sample analysis platform. Expect to perform water collection with Rosette while at dock. Hence docking should allow for deploying CTD/Rosette.

12. QA/QC Procedures

As outlined in the QAPP.

13. Survey Crew

Name	Survey Responsibility	Organization	Berth
Kennard Potts	Chief Scientist	EPA - Headquarters	02-36-2
Elizabeth Kim	Principal Investigator	EPA - Headquarters	02-35-1
Chris Meade	Survey Team	EPA – R10	01-34-2 (May not berth)
Rachel Jakuba	Survey Team	EPA- Headquarters	01-21-2
Jim Kaldy	Survey Team	EPA R10	01-23-1

Debra Falatko	Work Assignment Leader	ERG	01-27-2
Brian Lapointe	Survey Team	ERG	01-43-2 (7/5 -7/9)
Brian Herczeg	Survey Team	EPA R10	01-43-2 (7/11-7/21)
Jim Jendron	Survey Team	Alaska State DEC	1-22-3 (7/5-7/12)
Kenwyn George	Survey Team	Alaska State DEC	1-22-3 (7/13-7/21)

14. Reporting requirements

EPA will prepare a report which will discuss the experimental methods and summarize the data of the near field dilution studies by October 2008.

15. References

1.0 INTRODUCTION

ERG is providing technical support to the U.S. Environmental Protection Agency (EPA), who is working in partnership with the Alaska Department of Environmental Conservation (ADEC) to evaluate the potential impact of cruise ship wastewater (treated sewage and graywater) discharges in Alaskan waters. EPA plans to conduct the following three related studies in July 2008 using EPA's Ocean Survey Vessel *Bold* (OSV *Bold*):

- Plume Dilution Study- This study is intended to provide information on (a) near-field mixing dynamics of the cruise ship discharge plume in harbor waters, and (b) whether these plumes corroborate previous modeling efforts by ADEC.
- Nutrient Amendment Study- This study is intended to determine whether dissolved nutrients contained in cruise ship effluent are influencing phytoplankton growth in Skagway Harbor.
- Nutrient Uptake Study- This study is intended to determine the extent of anthropogenically-added nutrient uptake in macroalgae in Skagway Harbor, using stable nitrogen and carbon isotope analyses.

As directed by Work Assignment 5-24 of Contract No. 68-C-02-095, ERG has prepared this Quality Assurance Project Plan (QAPP) to ensure the survey adequately addresses the tasks and types of data that will be used in completing the work assignment.

It is responsive to all applicable elements specified in EPA Requirements for Quality Assurance Project Plans (1). This QAPP is a project-specific supplement to ERG's corporate Quality Management Plan, Revision 7, June 2002 (QMP) (2), which was prepared in accordance with EPA Requirements for Quality Management Plans (3). ERG's QMP details the responsibilities of the ERG Quality Assurance (QA) coordinators and Project Management Team, and describes procedures used to plan, implement, and assess project quality. These procedures, tailored to the needs of the tasked activities, will be used on this work assignment.

References are presented in Section 6.0. Throughout this document, each time a reference is cited, a number corresponding to the Section 6.0 listing is shown in parentheses.

2.0 PROJECT MANAGEMENT ELEMENTS

This section addresses project management, including project history and objectives, roles and responsibilities, and project goals. In addition, this section presents the mechanisms ERG uses to ensure that all participants understand the goals and the approach to be used for Work Assignment 5-24. EPA has identified eight elements to be discussed in this section:

- A.1: Title and Approval Sheet;
- A.2: Table of Contents;
- A.3: Distribution List;
- A.4: Project/Task Organization;
- A.5: Problem Definition and Background;
- A.6: Project/Task Description;
- A.7: Quality Objectives and Criteria; and
- A.9: Documentation and Records.

Element A.1, Title and Approval Sheet, and Element A.2, Table of Contents, have been provided earlier in this document. The remaining elements are presented below.

2.1 Element A.3: Distribution List

The distribution list for this QAPP is presented in Table 2-1.

Table 2-1. QAPP Distribution List

Name	Organization	Role
Joe Hall	US EPA/OW/OWOW	EPA QA Coordinator
Jonathan Amson	US EPA/OW/OWOW	EPA Work Assignment Manager
Damon Highsmith	US EPA/OW/OST	EPA Project Officer for ERG's Support Contract
Kennard Potts	US EPA/OW/OWOW	EPA Chief Scientist
Elizabeth Kim	US EPA/OW/OWOW	EPA Principal Investigator
Rachel Jakuba	US EPA/OW/ORD/NCER	EPA Survey Team Member

Name	Organization	Role
Chris Mead	US EPA Region 10	EPA Survey Team Member
Brian Herczog	US EPA Region 10	EPA Survey Team Member
Jim Kaldy	US EPA Region 10	EPA Survey Team Member
Deb Bartram	ERG	ERG Program Manager
Deb Falatko	ERG	ERG Work Plan Manager
Betsy Bicknell	ERG	Project QA Coordinator
Mark Briggs	ERG	ERG Survey Team Member
Brian Lapointe	Reef Research & Design, Inc.	Technical Support, ERG Subcontractor
Burt Jones	University of Southern California	Laboratory Analyst, ERG Subcontractor
Kathy Krogslund	University of Washington School of Oceanography Marine Chemistry Lab	Laboratory Analyst, ERG Subcontractor

2.2 Element A.4: Project Organization

Project organization for the July 2008 sampling program aboard the OSV *Bold* is divided into three distinct studies as described in Section 1.0. Figure 2-1 describes the roles and responsibilities of specific ERG staff, ERG subcontractors, and EPA staff for each of the three studies. Under EPA Contract No. 68-C-02-095, Work Assignment 5-24, ERG is providing technical support to EPA in conducting sampling activities using EPA's OSV *Bold* to evaluate the potential impact of cruise ship wastewater (treated sewage and graywater) discharges on Alaskan waters. ERG is supported by a sampling subcontractor, Reef Research & Design, Inc., and three contract laboratories, University of Washington School of Oceanography Marine Chemistry Lab (UW MCL), University of Southern California (USC), and USGS Reston Stable Isotope Lab (USGS Lab). Figure 2-2 describes ERG's project level quality control organization for the components of EPA's July 2008 sampling program for which ERG is responsible. For those aspects of EPA's July 2008 sampling program which do not fall under ERG's roles and responsibility as defined in this QAPP, EPA will manage the quality of the sampling data and documentation.

Debbie Falatko, a Senior Chemical Engineer, will serve as ERG's Work Plan Manager (WPM). She will be responsible for all management and administrative aspects of the work performed, and for ensuring that the quality of work, schedule, and budget meet the requirements of EPA's July 2008 OSV *Bold* sampling program. She will provide technical direction to ERG staff and will be responsible for the daily activities on the project. She will also provide onsite technical support during EPA's sampling program. Ms. Falatko will be the principal contact to the EPA WAM on project issues, deliverables, and schedule. She will also keep Betsy Bicknell, the Project QA Coordinator, and Deb Bartram, the ERG Program Manager, advised of any quality problems that arise.

Ms. Betsy Bicknell will serve as Project QA Coordinator, responsible for the development and execution of QA activities throughout this project, including work plan development and execution, data analysis, and data reporting. Additional details on ERG's project QA organization can be found in the June 2002 QMP, Section 1.2 Project Organization and Staff Responsibilities (2). The ERG project staff, including Kristi Bubb, Mark Briggs, Kim Wagoner, and others, will be responsible for day-to-day project activities. Mark Briggs will also provide onsite technical support during EPA's July 2008 sampling program.

ERG is supported by four subcontractors, Reef Research & Design, Inc., UW MCL, USC, and USGS Lab. Brian Lapointe with Reef Research & Design, Inc. will provide expertise in seaweed identification and support for sample collection and preparation for the nutrient uptake study. Kathy Krogslund with UW MCL will provide laboratory analysis of water samples collected during the survey. Burt Jones of USC will provide phytoplankton counts and taxonomy information. T.B. Coplen with USGS Lab will provide laboratory isotope analysis of water samples collected during the survey. ERG's subcontractors will function within ERG's quality system, and ERG will be responsible for the quality of their work. Subcontractors are responsible for following the applicable procedures noted in this QAPP and the specifications contained in their subcontract with ERG. The ERG WPM reviews the performance of ERG subcontractors and approves the payment of invoices only when subcontractor performance meets contract requirements.

Brain Lapointe will serve as Reef Research & Design's QA coordinator for the collection of macroalgae samples in the vicinity of Skagway Harbor. Kathy Krogslund and T.B. Coplen will serve as UW MCL's and USGS Lab QA coordinators for the analysis of nutrient water samples and isotope ratio determinations, respectively. Burt Jones will serve as USC's QA coordinator for conducting phytoplankton counts and taxonomy information for the nutrient amendment study. ERG is responsible for scheduling and tracking the samples analyzed by UW MCL and USGS Lab; resolving any analytical problems and implementing any necessary corrective actions; reviewing analytical data quality, and creating and providing to EPA a data package with a short written report discussing any data quality assurance or quality control issues or concerns. US EPA Region 10 is responsible for the isotope analysis for both the macroalgae samples and laboratory-cultured nutrient-depleted algae samples for the nutrient uptake study, and is also responsible for the quality of their work and the laboratory analysis of EPA's Western Ecology Division in Portland, Oregon.

Figure 2-1. Project Roles and Responsibility for EPA's July 2008 Sampling Program

Figure 2-2. Project Level QA Organization for ERG's Support of EPA's July 2008 Sampling Program

2.3 Element A.5: Problem Definition/Background

This section explains the purpose of the July 2008 sampling program. It also presents a review of the background of the planned sampling program.

2.3.1 Statement of Key Questions and Project Outcome

Work Assignment 5-24 directs ERG to provide technical support to EPA to conduct three related studies using the OSV *Bold* to evaluate the potential impact of cruise ship wastewater (treated sewage and graywater) discharges in Alaskan waters. ERG will support EPA in answering the following six key questions:

- 1) Can a dye dispersal study that incorporates advanced monitoring techniques be used to validate hydrodynamic modeling?

- 2) Is phytoplankton growth in Skagway Harbor limited by nitrogen or phosphorus concentrations?
- 3) Does the form of nitrogen added (i.e., ammonium vs. nitrate vs. urea) alter the level of phytoplankton growth?
- 4) Does the form of nitrogen added to harbor water select for different phytoplankton species than those that typically dominate in Skagway Harbor?
- 5) What is the spatial extent and relative magnitude of anthropogenic nutrient uptake by primary producers in the vicinity of Skagway Harbor?
- 6) Can the nutrients being utilized by primary producers be linked to specific anthropogenic sources?

ERG will support EPA in the following two issues:

- Provide near-field environmental monitoring data near cruise ship discharge ports to support possible regulatory option assessments by EPA and ADEC for controlling discharges from cruise ships.
- Provide data on nutrient releases in Skagway Harbor to enhance EPA's understanding of the fate and effects of nutrients released from cruise ships in Alaskan waters.

Table 2-1 lists the key measurements required to address each of the questions listed above and will serve as the focus for the data quality discussions outlined in this QAPP.

Table 2-2. Key Measurements for EPA's July 2008 Sampling Program

Question Number	Study Name	Key Measurement(s)
1	Plume Dilution Study	Concentration of Rhodamine WT dye at end-of-pipe and in near-field plume
2	Nutrient Amendment Study	- Concentration and amount of nutrients added to incubation containers - Level of chlorophyll fluorescence in incubation containers
3	Nutrient Amendment Study	- Level of chlorophyll fluorescence in incubation containers - Nutrient concentrations in incubation containers
4	Nutrient Amendment Study	Identification of phytoplankton species¹
5	Nutrient Uptake Study	- Geographic location of macroalgae sample collection sites - Identification of macroalgae species - Nitrogen and carbon isotope ratios of macroalgae¹
6	Nutrient Uptake Study	- Geographic location of water samples - Nutrient concentrations of water samples - Nitrogen and carbon isotope ratios of water samples - Nitrogen and carbon isotope ratios of laboratory-cultured nutrient-depleted algae samples¹

¹This measurement is outside the scope of this QAPP and will not be discussed in the following sections.

2.3.2 Background

As the cruise ship industry expands, there is increasing concern about the potential environmental impacts of cruise ship waste streams, such as sewage and graywater (waste water from showers, sinks, laundries and kitchens). EPA is engaged in a number of activities to address the potential environmental impacts of cruise ship waste streams. In particular, (1) EPA is evaluating the performance of various advanced sewage and graywater treatment systems to assess whether revised or additional standards are warranted for sewage and graywater discharges from large cruise ships operating in Alaska; (2) EPA is completing its Cruise Ship Discharge Assessment Report, which assesses five waste streams from cruise ships: sewage, graywater, oily bilge water, solid waste, and hazardous waste; and (3) EPA has conducted a survey to study the dilution of sewage and graywater discharges from cruise ships while underway.

To continue assessment of the potential environmental impacts of cruise ships, EPA is working with ADEC to conduct three related studies in July 2008 using EPA's OSV

Bold. First, EPA will track sewage and graywater discharge plumes from cruise ships in Skagway Harbor to measure the dilution of discharges from stationary vessels. Second, EPA will conduct a nutrient amendment study to determine if phytoplankton growth in Skagway Harbor is limited by nutrients. Third, EPA will examine nitrogen uptake by primary producers in the vicinity of Skagway Harbor to assess the relative importance of natural and anthropogenic sources of nutrient inputs.

2.4 **Element A.6: Project/Task Description**

ERG is supporting EPA in planning and executing an environmental sampling program in Skagway Harbor, Alaska. Appendix A includes EPA's survey plan for the Skagway Harbor nutrient study, which provides a detailed description of the three studies included in the sampling program. The survey plan will be the primary source of procedural information and a guide for the ERG field survey team, ERG subcontractors, and EPA staff participating in the field sampling efforts planned for July 1, 2008 through July 21, 2008. Information and data resulting from the survey will be documented in a final report prepared for EPA, and will be used in technical analyses to answer the questions listed in Section 2.3.1.

2.5 **Element A.7: Quality Objectives and Acceptance Criteria**

The objective of this QAPP is to ensure that data collected during EPA's July 2008 sampling program are of sufficient quality to evaluate environmental impacts from nutrients in Alaskan waters, and to support EPA and ADEC in the development of any additional regulatory options for controlling cruise ship discharges. This section provides the data quality objectives (DQOs) for the measurements listed in Table 2-2. These DQOs state the levels of uncertainty that are acceptable; they are established in terms of accuracy and precision, completeness, representativeness, and comparability. Table 2-3 describes the criteria EPA and ERG will use to describe the quality of the key measurements required to address the questions in Section 2.3.1. Several of the DQOs in Table 2-3 define the data quality goal to achieve a low relative percent difference (RPD) between "duplicate" analyses (Equation 2-1).

$$RPD = \frac{|S - D|}{\frac{1}{2}(S + D)} \times 100 \quad (2-1)$$

where:

S = First sample result; and

D = Duplicate sample result.

The RPD is a method for calculating agreement among measured values, to evaluate the quality of repeated measurements for different DQO assessments. In Table 2-3 the RPD goal is a value between 20 and 35 percent. This is not intended to be a required value, but to be a target for assessing data quality. If the DQO target is not met, ERG will assess the sampling, transport, and laboratory conditions that might have caused these limits to be exceeded, and will note any finding for all samples of the affected matrix type. Based on these findings, ERG, in consultation with the EPA WAM, will evaluate the data's fitness to answer the questions listed in 2.3.1.

Table 2-3. Data Quality Objectives for Key Measurements

Study Name and Key Measurement	Data Quality Review Criterion	Sampling Technique to Control Quality	How this quality criterion will be measured	Goal for this measurement
<u>Plume Dilution Study:</u> Concentration of Rhodamine WT dye at end-of-pipe and in near-field plume	Accuracy	Use dilution series of known concentrations to assess fluorometer accuracy	Comparison of measured value to known concentration value	Linear curve between known concentration and measured value.
	Precision (Reproducibility)	Field duplicate of near-field plume using two fluorometers	Comparison of duplicate values	Low RPD (20 to 35% is acceptable for most programs)
	Completeness	Follow sample collection procedures outlined in EPA's survey plan- no malfunctions or missed samples	% of planned samples for which fluorometer provides usable results	100% complete
	Representativeness	- Select appropriate sampling points - Use appropriate sample techniques	Can't measure directly. Poor comparison of duplicates will indicate if samples may not be representative	Low RPD (20 to 35% is acceptable for most programs)
	Comparability (Between ship discharge tests)	Use a standard methodology for sample point selection and sample collection	Compare sample point location distance and depth from discharge point between ship discharge tests	Sample points are equivalent between ship tests
<u>Nutrient Amendment Study:</u> Concentration and amount of nutrients added to incubation containers	Accuracy and Precision	- Use good lab practices - Use calibrated mass balance to measure solid nutrient additions - Use volumetric flask to make nutrient stock solutions for nutrient additions - Use Eppendorf pipette to measure volume added to incubation container	Can't measure directly. Proper use of lab equipment will ensure accuracy.	Added nutrient concentrations meet EPA's survey plan specifications
	Completeness	Incubation container preparation- no breakage or missed additions	% of incubation containers which follow EPA's survey plan methodologies	100% complete

Table 2-3. Data Quality Objectives for Key Measurements (continued)

Study Name and Key Measurement	Data Quality Review Criterion	Sampling Technique to Control Quality	How this quality criterion will be measured	Goal for this measurement
<u>Nutrient Amendment Study:</u> Level of chlorophyll fluorescence in incubation containers	Accuracy	Calibrate fluorometer at the beginning of the nutrient amendment study	Not measured directly. Instrument calibration is set based on a known standard provided by the vendor	Use the same calibration setting on the fluorometer for the entire nutrient amendment study.
	Precision (Reproducibility)	Create four replicate samples of each incubation container	Compare results from replicate samples	Low RPD (20 to 30% is acceptable for most programs.)
	Completeness	Follow sample collection procedures outlined in EPA's survey plan- no malfunctions or missed samples	% of planned samples for which fluorometer provides usable results	100% complete
	Representativeness	Use appropriate sample techniques	Can't measure directly. Poor comparison of replicate samples will indicate if samples may not be representative	Low RPD (20 to 30% is acceptable for most programs.)
	Comparability	Use standard equipment specified in EPA's study plan to collect samples	Not measured directly.	Use the same calibration setting on the fluorometer for the entire nutrient amendment study.
<u>Nutrient Amendment Study:</u> Nutrient concentrations in incubation containers	Accuracy	Use method-specified sample containers, hold times, sample collection procedures, and preservation	Accuracy can't be measured directly.	Follow sampling methods outlined in EPA's survey plan.
	Precision (Reproducibility)	Use methods outlined in EPA's study plan	Collect duplicate samples and calculate RPD values	Low RPD (20 to 35% is acceptable for most programs.)
	Completeness	- Use method-specified procedures - Shipping- meets hold times - Packing/shipping- no breakage - Sample collection- no breakage or missed samples	% of planned samples for which lab provides usable results	100% complete

Table 2-3. Data Quality Objectives for Key Measurements (continued)

Study Name and Key Measurement	Data Quality Review Criterion	Sampling Technique to Control Quality	How this quality criterion will be measured	Goal for this measurement
	Representativeness	Use sample techniques outlined EPA's study plan	Can't measure directly. Poor comparison of duplicates will indicate if samples may not be representative	Low RPD (20 to 35% is acceptable for most programs.)
	Comparability	Use standard analytical methods, conducted using standard procedures	Compare analytical methods and the detection limits they achieve	Analytical methods and detection limits are identical
<u>Nutrient Uptake Study:</u> Geographic location of water and macroalgae sample collection sites	Accuracy	Use factory calibrated global positioning unit (GPS)	Can't measure directly.	Use the same GPS unit throughout the nutrient uptake study
	Precision (Reproducibility)	Use sample techniques outlined EPA's study plan	Compare duplicate sample location latitude and longitude coordinates	Return to the same location
	Completeness	Follow sample collection procedures outlined in EPA's survey plan- no malfunctions	A measurement for every collection point	100% complete
	Comparability (Sampling from the same location)	Use standard equipment specified in EPA's study plan to collect samples	Not measured directly.	Use the same GPS unit throughout the nutrient uptake study.
<u>Nutrient Uptake Study:</u> Identification of macroalgae species	Accuracy	Follow sample collection procedures outlined in EPA's survey plan	Can't measure directly. Accuracy is dependent upon the expertise of sampler.	Collect macroalgae species specified in EPA's survey plan.
	Precision (Reproducibility)	Follow sample collection procedures outlined in EPA's survey plan	Can't measure directly. Precision is dependent upon the expertise of sampler.	Use the same expert to identify all macroalgae
	Completeness	Follow sample collection procedures outlined in EPA's survey plan- no missed samples	% of planned samples for which macroalgae are properly identified	100% complete
	Representativeness	Follow sample collection procedures outlined in EPA's survey plan	Can't measure directly. Representativeness is dependent upon the expertise of sampler.	Collect macroalgae species specified in EPA's survey plan.

Table 2-3. Data Quality Objectives for Key Measurements (continued)

Study Name and Key Measurement	Data Quality Review Criterion	Sampling Technique to Control Quality	How this quality criterion will be measured	Goal for this measurement
	Comparability	Follow sample collection procedures outlined in EPA's survey plan	Can't measure directly. Comparability is dependant upon the expertise of sampler.	Collect macroalgae species specified in EPA's survey plan.
<u>Nutrient Uptake Study:</u> Nutrient concentrations of water samples	Accuracy	Use method-specified sample containers, hold times, sample collection procedures, and preservation	Accuracy can't be measured directly.	Follow sampling methods outlined in EPA's survey plan.
	Precision (Reproducibility)	Use methods outlined in EPA's study plan	Collect duplicate samples and calculate RPD values	Low RPD (20 to 35% is acceptable for most programs.)
	Completeness	- Use method-specified procedures - Shipping- meets hold times - Packing/shipping- no breakage - Sample collection- no breakage or missed samples	% of planned samples for which lab provides usable results	100% complete
	Representativeness	Use sample techniques outlined EPA's study plan	Can't measure directly. Poor comparison of duplicates will indicate if samples may not be representative	Low RPD (20 to 35% is acceptable for most programs.)
	Comparability	Use standard analytical methods, conducted using standard procedures	Compare analytical methods and the detection limits they achieve	Analytical methods and detection limits are identical
<u>Nutrient Uptake Study:</u> Nitrogen and carbon isotope ratios of water samples	Accuracy	Use method-specified sample containers, hold times, sample collection procedures, and preservation	Accuracy can't be measured directly.	Follow sampling methods outlined in EPA's survey plan.
	Precision (Reproducibility)	Use methods outlined in EPA's study plan	Collect duplicate samples and calculate RPD values	Low RPD (20 to 35% is acceptable for most programs.)

Table 2-3. Data Quality Objectives for Key Measurements (continued)

Study Name and Key Measurement	Data Quality Review Criterion	Sampling Technique to Control Quality	How this quality criterion will be measured	Goal for this measurement
	Completeness	• Use method-specified procedures • Shipping- meets hold times • Packing/shipping- no breakage • Sample collection- no breakage or missed samples	% of planned samples for which lab provides usable results	100% complete
	Representativeness	• Use sample techniques outlined EPA's study plan	Can't measure directly. Poor comparison of duplicates will indicate if samples may not be representative	Low RPD (20 to 35% is acceptable for most programs.)
	Comparability	• Use standard analytical methods, conducted using standard procedures	Compare analytical methods and the detection limits they achieve	Analytical methods and detection limits are identical

2.6 Element A.9: Documents and Records

ERG has developed and instituted document control mechanisms for the review, revision, and distribution of QAPPs. Each QAPP has a signed approval form, title page, table of contents, and EPA-approved document control format (shown below) that appears in the upper right-hand corner of each page:

Section No. Revision No. Date:

The distribution list for this QAPP is presented in Table 2-1. During the course of the project, any revision to the QAPP will be circulated to the distribution list.

Standard controls for project-related data, documents, and records are presented in Section 5 of ERG's QMP (2). ERG's WPM, Debbie Falatko, is responsible for maintaining all ERG project files. She is also responsible for ensuring that ERG project team members use ERG Standard Operating Procedures (SOPs), including documenting all data sources used.

3.0 DATA GENERATION AND ACQUISITION

This section addresses EPA's survey plan (Appendix A) for the July 2008 sampling program to ensure that appropriate methods for data collection, generation, and acquisition are employed and documented. The sampling program includes the following three environmental studies: plume dilution study, nutrient amendment study, and nutrient uptake study. EPA has identified ten elements to be discussed in this section; however, not all of the elements are applicable to all of the studies described in the EPA's survey plan. Therefore, to facilitate discussion of data generation and acquisition, this section is divided into the following subsections:

- Section 3.1: Plume Dilution Study;
- Section 3.2: Nutrient Amendment Study; and
- Section 3.3: Nutrient Uptake Study.

3.1 Plume Dilution Study

This section describes data generation and acquisition for the plume dilution study described in the survey plan for the nutrient study (Appendix A). ERG has identified seven elements to be discussed:

- B.1: Sampling process design;
- B.2: Sampling methods;
- B.5: Quality control;
- B.6: Instrument/equipment testing, inspection and maintenance;
- B.7: Instrument/equipment calibration and frequency;
- B.8: Inspection/acceptance of supplies and consumables; and
- B.10: Data management.

3.1.1 Element B.1: Sampling Process Design

EPA is conducting a plume dilution study to provide information on (a) near-field mixing dynamics of the cruise ship discharge plume in harbor waters, and (b) whether these plumes corroborate previous modeling efforts by ADEC. In ADEC's models, the predicted dilution factor for stationary cruise ships in Skagway Harbor ranged from 5 to 60 during a neap tide. However, these modeling efforts used parameters that may not match ambient conditions. The dilution study will employ a tracer dye (Rhodamine WT) that will be added to ship effluent discharge systems for six different cruise ships. A fluorescence sensor will be towed by a rigid inflatable boat (RIB) adjacent to the ship discharge point; sensor measurements should provide spatial information on Rhodamine dye concentrations in the plume. Measurements of dye concentration, as well as hydrographic measurements, are not anticipated beyond a distance of 50 meters from the point of discharge. Measurements will occur within 10 meters of the discharge point; however, depending upon site conditions, distances will be determined by the EPA Chief Scientist. For addition information on the plume dilution study sample design, see Section 8.0 Part A in EPA's survey plan (Appendix A).

3.1.2 Element B.2: Sampling Methods

Section 8.0 Part A of EPA's survey plan describes the sample collection procedures for the plume dilution study. If the cruise ship wastewater treatment system or other components of the graywater and sewage collection, holding, and transfer system go down during the wastewater discharge, the survey team will record the times and dates they occur during the data analysis phase. During the sampling transects, the survey team will record weather conditions (e.g., temperature, wind speed, and wind direction) to document that samples were collected during calm weather conditions. The EPA Chief Scientist will determine if weather conditions are unsuitable for sample collection. In the event that EPA is unable to sample during slack tide due to equipment malfunction, cruise ship schedules, or other reasons, the EPA Chief Scientist will determine if sample collection should continue. The sampling equipment required for the study is outlined in Section 11.0 Part A of EPA's survey plan.

3.1.3 Element B.3: Sample Handling and Custody

This element describes how collected samples retain their original and physical form and chemical composition through collection through final disposal. The plume dilution study is not collecting any samples; therefore, this element does not apply.

3.1.4 Element B.4: Analytical Methods

This element identifies the procedures to analyze samples. The plume dilution study does not include any sample analysis; therefore, this element does not apply.

3.1.5 Element B.5: Quality Control

The plume dilution study will use the following equipment to measure environmental conditions and the concentration of Rhodamine WT dye:

- Sea-Bird SBE-19 CTD meter;
- Turner SCUFA Rhodamine WT fluorometer;
- Flomotion Systems Series BE6000 wall-mount flow transmitter;
- InterOcean S4 current meter with speed, direction, tilt, 128K; and
- RDI 1200 kHz Workhorse Monitor ADCP current meter.

Measurement quality will be controlled by continuing calibration of the equipment. See Section 3.1.5 for additional information.

3.1.6 Element B.6: Instrument/Equipment Testing, Inspection, and Maintenance

See Section 3.1.5 for additional information.

3.1.7 Element B.7: Instrument/Equipment Calibration and Frequency

ERG will rent the flow meters, fluorometers, current meters, and conductivity, depth, and temperature (CDT) meters required for the plume dilution study. EPA is responsible for purchasing the metering pumps required to inject dye into the wastewater discharge. ERG

will calibrate the fluorometers using a solution of Rhodamine WT dye diluted to 0.1 µg/L prior to the beginning of sampling activities, for each of the six discharge plume studies. In addition, ERG will test the fluorometer against a four step dilution series of Rhodamine WT dye with the following concentrations 300 µg/L, 100 µg/L, 10 µg/L, and 0.04 µg/L. The flow, current, and CDT meters are calibrated at the factory and maintained by the vendors; therefore, calibration in the field is not required. In addition to meter calibration, ERG will check that all internal clocks (time and date) on the meters are synchronized, to ensure data comparability at the end of each study. At the end of each vessel plume dilution study, all equipment will be cleaned with Alconox and rinsed to remove any dye or pathogens. ERG is responsible for ensuring that all field equipment is maintained in working condition, and that decontamination procedures are properly followed. Any variation from the guidelines outlined in this QAPP will be fully documented in field logs.

3.1.8 Element B.8 Inspection/Acceptance of Supplies and Consumables

One critical consumable for the study is the Rhodamine WT tracer dye used to track the near-field plume. ERG will purchase the Rhodamine WT dye and will inspect it to ensure that there is no breakage, evidence of tampering, or contamination of the dye.

3.1.9 Element B.9: Non-direct Measurement

This element addresses data obtained from existing data sources, not directly measured or generated during the study. The plume dilution study will not use any existing data sources; therefore, this element does not apply.

3.1.10 Element B.10: Data Management

This section describes the data reporting and documentation procedures for the data collected in the study. Field documentation tools for the study include logs, electronic memory storage on field equipment (e.g., flow meters, fluorometers, CDT, and current meters) and data collection sheets completed by the survey team. ERG will review all field logs and data collection sheets, and will ensure that records are legible and complete. ERG will download the data from the equipment to a laptop while in the field, and then will transfer the data into an

Excel spreadsheet to be stored and maintained electronically. ERG will retain all sample collection records from the plume dilution study. These records will include a copy of EPA's survey plan, sampling log sheets, data sheets, and electronic copies of the equipment data. Copies of these records will be provided to EPA as necessary.

3.2 Nutrient Amendment Study

This section describes the data generation and acquisition for the nutrient amendment study in EPA's survey plan for the Skagway Harbor. This study is intended to determine whether dissolved nutrients contained in cruise ship effluent are influencing phytoplankton growth. ERG has identified nine elements to be discussed:

- B.1: Sampling process design;
- B.2: Sampling methods;
- B.3: Sample handling and custody;
- B.4: Analytical methods;
- B.5: Quality control;
- B.6: Instrument/equipment testing, inspection and maintenance;
- B.7: Instrument/equipment calibration and frequency;
- B.8: Inspection/acceptance of supplies and consumables; and
- B.10: Data management.

3.2.1 Element B.1: Sampling Process Design

As noted above, the purpose of this study is to determine whether dissolved nutrients in cruise ship effluent are influencing phytoplankton growth in Skagway Harbor. Though data are limited, it is likely that dissolved nutrient concentrations are lowest during the summer months, when cruise ship presence is at its peak. The nutrient concentrations are low during the summer due to low levels of run-off, and to nutrient drawdown during the high

productivity spring season. For the nutrient amendment study, water will be collected above the halocline in Skagway Harbor, where cruise ship wastewater is likely to have the greatest impact.

Based on dissolved nutrient data in the Draft Cruise Ship TDD Environmental Assessment, EPA hypothesized that the phytoplankton community in Skagway Harbor may be nitrogen-limited, and is unlikely to be limited by phosphorus. Consequently, the following nutrient additions were selected for the nutrient amendment study:

- Control (no addition);
- Nitrogen ($35 \mu\text{mol L}^{-1}$ nitrate);
- Phosphorus ($2.5 \mu\text{mol L}^{-1}$ orthophosphate);
- Nitrogen + Phosphorus ($35 \mu\text{mol L}^{-1}$ nitrate and $2.5 \mu\text{mol L}^{-1}$ orthophosphate);
- Nitrogen as ammonia ($35 \mu\text{mol L}^{-1}$ ammonium chloride);
- Nitrogen as organic nitrogen ($35 \mu\text{mol L}^{-1}$ urea);
- Treated sewage dilution 1 (50-fold; $\sim 40 \mu\text{mol L}^{-1}$ inorganic nitrogen, $\sim 100 \text{ mg L}^{-1}$ total phosphorus); and
- Treated sewage dilution 2 (500-fold; $\sim 4 \mu\text{mol L}^{-1}$ inorganic nitrogen, $\sim 10 \text{ mg L}^{-1}$ total phosphorus).

For additional information on the nutrient amendment study design, see Section 8.0 Part B in EPA's survey plan (Appendix A).

3.2.2 Element B.2: Sampling Methods

Section 8.0 Part B of EPA's survey plan (Appendix A) describes the sampling procedures for the nutrient amendment study.

3.2.3 Element B.3: Sample Handling and Custody

This section describes sample handling and custody procedures for the nutrient amendment study.

Sample Handling

Section 8.0 Part B of EPA's survey plan (Appendix A) describes sampling handling procedures for the nutrient amendment study.

Sample Custody

The integrity of the samples will be maintained from collection through analysis. The study will use field logs, sample identification numbers, an Excel spreadsheet for detailed sample identification, and traffic reports to provide documentation. EPA will assign an identification number by writing directly on the bottles with a permanent marker, and will track the samples in an Excel spreadsheet to be delivered to the lab that will contain instructions on the required analysis for each sample.

To maintain a record of sample collection, transfer between personnel, shipment, and receipt by the laboratory, the survey team will complete a traffic report for each cooler or box that is shipped to a laboratory. These traffic reports will document custody transfer from the field to the laboratory, and will contain the following information:

- Incubation episode number;
- Sample number for each sample in shipment;
- Collection date and time for each sample in shipment;
- Amendment (yes or no);
- Number of containers of each sample;
- Sample description (environmental matrix);
- Analyses required for each sample;
- Shipment or airbill number;
- Date and method of shipment;
- The name of the person shipping the samples; and
- The name and address of the person receiving the samples.

Rachel Jakuba, the nutrient amendment study lead, is responsible for completing traffic reports, including referencing all applicable duplicate samples, and noting the date and time of shipment. ERG will inspect the traffic reports for accuracy and will initial any changes made to the form. One copy will be retained by ERG; two copies will accompany the sample shipment. A printout or CD of the Excel spreadsheet will also accompany the samples to the laboratory.

When a laboratory receives the samples, the laboratory sample custodian will check all bottles against traffic reports, record the condition of the samples, and sign, date, and mark the time of receipt on the traffic reports. The custodian will immediately report any discrepancies or problems to ERG.

3.2.4 Element B.4: Analytical Methods

Table 3-1 lists the analytical methods that will be used to analyze the ambient harbor water and the 48-hour and 96-hour incubation water samples collected for the nutrient amendment study. The table also lists the volume of sample to be collected, container type, preservation, and maximum holding times. The source of the analytical methods are identified; they are not reproduced in this document.

Table 3-1. Analytical Methods for Nutrient Analyses

Parameter	Method	Volume and Container Type	Preservation ¹	Holding Time
Ammonia	Slawyk and MacIsaac,1972 (4)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL
Nitrate/ Nitrite	Armstrong et al.,1967 (5)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL
Orthophosphate	Bernhardt and Wilhelms,1967 (6)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL
Silicate	Armstrong et al.,1967 (5)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL
Total Nitrogen	Valderrama,1981 (7)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL
Total Phosphorus	Valderrama,1981 (7)	One 60 mL, plastic	Filter using a 0.45 µm filter and freeze	2 weeks within receipt at UW MCL

¹ All sample preservation will be performed in the field prior to shipment to UW MCL.

3.2.5 Element B.5: Quality Control

Field quality control samples for the nutrient amendment study include duplicate samples. The purpose of the duplicate is to evaluate the precision (reproducibility) of data collected. ERG will verify that the laboratory performance for the nutrient samples sent to UW MCL is acceptable, by comparing the analytical results to method requirements. Based on this comparison, ERG will evaluate the validity of the data in consultation with the EPA WAM, and will submit all laboratory results including a report discussing any quality assurance or quality control issues or concerns regarding the data.

EPA is responsible for verifying that the laboratory performance for the phytoplankton samples sent to the University of Southern California meets the method requirements. For results from either laboratory, EPA may require the laboratories to re-analyze the samples if analytical performance does not meet method requirements.

In addition to duplicate samples, EPA will also use instrument calibration to control the quality of the chlorophyll field measurements. See Section 3.2.7 for additional information on instrument calibration for the nutrient amendment study.

3.2.6 Element B.6: Instrument/equipment testing, inspection and maintenance

See Section 3.2.7 for additional information.

3.2.7 Element B.7: Instrument/equipment calibration and frequency

EPA will calibrate the fluorometer per manufacturer's requirements prior to the nutrient amendment study. Once the meter is calibrated, EPA will use the same fluorometer with same calibration setting for the nutrient amendment study.

3.2.8 Element B.8: Inspection/acceptance of supplies and consumables

Critical supplies and consumables for this project include sample bottles, syringes, filters, nutrient amendment chemicals, preservation chemicals, and sampling equipment. See Section 11.0 Part B of EPA's survey plan for a complete list of supplies required for the study. ERG will purchase the required materials and will inspect materials upon receipt to ensure there is no breakage, evidence of tampering, or contamination.

3.2.9 Element B.9: Non-direct Measurement

This element addresses data obtained from existing data sources, not directly measured or generated during the study. The nutrient amendment study will not use any existing data sources; therefore, this element does not apply.

3.2.10 Element B.10: Data Management

This section describes the data reporting and documentation procedures for the data collected for the study. Documentation tools for the study include field logs and data collection sheets completed by the survey team. EPA will review all documentation (field logs and data collection sheets), and will ensure that all records are legible and complete. EPA will

retain all field sample collection records for the study. These records include a copy of EPA's survey plan, field log sheets, and field data sheets.

ERG is responsible for the laboratory analysis documentation and electronic data packages from UW MCL. Upon receipt of the data packages from the laboratory, ERG will assess the quality of the data as described in Section 3.2.5, and will deliver the electronic files to EPA. ERG will retain all laboratory and sample collection records for the nutrient analysis portion of the nutrient amendment study. These records include a copy of EPA's survey plan, the sample identification Excel spreadsheet, traffic reports, and electronic data packages from UW MCL. Copies of these records will be provided to EPA as necessary.

3.3 Nutrient Uptake Study

This section describes the data generation and acquisition for the nutrient uptake study described in EPA's survey plan (Appendix A). The nutrient uptake study is intended to determine the extent of anthropogenically-added nutrient uptake in macroalgae in Skagway Harbor, using stable nitrogen and carbon isotope analyses. The nutrient uptake study is divided into the following two parts:

- Part 1: Assessment of nutrient isotopes in naturally-abundant macroalgae in Taiya Inlet; and
- Part 2: Assessment of nutrient isotopes using laboratory-cultured nutrient-depleted algae samples.

EPA Region 10 is responsible for the macroalgae isotope analyses performed under Part 1 of the nutrient uptake study, and for all of procedures described in Part 2 of the nutrient uptake study. These methodologies are considered outside the scope of this QAPP, and will not be discussed further. ERG and its subcontractor Brian Lapointe, are responsible for the collection of the water and macroalgae samples for Part 1 of the study and are considered within the scope of this

QAPP. ERG has identified seven elements to be discussed for the water sample and macroalgae collection component of the study:

- B.1: Sampling process design;
- B.2: Sampling methods;
- B.3: Sample handling and custody;
- B.4: Analytical methods;
- B.5: Quality control;
- B.8: Inspection/acceptance of supplies and consumables; and
- B.10: Data management.

3.3.1 Element B.1: Sampling Process Design

Municipal (sewage outfall), riverine (Skagway River), oceanic (Taiya Inlet), and vessel (sewage and graywater) inputs are the major sources of the nutrient budget for Skagway Harbor. Stable isotope ratios are known to be indicative of nutrient sources, with anthropogenic nutrient sources being enriched in ^{15}N , and depleted in ^{13}C . To obtain an isotopic signature for each of the major nutrient inputs, ERG will collect water samples from Taiya Inlet (near the western coast of the inlet, approximately two kilometers south of Skagway Harbor, at a depth of one meter), Skagway River (approximately one kilometer northeast of Skagway, at a depth of one meter [conditions permitting]), the ZID of the municipal sewage outfall (i.e., 59° 26' 54.8"N, 135° 19' 36.6W at a depth of 25 meters), and the treated graywater and sewage effluent from a cruise ship designated by the EPA Chief Scientist. ERG's subcontractor, Brian Lapointe with Reef Research & Design, Inc. will collect naturally-abundant macroalgae (e.g., *Fucus*, *Ulva*) which are assumed to be representative of primary producers in the Taiya Inlet. Mr. Lapointe will collect macroalgae samples along the eastern coast line from Nahku Bay, through Skagway Harbor, and south to Sturgills Camp at approximately 0.5 km intervals. In addition, Mr. Lapointe will collect macroalgae samples from the western coastline of the Taiya Inlet from the mouth of the Taiya River to the intersection of the Lutak Inlet at approximately two km intervals. EPA

selected this geographic area to create a spatial relationship between the potential upstream and downstream nutrient inputs into Skagway Harbor. Jim Kaldy (EPA Region 10) is responsible for the nitrogen-starved algae experiment described in Part 2 of EPA's study plan. For additional information on the nutrient uptake study sample design see Section 8.0 Part C in EPA's survey plan (Appendix A).

3.3.2 Element B.2: Sampling Methods

Section 8.0 Part C of EPA's survey plan describes the sampling procedures for Part 1 (native macroalgae) of the study.

3.3.3 Element B.3: Sample Handling and Custody

This section discusses the sample handling and custody procedures for the study.

Sample Handling

Section 8.0 Part C of EPA's survey plan describes the sampling handling procedures for Part 1 of the study.

Sample Custody

Custody of the water samples sent to UW MCL and USGS Lab and phytoplankton samples sent to USC are the responsibility of ERG, and will follow the same sample custody procedures outlined in Section 3.2.3. Elizabeth Kim, EPA, the nutrient uptake study lead, is responsible for completing traffic reports. Custody for the native macroalgae samples in the vicinity of Skagway Harbor are the responsibility of Brian Lapointe, until the release of samples to EPA's Western Ecology Division in Portland, Oregon. Jim Kaldy (EPA Region 10) is responsible for tracking and maintaining sample custody records for the macroalgae isotope analyses at EPA's Western Ecology Division in Portland, Oregon.

3.3.4 Element B.4: Analytical Methods

Table 3-1 lists the analytical methods for the nutrient analyses used to analyze the ambient water collected in the vicinity of Skagway Harbor. The table also lists the volume of sample to be collected, container type, preservation, and maximum holding times. The source of the analytical methods are identified; they are not reproduced in this document.

Table 3-2 lists the analytical methods for nitrogen and carbon isotope analyses that will be used to analyze the ambient water collected at different sites in the vicinity of Skagway Harbor. The table also lists the volume of sample to be collected, container type, preservation, and maximum holding times. The source of the analytical methods are identified; they are not reproduced in this document.

Table 3-2. Analytical Methods for Nitrogen and Carbon Isotope Analyses

Parameter	Method	Volume and Container Type	Preservation
N15/N14 of ammonium dissolved in water	USGS 2898	1 L Plastic	H ₂ SO ₄ (low nitrogen content) to a pH of <2 and cooled to <6°C
N15/N14 of nitrate dissolved in water	USGS 2899	1 L Plastic	Frozen

¹ All sample preservation will be performed in the field prior to shipment to UW MCL.

3.3.5 Element B.5: Quality Control

Quality control samples for Part 1 of the nutrient uptake study include replicate water and macroalgae samples. The purpose of the field replicate is to evaluate the precision (reproducibility) of the data collected. ERG and ERG's subcontractor Brian Lapointe will collect field replicate samples, as outlined in EPA's survey plan (Appendix A). ERG is responsible for verifying that the laboratory performance for the ambient water samples sent to UW MCL and USGS Lab are acceptable by comparing the analytical results to the method requirements. Based on this comparison, ERG will evaluate the validity of the data in consultation with the EPA WAM, and will submit all laboratory results and will include a report discussing any quality assurance or quality control issues or concerns regarding the data. EPA may require the laboratories to re-analyze the samples if analytical performance does not meet method requirements.

In addition to duplicate samples, ERG and ERG's subcontractor Brian Lapointe will use a GPS to locate and verify sample locations, to ensure that ambient water and macroalgae samples are collected at the same locations throughout the nutrient uptake study. The GPS unit is factory-calibrated; no further calibrations are necessary.

3.3.6 Element B.6: Instrument/Equipment Testing, Inspection, and Maintenance

See Section 3.3.7 for additional information.

3.3.7 Element B.7: Instrument/Equipment Calibration and Frequency

3.3.8 Element B.8: Inspection/acceptance of supplies and consumables

Supplies and consumables for this project include sample bottles, filters, nutrient amendment chemicals, preservation chemicals, and sampling equipment. See Section 11.0 Part C of EPA's survey plan for a complete list of supplies required for the study. ERG will purchase the required materials for Part 1 of the study, and will inspect materials upon receipt to ensure there is no breakage, evidence of tampering, or contamination.

3.3.9 Element B.9: Non-direct Measurement

This element addresses data obtained from existing data sources, not directly measured or generated during the study. The nutrient uptake study will not use any existing data sources; therefore, this element does not apply.

3.3.10 Element B.10: Data Management

This section describes the data reporting and documentation procedures for Part 1 of the study. Documentation tools for the nutrient amendment study include field logs and data collection sheets completed by the survey team. ERG will review all documentation (field logs and data collection sheets) and ensure that all records are legible and complete. ERG will retain all sample collection records for water samples collected for Part 1 of the study. These records include a copy of EPA's survey plan, sampling log sheets, data sheets, and traffic reports for

water samples. Elizabeth Kim, the nutrient uptake study lead, will maintain the documentation records for the macroalgae samples collected.

ERG is responsible for the laboratory analysis documentation and electronic data packages from UW MCL and USGS Lab. Upon receipt of the data packages from the laboratory, ERG will assess the quality of the data as described in Section 3.3.4, and will deliver the electronic files to EPA. ERG will retain all laboratory sample collection records for the water sample nutrient and isotope analyses. These records include a copy of EPA's survey plan, the sample tracking Excel spreadsheet, traffic reports, and electronic data packages from UW MCL and USGS Lab. Copies of these records will be provided to EPA as necessary.

4.0 ASSESSMENT AND OVERSIGHT ELEMENTS

This section describes the methods ERG will use to determine the quality of the work performed. ERG has identified two elements to be discussed:

- C.1: Assessments and Response Actions; and
- C.2: Reports to Management.

4.1 Element C.1: Assessments and Response Actions

At the completion of the study, the ERG WPM will review the field activities for which ERG was responsible, and will evaluate the following elements:

- Compliance of all activities with EPA's survey plan;
- Compliance of all procedures and analyses with procedures outlined in the
- QAPP; and
- Completeness of field documentation (i.e., field logs, traffic reports, and data collection sheets).

Following this review, ERG will document any quality assurance or quality control issues or concerns that occurred during the survey.

ERG will review all laboratory data generated from UW MCL and USGS Lab for completeness, accuracy, and precision, to ensure that quality objectives and criteria discussed in Section 2.5 of this QAPP have been met. ERG will review documentation to determine if all required analyses and documentation were provided, and that all laboratory work met contract requirements. ERG will document the results of this assessment in a report that will discuss any quality assurance or quality control issues or concerns regarding the UW MCL and USGS Lab data.

EPA is responsible for reviewing the laboratory phytoplankton data from the University of Southern California; EPA Region 10 is responsible for reviewing the isotope data for the native macroalgae samples and nitrogen-starved algae samples collected in this study.

4.2 Element C.2: Reports to Management

This QAPP will be updated and appended as necessary. Updates to EPA's survey plan will be appended to this QAPP as necessary. ERG will inform the EPA Technical PO of the progress of all work activities on this work assignment through monthly written reports. Any quality deficiencies detected by ERG will be communicated, in writing, to the EPA WAM, as soon as any deficiencies are identified.

5.0 DATA VALIDATION AND USABILITY ELEMENTS

This section describes review, verification, and validation of data collected in the Skagway Harbor plume dilution study, nutrient amendment study, and nutrient uptake study. It also discusses how data will be evaluated to determine if they adequately answer the questions posed in Section 2.3.1, and whether they met the objectives stated in Table 2-3. ERG has identified three elements to be discussed:

- D.1: Data Review, Verification and Validation;
- D.2: Verification and Validation Methods; and
- D.3: Reconciliation with User Requirements.

5.1 Elements D.1 and D.2: Data Review, Verification, and Validation; and Validation Methods

As discussed in Sections 3.2.5 and 3.3.5, ERG will subject all analytical data generated by UW MCL and USGS Lab to a multi-stage review, verification, and validation process to ensure that the data are complete, contract-compliant, and usable.

ERG will conduct an overall assessment of the sampling and laboratory data for which ERG is responsible, as outlined in Figure 2-1. This review will consider the detected and non-detected pollutants, pollutant concentrations, laboratory quality control issues, and data variability observed during the program. ERG will evaluate if field equipment measurements are reasonable, as described in Section 2.5 of this QAPP. Table 2-3 presents the data quality review criteria that ERG will use.

5.2 Element D.3: Reconciliation with User Requirements

The primary objective of this QAPP is to ensure that data collected are of the quality necessary to address the questions posed in Section 2.3.1. ERG will describe the data

quality and limitations of the sampling episode and laboratory results from UW MCL and USGS Lab, so that any future users may determine if the data are of sufficient quality.
